# AMS34063

**DC-TO-DC CONVERTER CONTROL CIRCUIT**

## FEATURES

- Wide Input Voltage Operating Range from 2.5V to 40V
- Low Standby Current
- Current Limiting
- Output Switch Current of 1.5A
- Output Voltage Adjustable from 1.25 to 40V
- Frequency of Operation to 100kHz

## APPLICATIONS

- Step-Up Converter
- Step-Down Converter
- Voltage Inverting Application

## GENERAL DESCRIPTION

The AMS34063 series is a control circuit containing the basic functions required for DC-to-DC converters. The device consists of an internal temperature compensated reference, a comparator, a controlled duty cycle oscillator with an active current limit circuit, a driver and a high current output switch. Designed specifically to be incorporated in Step-Up, Step-Down and Voltage-Inverting applications, the AMS34063 requires a minimum number of external components.

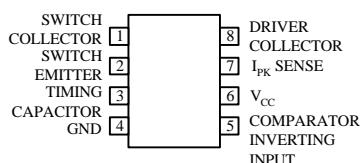

The AMS34063 is available in the 8-lead plastic SOIC and 8-lead plastic DIP packages.

**Note 1:** Absolute Maximum Ratings are limits beyond which damage to the device may occur. For guaranteed performance limits and associated test conditions, see the Electrical Characteristics tables.

**Note 2:** To minimize power dissipation, low duty cycle pulse testing is used.

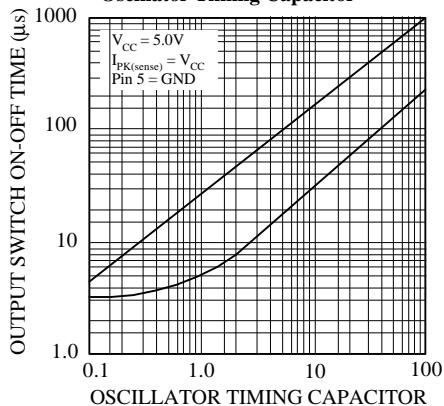

**Note 3:** Power dissipation at T<sub>A</sub> = 25°C is equal to 1.0W for the 8 lead P DIP package and 625mW for the SO-8 package. For operation at temperatures above T<sub>A</sub> = 25°C derate the power dissipation at 10mW/°C.

$C_O$	$\frac{I_{PK(switch)} (t_{ON} + t_{OFF})}{8V_{ripple(P-P)}}$	$\approx \frac{I_{OUT} t_{ON}}{V_{ripple}}$

$V_{SAT}$  = Saturation voltage of the output switch.

$V_F$  = Forward voltage drop of the ringback rectifier.

**Notes**

The following power supply characteristics must be chosen:

$V_{IN}$  – Nominal input voltage. If this voltage is not constant, then use  $V_{IN(MAX)}$  for step-down and  $V_{IN(MIN)}$  for step-up converter.

$$V_{OUT} - \text{Desired output voltage, } V_{OUT} = 1.25 \left( 1 + \frac{R_2}{R_1} \right).$$

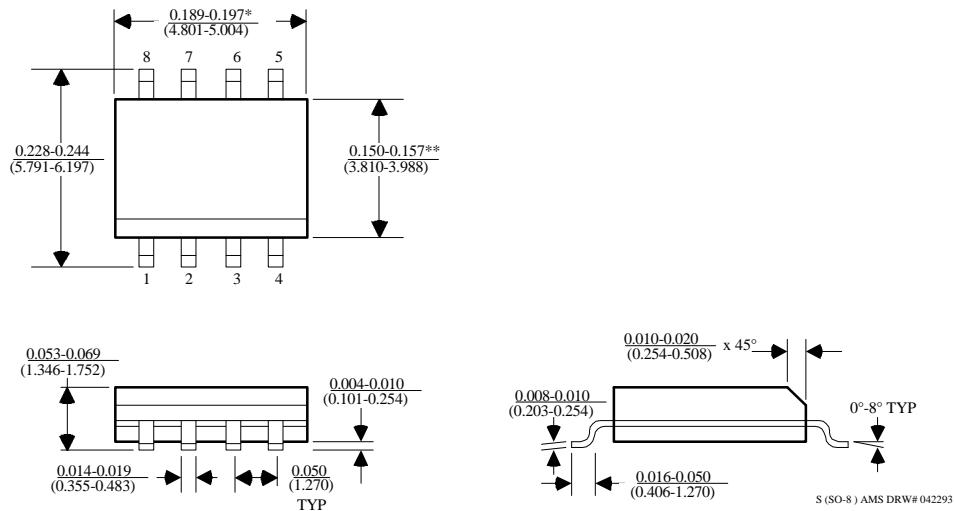

$I_{OUT}$  - Desired output current.

$f_{MIN}$  - Minimum desired output switching frequency at the selected values for  $V_{IN}$  and  $I_O$ .

$V_{ripple(P-P)}$  - Desired peak-to-peak output ripple voltage. In practice, the calculated value will need to be increased due to the capacitor's equivalent series resistance and board layout. The ripple voltage should be kept to a low value since it will directly effect the line and load regulation.
