74LCX821

Low Voltage 10-Bit D-Type Flip-Flop with 5V Tolerant Inputs and Outputs

General Description

The LCX821 consists of ten D-type Flip-Flops with 3-STATE outputs for bus organized system applications. The device is designed for low voltage (2.5V or 3.3V) $\rm V_{CC}$ applications with capability of interfacing to a 5V signal environment.

The LCX821 is fabricated with an advanced CMOS technology to achieve high speed operation while maintaining CMOS low power dissipation.

Features

- 5V tolerant inputs and outputs
- \blacksquare 2.3V–3.6V $\rm V_{CC}$ specifications provided
- \blacksquare 7.0 ns t_{PD} max (V_{CC} = 3.3V), 10 μ A I_{CC} max
- Power-down high impedance inputs and outputs
- Supports live insertion/withdrawal (Note 1)
- \pm 24 mA output drive ($V_{CC} = 3.0V$)
- Implements patented noise/EMI reduction circuitry
- Latch-up performance exceeds 500 mA
- ESD performance:

Human Body Model > 2000V Machine Model > 200V

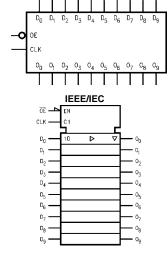

Note 1: To ensure the high-impedance state during power up or down, $\overline{\text{OE}}$ should be tied to V_{CC} through a pull-up resistor: the minimum value or the resistor is determined by the current-sourcing capability of the driver.

Ordering Code:

Order Number	Package Number	Package Description
74LCX821WM	M24B	24-Lead Small Outline Integrated Circuit (SOIC), JEDEC MS-013, 0.300 Wide
74LCX821MSA	MSA24	24-Lead Shrink Small Outline Package (SSOP), EIAJ TYPE II, 5.3mm Wide
74LCX821MTC	MTC24	24-Lead Thin Shrink Small Outline Package (TSSOP), JEDEC MO-153, 4.4mm Wide

Devices also available in Tape and Reel. Specify by appending the suffix "X" to the ordering code.

Functional Description

The LCX821 consists of ten edge-triggered flip-flops with individual D-type inputs with 3-STATE true outputs. The buffered clock and buffered Output Enable are common to all flip-flops. The ten flip-flops will store the state of their individual D inputs that meet the setup and hold time requirements on the LOW-to-HIGH Clock (CLK) transition. With the Output Enable (\overline{OE}) LOW, the contents of the ten flip-flops are available at the outputs. When $\overline{\text{OE}}$ is HIGH, the outputs go to the high impedance state. Operation of the OE input does not affect the state of the flip-flops.

Logic Diagram

Please note that this diagram is provided only for the understanding of logic operations and should not be used to estimate propagation delays.

		$V_{CC} = 2.7V - 3.0V$ $V_{CC} = 2.3V - 2.7V$		±12	mA
		$V_{CC} = 2.3V - 2.7V$		±8	
T _A	Free-Air Operating Temperature		-40	85	°C
Δt/ΔV	Input Edge Rate, $V_{IN} = 0.8V - 2.0V$, $V_{CC} = 3.0V$		0	10	ns/V

Note 2: The Absolute Maximum Ratings are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the Absolute Maximum Ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

Note 3: I_O Absolute Maximum Rating must be observed.

Note 4: Unused inputs must be held HIGH or LOW. They may not float.
