- A. The value of R_{θJA} is measured with the device in a still air environment with T_A=25°C.
 B. The power dissipation P_D is based on T_{J(MAX)}=150°C, using junction-to-case thermal resistance, and is more useful in setting the upper dissipation limit for cases where additional heatsinking is used.
 C. Repetitive rating, pulse width limited by junction temperature T_{J(MAX)}=150°C. Ratings are based on low frequency and duty cycles to keep initial T_J=25°C.
 D. The R_{θJA} is the sum of the thermal impedance from junction to case R_{θJC} and case to ambient.
 E. The static characteristics in Figures 1 to 6 are obtained using <300 μs pulses, duty cycle 0.5% max.
 F. These curves are based on the junction-to-case thermal impedance which is measured with the device mounted to a large heatsink, assuming a maximum junction temperature of T_{J(MAX)}=150°C. The SOA curve provides a single pulse rating.
 G. L=60mH, I_{AS}=6.3A, V_{DD}=150V, R_G=25Ω, Starting T_J=25°C
