- 8-Bit Resolution
- Easy Microprocessor interface or Stand-Alone Operation
- Operates Ratiometrically or With 5-V Reference
- Single Channel or Multiplexed Twin Channels With Single-Ended or Differential Input Options
- Input Range 0 to 5 V With Single 5-V Supply
- Inputs and Outputs Are Compatible With TTL and MOS
- Conversion Time of 32 μs at CLK = 250 kHz
- Designed to Be interchangeable With National Semiconductor ADC0831 and ADC0832

description

These devices are 8-bit successive-approximation analog-to-digital converters. The ADC0831A and ADC0831B have single input channels; the ADC0832A and ADC0832B have multiplexed twin input channels. The serial output is configured to interface with standard shift registers or microprocessors. Detailed information on interfacing to most popular microprocessors is readily available from the factory.

The ADC0832 multiplexer is software configured for single-ended or differential inputs. The differential analog voltage input allows for common-mode rejection or offset of the analog zero input voltage value. In addition, the voltage reference input can be adjusted to allow encoding any smaller analog voltage span to the full 8 bits of resolution.

The operation of the ADC0831 and ADC0832 devices is very similar to the more complex ADC0834 and ADC0838 devices. Ratiometric conversion can be attained by setting the REF input equal to the maximum analog input signal value, which gives the highest possible conversion resolution. Typically, REF is set equal to V_{CC} (done internally on the ADC0832). For more detail on the operation of the ADC0831 and ADC0832 devices, refer to the ADC0834/A DC0838 data sheet.

The ADC0831AC, ADC0831BC, ADC0832AC, and ADC0832BC are characterized for operation from 0° C to 70° C. The ADC0831AI, ADC0831BI, ADC0832AI, and ADC0832BI are characterized for operation from -40° C to 85° C.

ADC0831A, ADC0832A, ADC0831B, ADC0832B A/D PERIPHERALS WITH SERIAL CONTROL

SLAS006 - AUGUST 1985 - REVISED JUNE 1986

absolute maximum ratings over recommended operating free-air temperature range (unless otherwise noted)

Supply voltage, V _{CC} (see Note 1)	6.5 V
Input voltage range: Logic	
Analog	$-0.3 \text{ V to V}_{CC} + 0.3$
Input current	±5 mA
Total input current for package	±20 mA
Operating free-air temperature range: C-suffix	0°C to 70°C
I-suffix	–40°C to 85°C
Storage temperature range	65°C to 150°C
Lead temperature 1,6 mm (1/16 inch) from case for 10 seconds	260°C

NOTE 1: All voltage values, except differential voltages, are with respect to the network ground terminal.

recommended operating conditions

				MIN	NOM	MAX	UNIT
VCC	Supply voltage			4.5	5	6.3	V
VIH	High-level input voltage			2			V
VIL	Low-level input voltage	w-level input voltage				0.8	V
fclock	Clock frequency					400	kHz
	Clock duty cycle (see Note 2)					60	%
t _{wH(C} S)	Pulse duration, CS high						ns
t _{su}	Setup time, CS low or ADC0832 of	ata valid before CLK↑		350			ns
th	Hold time, ADC0832 data valid after CLK↑						ns
т.	Operating free-air temperature	C-suffix		0		70	°C
TA		I-suffix		-40		85	-0

NOTE 2: The clock duty cycle range ensures proper operation at all clock frequencies. If a clock frequency is used outside the recommended duty cycle range, the minimum pulse duration (high or low) is 1 μs.

electrical characteristics over recommended range of operating free-air temperature, $V_{CC} = 5 \text{ V}$, $f_{clock} = 250 \text{ kHz}$ (unless otherwise noted)

total device

	PARAMETER		TEST CONDITIONS [†]	MIN	TYP‡	MAX	UNIT
	- Supply gurrent	ADC0831			1	2.5	m ^
ľC	C Supply current	ADC0832			3	5.2	mA

[†] All parameters are measured under open-loop conditions with zero common-mode input voltage.

NOTES: 3. If channel IN— is more positive than channel IN+, the digital output code will be 0000 0000. Connected to each analog input are two on-chip diodes that conduct forward current for analog input voltages one diode drop above V_{CC}. Care must be taken during testing at low V_{CC} levels (4.5 V) because high-level analog input voltage (5 V) can, especially at high temperatures, cause this input diode to conduct and cause errors for analog inputs that are near full-scale. As long as the analog voltage does not exceed the supply voltage by more than 50 mV, the output code will be correct. To achieve an absolute 0 V to 5 V input voltage range requires a minimum V_{CC} of 4.95 V for all variations of temperature and load.

4. Standby input currents are currents going into or out of the on or off channels when the A/D converter is not performing conversion and the clock is in a high or low steady-state condition.

operating characteristics V_{CC} = REF = 5 V, f_{clock} = 250 kHz, t_r = t_f = 20 ns, T_A = 25°C (unless otherwise noted)

PARAMETER			TEST CONDITIONS§	Al,	AC SUFF	-IX	BI, BC SUFFIX			UNIT

L	Output disable time,		$C_L = 10 \text{ pF}, R_L = 10 \text{ k}\Omega$		125	250		125	250	20
^t dis	DO after CS↑		$C_L = 100 \text{ pF}, R_L = 2 \text{ k}\Omega$			500			500	ns
tconv	Conversion time (multiplexer a time not included)	ddressing				8	·		8	clock periods

[§] All parameters are measured under open-loop conditions with zero common-mode input voltage. For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions.

[‡] All typical values are at $V_{CC} = 5 \text{ V}$, $T_A = 25^{\circ}\text{C}$.

NOTES:5. Total unadjusted error includes offset, full-scale, linearity, and multiplexer errors.

^{6.} The most significant-bit-first data is output directly from the comparator and therefore requires additional delay to allow for comparator response time. Least-significant-bit-first data applies only to ADC0832.

IMPORTANT NOTICE

Texas Instruments and its subsidiaries (TI) reserve the right to make changes to their products or to discontinue any product or service without notice, and advise customers to obtain the latest version of relevant information to verify, before placing orders, that information being relied on is current and complete. All products are sold subject to the terms and conditions of sale supplied at the time of order acknowledgement, including those pertaining to warranty, patent infringement, and limitation of liability.

TI warrants performance of its semiconductor products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are utilized to the extent TI deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

CERTAIN APPLICATIONS USING SEMICONDUCTOR PRODUCTS MAY INVOLVE POTENTIAL RISKS OF DEATH, PERSONAL INJURY, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE ("CRITICAL APPLICATIONS"). TI SEMICONDUCTOR PRODUCTS ARE NOT DESIGNED, AUTHORIZED, OR WARRANTED TO BE SUITABLE FOR USE IN LIFE-SUPPORT DEVICES OR SYSTEMS OR OTHER CRITICAL APPLICATIONS. INCLUSION OF TI PRODUCTS IN SUCH APPLICATIONS IS UNDERSTOOD TO BE FULLY AT THE CUSTOMER'S RISK.

In order to minimize risks associated with the customer's applications, adequate design and operating safeguards must be provided by the customer to minimize inherent or procedural hazards.

TI assumes no liability for applications assistance or customer product design. TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of TI covering or relating to any combination, machine, or process in which such semiconductor products or services might be or are used. TI's publication of information regarding any third party's products or services does not constitute TI's approval, warranty or endorsement thereof.
