

PWM CONTROL 3A STEP-DOWN CONVERTER

FEATURES

- Input Voltage : 8V to 40V
- Output Voltage : 3.3V to 38V
- Duty Ratio : 0% to 100% PWM Control
- Oscillation Frequency Range is 50K~350KHz by Outside Resistance Setting
- Enable with Soft-Start Function
- Current Limit, Short Circuit Protect (SCP) and Thermal Shutdown Protection
- Built-in Internal SW P-channel MOS.
- ESOP-8 & PDIP-8 Pb-Free Package

DESCRIPTION

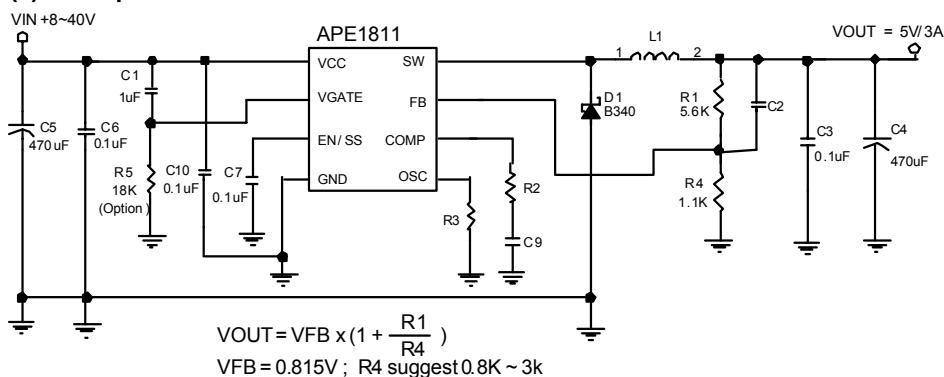

APE1811 consists of step-down switching regulator with PWM control. These devise include a reference voltage source, oscillation circuit, error amplifier, internal PMOS and etc.

APE1811 provides low-ripple power, high efficiency, and excellent transient characteristics. The PWM control circuit is able to the duty ratio linearly form 0 up to 100%. This converter is build out soft start function that prevents overshoot and inrush current at startup. An over current protect function and short circuit protect function are built inside, and when OCP or SCP happens, the operation frequency will be reduced. The operating frequency is decided by outside resistance. An external compensation is easily to system stable; the low ESR output capacitor can be used.

With the addition of an internal P-channel Power MOS, a coil, capacitors, and a diode connected externally, these ICs can function as step-down switching regulators. They serve as ideal power supply units for portable devices when coupled with the ESOP-8 packages, providing such outstanding features as low current consumption. Since this converter can accommodate an input voltage up to 40V, it is also suitable for the operation via an AC adapter.

PIN DESCRIPTIONS

PIN SYMBOL	PIN DESCRIPTION
V_{ss}	GND Pin
FB	Feedback Pin
EN/SS	ON/OFF Shutdown and Soft-start pin
SW	Switch Pin. Connect External Inductor & Diode here.
VGATE	Driver GATE clamping pin. The pin must connect a 1uF capacitor to VCC
V_{cc}	IC Power Supply Pin
COMP	Compensation pin
OSC	Frequency Set Pin. The pin connect a resistance to GND.

BLOCK DIAGRAM

FUNCTION DESCRIPTION

EN/SS

This pin can be supplied shutdown or soft start function. It is inside pull high function. For normal application, the pin must be connected a capacitor to ground. There is a 5uA current to charge this capacitor, vary the different capacitor value to control soft start time. Allow the switching regulator circuit to be shutdown pulling this pin below a 0.8V threshold voltage.

OSC

External frequency set pin. The pin connects a resistance (R3) to reduce system frequency. This converter's frequency can be set from 50K to 350KHz, please refer the below table to set frequency.

T=Room Temperature				
R3 (Ω)	10M	240K	110K	68K
Frequency (Hz)	52K	150K	250K	350K

COMP

Compensation pin. For EL output capacitor application, the COMP pin connects R2 and C9 to ground for all condition; please refer the compensation table.

APPLICATION INFORMATION

Setting the Output Voltage

Application circuit item shows the basic application circuit with adjustable output version. The external resistor sets the output voltage according to the following equation:

$$V_{out} = 0.815V \times \left(1 + \frac{R1}{R4}\right)$$

Table 1 Resistor select for output voltage setting

V _{OUT}	R4	R1
5V	1.1K	5.6K
3.3V	2.7K	8.2K

Inductor Selection

For most designs, the different frequency can be reducing the inductor value; The APE1811 is suggested 22 μ H to 100 μ H for 350K to 50KHz frequencies. Please refer the below table to design.

L1 recommend value ($V_{IN}=8\sim40V$, $V_{OUT}=5V$, $I_{OUT}=3A$)				
Frequency (Hz)	50K	150K	250K	350K
L1 Value (H)	100 μ H	68 μ H	33 μ H	22 μ H

Where is inductor Ripple Current. Large value inductors lower ripple current and small value inductors result in high ripple currents. Choose inductor ripple current approximately 20% of the maximum load current 3A, $\Delta I_L=0.6A$. The DC current rating of the inductor should be at least equal to the maximum load current plus half the ripple current to prevent core saturation (3A+0.3A).

Input Capacitor Selection

This capacitor should be located close to the IC using short leads and the voltage rating should be approximately 1.5 times the maximum input voltage. The RMS current rating requirement for the input capacitor of a buck regulator is approximately 1/2 the DC load current. A low ESR input capacitor sized for maximum RMS current must be used. A 470 μ F low ESR capacitor for most applications is sufficient.

Output Capacitor Selection

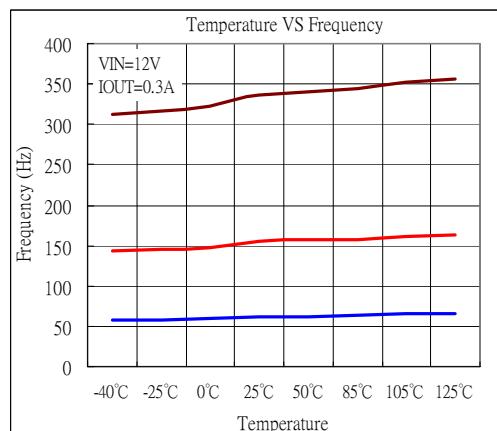

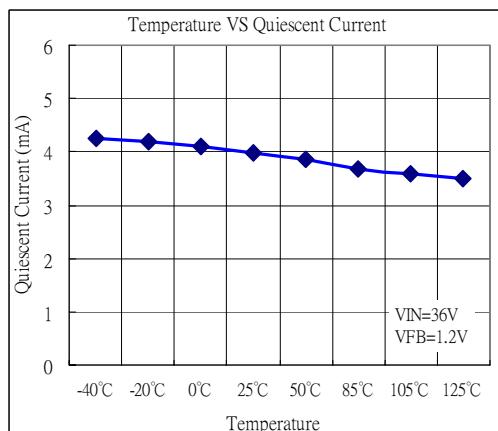

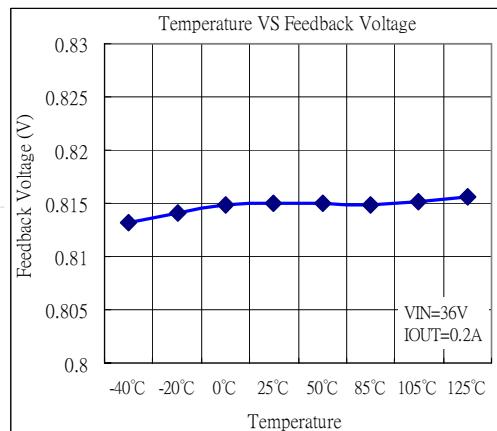

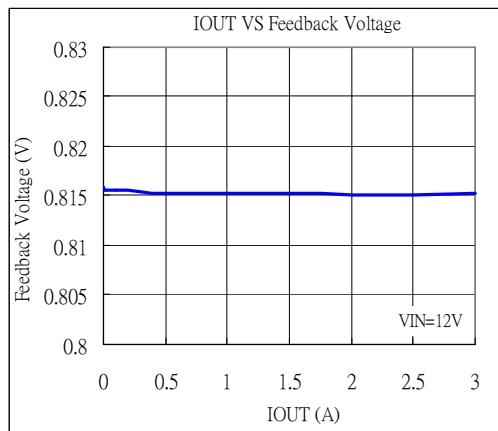

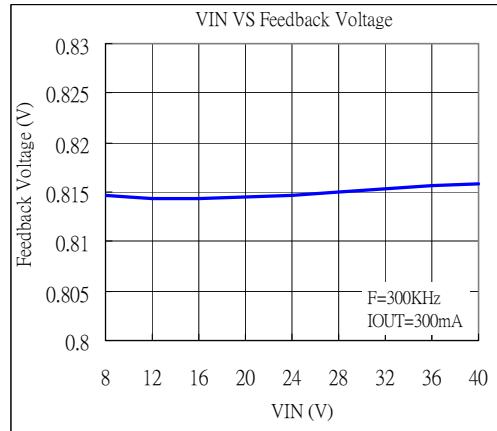

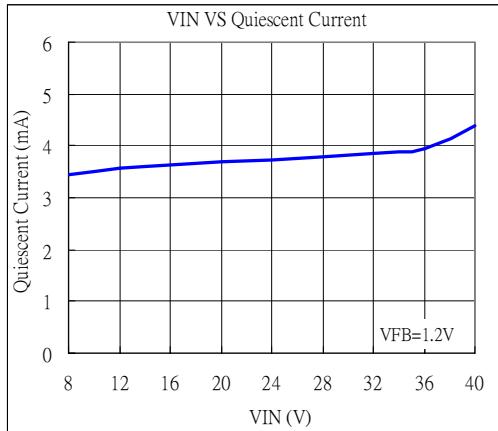

The output capacitor is required to filter the output and provide regulator loop stability. The important capacitor parameters are; the 100 KHz Equivalent Series Resistance (ESR), the RMS ripples current rating, voltage rating, and capacitance value. For the output capacitor, the ESR value is the most important parameter. The ESR can be calculated from the following formula.

$$V_{RIPPLE} = \Delta I_L \times ESR = 0.6A \times 80m\Omega = 48mV$$

An aluminum electrolytic capacitor's ESR value is related to the capacitance and its voltage rating. In most case, higher voltage electrolytic capacitors have lower ESR values. Most of the time, capacitors with much higher voltage ratings may be needed to provide the low ESR values required for low output ripple voltage. It is recommended to replace this low ESR capacitor by using a 470 μ F low ESR values <
