**Notes on Ratings and Characteristics****1.0 Voltage Grade Table**

Voltage Grade	$V_{DRM}$ V	$V_{DSM}$ V	$V_{RRM}$ V	$V_{RSM}$ V	$V_D$ DC V	$V_R$ DC V
60	6000			6100	3000	
62	6200			6300	3100	
64	6400			6500	3200	
65	6500			6600	3250	

**2.0 Extension of Voltage Grades**

This report is applicable to other voltage grades when supply has been agreed by Sales/Production.

**3.0 De-rating Factor**

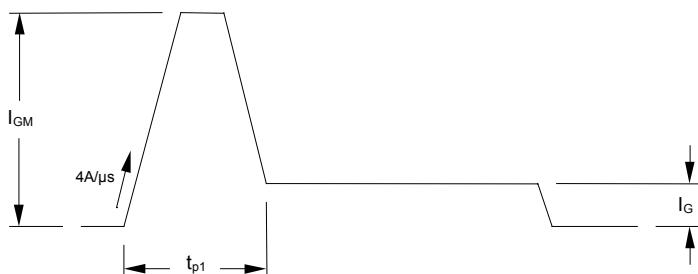

A blocking voltage de-rating factor of 0.13%/°C is applicable to this device for  $T_j$  below 25°C.

**4.0 Repetitive dv/dt**

Standard dv/dt is 1000V/μs.

**5.0 Gate Drive**

The nominal requirement for a typical gate drive is illustrated below. An open circuit voltage of at least 30V is assumed. This gate drive must be applied when using the full di/dt capability of the device.

The magnitude of  $I_{GM}$  should be between five and ten times  $I_{GT}$ , which is shown on page 2. Its duration ( $t_{p1}$ ) should be 20μs or sufficient to allow the anode current to reach ten times  $I_L$ , whichever is greater. Otherwise, an increase in pulse current could be needed to supply the necessary charge to trigger. The 'back-porch' current  $I_G$  should remain flowing for the same duration as the anode current and have a magnitude in the order of 1.5 times  $I_{GT}$ .

**6.0 Frequency Ratings**

The curves illustrated in figures 17 & 18 are for guidance only and are superseded by the maximum ratings shown on page 1. For operation above line frequency, please consult the factory for assistance.

**7.0 Rate of rise of on-state current**

The maximum un-primed rate of rise of on-state current must not exceed 300A/μs at any time during turn-on on a non-repetitive basis. For repetitive performance, the on-state rate of rise of current must not exceed 150A/μs at any time during turn-on. Note that these values of rate of rise of current apply to the total device current including that from any local snubber network.

**8.0 Square wave frequency ratings**

These ratings are given for load component rate of rise of on-state current of 50A/μs.

## 9.0 Computer Modelling Parameters

### 9.1 Device Dissipation Calculations

$$I_{AV} = \frac{-V_{T0} + \sqrt{V_{T0}^2 + 4 \cdot ff^2 \cdot r_T \cdot W_{AV}}}{2 \cdot ff^2 \cdot r_T}$$

and:

$$W_{AV} = \frac{\Delta T}{R_{th}}$$

$$\Delta T = T_{j\max} - T_{Hs}$$

Where  $V_{T0}=1.568V$ ,  $r_T=2.428m\Omega$ ,

$R_{th}$  = Supplementary thermal impedance, see table below and

$ff$  = Form factor, see table below.

### 9.2 D.C. Thermal Impedance Calculation

$$r_t = \sum_{p=1}^{p=n} r_p \cdot \left( 1 - e^{\frac{-t}{\tau_p}} \right)$$

Where  $p = 1$  to  $n$ ,  $n$  is the number of terms in the series and:

$t$  = Duration of heating pulse in seconds.

$r_t$  = Thermal resistance at time  $t$ .

$r_p$  = Amplitude of  $r_{th}$  term.

$\tau_p$  = Time Constant of  $r_{th}$  term.

The coefficients for this device are shown in the tables below:

D.C. Double Side Cooled				
Term	1	2	3	4
$r_p$	0.01771901	$4.240625 \times 10^{-3}$	$6.963806 \times 10^{-3}$	$3.043661 \times 10^{-3}$
$\tau_p$	0.7085781	0.1435833	0.03615196	$2.130842 \times 10^{-3}$

$\tau_p$	4.090062	1.078983	0.08530917	0.01128791	$1.240861 \times 10^{-3}$

### 9.3 Calculating $V_T$ using ABCD Coefficients

The on-state characteristic  $I_T$  vs.  $V_T$ , on page 6 is represented in two ways;

- (i) the well established  $V_{TO}$  and  $r_T$  tangent used for rating purposes and
- (ii) a set of constants A, B, C, D, forming the coefficients of the representative equation for  $V_T$  in terms of  $I_T$  given below:

$$V_T = A + B \cdot \ln(I_T) + C \cdot I_T + D \cdot \sqrt{I_T}$$

The constants, derived by curve fitting software, are given below for the hot and cold characteristics. The resulting values for  $V_T$  agree with the true device characteristic over a current range, which is limited to that plotted.

25°C Coefficients		115°C Coefficients	
A	0.2103143	A	-0.8731799
B	0.4754865	B	0.650089
C	$2.581886 \times 10^{-3}$	C	$3.072624 \times 10^{-3}$
D	-0.09062255	D	-0.08511282

### 10.0 Snubber Components

When selecting snubber components, care must be taken not to use excessively large values of snubber capacitor or excessively small values of snubber resistor. Such excessive component values may lead to device damage due to the large resultant values of snubber discharge current. If required, please consult the factory for assistance.

### 11.0 Reverse recovery ratings

- (i)  $Q_{ra}$  is based on 50%  $I_{rm}$  chord as shown in Fig. 1
- (ii)  $Q_{rr}$  is based on a 150μs integration time i.e.

$$Q_{rr} = \int_0^{150\mu s} i_{rr} dt$$

$$(iii) K Factor = \frac{t_1}{t_2}$$

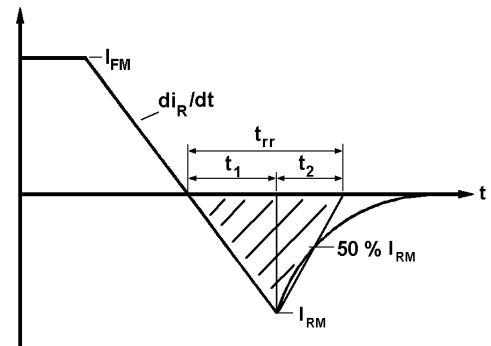

Fig. 1

### 12.0 Duty cycle lines

The 100% duty cycle is represented on the frequency ratings by a straight line. Other duties can be included as parallel to the first.
