Ultra-Low On-Resistance, Power Load Switch with Soft Start

Features

- **Ultra-Low On-Resistance: 15mΩ(typical)**
- **Low Quiescent Current: 20μA(max)**
- **Soft Start Time Programmable by External Capacitor**
- **Wide Input Voltage Range (VIN): 0.8V to V_{DD}+0.3**
- **Supply Voltage Range (VDD): 3V to 5.5V**
- **Current Limit Protection**
- **Enable Input**
- **Output Discharge when Switch Disabled**
- **Over-Temperature Protection**
- **Tiny small WLCSP 1.2x0.8-6 Package**
- **Lead Free and Green Devices Available (RoHS Compliant)**

General Description

The APL3527 is an ultra-low on-resistance, power-distribution switch with external soft start control.

The device integrates some protection features, including current-limit protection and over-temperature protection. The current-limit protection can protect down stream devices from catastrophic failure by limiting the output current at current limit threshold during over-load or short-circuit events. The over temperature protection function shuts down the N-channel MOSFET power switch when the junction temperature rises beyond 150°C and will automatically turns on the power switch when the temperature drops by 30°C. The device is available in lead free WLCSP1.2x0.8-6 package.

Applications

- **Notebook**
- **AIO PC**

Note: ANPEC lead-free products contain molding compounds/die attach materials and 100% matte tin plate termination finish; which are fully compliant with RoHS. ANPEC lead-free products meet or exceed the lead-free requirements of IPC/JEDEC J-STD-020D for MSL classification at lead-free peak reflow temperature. ANPEC defines “Green” to mean lead-free (RoHS compliant) and halogen free (Br or Cl does not exceed 900ppm by weight in homogeneous material and total of Br and Cl does not exceed 1500ppm by weight).

Absolute Maximum Ratings (Note 1)

Symbol	Parameter	Rating	Unit
V_{DD}	VDD to GND Voltage	-0.3 ~ 6	V
V_{IN}	VIN to GND Voltage	-0.3 ~ 6	V
V_{OUT}	VOUT to GND Voltage	-0.3 ~ 6	V
V_{EN}, V_{ENB}	EN, ENB to GND Voltage	-0.3 ~ 6	V
I_{OUT}	Continuous Output Current	Internally Limited	A
T_J	Maximum Junction Temperature	-40 ~ 150	°C
T_{STG}	Storage Temperature	-65 ~ 150	°C
T_{SDR}	Maximum Lead Soldering Temperature (10 Seconds)	260	°C

Note1: Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability

Thermal Characteristics

Symbol	Parameter	Typical Value	Unit
θ_{JA}	Junction-to-Ambient Thermal Resistance in free air (Note 2) WLCSP1.2X0.8-6	100	°C/W

Note 2: θ_{JA} is measured with the component mounted on a high effective thermal conductivity test board in free air.

Recommended Operating Conditions (Note 3)

Symbol	Parameter		Range	Unit
V_{DD}	VDD Input Voltage ($V_{DD} \geq V_{IN}$)		3.0 ~ 5.5	V
V_{IN}	VIN Input Voltage		0.8 ~ V_{DD}+0.3	V
I_{OUT}	VOUT Output Current	APL3527A/D	0 ~ 1.5	A
		APL3527B/E	0 ~ 1	A
		APL3527C/F	0 ~ 0.5	A
		APL3527G/H	0 ~ 3	A
V_{IH}	EN Logic High Input Voltage		0.9 ~ 5.5	V
V_{IL}	ENB Logic Low Input Voltage		0 ~ 0.3	V
C_{SS}	Soft-Start Capacitor		0 ~ 100	nF
T_A	Ambient Temperature		-40 ~ 85	°C
T_J	Junction Temperature		-40 ~ 125	°C

Note 3: Please refer to the typical application circuit.

Electrical Characteristics

Unless otherwise specified, these specifications apply over V_{IN}= 5V, V_{DD} =5V, V_{EN} =5V (or V_{ENB}=0V) and T_A= -40~85°C. Typical values are at T_A=25°C.

Pin Description

PIN		Function
NO.	NAME	
C1	VDD	VDD voltage input pin for internal control circuitry.
B1	EN	Enable input of switch. Logic high turns on switch. The EN pin cannot be left floating.
	ENB	Enable input of switch. Logic low turns on switch. The ENB pin cannot be left floating.
A1	VIN	Power supply Input of switch. Connect this pin to an external DC supply.
A2	VOUT	Switch output.
B2	GND	Ground pin of the circuitry. All voltage levels are measured with respect to this pin.
C2	SS	Soft start control of switch. A capacitor from this pin to ground sets the VOUT's rise slew rate.

2200	2.286	2.301
4700	2.536	2.696
10000	3.008	3.430

Note 4: The table Contains soft-start time values and turn on delay time values measured on a typical device. The soft-start times (t_R) and turn on delay times (t_D) shown are only valid for the power up sequence where V_{IN} and V_{DD} are already in steady state condition, and EN or ENB pin is asserted high or low.

Function Description

VIN Under-voltage Lockout (UVLO)

A under-voltage lockout (UVLO) circuit monitors the VDD pins voltage to prevent wrong logic controls. The UVLO function initiates a soft-start process after the VDD supply voltages exceed rising UVLO voltage threshold during powering on.

Current-Limit Protection

The APL3527 power switch provides the current-limit protection function. During current-limit, the devices limit output current at current-limit threshold. For reliable operation, the device should not be operated in current limit for extended period time.

Soft-Start

The APL3527 has a dedicated enable pin (EN or ENB). A logic low (EN) or high (ENB) signal applied to this pin shuts down the output. Following a shutdown, a logic high signal re-enables the output through initiation of a new soft-start cycle.

Over-Temperature Protection

When the junction temperature exceeds 150°C, the internal thermal sense circuit turns off the power FET and allows the device to cool down. When the device¡¦s junction temperature cools by 30°C, the internal thermal sense circuit will enable the device, resulting in a pulsed output during continuous thermal protection. Thermal protection is designed to protect the IC in the event of over temperature conditions. For normal operation, the junction temperature cannot exceed T_J=+125°C.

Application Information

Input Capacitor

A 1µF or higher ceramic bypass capacitor from VIN to GND, located near the APL3527, is strongly recommended to suppress the ringing during short circuit fault event.

When the load current trips the current limit threshold in an over load condition such as a short circuit, hot plug-in or heavy load transient the IC immediately turns off the internal power switch that will cause VIN ringing due to the inductance between power source and VIN. Without the bypass capacitor, the output short may cause sufficient ringing on the input to damage internal control circuitry.

Input capacitor is especially important to prevent V_{IN} from ringing too high in some applications where the inductance between power source to VIN is large (ex, an extra bead is added between power source line to VIN for EMI reduction), additional input capacitance may be needed on the input to reduce voltage overshoot from exceeding the absolute maximum voltage of the device during over load conditions.

The recommended output capacitance of VOUT is 1µF at least. Please place the capacitors near the APL3527 as close as possible.

A bulk output capacitors, placed close to the load, is recommended to support load transient current.

Power Switch

The power switch is an N-channel MOSFET with a ultra-low $R_{DS(ON)}$. When IC is in shutdown state, the internal parasitic diodes connected from VOUT to VIN will be forward biased.

Thermal Consideration

The APL3527 maximum power dissipation depends on the differences of the thermal resistance and temperature between junction and ambient air. The power dissipation P_D across the device is:

$$P_D = (T_J - T_A) / \theta_{JA}$$

where (T_J-T_A) is the temperature difference between the junction and ambient air. θ_{JA} is the thermal resistance between junction and ambient air. Assuming the T_A=25°C and maximum T_J=150°C (typical thermal limit threshold), the maximum power dissipation is calculated as:

$P_{D(max)}$=(150-25)/100

= 1.25(W)

For normal operation, do not exceed the maximum operating junction temperature of T_J = 125°C. The calculated power dissipation should be less than:

P_D =(125-25)/100

=1(W).....T_A=25°C

P_D =(125-85)/100

=0.4(W).....T_A=85°C

The power dissipation depends on operating ambient temperature for fixed T_J=125°C and thermal resistance θ_{JA}. For APL3527 packages, the Figure 2 of derating curves allows the designer to see the effect of rising ambient temperature on the maximum power allowed.

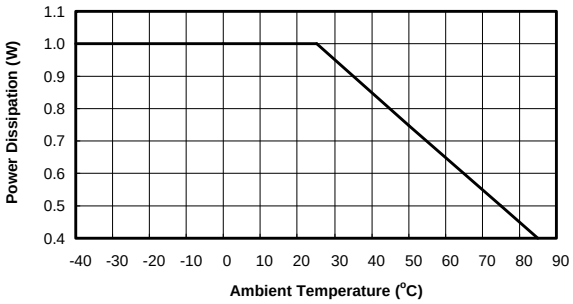

Figure 2. Derating Curves for APL3527 Package
