9-Bit Latchable Transceiver with Parity Generator/Checker

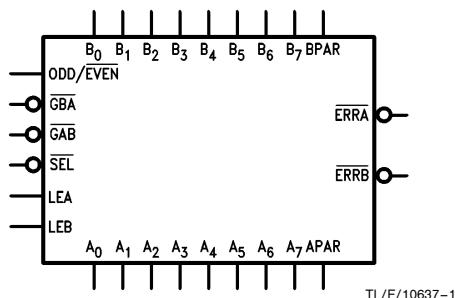

General Description

The 'AC/'ACT899 is a 9-bit to 9-bit parity transceiver with transparent latches. The device can operate as a feed-through transceiver or it can generate/check parity from the 8-bit data busses in either direction. The 'AC/'ACT899 features independent latch enables for the A-to-B direction and the B-to-A direction, a select pin for ODD/EVEN parity, and separate error signal output pins for checking parity.

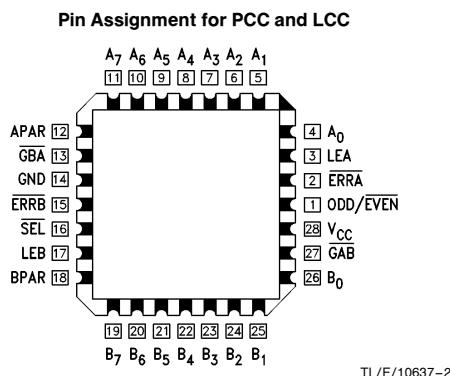

Features

- Latchable transceiver with output sink of 24 mA
- Option to select generate parity and check or "feed-through" data/parity in directions A-to-B or B-to-A
- Independent latch enable for A-to-B and B-to-A directions
- Select pin for ODD/EVEN parity
- \overline{ERRA} and \overline{ERRB} output pins for parity checking
- Ability to simultaneously generate and check parity
- May be used in system applications in place of the '280
- May be used in system applications in place of the '657 and '373 (no need to change T/R to check parity)
- 4 KV minimum ESD immunity

Pin Names	Description
A ₀ -A ₇	A Bus Data Inputs/Data Outputs
B ₀ -B ₇	B Bus Data Inputs/Data Outputs
APAR, BPAR	A and B Bus Parity Inputs
ODD/EVEN	ODD/EVEN Parity Select, Active LOW for EVEN Parity
GBA, GAB	Output Enables for A or B Bus, Active LOW
SEL	Select Pin for Feed-Through or Generate Mode, LOW for Generate Mode
LEA, LEB	Latch Enables for A and B Latches, HIGH for Transparent Mode
ERRA, ERRB	Error Signals for Checking Generated Parity with Parity In, LOW if Error Occurs

Functional Description

The 'AC/'ACT899 has three principal modes of operation which are outlined below. These modes apply to both the A-to-B and B-to-A directions.

- Bus A (B) communicates to Bus B (A), parity is generated and passed on to the B (A) Bus as BPAR (APAR). If LEB (LEA) is HIGH and the Mode Select (SEL) is LOW, the parity generated from B[0:7] (A[0:7]) can be checked and monitored by $\overline{\text{ERRB}}$ ($\overline{\text{ERRA}}$).
- Bus A (B) communicates to Bus B (A) in a feed-through mode if SEL is HIGH. Parity is still generated and checked as $\overline{\text{ERRA}}$ and $\overline{\text{ERRB}}$ in the feed-through mode (can be used as an interrupt to signal a data/parity bit error to the CPU).
- Independent Latch Enables (LEA and LEB) allow other permutations of generating/checking (see Function Table below).
