# A5338

## *Smoke Detector with Interconnect and Timer*

Package A, 16-lead DIP

Approximate Scale 1:1

The A5338CA is a low-current, CMOS circuit providing all of the required features for an ionization-type smoke detector. A networking capability allows as many as 125 units to be interconnected so that if any unit senses smoke, all units will sound an alarm. In addition, special features are incorporated to facilitate alignment and test of the finished smoke detector. This device is designed to comply with Underwriters Laboratories Specification UL217.

The internal oscillator and timing circuitry keeps standby power to a minimum by powering down the device for 1.66 seconds and sensing smoke for only 10 ms. Every 24 on/off cycles, a check is made for low battery condition. By substituting other types of sensors, or a switch for the ionization detector, this very-low power device can be used in numerous other battery-operated safety/security applications.

The A5338CA is supplied in a low-cost, 16-pin dual in-line plastic package. It is rated for continuous operation over the temperature range of 0°C to +50°C.
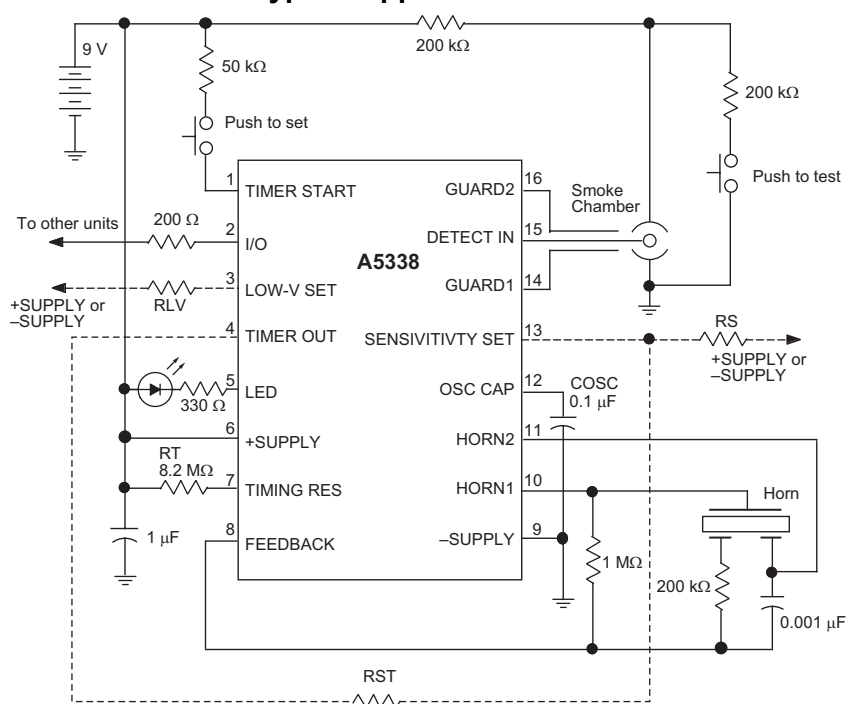

**Features**

- Interconnect up to 125 detectors
- Piezoelectric horn driver
- Guard outputs for detector input
- Pulse testing for low battery
- Power-on reset
- Internal reverse battery protection
- Internal timer and control for reduced sensitivity
- Built-in hysteresis reduces false triggering

## Terminal List Table

| Number | Name | Function |
|---|---|---|
| 1 | TIMER START | Logic input for setting device mode. |
| 2 | I/O | Logic input/output, where multiple detectors can be connected. |
| 3 | LOW-V SET | Terminal for a resistor, RLV, to the –SUPPLY pin ($V_{SS}$) or to the +SUPPLY pin ($V_{DD}$), which may be added to modify the battery Low Voltage Threshold, $V_{DDL}$. |
| 4 | TIMER OUT | Terminal for a resistor, RST, to reduce sensitivity during Timer mode. |
| 5 | LED | LED output. |
| 6 | +SUPPLY | Device supply, $V_{DD}$. |
| 7 | TIMING RES | Terminal for timing resistor. |
| 8 | FEEDBACK | Feedback from horn external circuit. |
| 9 | –SUPPLY | Device supply, $V_{SS}$. |
| 10 | HORN1 | Horn driver output 1. |
| 11 | HORN2 | Horn driver output 2. |
| 12 | OSC CAP | Terminal for timing oscillator capacitor. |
| 13 | SENSITIVITY SET | Terminal for resistor, RS, to adjust sensitvity for a particular smoke chamber. |
| 14 | GUARD1 | Terminal for smoke detector guard 1. |
| 15 | DETECT IN | Terminal for smoke detector input. |
| 16 | GUARD2 | Terminal for smoke detector guard 2. |

[1]Alarm (smoke detected) condition is defined as $V_{DETECT\_IN}$ < $V_{SENSITIVITY\_SET}$; No-Alarm (no smoke detected) condition is defined as $V_{DETECT\_IN}$ > $V_{SENSITIVITY\_SET}$.
[2]Negative current is defined as coming out of (sourcing) the specified device pin.

## Functional Description

The A5338 is a low-current CMOS circuit providing all of the required features for an ionization-type smoke detector.

**Oscillator**. An internal oscillator operates with a period of 1.67 s during no-smoke conditions. Every 1.67 s, internal power is applied to the entire circuit and a check is made for smoke. Every 24 oscillator cycles (40 s total), the LED is pulsed and a check is made for low battery by comparing $V_{DD}$ to an internal reference. Because very low currents are used in the device, the oscillator capacitor, COSC, at the OSC CAP pin should be a low-leakage type (PTFE, polystyrene, or polypropylene).

**Detector Circuitry.** When smoke is detected, the resistor divider network that sets the sensitivity (smoke trip point) is altered to increase the voltage on the SENSITIVITY SET pin by 130 mV typical, when there are no external connections to the SENSITIVITY SET pin or LOW-V SET pin. This provides hysteresis and reduces false triggering. An active guard is provided on both GUARD*x* pins, adjacent to the DETECT IN detector input pin. The voltage at the GUARD*x* pins will be within 100 mV of DETECT IN. This will keep surface leakage currents to a minimum, and provide a method of measuring the input voltage without loading the ionization chamber. The active guard amplifier is not power-strobed and thus provides constant protection from surface leakage currents. The detector input has internal diode protection against static damage.

**Alarm Circuitry.** If smoke is detected, the oscillator period changes to 40 ms and the horn is enabled. The horn output is 160 ms ON, and 80 ms OFF, typical. During the OFF time, smoke is again checked and the circuit will inhibit further horn output if smoke is not sensed. During smoke conditions, the low-battery-warning is inhibited. The LED is driven at a 1 Hz rate, and will only turn ON while the horn outputs are in the OFF state.

**Sensitivity Adjust.** The detector sensitivity to smoke is set internally by a voltage divider connected between $V_{DD}$ and $V_{SS}$. The sensitivity can be externally adjusted to the individual characteristics of the ionization chamber by connecting a resistor, RS, between the SENSITIVITY SET pin and +SUPPLY, or between SENSITIVITY SET pin and –SUPPLY.

**Low Battery.** The low-battery threshold is set internally by a voltage divider connected between $V_{DD}$ and $V_{SS}$. The threshold can be increased by connecting a resistor, RLV, between the LOW-V SETpin and +SUPPLY. The threshold can be decreased by connecting RLV between LOW-V SETpin and –SUPPLY. The battery voltage level is checked every 40 s during the 10 mA, 10 ms LED pulse. If an LED is not used, it should be replaced with an equivalent resistor (typically 500 to 1000 Ω), such that the battery loading remains at 10 mA.
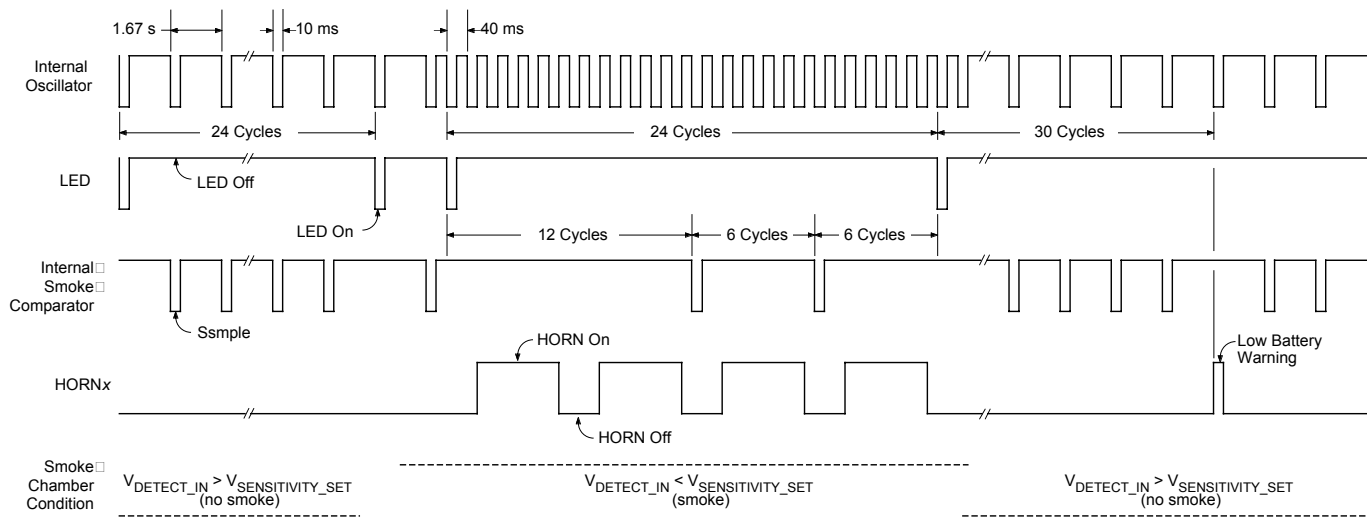

**Timer.** An internal timer is provided that can be used in various configurations to allow for a period of reduced smoke detector sensitivity, *Hush* mode. When a high-to-low transition occurs at the TIMER START pin, the internal timer is reset, Timer mode is enabled, and the circuit is reset to a no-alarm condition. During Hush mode, the LED will flash at a 10 s rate. If the level of smoke is increased such that the reduced sensitivity level is reached, the device will go into the alarm condition. The timer, however, will continue to completion of the nominal 6.5 minute period (232 oscillator cycles). If Timer mode is not used, the TIMER START pin should be tied low. While in Hush mode, the battery is checked. If a low-battery condition is detected, the low-battery warning chirp will be activated.

**I/O.** The I/O pin provides a terminal to allow multiple smoke detectors to be commoned. If any single unit detects smoke (I/O is driven high), all connected units will sound their associated horns after a nominal 3 s delay. The LED is suppressed when an alarm is signaled from another interconnected unit. An internal NMOS device acts as a charge dump to aid in applications involving a large (distributed) capacitance on the I/O pin. The charge dump is activated only on the removal of a local alarm.

**Testing.** On power-up, all internal counters are reset. Internal test circuitry allows for low-battery check by holding the FEEDBACK and OSC CAP pins low during power-up, then reducing $V_{DD}$ and monitoring HORN1. All functional tests can be accelerated by driving OSC CAP with a 2 kHz square wave. The 10 ms strobe period must be maintained for proper operation of the comparator circuitry.
