

## Description

The 8V19N472 is a fully integrated FemtoClock NG Jitter Attenuator and Clock Synthesizer designed as a high-performance clock solution for conditioning and frequency/phase management of wireless base station radio equipment boards. The device is optimized to deliver excellent phase noise performance as required in GSM, WCDMA, LTE, and LTE-A radio board implementations.

A two-stage PLL architecture supports both jitter attenuation and frequency multiplication. The first stage PLL is the jitter attenuator and uses an external VCXO for best possible phase noise characteristics. The second stage PLL locks on the VCXO-PLL output signal and synthesizes the target frequency. This PLL has two VCO circuits at 2949.12MHz and 2400–2500MHz, respectively, for enhanced frequency flexibility.

The device generates the output clock signals from the selected VCO by frequency division. Five independent frequency dividers are available, four support integer-divider ratios and one integer as well as fractional-divider ratios. Delay circuits can be used for achieving alignment and controlled phase delay between clock signals. The two redundant inputs are monitored for activity. Four selectable clock switching modes are provided to handle clock input failure scenarios. Auto-lock, individually programmable output frequency dividers, and phase adjustment capabilities are added for flexibility.

The 8V19N472 is configured through an SPI interface and reports lock and signal loss status in internal registers and via a lock detect (LOCK) output. Internal status bit changes can also be reported via the nINT output. The device is ideal for driving converter circuits in wireless infrastructure, radar/imaging, and instrumentation/medical applications. The device is a member of the high-performance clock family from IDT.

## Typical Applications

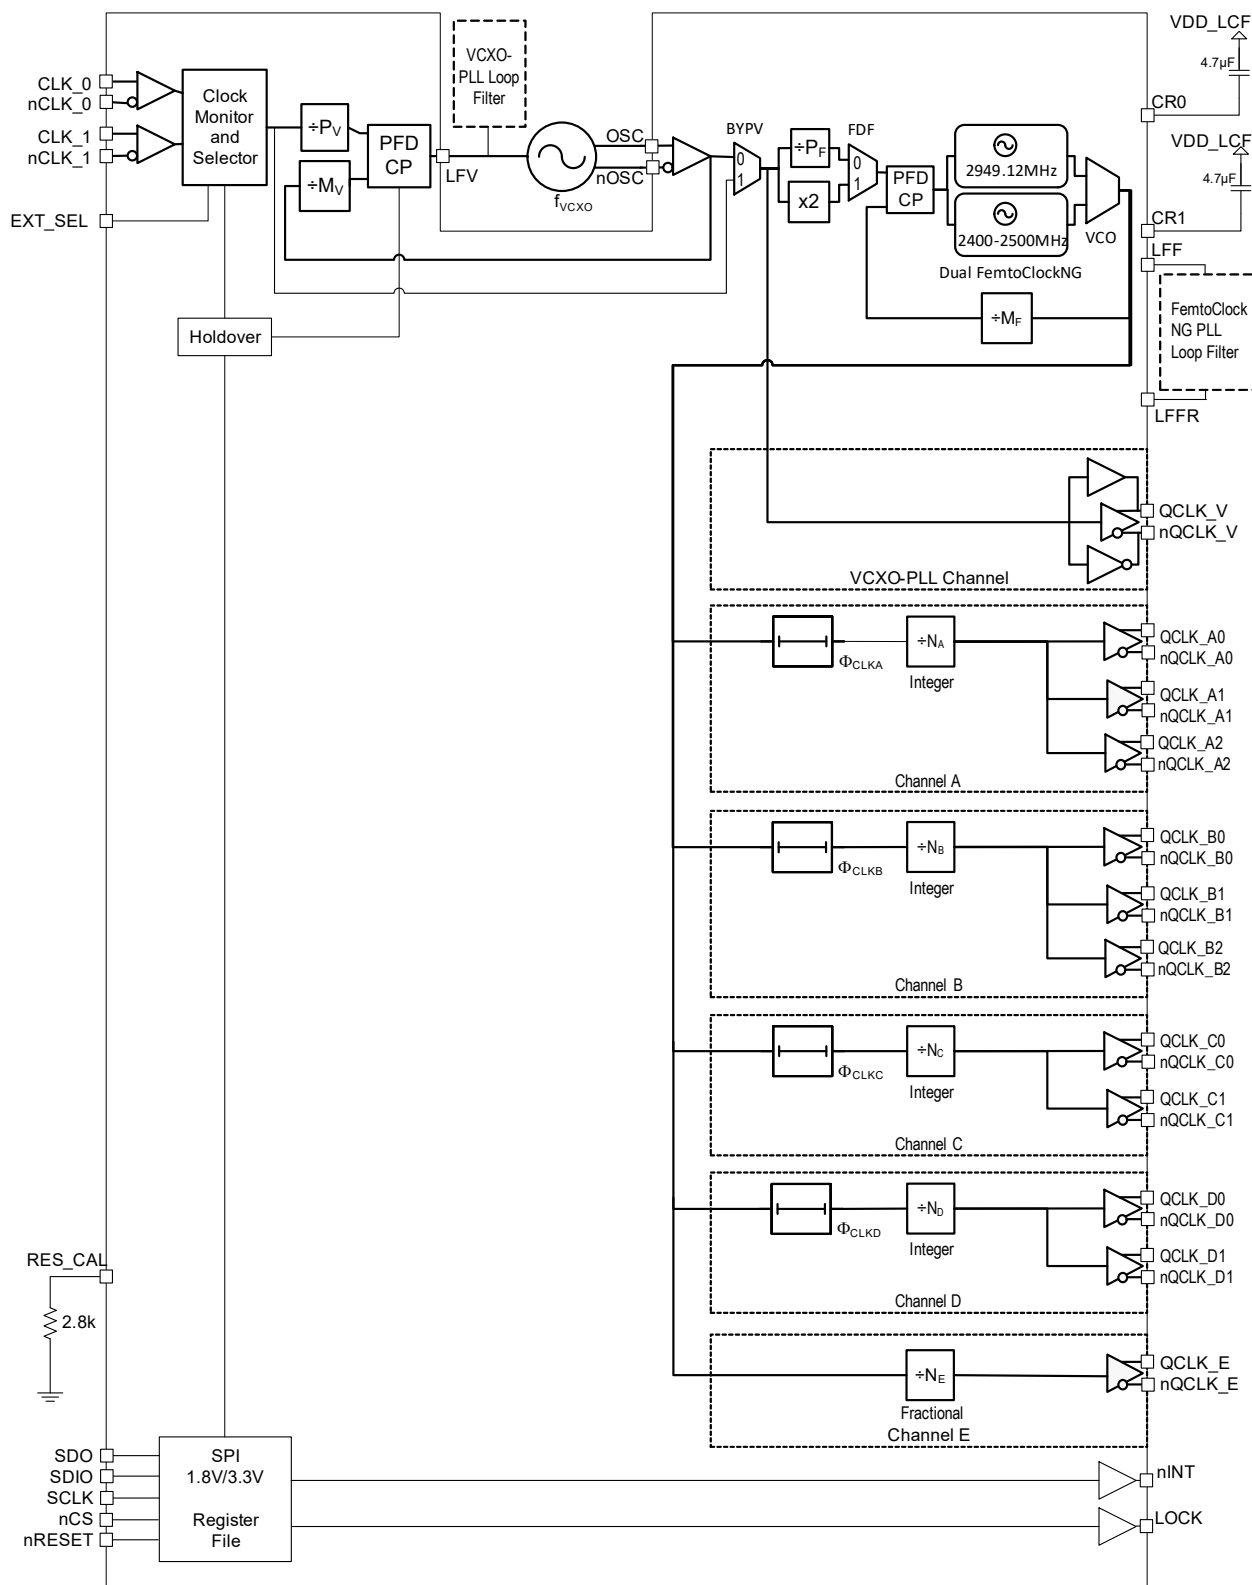

- Low-phase noise clock generation, specifically for jitter-sensitive ADC and DAC circuits
- Wireless infrastructure applications: GSM, WCDMA, LTE, LTE-A
- Ethernet

## Features

- High-performance clock RF-PLL
- Optimized for low phase noise: <-150dBc/Hz (1MHz offset; 245.76MHz clock)
- Dual-PLL architecture
  - 1st-PLL stage with external VCXO for clock jitter attenuation
  - 2nd-PLL stage with internal FemtoClockNG PLL at selectable 2949.12MHz and MHz (2400–2500MHz) VCO frequency
- Six output banks with a total of 12 outputs, organized in:
  - Two clock banks with one integer frequency divider and three differential outputs
  - Two clock banks with one integer frequency divider and two differential outputs
  - One clock bank with one fractional output divider and one differential output
  - One VCXO-PLL output bank with one selectable LVDS/two LVCMOS outputs
- Supported clock output frequencies include:
  - From VCO-0: 2949.12, 1474.56, 983.04, 491.52, 368.64, 122.88MHz
  - From VCO-1: 2457.6, 1228.8, 614.4, 307.2, 153.6, 76.8MHz
  - From the fractional output divider: 80 – 300MHz
- Clock channels with integer output divider contain a phase delay circuit with 512 steps of half of the selected VCO period
- Low-power LVPECL/LVDS outputs support configurable signal amplitude, DC and AC coupling and LVPECL, LVDS line terminations techniques
- Redundant input clock architecture
  - Two inputs with an individual input signal monitor
  - Digital holdover
  - Manual and automatic clock selection
  - Hitless switching
- Status monitoring and fault reporting
  - Input signal status
  - Hold-over and reference loss status
  - Lock status with one status pin
  - Maskable status interrupt pin
- Voltage supply:
  - Device core supply voltage: 3.3V
  - Output supply voltage: 3.3V, 2.5V, or 1.8V
  - SPI control I/O voltage: 1.8V or 3.3V (selectable), 3.3V tolerant inputs when set to 1.8V
- Package: 81-FPBGA (8 × 8mm, 0.8 mm ball pitch)
- Temperature range: -40°C to +85°C

# Pin Descriptions

Table 1. Pin Descriptions<sup>[a]</sup>

| Ball Number | Name                 | Type <sup>[b]</sup> |       | Description   |
|-------------|----------------------|---------------------|-------|---|
| D6          | CLK_0                | Input               | PD    | Device clock 0 inverting and non-inverting differential clock input. Inverting input is biased to $V_{DD\_V}/2$ by default when left floating. Compatible with LVPECL, LVDS, and LVC MOS signals. |
| E6          | nCLK_0               |                     | PD/PU |   |
| D5          | CLK_1                | Input               | PD    | Device clock 1 inverting and non-inverting differential clock input. Inverting input is biased to $V_{DD\_V}/2$ by default when left floating. Compatible with LVPECL, LVDS, and LVC MOS signals. |
| E5          | nCLK_1               |                     | PD/PU |   |
| B3          | EXT_SEL              | Input               | PD    | Clock reference select. 1.8V LVC MOS interface levels.  |
| D9,<br>D8   | QCLK_A0,<br>nQCLK_A0 | Output              |       | Differential clock output A0 (Channel A). Configurable LVPECL/LVDS style and amplitude. Output levels are determined by the VDDO_QCLKA supply voltage.  |
| C9,<br>C8   | QCLK_A1,<br>nQCLK_A1 | Output              |       | Differential clock output A1 (Channel A). Configurable LVPECL/LVDS style and amplitude. Output levels are determined by the VDDO_QCLKA supply voltage.  |
| A9,<br>B9   | QCLK_A2,<br>nQCLK_A2 | Output              |       | Differential clock output A2 (Channel A). Configurable LVPECL/LVDS style and amplitude. Output levels are determined by the VDDO_QCLKA supply voltage.  |
| J9,<br>H9   | QCLK_B0,<br>nQCLK_B0 | Output              |       | Differential clock output B0 (Channel B). Configurable LVPECL/LVDS style and amplitude. Output levels are determined by the VDDO_QCLKB supply voltage.  |
| G9,<br>G8   | QCLK_B1,<br>nQCLK_B1 | Output              |       | Differential clock output B1 (Channel B). Configurable LVPECL/LVDS style and amplitude. Output levels are determined by the VDDO_QCLKB supply voltage.  |
| F9,<br>F8   | QCLK_B2,<br>nQCLK_B2 | Output              |       | Differential clock output B2 (Channel B). Configurable LVPECL/LVDS style and amplitude. Output levels are determined by the VDDO_QCLKB supply voltage.  |
| J1,<br>J2   | QCLK_C0,<br>nQCLK_C0 | Output              |       | Differential clock output C0 (Channel C). Configurable LVPECL/LVDS style and amplitude. Output levels are determined by the VDDO_QCLKC supply voltage.  |
| H1,<br>H2   | QCLK_C1,<br>nQCLK_C1 | Output              |       | Differential clock output C1 (Channel C). Configurable LVPECL/LVDS style and amplitude. Output levels are determined by the VDDO_QCLKC supply voltage.  |
| A1,<br>A2   | QCLK_D0,<br>nQCLK_D0 | Output              |       | Differential clock output D0 (Channel D). Configurable LVPECL/LVDS style and amplitude. Output levels are determined by the VDDO_QCLKD supply voltage.  |
| B1,<br>B2   | QCLK_D1,<br>nQCLK_D1 | Output              |       | Differential clock output D1 (Channel D). Configurable LVPECL/LVDS style and amplitude. Output levels are determined by the VDDO_QCLKD supply voltage.  |
| E1,<br>E2   | QCLK_E,<br>nQCLK_E   | Output              |       | Differential clock output E (Channel E). Configurable LVPECL/LVDS style and amplitude. Output is supplied by 3.3V (VDD_QCLK_E)  |

Table 1. Pin Descriptions<sup>[a]</sup> (Cont.)

| Ball Number  | Name            | Type <sup>[b]</sup> |       | Description  |
|--|-----------------|---------------------|-------|--|
| A4, B4   | QCLK_V, nQCLK_V | Output              |       | Differential VCXO-PLL clock outputs. Selectable LVPECL/LVDS/(2x LVCMOS 1.8V) style.  |
| C4   | nINT            | Output              |       | Status output pin for signaling internal changed conditions. Selectable 1.8V/3.3V LVCMOS interface levels.                     |
| E3   | LOCK            | Output              |       | PLL lock detect status output for both PLLs. Selectable 1.8V/3.3V LVCMOS interface levels.                                     |
| C5   | SDIO            | Input/Output        |       | Serial Control Port SPI Mode Clock Input/Output. Selectable 1.8V/3.3V LVCMOS interface levels. 3.3V tolerant when set to 1.8V. |
| C6   | SDO             | Output              |       | Serial Control Port SPI Mode Output. Selectable 1.8V/3.3V LVCMOS interface levels.   |
| D4   | SCLK            | Input               | PD    | Serial Control Port SPI Clock. Selectable 1.8V/3.3V LVCMOS interface levels. 3.3V tolerant when set to 1.8V.                   |
| C3   | nCS             | Input               | PU    | Serial Control Port SPI Chip Select Input. 1.8V/3.3V LVCMOS interface levels. 3.3V tolerant when set to 1.8V.                  |
| D3   | nRESET          | Input               | PU    | SPI interface reset. Selectable 1.8V/3.3V LVCMOS interface levels. 3.3V tolerant when set to 1.8V.                             |
| H6   | CR0             | Analog              |       | Internal VCO (0) regulator bypass capacitor. Use a 4.7 $\mu$ F capacitor between the CR0 and the VDD_LCF terminals.            |
| H5   | CR1             | Analog              |       | Internal VCO (1) regulator bypass capacitor. Use a 4.7 $\mu$ F capacitor between the CR1 and the VDD_LCF terminals.            |
| A7   | LFV             | Output              |       | VCXO-PLL charge pump output. Connect to the loop filter for the external VCXO.   |
| B6   | OSC             | Input               | PD    | VCXO non-inverting and inverting differential clock input. Compatible with LVPECL, LVDS, and LVCMOS signals.                   |
| B5   | nOSC            |                     | PD/PU |  |
| J6   | LFF             | Output              |       | Loop filter/charge pump output for the FemtoClock NG PLL. Connect to the external loop filter.                                 |
| J5   | LFFR            | Analog              |       | Ground return path pin for the VCO loop filter.  |
| B7   | RES_CAL         | Analog              |       | Connect a 2.8k $\Omega$ (1%) resistor to GND for output current calibration.   |
| C7, D2, D7, E7, E8, E9, F1, F2, F3, F4, F5, F6, F7, G3, H3, H7, J3 | GND             | Power               |       | Ground supply voltage (GND) and ground return path. Connect to board GND (0V).   |
| G4   | CBIAS1          | Analog              |       | Internal bias circuit for VCO-1. Connect a 4.7 $\mu$ F capacitor to GND.   |
| G5   | CLDO1           | Analog              |       | Internal LDO bypass for VCO-1. Connect a 10 $\mu$ F capacitor to GND.  |
| G6   | CBIAS0          | Analog              |       | Internal bias circuit for VCO-0. Connect a 4.7 $\mu$ F capacitor to GND.   |
| G7   | CLDO0           | Analog              |       | Internal LDO bypass for VCO-0. Connect a 10 $\mu$ F capacitor to GND.  |
| A8   | VDDO_QCLKA      | Power               |       | Positive supply voltage (3.3V, 2.5V, or 1.8V) for the QCLK_A[2:0] outputs.   |
| B8   | VDD_QCLKA       | Power               |       | Positive supply voltage (3.3V) for channel A.  |

|-------------|------------|---------------------|--|--|
| J8          | VDDO_QCLKB | Power               |  | Positive supply voltage (3.3V, 2.5V, or 1.8V) for the QCLK_B[2:0] outputs.   |
| H8          | VDD_QCLKB  | Power               |  | Positive supply voltage (3.3V) for channel B.  |
| G1          | VDDO_QCLKC | Power               |  | Positive supply voltage (3.3V, 2.5V, or 1.8V) for the QCLK_C[1:0] outputs.   |
| G2          | VDD_QCLKC  | Power               |  | Positive supply voltage (3.3V) for channel C.  |
| C1          | VDDO_QCLKD | Power               |  | Positive supply voltage (3.3V, 2.5V, or 1.8V) for the QCLK_D[1:0] outputs.   |
| C2          | VDD_QCLKD  | Power               |  | Positive supply voltage (3.3V) for channel D.  |
| D1          | VDD_QCLK_E | Power               |  | Positive supply voltage (3.3V) for the QCLK_E output and channel.  |
| A3          | VDD_SPI    | Power               |  | Positive supply voltage (3.3V) for the SPI interface.  |
| E4          | VDD_INP    | Power               |  | Positive supply voltage (3.3V) for the differential inputs (CLK[1:0]).   |
| H4          | VDD_LCV    | Power               |  | Positive supply voltage (3.3V) for the VCXO-PLL.   |
| J4          | VDD_LCF    | Power               |  | Positive supply voltage (3.3V) for the internal oscillator of the FemtoClockNG PLL. For more information on power supply filtering, see <a href="#">Power Supply Filtering</a> . |
| A6          | VDD_CPV    | Power               |  | Positive supply voltage (3.3V) for internal VCXO_PLL circuits.   |
| J7          | VDD_CPF    | Power               |  | Positive supply voltage (3.3V) for internal FemtoClockNG circuits.   |
| A5          | VDD_OSC    | Power               |  | Positive supply voltage (3.3V) for the VCXO input.   |

[a] For essential information on power supply filtering. See [Section "Power Supply Filtering" on page 72](#).

[b] PU (pull-up) and PD (pull-down) indicate internal input resistors. See [Figure 37](#) for values.

## Principles Of Operation

### Overview

The 8V19N472 generates low-phase noise, synchronized clock output signals locked to an input reference frequency. The device contains two PLLs with configurable frequency dividers. The first PLL (VCXO-PLL, suffix V) uses an external VCXO as the oscillator and provides jitter attenuation. The external loop filter is used to set the VCXO-PLL bandwidth frequency in conjunction with internal parameters. The second, low-phase noise PLL (FemtoClockNG, suffix F) multiplies the VCXO-PLL frequency to one of its two selectable VCO frequencies of 2949.12MHz or 2457.6MHz.

The FemtoClockNG PLL is completely internal and provides a central reference timing reference point for all output signals. From this point, fully synchronous dividers generate the output frequencies. The device has five output channels (A to E), four channel with one integer output divider (A to D), and one channel with a fractional output divider (E). The clock outputs are configurable with support for LVPECL and LVDS formats, and a variable output amplitude. In channels A to D, the clock phase can be adjusted in phase. Individual outputs and channels, and unused circuit blocks support powered-down states for operation at reduced power consumption. The [Register Map](#), accessible through a selectable 3/4-wire SPI interface with read-back capability, controls the main device settings and delivers device status information. For redundancy purpose, there are two selectable reference frequency inputs and a configurable switch logic with manual, auto-selection, and holdover support.

# Phase-Locked Loop Operation

## Frequency Generation

Table 2 displays the available frequency dividers for clock generation. The dividers must be set by the user to match input, VCXO and VCO frequency, and to achieve frequency and phase lock on both PLLs. The frequency of the external VCXO is chosen by the user. The internal VCO frequency can be selected at frequencies of 2949.12MHz or 2457.6MHz. Table 10 shows example divider configurations for typical wireless infrastructure applications.

Table 2. PLL Divider Values

| Divider  | Range   | Operation   |   |
|--|---|---|---|
|  |   | Jitter Attenuation<br>(Dual PLL, BYPV = 0)  | Frequency Synthesis<br>(VCXO-PLL bypassed, BYPV = 1)  |
| VCXO-PLL<br>Pre-Divider P <sub>V</sub>               | ÷1...÷32767: (15-bit)   | Input clock frequency:<br><br>$f_{CLK} = P_V \times \frac{f_{VCXO}}{M_V}$   | No external VCXO required   |
| VCXO-PLL<br>Feedback Divider<br>M <sub>V</sub>       | ÷1...÷32767: (15-bit)   |   |   |
| FemtoClock NG<br>Pre-Divider P <sub>F</sub>          | ÷1...÷63: (6-bit)   | VCXO frequency:<br><br>$f_{VCXO} = \frac{P_F}{M_F} \times f_{VCO}$<br><br>f <sub>VCO</sub> = 2949.12MHz or 2457.6MHz<br><br>P <sub>F</sub> : Set P <sub>F</sub> to 0.5 in above equation if<br>the frequency doubler is engaged by<br>setting FDF = 1 | Input clock frequency:<br><br>$f_{CLK} = \frac{P_F}{M_F} \times f_{VCO}$<br><br>f <sub>VCO</sub> = 2949.12MHz or 2457.6MHz<br><br>P <sub>F</sub> : Set P <sub>F</sub> to 0.5 in above equation if the<br>frequency doubler is engaged by setting<br>FDF = 1 |
| FemtoClock NG<br>Feedback Dividers<br>M <sub>F</sub> | ÷8 ...÷511 (9-bit)  |   |   |
| Output Divider N <sub>x</sub><br>(x=A-D)             | ÷1...÷160   | Output frequency<br><br>$f_{OUT} = \frac{f_{VCO}}{N_X}$   |   |
| Output Divider N <sub>E</sub>                        | Fractional Mode <sup>[a]</sup> :<br>▪ N: Integer part (4...2 <sup>4</sup> -1)<br>▪ F: Fractional part<br>(1...2 <sup>24</sup> -1) | Output frequency<br><br>$f_{OUT} = \frac{f_{VCO}}{N_E}$<br><br>$N_E = 2 \cdot \left( N_{INT} + \frac{N_{FRAC}}{2^{24}} \right)$   |   |

[a] Greatest  $N_E$  fractional divider is  $2 \times (14 + [2^{24}-1] / 2^{24}) \approx 29.99999988$

## VCXO-PLL

The prescaler  $P_V$  and the VCXO-PLLs feedback divider  $M_V$  require configuration to match the input frequency to the VCXO-frequency. With a divider value range of 15-bit the dividers  $M_V$  and  $P_V$ , the device support is very flexible and supports a wide range of input and VCXO-frequencies. In addition, the range of available input and feedback dividers allows the adjustment of the phase detector frequency independent of the used input and VCXO frequencies as shown in Table 3 and Table 4. The VCXO-PLL charge pump current is controlled via internal registers, and can be set in 50 $\mu$ A steps from 50 $\mu$ A to 1.6mA. The VCXO-PLL can be bypassed (BYPV): when in bypass, the FemtoClockNG PLL locks to the pre-divided input frequency.

Table 3. Example Configurations for  $f_{VCXO}=30.72\text{MHz}$

| Input Frequency (MHz) | VCXO-PLL Divider Settings |      | $f_{PFD}$ (MHz) |
|-----------------------|---------------------------|------|-----------------|
|                       | PV                        | MV   |                 |
| 122.88                | 4                         | 1    | 30.72           |
|                       | 16                        | 4    | 7.68            |
|                       | 64                        | 16   | 1.92            |
|                       | 256                       | 64   | 0.48            |
| 156.25                | 15625                     | 3072 | 0.01            |

Table 4. Example Configurations for  $f_{VCXO}=122.88\text{MHz}$

| Input Frequency (MHz) | VCXO- PLL Divider Settings |     | $f_{PFD}$ (MHz) |
|-----------------------|----------------------------|-----|-----------------|
|                       | PV                         | MV  |                 |
| 122.88                | 4                          | 4   | 30.72           |
|                       | 16                         | 16  | 7.68            |
|                       | 64                         | 64  | 1.92            |
|                       | 256                        | 256 | 0.48            |

Table 5. Example Configurations for  $f_{VCXO}=153.6\text{MHz}$

| Input Frequency (MHz) | VCXO- PLL Divider Settings |      | $f_{PFD}$ (MHz) |

|                       | 100                        | 100   | 1.5625          |

Table 8. VCXO-PLL Bypass Settings

| BYPV | Operation   |
|------|---|
| 0    | VCXO-PLL operation.   |
| 1    | VCXO-PLL bypassed and disabled. The reference clock for the FemtoClockNG PLL is the selected input clock. The input clock selection must be set to manual by the user. Clock switching and holdover are not defined. Device synthesizes an output frequency but will not attenuate input jitter. No external VCXO component and loop filter required. |

## FemtoClockNG PLL

The FemtoClockNG PLL is the second stage PLL and locks to the output signal of the VCXO-PLL (BYPV=0). It requires configuration of the frequency doubler FDF or the pre-divider PF and the feedback divider MF to match the VCXO-PLL frequency to the selected VCO frequency of 2949.12MHz or 2457.6MHz. The best phase noise is typically achieved by engaging the internal frequency doubler (FDF= 1, x2). If engaged, the signal from the first PLL stage is doubled in frequency, increasing the phase detector frequency of the FemtoClockNG PLL. Enabling the frequency doubler disables the frequency pre-divider PF. If the frequency doubler is not used (FDF=0), the PF pre-divider has to be configured. Typically, PF is set to  $\div 1$  to keep the phase detector frequency as high as possible. Set PF to other divider values to achieve specific frequency ratios between first and second PLL stage. This PLL is internally configured to high-bandwidth.

Table 9. Frequency Doubler

| FDF | Operation   |
|-----|---|
| 0   | Frequency doubler off. PF divides clock signal from VCXO-PLL or input (in bypass)                                       |
| 1   | Frequency doubler on (x2). Signal from VCXO-PLL or input (in bypass) is doubled in frequency. PF divider has no effect. |

Table 10. Example PLL Configurations

| VCXO-Frequency (MHz) | FemtoClock NG Divider Settings for VCO |    |    |           |    |    |
|----------------------|--|----|----|-----------|----|----|
|                      | 2949.12MHz                             |    |    | 2457.6MHz |    |    |

## Channel Frequency Divider

The device supports five independent output channels, A to E. Channels A to D have one configurable integer frequency divider  $N_x$  ( $x=A$  to  $D$ ) that divides the VCO frequency to the desired output frequency with very low phase noise. The integer divider values can be selected from the range of  $\div 1$  to  $\div 160$  as shown in [Table 11](#). Channel E supports fractional divider ratios (see [Table 12](#)).

Table 11. Integer Frequency Divider Settings

| Channel Divider $N_x$ <sup>[a]</sup> | Output Clock Frequency (MHz) for VCO (MHz) |         |
|--------------------------------------|--|---------|
|                                      | 2949.12                                    | 2457.6  |
| $\div 1$                             | 2949.12                                    | 2457.6  |
| $\div 2$                             | 1474.56                                    | 1228.8  |

| $f_{VCO} = 2457.6\text{MHz}$  |                     |                              |
| 15.72864                      | $49152 \div 3125$   | 156.25                       |
| 19.6608                       | $12288 \div 625$    | 125                          |

[a] Greatest  $NE$  fractional divider is  $2 \times (14 + [2^{24}-1] / 2^{24}) \approx 29.99999988$

## Redundant Inputs

The two inputs are compatible with LVDS and LVPECL signal formats, and also support single-ended signals (LVCMOS, see [Applications Information](#) for applicable input interface circuits).

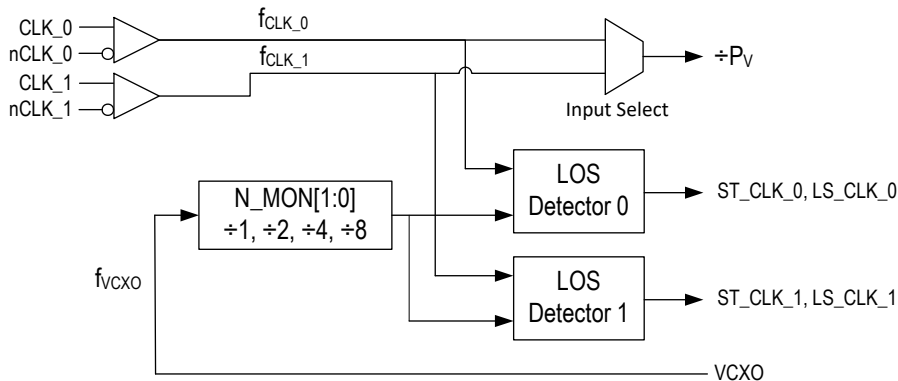

## Monitoring

The two clock inputs of the device are individually and permanently monitored for activity. Inactivity is defined by a static input signal. Input frequency changes are not monitored.

### Loss of Input Signal (LOS)

In operation, a clock input is declared invalid (LOS) with the corresponding  $ST\_CLK\_n$  and  $LS\_CLK\_n$  indicator bits set after a specified number of consecutive clock edges. If differential input signals are applied, the input will also detect an LOS condition in case of a zero differential input voltage. The device supports LOS detect circuits, one for each input. The signal detect circuits compare the signals at the  $CLK\_0$  and  $CLK\_1$  inputs to internally frequency-divided signals from the VCXO-PLL (for information, see [Figure 3](#)). The loss-of-signal fault condition is declared upon three or more missing clock input edges. LOS requires configuration of the  $N\_MON[1:0]$  frequency divider setting to individually match the input frequencies  $CLK\_n$  to the VCXO frequency:  $f_{VCXO} \div N\_MON[1:0] = f_{CLK\_n}$ . For instance, if one of the input frequencies is 15.36MHz and a 30.72MHz VCXO is used, set  $N\_MON[1:0] = \div 2$  (for configuration details, see [Table 28](#)). Then, LOS is declared after three consecutive missing clock edges. LOS is signaled through the  $ST\_CLK\_n$  (momentary) and  $LS\_CLK\_n$  (sticky, resettable) status bits, and can be reported as an interrupt signal on the  $nINT$  output. The LOS circuit requires the jitter attenuation mode of device ( $BYPV=0$ ). LOS does not detect frequency errors.

Figure 3. LOS Detect Circuit

## Input Re-Validation

A clock input is declared valid and the corresponding ST\_CLK\_n bit is reset after the clock input signal returns for an user-configurable number of consecutive input periods. This re-validation of the selected input clock is controlled by the CNTV setting (verification pulse counter).

## Input Clock Selection

The 8V19N472 supports external, pin-controlled clock selection and internal, register controlled clock selection. The EXT\_SEL pin controls the input selection mode. In internal mode, automatic clock selection and manual register-controlled clock selection is available.

### Definitions for Input Clock Selection

- Manual input selection – The CLK\_n input is selected by the user by pin (external) or register control (internal).
- Automatic input selection – The CLK\_n input is selected by an internal state machine based on internal priorities, as response to the clock input status.
- Primary clock – The CLK\_n input is selected by the selection logic.
- Secondary clock – The CLK\_n input is not selected by the selection logic.
- PLL reference clock – The CLK\_n input is selected as the PLL reference signal by the selection logic. In automatic switching mode, the selection can be overwritten by a state machine.

### Clock Selection

The device supports five input selection modes: manual with and without holdover, short-term holdover, and two automatic switch modes.

Table 13. Clock Selection Settings

| Mode   |      |      | Name                              | Description  | Flags      |                  |                               |                                     | Application  |
|--------|------|------|-----------------------------------|--|------------|------------------|-------------------------------|-------------------------------------|--|
| nHO_EN | nMA1 | nMA0 |                                   |  | ST_CLKn    | nST_HOLD         | ST_SEL                        | ST_REF                              |  |
| 0      | X    | X    | Manual holdover control (default) | Input selection follows user-configuration of the EXT_SEL pin or INT_SEL register bit as set by nEXT_INT with holdover. Input selection is <i>never</i> changed by the internal state machine.   | LOS status | 1                | Selected input                | 0 <sup>[a]</sup>                    | Startup and external selection control with holdover |
|        |      |      |                                   | <u>Manual change of the reference clock:</u> The device <i>will go into holdover</i> and the hold-off down-counter (CNTH) starts. The device initiates a clock switch <i>after</i> expiration of the hold-off counter. Duration of holdover is set by $CNTH \times CNTR / f_{VCO}$ . Holdover is terminated even if the secondary clock input is bad (LOS). See “Manual Holdover Control (nHO_EN = 0)” |            | 0 <sup>[b]</sup> | Selected input <sup>[c]</sup> | LOS status of <i>selected</i> input |  |

Table 13. Clock Selection Settings (Cont.)

| Mode   |      |      | Name           | Description   | Flags      |          |  |   | Application                                  |

| 1      | 0    | 0    | Manual control | Input selection follows user-configuration of the EXT_SEL pin or INT_SEL register bit as set by nEXT_INT. Input selection is <i>never</i> changed by the internal state machine.  |            |          |  |   |  |
|        |      |      |                | <u>LOS on the primary reference clock:</u> Active reference stays selected and the PLLs may stall. Device will not go into holdover.  | LOS status | 1        | Selected input                             | 0   | External selection control                   |
|        |      |      |                | <u>Manual change of the reference clock:</u> The device will not go into holdover and will attempt to lock to the newly selected reference.   |            | 1        | Selected input                             | Actual LOS status of selected input                             |  |
| 1      | 0    | 1    | Automatic      | Input selection follows LOS status. A failing input clock will cause an LOS event for that clock input. If the selected clock has an LOS event, the device will immediately initiate a clock failover switch.   |            |          |  |   |  |
|        |      |      |                | <u>LOS on the primary reference clock:</u> The device will switch to the secondary clock without holdover. Input selection is determined by a state machine and may differ from the user's clock selection<br>No valid clock scenario: If no valid input clocks exist, the device will not attempt to switch and will not enter the holdover state. The PLL is not locked.<br>Re-validation of all input clocks will result in the PLL to attempt to lock on that input clock. See " <a href="#">Revertive Switching</a> ". | LOS status | 1        | Selected input determined by state machine | Actual LOS status of selected input determined by state machine | Multiple inputs with qualified clock signals |
|        |      |      |                | <u>Manual change of the reference clock:</u> The device will switch to the newly selected clock without holdover. If the newly selected clock is not valid, the PLL may stall.  |            | 1        | Selected Input                             | Actual LOS status of selected input                             |  |

Table 13. Clock Selection Settings (Cont.)

| Mode   |      |      | Name                    | Description  | Flags      |                          |  |   | Application   |
|--------|------|------|-------------------------|--|------------|--------------------------|--|---|---|
| nHO_EN | nMA1 | nMA0 |                         |  | ST_CLKn    | nST_HOLD                 | ST_SEL                                     | ST_REF  |   |
| 1      | 1    | 0    | Short-term Holdover     | Input selection follows user-configuration of EXT_SEL pin or INT_SEL register bit as set by nEXT_INT. Selection is never changed by the internal state machine.  |            |                          |  |   |   |
|        |      |      |                         | <u>LOS on the primary reference clock:</u> A failing reference clock will cause an LOS event. If the selected reference fails, the device will enter holdover <i>immediately</i> . Re-validation of the selected input clock is controlled by the CNTV setting. A successful re-validation will result in the PLL to re-lock on that input clock.  | LOS status | 0 for hold over duration | Selected Input                             | LOS status for duration of LOS until revalidation | Use if a single reference is occasionally interrupted |
| 1      | 1    | 1    | Automatic with holdover | Input selection follows LOS status. A failing input clock will cause an LOS event for that clock input. If the <i>selected</i> clock has an LOS event, the device will go into holdover and switches input clocks after the hold-off counter expires.  |            |                          |  |   |   |
|        |      |      |                         | <u>LOS on the primary reference clock or</u><br>Manual change of the reference clock:<br>the device will go into holdover and the hold-off down-counter (CNTH) starts. The device initiates a clock failover switch to a valid secondary clock input <i>after</i> expiration of the hold-off counter. Duration of holdover is set by $CNTH \cdot CNTR \cdot f_{VCO}$ . The holdover is terminated prior hold-off count-down if the primary clock revalidates or is terminated by a manual change of the reference clock (for more information, see <a href="#">Automatic with Holdover (nHO_EN = 1, nM/A[1:0]=11)</a> and <a href="#">Revertive Switching</a> ).<br><br>No valid clock scenario: The device remains in holdover if the secondary input clock is invalid. | LOS status | 0 for hold over duration | Selected input determined by state machine | Actual LOS status of selected input               | Multiple inputs                                       |

[a] For the duration of an invalid input signal (LOS).

[b] For the duration of holdover.

[c] Delayed by holdover period.

## Holdover

In holdover state, the output frequency and phase is derived from an internal, digital value based on previous frequency and phase information. Holdover characteristics are defined in [Table 43](#).

### Manual Holdover Control (nHO\_EN = 0)

This is the default switching mode of the device. The switch control is manual. The EXT\_SEL pin or the INT\_SEL bit as set by nEXT\_INT determines the selected reference clock input. If the selection is changed by the user, the device will enter holdover until the CNTH[7:0] counter expires, then the new reference is selected (input switch). Application for this mode is startup and external selection control.

- ST\_REF – Status of selected reference clock
- ST\_CLK\_n will both reflect the status of the corresponding input
- ST\_SEL – The new selection
- nST\_HOLD = 0 for the duration of holdover

### Automatic with Holdover (nHO\_EN = 1, nM/A[1:0]=11)

*If an LOS event is detected on the active reference clock:*

- Holdover begins immediately
- Corresponding ST\_REF and LS\_REF go low immediately
- Hold-off countdown begins immediately

During this time, both input clocks continue to be monitored and their respective ST\_CLK and LS\_CLK flags are active. LOS events are indicated on ST\_CLK and LS\_CLK when they occur.

*If the active reference clock resumes and is validated during the hold-off countdown:*

- Its ST\_CLK status flag will return high and the LS\_CLK is available to be cleared by an SPI write of 1 to that register bit
- No transitions will occur of the active REF clock; ST\_SEL does not change
- Revertive bit has no effect during this time (whether 0 or 1)

*When the hold-off countdown reaches zero:*

- If the active reference has resumed and has been validated during the countdown, it will maintain being the active reference clock:
  - ST\_SEL does not change
  - ST\_REF returns to 1
  - LS\_REF can be cleared by an SPI write of 1 to that register
  - Holdover turns off and the VCXO-PLL attempts to lock to the active reference clock
- If the active reference has not resumed but the other clock input CLK\_n is validated, then:
  - ST\_SEL1:0 changes to the new active reference
  - ST\_REF returns to 1
  - LS\_REF can be cleared by an SPI write of 1 to that register
  - Holdover turns off
- If there is no validated CLK:
  - ST\_SEL does not change
  - ST\_REF remains low
  - LS\_REF cannot be cleared by an SPI write of 1 to that register
  - Holdover remains active

Revertive capability returns if REVS = 1.

## Hold-off Counter

A configurable down-counter applicable to the “Automatic with holdover” and “manual with holdover” selection modes. The purpose of this counter is a deferred, user-configurable input switch. The counter expires when a zero-transition occurs; this triggers a new reference clock selection. The counter is clocked by the frequency-divided VCXO-PLL signal. The CNTR setting determines the hold-off counter frequency divider and the CNTH setting the start value of the hold-off counter. For instance, set CNTR to a value of  $\div 131072$  to achieve 937.5Hz (or a period of 1.066ms at  $f_{VCXO}=122.88\text{MHz}$ ): the 8-bit CNTH counter is clocked by 937.5Hz and the user-configurable hold-off period range is 0ms (CNTR = 0x00) to 272ms (CNTR = 0xFF). After the counter expires, it reloads automatically from the CNTH SPI register. After the LOS status bit (LS\_CLK\_n) for the corresponding input CLK\_n is cleared by the user, the input is enabled for generating a new LOS event. The CNTR counter is only clocked if the device is configured in the clock selection modes “Automatic with holdover” AND the *selected* reference clock experiences an LOS event or in the “manual with holdover” mode with manual switching. Otherwise, the counter is automatically disabled (not clocked).

## Revertive Switching

Revertive switching is only applicable to the two automatic switch modes shown in [Table 13](#):

- Revertive switching enabled – Re-validation of any non-selected input clock(s) will cause a new input selection according to the user-preset input priorities (revertive switch). An input switch is only done if the re-validated input has a higher priority than the currently selected reference clock.
- Revertive switching disabled – Re-validation of a non-selected input clock has no impact on the clock selection. Default setting is revertive switching disabled.

## VCXO-PLL Lock Detect

The VCXO-PLL lock detect circuit uses the signal phase difference at the phase detector as loss-of-lock criteria. Loss-of-lock is reported if the actual phase difference is larger than a configurable phase detector window set by the LOCK\_TH[14:0] configuration bits. A loss-of-lock state is reported through the nST\_LOLV and nLS\_LOLV status bits (see [Table 17](#)).

## FemtoClockNG Loss-of-Lock (LOLF)

FemtoClockNG-PLL loss of lock is signaled through the nST\_LOLF (momentary) and nLS\_LOLF (sticky, resettable) status bits, and can be reported as hardware signal on the LOCK\_V output as well as an interrupt signal on the nINT output.

## Differential Outputs

Table 14. Output Features

| Output | Style                  | Ampl. <sup>[a]</sup> | Disable | Power Down | Termination                    |
|--------|------------------------|----------------------|---------|------------|--------------------------------|

|                   |              |       |  | 1      | Enable                 | 00     | 350                           |
|                   |              |       |  |        |                        | 01     | 500                           |
|                   |              |       |  |        |                        | 10     | 700                           |
|                   |              |       |  |        |                        | 11     | 850                           |

[a] Power-down modes are available for the individual channels A–D and the outputs QCLK\_y (A0–D1). QCLK\_E is defined: nPD\_E = 0: power down and nPE=0.

[b] Output amplitudes of 700mV and 850mV require a 3.3V output supply (V<sub>DDO\_V</sub>). 350mV and 500mV output amplitudes support V<sub>DDO\_V</sub> = 2.5V and 1.8V.

[c] Differential output is disabled in static low/high state

[d] See Table 50 for V<sub>TT</sub> (Termination voltage) values.

## Output Phase-Delay

Output phase delay is supported in each channel. The selected VCO frequency sets the delay unit to 1/f<sub>VCO</sub>.

Table 16. Delay Circuit Settings

| Delay Circuit               | Unit   | Steps | Range                   |
|-----------------------------|--|-------|-------------------------|
| Clock Phase $\Phi_{CLK\_x}$ | $\frac{1}{f_{VCO}}$<br>f <sub>VCO</sub> =2949.12MHz: 339ps<br>f <sub>VCO</sub> =2457.6MHz: 407ps | 256   | 0-86.46ns<br>0-103.75ns |

# Status Conditions and Interrupts

The 8V19N472 has an interrupt output to signal changes in status conditions. Settings for status conditions can be accessed in the [Status Registers](#). The device has several conditions that can indicate faults and status changes in the operation of the device. These are shown in [Table 17](#) and can be monitored directly in the status registers. Status bits (named: ST\_ status\_condition) are read-only and reflect the momentary device status at the time of read-access. Several status bits are also copied into latched bit positions (named: LS\_ status\_condition).

The latched version is controlled by the corresponding fault and status conditions and remains set (“sticky”) until reset by the user by writing 1 to the status register bit. The reset of the status condition only has an effect if the corresponding fault condition is removed, otherwise, the status bit will be set again. Setting a status bit on several latched registers can be programmed to generate an interrupt signal (nINT) via settings in the Interrupt Enable bits (named: IE\_ condition). A setting of 0 in any of these bits will mask the corresponding latched status bit from affecting the interrupt status pin. Setting all IE bits to 0 has the effect of disabling interrupts from the device.

Table 17. Status Bit Functions

| Status Bit |          | Function                      |                                |                    | Interrupt Enable Bit |
|------------|----------|-------------------------------|--------------------------------|--------------------|----------------------|
| Momentary  | Latched  | Description                   | Status if Bit is:              |                    |                      |
|            |          |                               | 1                              | 0                  |                      |
| ST_CLK_0   | LS_CLK_0 | CLK 0 input status            | Active                         | LOS                | IE_CLK_0             |
| ST_CLK_1   | LS_CLK_1 | CLK 1 input status            | Active                         | LOS                | IE_CLK_1             |
| nST_LOLV   | nLS_LOLV | VCXO-PLL loss of lock         | Locked                         | Loss of lock       | IE_LOLV              |
| nST_LOLF   | nLS_LOLF | FemtoClockNG-PLL loss of lock | Locked                         | Loss of lock       | IE_LOLF              |
| nST_HOLD   | nLS_HOLD | Holdover                      | Not in holdover                | Device in holdover | IE_HOLD              |
| ST_VCOF    | —        | FemtoClockNG VCO calibration  | Not completed                  | Completed          | —                    |
| ST_SEL     | —        | Clock input selection         | 0 = CLK_0<br>1 = CLK_1         |                    | —                    |
| ST_REF     | LS_REF   | PLL reference status          | Valid reference <sup>[a]</sup> | Reference lost     | IE_REF               |

[a] Manual and short-term holdover mode: 0 indicates if the selected reference is lost, 1 if not lost.

Automatic mode: will transition to 0 while the input clock is lost and during input selection by priority. Will transition to 1 once a new reference is selected.

Automatic with holdover mode: 0 indicates the reference is lost and still in holdover

Interrupts are cleared by resetting the appropriate bit(s) in the latched register after the underlying fault condition has been resolved. When all valid interrupt sources have been cleared in this manner, this will release the nINT output until the next unmasked fault.

Table 18. Fault Indicator Functions

| Status Bit (PLL)    |                         | Status Reported on LOCK <sup>[a]</sup> Output <sup>[b]</sup> |
|---------------------|-------------------------|--|
| nLS_LOLV (VCXO-PLL) | nLS_LOLF (FemtoClockNG) |  |
| Locked              | Locked                  | 1  |
| Locked              | Not locked              | 0  |
| Not locked          | Locked                  | 0  |

[a] Hardware interrupts on nINT required to set the IE\_LOLV, IE\_LOLF bits to “enable interrupt”.

[b] SELSV1 controls the logic level 1.8V/3.3V of LOCK and nINT outputs.

## Device Startup, Reset, and Synchronization

At startup, an internal POR (power-on reset) resets the 8V19N472 and sets all register bits to their default values. The device forces the VCXO control voltage at the LFV pin to half of the power supply voltage to center the VCXO-frequency. In the default configuration the QCLK<sub>y</sub> outputs are disabled at startup.

Recommended configuration sequence (in order):

1. (Optional) Set the value of the CPOL register bit to define the SPI read mode supported by the SPI controller. Set LSBIT\_1ST, SDO\_ACT, ACS\_ON, and the corresponding mirrored bits in register 0x00 as appropriate for SPI read access to the device.
2. Configure all PLL and output divider and delay circuits as well as other device configurations, such as the charge pump currents. Set the TRANSFER bit (register 0x0F, bit D0) for PLL registers wider than then 8 bits (see double-buffered registers).
3. Set the initialization bit, INIT\_CLK.  
This will initiate all divider and delay circuits and synchronize them to each other. The INIT\_CLK bit will self-clear.
4. Set both the RELOCK bit and PB\_CAL bit. This step should not be combined with the previous step (setting INIT\_CLK) in a multi SPI-byte register access. Both bits will self-clear.
5. Clear the FVCV bit to release the VCXO control voltage and VCXO-PLL will attempt to lock to the input clock signal starting from its center frequency.
6. Clear the status flags.
7. Enable the outputs by accessing the output-enable registers in a separate SPI write access.

### Changing Frequency Dividers and Phase Delay Values

If a change must be made to a clock divider or phase delay value  $N_{A-D}$ , and  $\Phi_{CLKA-D}$ , complete the following procedure:

1. (Optional) Set the value of the CPOL register to define the SPI read mode so that SPI settings can be validated by subsequent SPI read accesses.
2. (Optional) Disable the outputs whose frequency divider or delay value is changed.
3. Configure the  $N_{A-D}$  dividers and the delay circuits  $\Phi_{CLKA-D}$  to the desired new values.
4. Set the initialization bit INIT\_CLK.  
This will initiate all divider and delay circuits and synchronize them to each other. The INIT\_CLK bit will self-clear. During this initialization step, all QCLK<sub>y</sub> outputs are reset to the logic low state.
5. Set the RELOCK bit. This step should not be combined with the setting INIT\_CLK in a multi SPI-byte register access. This bit will self-clear.
6. (Optional) Enable the outputs whose frequency divider was changed.

## SPI Interface

The 8V19N472 has a selectable 3/4-wire serial control port capable of responding as a slave in an SPI configuration to allow read and write access to any of the internal registers for device programming or read back. The SPI interface consists of the SCLK (clock), SDIO (serial data input and output in 3-wire mode, input in 4-wire mode), SDO (output in 4-wire mode), nCS (chip select) and nRESET (SPI reset) pins. A data transfer contains 16 bits (direction + 15 bit address) and any integer multiple of 8 bits (input or output data), and is always initiated by the SPI master on the bus. Internal register data is organized in SPI bytes of 8 bits each. The device supports the most-significant bit (MSBit) and least-significant (LSBit) first transfer bit positions, single byte and multi-byte data streaming modes with address auto-increment and auto-decrement. For SPI logic diagrams, see [Figure 4](#) to [Figure 7](#).

**Chip select.** If the nCS pin is at logic high, the SDIO/SDO data output pin is in high-impedance state and the SPI interface of the device is disabled.

**3/4-wire mode.** In 3-wire mode, the SDIO pin acts as bidirectional input/output and the SDO pin is in high-impedance state. In 4-wire mode, the SDIO pin is the SPI input and the SDO pin is the SPI output. The SPI interface mode is defined by the SDO\_ACT bit in the SPI device configuration register.

**Active clock edge.** In a write operation, data on SDIO is clocked in on the rising edge of SCLK. In a read operation, data on SDIO/SDO is clocked out on the falling or rising edge of SCLK depending on the CPOL setting (CPOL=0: output data changes on the falling edge, CPOL=1: output data changes on the rising edge).

**Reset.** By asserting the nRESET pin, the SPI engine is reset and all internal device registers reset to its default values.

**Logic levels.** The SPI pins nRESET, nCS, SCLK, SDIO, and SDO have selectable 1.8V/3.3V logic levels. The SELSV0 register bit controls the logic level. SELSV0=0: 1.8V logic and SELSV0=1: 3.3V logic.

**Least Significant Bit Position.** The device supports LSBit (least significant bit first) and MSBit (most significant bit first) transfers between master and slave. If MSBit first is set, data is transferred in this order: transfer direction bit first, then the register address bits A14 to A0, then the data bits of the first data byte D7 to D0. If LSBit first is set, the order is: address bits A0 to A14 first, then the transfer direction bit, then the data bits of the first data byte D0 to D7.

**Starting a data transfer** requires the nCS pin to set and hold at logic low level during the entire transfer. Setting nCS = 0 will enable the SPI interface with the SDIO pin in data input mode. The master must initiate the first 16-bit transfer containing the transfer direction bit and the SPI register address to access.

**Transfer direction bit:** Defines if the master reads data from the device or writes data to the device. R/nW (1=Read,0=Write). If MSB first is set, the transfer bit is presented by the master as the first bit in the transfer. If LSB first is set, the transfer bit is the 16th bit presented by the master.

**Address:** The device supports a 15-bit address A[14:0] pointing to an internal register in the address space 0 to 0x7FFF. The device implements registers at the addresses 0x00–0x63.

**Read operation from an internal register:** a read operation starts with a 16-bit transfer from the master to the slave: the SDIO signal is clocked on the *rising* edge of SCLK. The transfer direction bit R/nW must be to 1 to indicate a read transfer, the other 15 bits is the address A[14:0] to read from. After the first 16 bits are clocked into the SDIO pin, the SDIO I/O changes to output if 4-wire mode is set by SDO\_ACT=0 (in 3-wire mode set by SDO\_ACT=1, the pin SDO is the output). The register content addressed by A[14:0] are the presented at the SPI output at the next 8 SCLK *falling* (CPOL=1) or next 8 SCLK *rising* (CPOL=1) clock cycles and transfer these to the master. Transfers must be completed with de-asserting nCS after any multiple 8 SCLK cycles. If nCS is de-asserted at any other number of SCLKs, the SPI behavior is undefined. Read operation transfers multiple bytes in streaming mode with the 15-bit register address auto-increment or decrement. Single byte transfers are supported in streaming mode by de-asserting nCS after the first payload byte.

**Write operation to a device register:** During a write transfer, an SPI master transfers one or more bytes of data into the internal registers of the device. A write transfer starts by asserting the nCS to pin low logic level. The transfer direction bit R/nW must be set to 0 to indicate a write transfer, the other 15 bits are the address A[14:0] to write to. Bits D[7:0] contain 8 bits of transfer data, which is written into the register specified by A[14:0] at the end of each 8-bit write transfer. Multiple, subsequent register transfers from the master to the slave are supported in streaming mode by holding nCS asserted at logic low level during write transfers. Transfers must be completed with de-asserting nCS after any multiple 8 SCLK cycles. If nCS is de-asserted at any other number of SCLKs, the SPI behavior is undefined. The 15-bit register address will auto-increment or decrement (streaming mode). Single byte transfers are supported in streaming mode by de-asserting nCS after the first payload byte.

**Register Streaming Mode.** Streaming mode is the transfer of multiple data bytes back to back. The address A[14:0] specifies the register location of the first byte to transfer; for the next transfer, the address is automatically incremented or decremented. nCS must stay at logic low level and SDIO/SDO will present multiple registers (e.g. (A), (A-1), (A-2), etc.) with each 8 SCLK cycles. During SPI Read operations, the user may continue to hold nCS low and provide further bytes. The ASC\_ON register defines if registers auto-increment ((A), (A+1), (A+2), etc.), or auto-decrement ((A), (A-1), (A-2), etc.).

**Address wrap-around:** Applicable to streaming mode: The address will wrap around the address range of 0x00–0x63. The SPI engine auto-increments to address 0x00 after 0x63 and auto-decrements to address 0x63 after 0x00.

**End of transfer:** After nCS is de-asserted to logic 1, the SPI bus is available to transfers to other slaves on the SPI bus. See the READ diagrams (Figure 5 and Figure 6) and WRITE diagram (Figure 4) displaying the transfer of a single byte of data from and into registers.

**Mirrored register bits.** The register bits D7–D4 in the device SPI configuration register (0x00) are mirrored with the bits D3–D0 in the same register for a LSBit/MSBit First independent access. Setting a mirrored bit to the 1 state requires to set both bit and its <mirrored\_bit> to 1.

**Double-buffered registers.** PLL divider registers that are wider than 8 bits are double buffered for synchronous access. Synchronous configuration of these registers requires to write the multiple-byte setting into the SPI registers first, and then transfer the contents into the device registers by asserting the TRANSFER bit. The configuration only takes effect after the TRANSFER bit is asserted. Configuration data can be read back from SPI and device registers as specified by the RB\_MODE bit.

**Internal debug registers.** Registers in the address range 0x4E–0x4F and 0x5C to 0xFF should not be used. Do not write into any registers in the 0x4E–0x4F and 0x5C to 0xFF address range.

**Default SPI modes:** After power-up and reset by the nRESET pin, the SPI interface is in 3-wire mode with SDO in high-impedance, MSB first mode, streaming mode on with address auto-decrement. In read transfer mode, data is output on SDIO/SDO on the falling edge of SCLK.

## Register Descriptions

This section contains all addressable registers, sorted by function, followed for a detailed description of each bit field for each register. Several functional blocks with multiple instances in this device have individual registers controlling their settings, but since the registers have an identical format and bit meaning, they are described only once with an additional table to indicate their addresses and default values. All writable register fields will come up with a default values as indicated in the Factory Defaults column unless altered by values loaded from non-volatile storage during the initialization sequence.

Fixed read-only bits will have defaults as indicated in their specific register descriptions. Read-only status bits will reflect valid status of the conditions they are designed to monitor once the internal power-up reset has been released. Unused registers and bit positions are Reserved. Reserved bit fields can be used for internal debug test and debug functions.

# Device Configuration Registers

| POLV                 | R/W        | 0<br>Value = Positive Polarity            | VCXO Polarity<br>0 = Positive polarity. Use for an external VCXO with a positive $f(V_C)$ characteristics.<br>1 = Negative polarity. Use for an external VCXO with a negative $f(V_C)$ characteristics.   |
| FVCV                 | R/W        | 1<br>Value:<br>Value: LFV = $V_{DD\_V}/2$ | VCXO-PLL Force VC control voltage<br>0 = Normal operation.<br>1 = Forces the voltage at the LFV control pin (VCXO input) to $V_{DD\_V}/2$ . VCXO-PLL unlocks and the VCXO is forced to its mid-point frequency. FVCV=1 is the default setting at startup to center the VCXO frequency. FVCV should be cleared after startup to enable the PLL to lock to the reference frequency. |

Table 26. PLL Control Register Descriptions (Cont.)

| Register Description |            |                           |   |
|----------------------|------------|---------------------------|---|
| Bit Field Name       | Field Type | Default (Binary)          | Description   |
| CPV[4:0]             | R/W        | 0 1111<br>Value:<br>0.8mA | <p>VCXO-PLL Charge-Pump Current</p> <p>Controls the charge pump current <math>I_{CPV}</math> of the VCXO-PLL. Charge pump current is the binary value of this register plus one multiplied by 50μA.</p> $I_{CPV} = 50\mu A \times (CPV[4:0] + 1).$ <p>CPV[4:0] = 00000 sets ICPV to the minimum current of 50μA. Maximum charge pump current is 1.6 mA. Default setting is 0.8mA: ((15 + 1) × 50μA).</p>  |
| OSVEN                | R/W        | 0                         | <p>VCXO-PLL Offset Enable</p> <p>0 = No offset<br/>1 = Offset enabled. A static phase offset of OFFSET[4:0] is applied to the PFD of the VCXO-PLL</p>   |
| OFFSETV[4:0]         | R/W        | 0 0000<br>Value: 0°       | <p>VCXO-PLL Static Phase Offset</p> <p>Controls the static phase detector offset of the VCXO-PLL. Phase offset is the binary value of this register multiplied by 0.9° of the PFD input signal (OFFSET [4:0] × <math>f_{PFD} \div 400</math>). Maximum offset is <math>31 \times 0.9^\circ = 27.9^\circ</math>. Setting OFFSET to 0.0° eliminates the thermal noise of an offset current. If the VCXO-PLL input jitter period <math>T_{JIT}</math> exceeds the average input period, set OFFSET to a value larger than <math>f_{PFD} \times T_{JIT} \times 400</math> to achieve a better charge pump linearity and lower in-band noise of the PLL.</p> |
| CPF[4:0]             | R/W        | 0 0110<br>Value:<br>1.4mA | <p>FemtoClockNG-PLL Charge-Pump Current</p> <p>Controls the charge pump current <math>I_{CPF}</math> of the FemtoClockNG PLL. Charge pump current is the binary value of this register plus one multiplied by 200μA.</p> $I_{CPF} = 200\mu A \times (CPF[4:0] + 1).$ <p>CPF[4:0] = 00000 sets ICPF to the minimum current of 200μA. Maximum charge pump current is 6.4mA. Default setting is 1.4mA: ((6+1) × 200μA).</p>  |

If nM/A[1:0] = X0, the REVS setting has no meaning.<br>0 = Disabled: Re-validation of the non-selected input clock has no impact on the clock selection.<br>1 = Enabled: Re-validation of the non-selected input clock will cause a new input selection according to the pre-set input priorities (revertive switch).<br>The default setting is revertive switching turned off.   |
| nM/A[1:0]            | R/W        | 00<br>Value: Manual Selection | Reference Input Selection Mode.<br>In any of the manual selection modes (nM/A[1:0] = 00 or 10), the VCXO-PLL reference input is selected by INT_SEL. In any of the automatic selection modes, the VCXO-PLL reference input is selected by an internal state machine according to the input LOS states and the priorities in the input priority registers<br>00 = Manual selection (no holdover)<br>01 = Automatic selection (no holdover)<br>10 = Short-term holdover<br>11 = Automatic selection with holdover  |
| INT_SEL              | R/W        | 0<br>Value: CLK0 selected     | VCXO-PLL Input Reference Selection<br>Controls the selection of the VCXO-PLL reference input in internal (nEXT_INT=1) and in manual selection mode (nHO_EN=1, nM/A[1:0] = 00 or 10). In external (nEXT_INT=0) and in automatic selection modes (nM/A[1:0]=X1), INT_SEL has no meaning.<br>0 = CLK_0 is the selected VCXO-PLL reference clock<br>1 = CLK_1 is the selected VCXO-PLL reference clock   |
| CNTH[7:0]            | R/W        | 1000 0000<br>Value: 136ms     | Short-term holdover: Hold-off counter period. The device initiates a clock failover switch upon counter expiration (zero transition). The counters start to counts backwards after an LOS event is detected. The hold-off counter period is determined by the binary number of VCXO-PLL output pulses divided by CNTR[1:0]. With a VCXO frequency of 122.88MHz and CNTR[1:0]=10, the counter has a period of (1.066ms × binary setting). After each zero-transition, the counter automatically re-loads to the setting in this register. The default setting is 136ms (VCXO=122.88MHz: 1/122.88MHz × 2 <sup>17</sup> × 128). |

| CNTV[1:0]            | R/W        | 10<br>Value: 32)      | Revalidation counter<br>Controls the number of required consecutive, valid input reference pulses for clock re-validation on CLK_ <i>n</i> in number of input periods. At an LOS event, the re-validation counter loads this setting from the register and counts down by one with every valid, consecutive input signal period. Missing input edges (for one input period) will cause this counter to re-load its setting. An input is re-validated when the counter transitions to zero and the corresponding LOS flag is reset.<br>00 = 2 (shortest possible)<br>01 = 16<br>10 = 32<br>11 = 64 |

## Channel Registers

The content of the channel registers set the channel state, the clock divider the clock phase delay, and the power-down state.

Table 36. General Control Register Descriptions

| Register Description |                      |                  |  |
|----------------------|----------------------|------------------|--|
| Bit Field Name       | Field Type           | Default (Binary) | Description  |
| INIT_CLK             | W only<br>Auto-Clear | X                | Set INIT_CLK = 1 to initialize divider functions. Required as part of the startup procedure.   |
| RELOCK               | W only<br>Auto-Clear | X                | Setting this bit to 1 will force the FemtoClockNG PLL to re-lock.  |
| PB_CAL               | W only<br>Auto-Clear | X                | Precision Bias Calibration<br>Setting this bit to 1 will start the calibration of an internal precision bias current source. The bias current is used as reference for outputs configured as LVDS and for as reference for the charge pump currents. This bit will auto-clear after the calibration completed. Set as part of the startup procedure. |
| CPOL                 | R/W                  | 0                | SPI Read Operation SCLK Polarity<br>0 = Data bits on SDIO/SDO are output at the falling edge of SCLK edge.<br>1 = Data bits on SDIO/SDO are output at the rising edge of SCLK edge.  |

## DC Characteristics

Table 37. Pin Characteristics,  $V_{DD\_V} = 3.3V \pm 5\%$ ,  $V_{DDO\_V} = (3.3V, 2.5V \text{ or } 1.8V) \pm 5\%$ ,  $T_A = -40^\circ\text{C to } +85^\circ\text{C}$

| Symbol    | Parameter                | Test Conditions              | Minimum | Typical | Maximum | Units      |
|-----------|--------------------------|------------------------------|---------|---------|---------|------------|
| $C_{IN}$  | Input Capacitance        | OSC, nOSC                    |         | 2       | 4       | pF         |
|           |                          | other inputs                 |         | 2       | 4       | pF         |
| $R_{PD}$  | Input Pull-Down Resistor | CLK_n, nCLK_n, SCLK, EXT_SEL |         | 51      |         | k $\Omega$ |
| $R_{PU}$  | Input Pull-Up Resistor   | nCLK_n, nCS, nRESET          |         | 51      |         | k $\Omega$ |
| $R_{OUT}$ | LVC MOS Output Impedance | nINT, LOCK                   |         | 25      |         | $\Omega$   |

Table 38. Power Supply DC Characteristics,  $V_{DD\_V} = 3.3V \pm 5\%$ ,  $V_{DDO\_V} = (3.3V, 2.5V \text{ or } 1.8V) \pm 5\%$ ,  $T_A = -40^\circ\text{C to } +85^\circ\text{C}$  [a] [b]

| Symbol       | Parameter             | Test Conditions | Minimum | Typical       | Maximum | Units |
|--------------|-----------------------|-----------------|---------|---------------|---------|-------|
| $V_{DD\_V}$  | Core Supply Voltage   |                 | 3.135   | 3.3           | 3.465   | V     |
| $V_{DDO\_V}$ | Output Supply Voltage |                 | 1.71    | 1.8, 2.5, 3.3 | 3.465   | V     |
| $I_{DD}$     | Power Supply Current  | Note [c]        |         |               | 789     | mA    |

[a] Design Target Specifications.

[b] Electrical parameters are guaranteed over the specified ambient operating temperature range, which is established when the device is mounted in a test socket with maintained transverse airflow greater than 500 lpm. The device will meet specifications after thermal equilibrium has been reached under these conditions.

[c] Configuration for  $I_{DD(MAX)}$ : selected VCO-0; set PV, MV, N[a:D] to their maximum values, all delay settings to maximum, all outputs configured to LVDS, maximum amplitude and turned on. QCLKE set to 156.MHz output frequency.

Table 39. LVC MOS DC Characteristics,  $V_{DD\_V} = 3.3V \pm 5\%$ ,  $V_{DDO\_V} = (3.3V, 2.5V \text{ or } 1.8V) \pm 5\%$ ,  $T_A = -40^\circ\text{C to } +85^\circ\text{C}$

| Symbol  | Parameter                              |   | Test Conditions                      | Minimum | Typical | Maximum | Units |
|---|--|---|--------------------------------------|---------|---------|---------|-------|
| Control inputs EXT_SEL, nRESET (1.8V logic and 3.3V tolerance)          |  |   |                                      |         |         |         |       |

[a] Electrical parameters are guaranteed over the specified ambient operating temperature range, which is established when the device is mounted in a test socket with maintained transverse airflow greater than 500 lfm. The device will meet specifications after thermal equilibrium has been reached under these conditions.

[b] Outputs terminated with  $50\Omega$  to  $V_{TT}$ . See Table 50 for termination voltage  $V_{TT}$  values.

[c] 750mV and 1000mV amplitude settings are only available at  $V_{DDO\_V} \geq 2.5V$

Table 42. LVDS DC Characteristics (QCLK\_y, QREF\_r, STYLE=0),  $V_{DD\_V} = 3.3V \pm 5\%$ ,  $V_{DDO\_V} = (3.3V, 2.5V \text{ or } 1.8V) \pm 5\%$ ,  $T_A = -40^\circ\text{C to } +85^\circ\text{C}$  [a]

[a] Electrical parameters are guaranteed over the specified ambient operating temperature range, which is established when the device is mounted in a test socket with maintained transverse airflow greater than 500 lfm. The device will meet specifications after thermal equilibrium has been reached under these conditions.

[b] VCXO-PLL bandwidth = 100Hz.

[c]  $V_{IL}$  should not be less than -0.3V and  $V_{IH}$  should not be greater than  $V_{DD\_V}$

[d] Common Mode Input Voltage is defined as the cross-point voltage.

[e] Outputs terminated with  $50\Omega$  to  $V_{TT}$ . See Table 50 for termination voltage  $V_{TT}$  values.

[f] LVDS outputs terminated  $100\Omega$  across terminals

[g] This parameter is defined in accordance with JEDEC standard 65

[h] Defined as skew between outputs at the same supply voltage and with equal load conditions. Measured at the differential cross points

[i] Measured from LOS to both PLLs lock-detect asserted; hold-off timer = 200, initial frequency error <200 ppm.

[a] Electrical parameters are guaranteed over the specified ambient operating temperature range, which is established when the device is mounted in a test socket with maintained transverse airflow greater than 500 lpm. The device will meet specifications after thermal equilibrium has been reached under these conditions.

[b] Phase noise specifications are applicable for all outputs active, Nx not equal. Measured using a VCXO with the following characteristics: 122.88MHz, phase noise -75dBc/Hz at 0.01kHz, -105dBc/Hz at 0.1kHz, -129dBc/Hz at 1kHz, -147dBc/Hz at 10kHz, -151dBc/Hz at 100kHz; input reference frequency: 122.88MHz, VCXO-PLL bandwidth: 30 Hz, VCXO-PLL charge pump current: 1.6mA, FemtoClockNG PLL bandwidth: 127kHz

# Clock Phase Noise Characteristics

## Conditions for Phase Noise Characteristics:

VCXO characteristics:  $f = 30.72\text{MHz}$  and phase noise:  $-96\text{dBc/Hz}$  (10Hz),  $-127\text{dBc/Hz}$  (100Hz),  $-144\text{dBc/Hz}$  (1kHz),  $-159\text{dBc/Hz}$  (10kHz),  $-162\text{dBc/Hz}$  (100kHz)

- Input reference frequency: 30.72MHz
- VCXO-PLL bandwidth: 30Hz
- VCXO-PLL charge pump current: 1.6mA
- FemtoClock-NG PLL bandwidth: 139kHz
- $V_{DD\_V} = 3.3\text{V}$ ,  $T_A = 25^\circ\text{C}$

[a] Standard JEDEC 2S2P multilayer PCB.

[b] Thermal model where the heat dissipated in the component is conducted through the board.  $T_B$  is measured on or near the component lead.

## Temperature Considerations

The device supports applications in a natural convection environment as long as the junction temperature does not exceed the specified junction temperature  $T_J$ . In applications where the heat dissipates through the PCB,  $\Theta_{JB}$  is the correct metric to calculate the junction temperature. The following calculation uses the junction-to-board thermal characterization parameter  $\Theta_{JB}$  to calculate the junction temperature ( $T_J$ ). Care must be taken to not exceed the maximum allowed junction temperature  $T_J$  of 125°C.

The junction temperature  $T_J$  is calculated using the following equation:  $T_J = T_B + P_{TOT} \times \Theta_{JB}$

where:

- $T_J$  is the junction temperature at steady state conditions in °C.
- $T_B$  is the board temperature at steady state condition in °C, measured on or near the component lead.
- $\Theta_{JB}$  is the thermal characterization parameter to report the difference between  $T_J$  and  $T_B$ .
- $P_{TOT}$  is the total device power dissipation.

**Application power dissipation scenarios:** Applications may use device settings that result in a lower power dissipation than the maximum power scenario. The 8V19N472 is a multi-functional, high-speed device that targets a variety of applications. Since this device is highly programmable with a broad range of settings and configurations, the power consumption will vary as settings and configurations are changed. [Table 38](#) shows the typical current consumption and total device power consumption along with the junction temperature for the test cases shown in [Table 48](#) and [Table 49](#). The table also displays the maximum board temperature for the  $\Theta_{JB}$  model.

**Reducing power consumption:** The output state (on/off) and the output amplitude have the largest impact on the device power consumption and the junction temperature: setting the output amplitude to lower voltages and supplying the outputs by 1.8V reduces power consumption. Unused and periodically unused outputs and inputs should be turned off in phases of inactivity to reduce power. For any given divider setting, the clock frequency has no impact on the device power consumption of the device.

Table 48. Typical Device Power Dissipation and Junction Temperature for LVDS Output Configurations

| Test Case <sup>[a]</sup> | Output Configuration           | Device      |              |           | $\Theta_{JB}$ Thermal Model |                    |

## Applications Information

### VCXO-PLL Loop Filter

Each of the two PLLs uses a loop filter with external components. The value of the external components depends on the desired loop bandwidth for each PLL, the input clock frequency and in the case of the VCXO-PLL, on the external VCXO component. For the VCXO-PLL (first PLL stage), a 2nd or 3rd order loop filter can be used. The loop filter of the VCXO-PLL is connected to the device through the LFV charge pump input. The filter output is connected to the control voltage input of the external VCXO. The FemtoClock NG PLL (second PLL stage) can use a 2nd order loop filter. The LFF output of the device connects to filter input and LFFR to the filter output.

Typical loop filters are shown in [Figure 16](#) (2nd order) in [Figure 17](#) (3rd order) and are discussed below. Step by step calculations to determine the value of the loop filter components values are shown.

#### Second-Order Loop Filter

Figure 16. Second-Order Loop Filter

#### Step-by-step calculation:

Step 1: Determine the desired loop bandwidth  $f_C$ .  $f_C$  must satisfy the following condition:

$$\frac{f_{PD}}{f_C} \gg 20$$

Where  $f_{PD}$  is the input frequency of the VCXO-PLL phase detector frequency.

Step 2: Calculate  $R_Z$  by:

$$R_Z = \frac{2\pi \times f_C M_V}{I_{CP} \times K_{VCXO}}$$

Where  $I_{CP}$  is the VCXO-PLL charge pump current and  $K_{VCXO}$  is the gain of the VCXO component (consult the datasheet of the external VCXO for its gain parameter).  $M_V$  is the effective feedback divider:

$$M_V = \frac{f_{VCXO}}{f_{PD}}$$

$f_{VCXO}$  is the frequency of the external VCXO component.

Step 3: Calculate  $C_Z$  by:

$$C_Z = \frac{\alpha}{2\pi f_C R_Z}$$

$$\alpha = \frac{f_C}{f_Z}$$

$\alpha$  is ratio between the loop bandwidth and the filter zero.  $f_Z$  is the filter zero.  $\alpha$  should be greater than 3.

Step 4: Calculate  $C_P$  by:

$$C_P = \frac{C_Z}{\alpha\beta}$$

$$\beta = \frac{f_P}{f_C}$$

$f_P$  is the pole and  $\beta$  is ratio between the pole and the loop bandwidth.  $\beta$  should be greater than 3.

Step 4: Verify that the phase margin PM is greater than  $50^\circ$ .

$$PM = \text{atan} \frac{b-1}{2\sqrt{b}}$$

$$b = \frac{C_Z}{C_P} + 1$$

**Example calculation:** Figure 16 shows a 2nd order loop filter for the VCXO-PLL. In this example, the VCXO-PLL reference frequency is 122.88MHz and an external VCXO component of 122.88MHz is used. The desired VCXO-PLL loop bandwidth  $f_C$  is 40Hz. To achieve the desired loop bandwidth with small size loop filter components, set the PLL frequency pre-divider  $P_V$  and the PLL feedback divider  $M_V$  to 1024. According to the step 1 instruction,  $f_{PD}$  is 120kHz. This satisfies the condition  $f_{PD}/f_C \gg 20$ .  $R_Z$  is calculated 32.2k $\Omega$ .

The VCXO gain  $K_{VCXO}$  used for the device reference circuit is 10kHz/V. The charge pump current of the VCXO-PLL is configurable from 50 $\mu$ A to 1200 $\mu$ A. The charge pump current is programmed to  $I_{CP} = 800\mu$ A. For  $\alpha = 8$ ,  $C_Z$  is calculated to be 0.99 $\mu$ F.  $C_Z$  greater than this value assures  $\alpha > 12$ . For example, the actual chosen value is the standard capacitor value of 1 $\mu$ F. For  $\beta = 5$ ,  $C_P$  is calculated 24.7nF. The standard capacitor value of  $C_P = 27$ ps ensures  $\beta > 7$ .

## Third-Order Loop Filter

Figure 17. Third Order Loop Filter

Figure 17 shows a third-order loop filter. The filter is equivalent to the 2nd order filter in Figure 16 with the addition components  $R_{P2}$  and  $C_{P2}$ . The additional components  $R_{P2}$  and  $C_{P2}$  should be calculated as shown:

$$C_{P2} = \frac{C_P \times R_Z}{\gamma \times R_{P2}}$$

$$R_{P2} \sim R_Z \times 1.5$$

$\gamma$  is the ratio between the 1<sup>st</sup> pole and the 2<sup>nd</sup> pole.  $\gamma$  should be greater than 3.

Example calculation for the 3<sup>rd</sup> order loop filter shown in Figure 17: Equivalent to the 2nd order loop filter calculation,  $R_Z = 33k\Omega$ ,  $C_Z = 1\mu F$ , and  $C_P = 27nF$ .  $R_{P2}$  should be in the range of  $0.5 \times R_Z < R_{P2} < 2.5 \times R_Z$ , for instance  $51k\Omega$ . With  $\gamma = 4$ ,  $C_{P2}$  is  $4.37nF$  (select  $4.7\mu F$ ).

## FemtoClock NG PLL Loop Filter

Figure 18 shows a 2nd order loop filter for the FemtoClock NG PLL. This loop filter is equivalent to Figure 16 and uses the loop filter components  $R_{ZF}$  ( $R_Z$ ),  $C_{ZF}$  ( $C_Z$ ) and  $C_{PF}$  ( $C_P$ ). The VCO frequency of the FemtoClock NG PLL is 2949.12MHz.

Figure 18. 2nd Order Loop Filter for the FemtoClock NG PLL

Example calculation for the 2nd order loop filter shown in Figure 18: the FemtoClock NG receives its reference frequency from the VCXO output. With the  $P_F$  pre-divider set to 1, the phase detector frequency is also 122.88MHz. The PLL feedback divider must be set to  $M_F = 24$  in order to locate the VCO frequencies in its center range. A target PLL loop bandwidth  $f_C$  is 80kHz satisfies the condition in step 1. The gain of the internal VCO is 30MHz/V and the charge pump current  $I_{CP}$  is set to 3.6mA. Using the formula for  $R_Z$  in step 2,  $R_{ZF}$  is calculated  $103\Omega$  (chose the standard value of  $100\Omega$ ); using the formula for  $C_Z$  in step 3,  $C_{ZF}$  is calculated  $88nF$  for  $\alpha = 4$ . A capacitor larger than  $88nF$  should be used for  $C_{ZF}$  to assure that the  $\alpha$  is greater than 4, for instance the standard component capacitor value  $100nF$ .

The recommended  $C_{PF}$  value for the loop filter is  $40pF$  (loop filter components are partially integrated). The selected 2nd order loop filter components for this PLL are:  $R_{ZF} = 100\Omega$ ,  $C_{ZF} = 100nF$ , and  $C_{PF} = 40pF$ .

# Output Termination

## LVPECL-style outputs

Differential outputs configured to LVPECL-style are of open-emitter type and require a termination with a DC current path to GND. This section displays parallel and thevenin termination, Y-termination and source termination for various output supply ( $V_{DDO\_v}$ ), and amplitude settings.  $V_{TT}$  is the termination voltage.

Figure 19. Parallel Termination 1

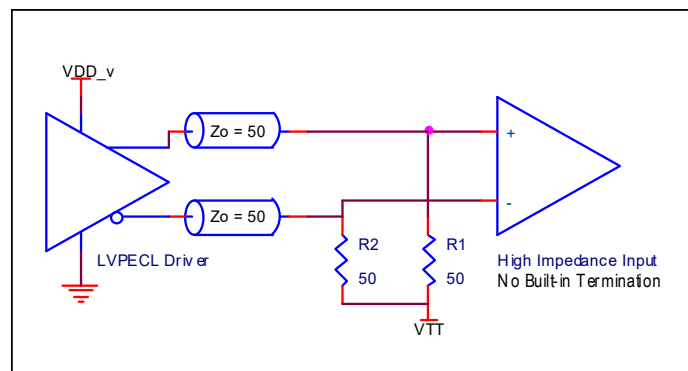

Table 50. Termination Voltage  $V_{TT}$  for Figure 19<sup>[a]</sup>

| LVPECL Amplitude (mV) | $V_{TT}$ (V)        |
|-----------------------|---------------------|
| 350                   | $V_{DDO\_v} - 1.60$ |
| 500                   | $V_{DDO\_v} - 1.75$ |
| 700                   | $V_{DDO\_v} - 1.95$ |
| 850                   | $V_{DDO\_v} - 2.10$ |

[a] Output power supplies supporting 3.3V, 2.5V and 1.8V are  $V_{DDO\_QCLKA}$ ,  $V_{DDO\_QCLKB}$ ,  $V_{DDO\_QCLKC}$  and  $V_{DDO\_QCLKD}$ .

| 1.8                       | 350, 500              | 0      |

[a] Output power supplies supporting 3.3V, 2.5V and 1.8V are VDDO\_QCLKA, VDDO\_QCLKB, VDDO\_QCLKC and VDDO\_QCLKD.

## Power Supply Filtering

Please refer to the document *8V19N470 Hardware Design Guide* for comprehensive information about power supply and isolation, loop filter design for VCXO and VCO, schematics, input and output interfaces/terminations, and an example schematics. This document shows a recommended power supply filter schematic in which the device is operated at  $VDD\_v = 3.3V$  (The output supply voltages of  $VDDO\_v = 3.3V, 2.5V$  and  $1.8V$  are supported). This example focuses on power supply connections and is not configuration specific. Refer to the pin description and functional tables in the datasheet to ensure that the logic control inputs are properly set for the application.

As with any high-speed analog circuitry, the power supply pins are vulnerable to board supply or device generated noise. This device requires an external voltage regulator for the  $VDD\_v$  pins for isolation of board supply noise. This regulator (example component: PS7A8300RGT) is indicated in the schematic by the power supply, VREG\_3.3V. Consult the voltage regulator specification for details of the required performance. To achieve optimum jitter performance, power supply isolation is required to minimize device generated noise. The  $VDD\_LCF$  terminal requires the cleanest power supply. The device provides separate power supplies to isolate any high switching noise from coupling into the internal PLLs and into other outputs as shown. In order to achieve the best possible filtering, it is recommended that the placement of the filter components be on the device side of the PCB as close to the power pins as possible. If space is limited the  $0.1\mu F$  and  $0.01\mu F$  capacitors in each power pin filter should be placed on the device side. The other components can be on the opposite side of the PCB. Pull-up and pull-down resistors to set configuration pins can all be placed on the PCB side opposite the device side to free up device side area if necessary.

Power supply filter recommendations are a general guideline to be used for reducing external noise from coupling into the devices. The filter performance is designed for a wide range of noise frequencies. This low-pass filter starts to attenuate noise at approximately 10kHz. If a specific frequency noise component is known, such as switching power supplies frequencies, it is recommended that component values be adjusted and if required, additional filtering be added. Additionally, good general design practices for power plane voltage stability suggests adding bulk capacitance in the local area of all devices.

Figure 27. Package Outline Drawings - Sheet 3

# Marking Diagram

Figure 28. Marking Diagram

1. Lines 1 and 2 indicate the part number.
2. Line 3 indicates the package part number code.
3. Line 4 indicates the following:
  - “YYWW” is the last digit of the year and week that the part was assembled.
  - #: denotes sequential lot number.
  - \$: denotes mark code.

# Ordering Information

| Part/Order Number | Marking         | Package                   | Shipping Packaging | Temperature    |
|-------------------|-----------------|---------------------------|--------------------|----------------|
| 8V19N472BFGI      | IDT8V19N472BFGI | 8 × 8 × 1.35 mm, 81-FPBGA | Tray               | -40°C to +85°C |
| 8V19N472BFGI8     | IDT8V19N472BFGI | 8 × 8 × 1.35 mm, 81-FPBGA | Tape & Reel        | -40°C to +85°C |

# Glossary

Table 54. Abbreviations and Nomenclature

| Abbreviation     | Description  |
|------------------|--|
| Index <i>n</i>   | Denominates an clock input. Range: 0 to 1  |
| Index <i>x</i>   | Denominates a channel, channel frequency divider and the associated configuration bits. Range: A, B, C, D, E   |
| Index <i>y</i>   | Denominates a QCLK output and associated configuration bits. Range: A0, A1, A2, B0, B1, B2, C0, C1, D0, D1, E  |
| VDD_v            | Denominates core voltage supply pins. Range: VDD_QCLKA, VDD_QCLKB, VDD_QCLKC, VDD_QCLKD, VDD_QCLKE, VDD_SPI, VDD_INP, VDD_LCV, VDD_LCF, VDD_CPV, VDD_CPF and VDD_OSC |
| VDDO_v           | Denominates output voltage supply pins. Range: VDDO_QCLKA, VDDO_QCLKB, VDDO_QCLKC and VDDO_QCLKD   |
| status_condition | Status conditions are: LOLV (Loss of VCXO-PLL lock), LOLF (Loss of FemtoClockNG-PLL lock) and LOS (Loss of input signal)   |
| [...]            | Index brackets describe a group associated with a logical function or a bank of outputs.   |
| {...}            | List of discrete values  |
| Suffix V         | Denominates a function associated with the VCXO-PLL  |
| Suffix F         | Denominates a function associated with the 2nd stage PLL (FemtoClock NG)   |

## Revision History

| Revision Date    | Description of Change |
|------------------|-----------------------|
| November 7, 2017 | Initial release.      |

## IMPORTANT NOTICE AND DISCLAIMER

RENESAS ELECTRONICS CORPORATION AND ITS SUBSIDIARIES ("RENESAS") PROVIDES TECHNICAL SPECIFICATIONS AND RELIABILITY DATA (INCLUDING DATASHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING, WITHOUT LIMITATION, ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for developers skilled in the art designing with Renesas products. You are solely responsible for (1) selecting the appropriate products for your application, (2) designing, validating, and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, or other requirements. These resources are subject to change without notice. Renesas grants you permission to use these resources only for development of an application that uses Renesas products. Other reproduction or use of these resources is strictly prohibited. No license is granted to any other Renesas intellectual property or to any third party intellectual property. Renesas disclaims responsibility for, and you will fully indemnify Renesas and its representatives against, any claims, damages, costs, losses, or liabilities arising out of your use of these resources. Renesas' products are provided only subject to Renesas' Terms and Conditions of Sale or other applicable terms agreed to in writing. No use of any Renesas resources expands or otherwise alters any applicable warranties or warranty disclaimers for these products.
