Absolute Maximum Ratings

Parameter	Symbol	Value	Unit
Voltage on any pin relative to Vss	V _{IN} , V _{OUT}	-0.5 ~ 3.6	V
Voltage on V _{DD} supply relative to Vss	V _{DD} , V _{DDQ}	-1.0 ~ 3.6	V
Storage temperature	T _{STG}	-55 ~ +150	°C
Power dissipation	P _D	1.5 * # of component	W
Short circuit current	I _{OS}	50	mA

Note : Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded.
Functional operation should be restricted to recommended operating condition.
Exposure to higher than recommended voltage for extended periods of time could affect device reliability.

Power & DC Operating Conditions (SSTL_2 In/Out)

Recommended operating conditions(Voltage referenced to Vss=0V, TA=0 to 70°C)

Parameter	Symbol	Min	Max	Unit	Note
Supply voltage(for device with a nominal V _{DD} of 2.5V for DDR266/333)	V _{DD}	2.3	2.7	V	
Supply voltage(for device with a nominal V _{DD} of 2.6V for DDR400)	V _{DD}	2.5	2.7	V	
I/O Supply voltage(for device with a nominal V _{DD} of 2.5V for DDR266/333)	V _{DDQ}	2.3	2.7	V	
I/O Supply voltage(for device with a nominal V _{DD} of 2.6V for DDR400)	V _{DDQ}	2.5	2.7	V	
I/O Reference voltage	V _{REF}	0.49*V _{DDQ}	0.51*V _{DDQ}	V	1
I/O Termination voltage(system)	V _{TT}	V _{REF} -0.04	V _{REF} +0.04	V	2
Input logic high voltage	V _{IH} (DC)	V _{REF} +0.15	V _{DDQ} +0.3	V	
Input logic low voltage	V _{IL} (DC)	-0.3	V _{REF} -0.15	V	
Input Voltage Level, CK and $\overline{\text{CK}}$ inputs	V _{IN} (DC)	-0.3	V _{DDQ} +0.3	V	
Input Differential Voltage, CK and $\overline{\text{CK}}$ inputs	V _{ID} (DC)	0.36	V _{DDQ} +0.6	V	3
V-I Matching: Pullup to Pulldown Current Ratio	V _I (Ratio)	0.71	1.4	-	4
Input leakage current	I _I	-2	2	uA	
Output leakage current	I _{OZ}	-5	5	uA	
Output High Current(Normal strength driver) ; V _{OUT} = V _{TT} + 0.84V	I _{OH}	-16.8		mA	
Output High Current(Normal strength driver) ; V _{OUT} = V _{TT} - 0.84V	I _{OL}	16.8		mA	
Output High Current(Half strength driver) ; V _{OUT} = V _{TT} + 0.45V	I _{OH}	-9		mA	
Output High Current(Half strength driver) ; V _{OUT} = V _{TT} - 0.45V	I _{OL}	9		mA	

Note : 1. V_{REF} is expected to be equal to 0.5*V_{DDQ} of the transmitting device, and to track variations in the dc level of same. Peak-to-peak noise on V_{REF} may not exceed +/-2% of the dc value.
2. V_{TT} is not applied directly to the device. V_{TT} is a system supply for signal termination resistors, is expected to be set equal to V_{REF}, and must track variations in the DC level of V_{REF}.
3. V_{ID} is the magnitude of the difference between the input level on CK and the input level on $\overline{\text{CK}}$.
4. The ratio of the pullup current to the pulldown current is specified for the same temperature and voltage, over the entire temperature and voltage range, for device drain to source voltages from 0.25V to 1.0V. For a given output, it represents the maximum difference between pullup and pulldown drivers due to process variation. The full variation in the ratio of the maximum to minimum pullup and pulldown current will not exceed 1.7 for device drain to source voltages from 0.1 to 1.0.

Preliminary
DDR SDRAM

System Notes :

- a. Pullup slew rate is characterized under the test conditions as shown in Figure 2.

Figure 2 : Pullup slew rate test load

- b. Pulldown slew rate is measured under the test conditions shown in Figure 3.

Figure 3 : Pulldown slew rate test load

- c. Pullup slew rate is measured between $(VDDQ/2 - 320 \text{ mV} \pm 250 \text{ mV})$
 Pulldown slew rate is measured between $(VDDQ/2 + 320 \text{ mV} \pm 250 \text{ mV})$
 Pullup and Pulldown slew rate conditions are to be met for any pattern of data, including all outputs switching and only one output switching.
 Example : For typical slew rate, DQ0 is switching
 For minimum slew rate, all DQ bits are switching from either high to low, or low to high.
 The remaining DQ bits remain the same as for previous state.
- d. Evaluation conditions
 Typical : 25 °C (T Ambient), VDDQ = 2.5V(for DDR266/333) and 2.6V(for DDR400), typical process
 Minimum : 70 °C (T Ambient), VDDQ = 2.3V(for DDR266/333) and 2.5V(for DDR400), slow - slow process
 Maximum : 0 °C (T Ambient), VDDQ = 2.7V(for DDR266/333) and 2.7V(for DDR400), fast - fast process
- e. The ratio of pullup slew rate to pulldown slew rate is specified for the same temperature and voltage, over the entire temperature and voltage range. For a given output, it represents the maximum difference between pullup and pulldown drivers due to process variation.
- f. Verified under typical conditions for qualification purposes.
- g. TSOP11 package devices only.
- h. Only intended for operation up to 266 Mbps per pin.
- i. A derating factor will be used to increase tIS and tIH in the case where the input slew rate is below 0.5V/ns as shown in Table 2. The Input slew rate is based on the lesser of the slew rates determined by either VIH(AC) to VIL(AC) or VIH(DC) to VIL(DC), similarly for rising transitions.
- j. A derating factor will be used to increase tDS and tDH in the case where DQ, DM, and DQS slew rates differ, as shown in Tables 3 & 4. Input slew rate is based on the larger of AC-AC delta rise, fall rate and DC-DC delta rise, Input slew rate is based on the lesser of the slew rates determined by either VIH(AC) to VIL(AC) or VIH(DC) to VIL(DC), similarly for rising transitions.
 The delta rise/fall rate is calculated as:
 $\{1/(\text{Slew Rate1})\} - \{1/(\text{Slew Rate2})\}$
 For example : If Slew Rate 1 is 0.5 V/ns and slew Rate 2 is 0.4 V/ns, then the delta rise, fall rate is - 0.5ns/V . Using the table given, this would result in the need for an increase in tDS and tDH of 100 ps.
- k. Table 3 is used to increase tDS and tDH in the case where the I/O slew rate is below 0.5 V/ns. The I/O slew rate is based on the lesser of the AC - AC slew rate and the DC- DC slew rate. The input slew rate is based on the lesser of the slew rates determined by either VIH(ac) to VIL(ac) or VIH(DC) to VIL(DC), and similarly for rising transitions.
- m. DQS, DM, and DQ input slew rate is specified to prevent double clocking of data and preserve setup and hold times. Signal transitions through the DC region must be monotonic.

Note : 1. OP Code : Operand Code. A0 ~ A12 & BA0 ~ BA1 : Program keys. (@EMRS/MRS)

2. EMRS/ MRS can be issued only at all banks precharge state.

A new command can be issued 2 clock cycles after EMRS or MRS.

3. Auto refresh functions are same as the CBR refresh of DRAM.

The automatical precharge without row precharge command is meant by "Auto".

Auto/self refresh can be issued only at all banks precharge state.

4. BA0 ~ BA1 : Bank select addresses.

If both BA0 and BA1 are "Low" at read, write, row active and precharge, bank A is selected.

If BA0 is "High" and BA1 is "Low" at read, write, row active and precharge, bank B is selected.

If BA0 is "Low" and BA1 is "High" at read, write, row active and precharge, bank C is selected.

If both BA0 and BA1 are "High" at read, write, row active and precharge, bank D is selected.

5. If A10/AP is "High" at row precharge, BA0 and BA1 are ignored and all banks are selected.

6. During burst write with auto precharge, new read/write command can not be issued.

Another bank read/write command can be issued after the end of burst.

New row active of the associated bank can be issued at t_{RP} after the end of burst.

7. Burst stop command is valid at every burst length.

8. DM sampled at the rising and falling edges of the DQS and Data-in are masked at the both edges (Write DM latency is 0).

9. This combination is not defined for any function, which means "No Operation(NOP)" in DDR SDRAM.
