ADC-304 is its

8-Bit, ZUIVITZ, LOW-POWER Flash AD Converters

NOTRECOMMENDED

FOR NEW DESIGNS BY S ADC-304 is an 8-bit, 20MHz analog-toAnother novel feature of the

Datel's ADC-304 is an 8-bit, 20MHz analog-tosital flash converter. The ADC-304 offers many

performance features not obtainable from other flash A/D's.

Key reatures include a low power dissipation of 375mW and TTL-compatible outputs. A wide analog input bandwidth of 8MHz (-3dB) allows operation without the need of a sample-hold. Also, single +5V supply operation is obtainable with an input range of +3 to +5V, eliminating the need for an additional power supply. A 0 to -2V input range is available with $\pm 5V$ supply operation.

pins allow selection of binary, complementary binary, and if external offset circuitry is used for bipolar inputs, offset binary, two's complement and

The ADC-304 is supplied in a 28-pin plastic DIP or a 28-pin plastic SOP package. Operating temperature range is -20 to $+75^{\circ}$ C. Storage temperature range is -55 to $+150^{\circ}$ C.

complementary two's complement coding.

FEATURES

- 8-bit resolution
- 20MHz conversion rate
- ±1/2LSB maximum nonlinearity
- 8MHz input bandwidth
- Low power consumption, 375mW
- TTL compatible
- Single or dual supply operation

TECHNICAL NOTES

- The two DIGITAL GND pins (pins 5 and 11 on the DIP, pins 12 and 18 on the SOP) are not
 connected to each other internally and neither are the two +5V POWER pins (6 and 10 on the DIP,
 13 and 17 on the SOP). All four pins must be externally connected to the appropriate pcb patterns.
 Also, the DIGITAL GND and ANALOG GND pins are not connected to each other internally.
- 2. Layout of the analog and digital sections should be separated to reduce interference from noise. To further guard against unwanted noise, it is recommended to bypass, as close as possible, the voltage supply pins to their respective ground pins with $1\mu F$ tantalum and $0.01\mu F$ ceramic disk capacitors in parallel.
- 3. The input capacitance of the analog input is much smaller than that of a typical flash A/D converter. It is necessary to use an amplifier with sufficient bandwidth and driving power. The analog input pins are separated internally, so they should be connected together externally. If the ADC-304 is driven with a low output impedance amplifier, parasitic oscillations may occur.

These parasitic oscillations can be prevented by introducing a small resistance of 2 to 10Ω between the amplifier output and the ADC-304's A/D input. This resistance must have a very low value of series inductance at high frequencies.

Note that each of the analog input pins is divided in this manner with these resistances. Connect the driving amplifier as close as possible to the A/D input of the ADC-304.

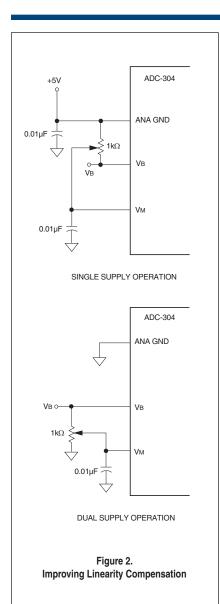

4. The voltage between VT and VB is equivalent to the dynamic range of the analog input. Bypass VB to ANALOG GND USING a 1μF and a 0.01μF capacitor in parallel. To balance the characteristics of the ADC-304 at high frequencies, bypass VM with a 0.01μF capacitor to ANALOG GND.

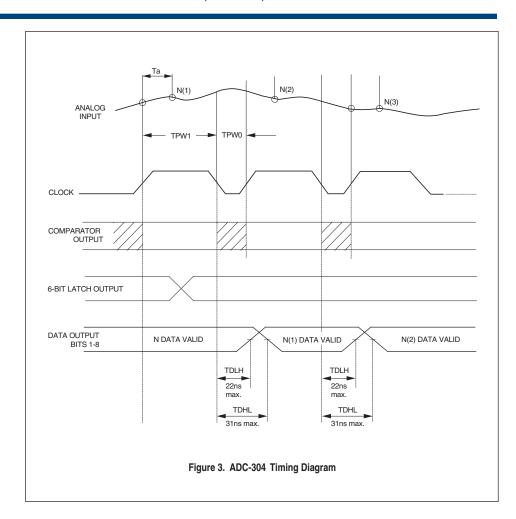

Also, VM can be used as a trimming pin for more precise linearity compensation. A stable voltage source with a potential equal to VB and a $1k\Omega$ potentiometer can be connected to VM as shown in Figure 2 for this purpose.

- Separate the clock input, CLOCK, from other leads as much as possible, observing proper EMI and RFI wiring techniques. This reduces the inductive pick-up of this lead from interfering with the "clean" operation of the ADC-304.
- 6. The analog input signal is sampled on the positive-going edge of CLOCK. Corresponding digital data appears at the output on the negative-going edge of the CLOCK pulse after a brief delay of 31ns maximum (TDLH, TDHL). Refer to the Timing Diagram (Figure 3) for more information.
- 7. Connect all free pins to ANALOG GND to reduce unwanted noise.

The analog input range is equal to a 2V spread. The voltage on VT-VB will equal 2V. The connection of VT and ANALOG GND is 2V higher than VB. Whether using a single or dual power supply, the analog input will range from the value of VT to VB. If VT equals +5V, then VB will equal +3V and the analog input range will be from +3 to +5V.
