

# AR8035 Integrated 10/100/1000 Mbps Ethernet Transceiver

### **General Description**

the MAC.™

The AR8035 is part of the Arctic family of devices - which includes the AR8031, AR8033, and the AR8035. It is Atheros' 4<sup>th</sup> generation, single port 10/100/1000 Mbps Tri-speed Ethernet PHY. It supports RGMII interface to

The AR8035 provides a low power, low BOM (Bill of Materials) cost solution for comprehensive applications including consumer, enterprise, carrier and home networks such as PC, HDTV, Gaming machines, Blue-ray players, IPTV STB, Media Players, IP Cameras, NAS, Printers, Digital Photo Frames, MoCA/Homeplug (Powerline)/EoC/ adapters and Home Router & Gateways, etc.

The AR8035 integrates Atheros latest Green Ethos<sup>®</sup> power saving technologies and significantly saves power not only during work time, but also during overtime. Atheros Green Ethos<sup>®</sup> power savings include ultra-low power in cable unplugged mode or port power down mode, and automatic optimized power saving based on cable length. Furthermore, the AR8035 supports Wake-on-LAN (WoL) feature to be able to help manage and regulate total system power requirements.

The AR8035 embeds CDT (Cable Diagnostics Test) technology on-chip which allows customers to measure cable length, detect the cable status, and identify remote and local PHY malfunctions, bad or marginal patch cord segments or connectors. Some of the possible problems that can be detected include opens, shorts, cable impedance mismatch, bad connectors, termination mismatch, and a bad transformer.

The AR8035 also integrates a voltage regulator on chip. It reduces the termination R/C circuitry on both the MAC interface (RGMII) and line side.

The AR8035 supports IEEE 802.3az Energy Efficient Ethernet (EEE) standard and Atheros proprietary SmartEEE, which allows legacy MAC/SoC devices without 802.3az support to function as the complete 802.3az system. The key features supported by the device are:

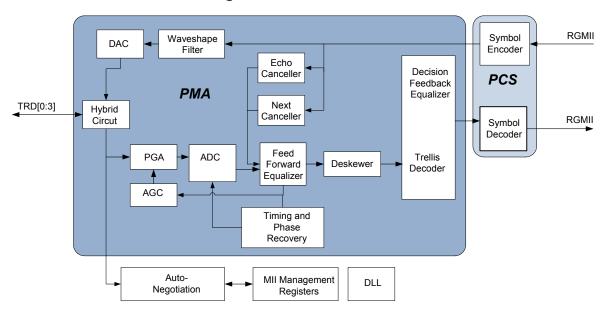

- 10BASE-Te PHY supports reduced transmit amplitude.
- 100BASE-TX and 1000BASE-T use Low Power Idle (LPI) mode to turn off unused analog and digital blocks to save power while data traffic is in idle.

#### Features

- 10BASE-Te/100BASE-TX/1000 BASE-T IEEE 802.3 compliant
- Supports 1000 BASE-T PCS and autonegotiation with next page support
- Supports RGMII interface to MAC devices with a broad I/O voltage level options including 2.5V, 1.8V and 1.5V, and is compatible with 3.3V I/O
- RGMII timing modes support internal delay and external delay on Rx path
- Error-free operation up to 140 meters of CAT5 cable
- Supports Atheros latest Green Ethos<sup>®</sup> power saving modes with internal automatic DSP power saving scheme
- Supports 802.3az (Energy Efficient Ethernet)
- Fully integrated digital adaptive equalizers, echo cancellers, and near end crosstalk (NEXT) cancellers
- Supports Wake-on-LAN (WoL) to detect magic packet and notify the sleeping system to wake up
- A robust Cable Discharge Event (CDE) tolerance of ± 6kV
- A robust surge protection with ±750V/ differential mode and ±4KV/common mode
- Jumbo Frame support up to 10KB (full duplex)
- All digital baseline wander correction
- Automatic channel swap (ACS)
- Automatic MDI/MDIX crossover
- Automatic polarity correction
- IEEE 802.3u compliant Auto-Negotiation
- Software programmable LED modes
- Multiple Loopback modes for diagnostics

## 1. Pin Descriptions

This section contains a package pinout for the AR8035 QFN 40 pin and a listing of the signal descriptions (see Figure 1-1).

The following nomenclature is used for signal names:

Table 1-1.

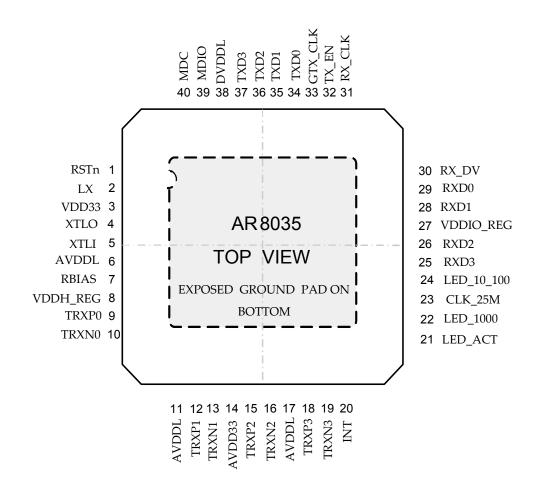

| No connection to the internal die is made from this pin                                   |
|-------------------------------------------------------------------------------------------|
| At the end of the signal name, indicates active low signals                               |
| At the end of the signal name,<br>indicates the positive side of a<br>differential signal |
| At the end of the signal name<br>indicates he negative side of a<br>differential signal   |
|                                                                                           |

The following nomenclature is used for signal types described in Table 1-1:

Table 1-2.

- D Open drain
- IA Analog input signal
- I Digital input signal
- IH Input signals with weak internal pull-up, to prevent signals from floating when left open
- IL Input signals with weak internal pull-down, to prevent signals from floating when left open
- I/O A digital bidirectional signal
- OA An analog output signal
- O A digital output signal
- P A power or ground signal
- PD Internal pull-down for input
- PU Internal pull-up for input

Figure 1-1 shows the pinout diagram for the AR8035.

#### Figure 1-1. Pinout Diagram

**NOTE:** There is an exposed ground pad on the back side of the package.

#### Table 1-3.

| Symbol             | Pin       | Туре       | Description                                                                                                                                                                   |  |

| RX_CLK   | 1.8V/1.5V                        | Select the RGMII/RMII I/O voltage level<br>1: 1.8V I/O<br>0: 1.5V I/O                                           | 0                                                     |

#### **NOTE:** 0=Pull-down, 1=Pull-up

**NOTE:** Power on strapping pins are latched during power-up reset or warm hardware reset.

**NOTE:** Some MAC devices input pins may drive high/low during power-up or reset. So PHY power on strapping status may be affected by the MAC side. In this case an external  $10k\Omega$  pulldown or pull-high resistor is needed to ensure a stable expected status.

**NOTE:** When using 2.5V RGMII I/O voltage level, RX\_CLK can be pull-up or pull-down.

Table 1-5.

| MODE[3:0] | Description         |
|-----------|---------------------|
| 1100      | RGMII, PLLOFF, INT; |
| 1110      | RGMII, PLLON, INT;  |
| Others    | Reserved            |

**NOTE:** PLLOFF means AR8035 can shut down internal PLL in power saving mode; In PLLOFF mode, when the AR8035 enters power saving mode (hibernation), CLK\_25m output drops periodically, which saves more power. In PLLON mode, CLK\_25M outputs continuously.

# 2. Functional Description

The AR8035 is Atheros's low cost GbE PHY. It is a highly integrated analog front end (AFE) and digital signal transceiver, providing high performance combined with substantial cost reduction. The AR8035 provides physical layer functions for half/full -duplex 10 BASE-Te, 100 BASE-Tx and 1000 BASE-T Ethernet to transmit and receive high-speed data over standard category 5 (CAT5) unshielded twisted pair cable.

The AR8035 10/100/1000 PHY is fully 802.3ab compliant, and supports the reduced Gigabit

Media-Independent Interface (RGMII) to connect to a Gigabit-capable MAC.

The AR8035 transceiver combines echo canceller, near end cross talk (NEXT) canceller, feed-forward equalizer, joint Viterbi, feedback equalizer, and timing recovery, to enhance signal performance in noisy environments.

The AR8035 is a part of the Arctic family of devices — which includes the AR8031, the AR8033, and the AR8035. A comparison of these is shown below.

Table 2-1 shows a feature comparison across the AR8031, AR8033, and AR8035 family.

| Feature                   | AR8031 | AR8033 | AR8035 |
|---------------------------|--------|--------|--------|
| RGMII                     | yes    | yes    | yes    |
| SGMII                     | yes    | yes    |        |
| Cu Ethernet <sup>**</sup> | yes    | yes    | yes    |
| EEE (802.3az)             | yes    | yes    | yes    |
| Wake-on-LAN               | yes    | yes    | yes    |
| SERDES/Fiber              | yes*** | yes*** |        |
| 1588v2                    | yes    |        |        |
| Sync-E                    | yes    | yes    |        |
| Packaging                 | 48-pin | 48-pin | 40-pin |

Table 2-1. AR8031, AR8033, AR8035 Comparison

NOTE: AR8031, AR8033 is pin-to-pin compatible

NOTE: \*\* 10BASE-Te, 100BASE-TX, 1000BASE-T will be supported

NOTE: \*\*\* 100BASE-FX, and 1000BASE-X will be supported

#### 2.1 Transmit Functions

Table 2-2 describes the transmit function encoder modes.

#### Table 2-2. Encoder Mode

| Encoder Mode | Description                                                                                                                                                                                              |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1000 BASE-T  | In 1000 BASE-T mode, the AR8035<br>scrambles transmit data bytes<br>from the MAC interfaces to 9-bit<br>symbols and encodes them into<br>4D five-level PAM signals over the<br>four pairs of CAT5 cable. |
| 100 BASE-TX  | In 100 BASE-TX mode, 4-bit data<br>from the MII is 4B/5B serialized,<br>scrambled, and encoded to a<br>three-level MLT3 sequence<br>transmitted by the PMA.                                              |
| 10 BASE-Te   | In 10 BASE-Te mode, the AR8035<br>transmits and receives<br>Manchester-encoded data.                                                                                                                     |

#### 2.2 Receive Functions

#### 2.2.1 Decoder Modes

Table 2-3 describes the receive functiondecoder modes.

#### Table 2-3. Decoder Mode

| Decoder Mode | Description                                                                                                                                                                                                                                                                                                                                                                         |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1000 BASE-T  | In 1000 BASE-T mode, the PMA<br>recovers the 4D PAM signals after<br>accounting for the cabling<br>conditions such as skew among<br>the four pairs, the pair swap order,<br>and the polarity of the pairs. The<br>resulting code group is decoded<br>into 8-bit data values. Data stream<br>delimeters are translated<br>appropriately and data is output<br>to the MAC interfaces. |
| 100 BASE-TX  | In 100 BASE-TX mode, the receive<br>data stream is recovered and<br>descrambled to align to the<br>symbol boundaries. The aligned<br>data is then parallelized and 5B/<br>4B decoded to 4-bit data. This<br>output runs to the MII receive<br>data pins after data stream<br>delimiters have been translated.                                                                       |
| 10 BASE-Te   | In 10 BASE-Te mode, the<br>recovered 10 BASE-Te signal is<br>decoded from Manchester then<br>aligned.                                                                                                                                                                                                                                                                               |

#### 2.2.2 Analog to Digital Converter

The AR8035 device employs an advanced high speed ADC on each receive channel with high resolution, which results in better SNR and lower error rates.

#### 2.2.3 Echo Canceller

A hybrid circuit is used to transmit and receive simultaneously on each pair. A signal reflects back as an echo if the transmitter is not perfectly matched to the line. Other connector or cable imperfections, such as patch panel discontinuity and variations in cable impedance along the twisted pair cable, also result in drastic SNR degradation on the receive signal. The AR8035 device implements a digital echo canceller to adjust for echo and is adaptive to compensate for the varied channel conditions.

#### 2.2.4 NEXT Canceller

The 1000 BASE-T physical layer uses all four pairs of wires to transmit data. Because the four twisted pairs are bundled together, significant high frequency crosstalk occurs between adjacent pairs in the bundle. The AR8035 device uses three parallel NEXT cancellers on each receive channel to cancel high frequency crosstalk. The AR8035 cancels NEXT by subtracting an estimate of these signals from the equalizer output.

#### 2.2.5 Baseline Wander Canceller

Baseline wander results from Ethernet links that AC-couple to the transceivers and from AC coupling that cannot maintain voltage levels for longer than a short time. As a result, transmitted pulses are distorted, resulting in erroneous sampled values for affected pulses. Baseline wander is more problematic in the 1000 BASE-T environment than in 100 BASE-TX due to the DC baseline shift in the transmit and receive signals. The AR8035 device uses an advanced baseline wander cancellation circuit that continuously monitors and compensates for this effect, minimizing the impact of DC baseline shift on the overall error rate.

#### 2.2.6 Digital Adaptive Equalizer

The digital adaptive equalizer removes intersymbol interference at the receiver. The digital adaptive equalizer takes unequalized signals from ADC output and uses a combination of feedforward equalizer (FFE) and decision feedback equalizer (DFE) for the bestoptimized signal-to-noise (SNR) ratio.

#### 2.2.7 Auto-Negotiation

The AR8035 device supports 10/100/1000 BASE-T Copper auto-negotiation in accordance with IEEE 802.3 clauses 28 and 40. Autonegotiation provides a mechanism for transferring information between a pair of link partners to choose the best possible mode of operation in terms of speed, duplex modes, and master/slave preference. Auto-negotiation is initiated upon any of the following scenarios:

- Power-up reset
- Hardware reset
- Software reset
- Auto-negotiation restart
- Transition from power-down to power-up
   The link area down
- The link goes down

If auto-negotiation is disabled, a 10 BASE-Te or 100 BASE-TX can be manually selected using the IEEE MII registers.

#### 2.2.8 Smartspeed Function

The Atheros Smartspeed function is an enhanced feature of auto-negotiation that allows the AR8035 device to fall back in speed based on cabling conditions as well as operate over CAT3 cabling (in 10 BASE-T mode) or two-pair CAT5 cabling (in 100 BASE-TX mode).

By default, the Smartspeed feature is enabled. Refer to the register "Smart Speed" on page 47, which describes how to set the parameters. Set these register bits to control the Smartspeed feature:

- Bit [5]: 1 = Enables Smartspeed (default)
- Bits [4:2]: Sets the number of link attempts before adjusting
- Bit [1]: Timer to determine the stable link condition

#### 2.2.9 Automatic MDI/MDIX Crossover

During auto-negotiation, the AR8035 device automatically determines and sets the required MDI configuration, eliminating the need for external crossover cable. If the remote device also implements automatic MDI crossover, the crossover algorithm as described in IEEE 802.3 clause 40.4.4 ensures that only one device performs the required crossover.

#### 2.2.10 Polarity Correction

If cabling has been incorrectly wired, the AR8035 automatically corrects polarity errors

on the receive pairs in 1000 BASE-T, 100 BASE-TX and 10 BASE-Te modes.

#### 2.3 Loopback Modes

#### 2.3.1 Digital Loopback

Digital loopback provides the ability to loop transmitted data back to the receiver using digital circuitry in the AR8035 device. Figure 2-1 shows a block diagram of a digital loopback.

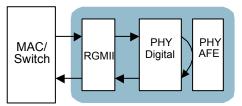

Figure 2-1. Digital Loopback

- 1000M loopback: write register 0x0 = 0x4140 to enable 1000M digital loopback.
- 100M loopback: write register 0x0 = 0x6100 to enable 100M digital loopback.
- 10M loopback: write register 0x0 = 0x4100 to enable 10M digital loopback.

#### 2.3.2 External Cable Loopback

External cable loopback loops Tx to Rx through a complete digital and analog path and an external cable, thus testing all the digital data paths and all the analog circuits. Figure 2-2 shows a block diagram of external cable loopback.

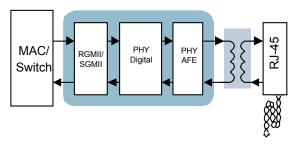

Figure 2-2. External Cable Loopback

- 1. Plug in an external loopback cable (1-3/2-6/ 4-7/5-8)
- 2. Write debug register 0xB[15] = 0 to disable hibernate (power-saving mode)
- 3. Write debug register 0x11[0] = 1 to enable external loopback
- 4. Select wire speed, as follows:

- 1000M loopback: write register 0x0 = 0x8140 to set 1000M external loopback
- 100M loopback: write register 0x0 = 0xA100 to set 100M external loopback
- 10M loopback: write register 0x0 = 0x0x8100 to set 10M external loopback
- 5. When the cable in 1000M mode is replugged, need to write 0x0 = 0x8140 again to make the PHY link.

#### 2.3.3 Remote PHY Loopback

The Remote loopback connects the MDI receive path to the MDI transmit path, near the RGMII interface, thus the remote link partner can detect the connectivity in the resulting loop. Figure 2-3, below, shows the path of the remote loopback.

Figure 2-3 shows a block diagram of external cable loopback.

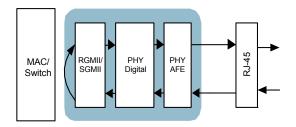

Figure 2-3. Remote PHY Loopback

Write MMD3 register 0x805A[0]= 1 to enable remote PHY loopback.

**Please note**: The packets from link partner will still appear at RGMII interface when remote loopback is enabled.

Also, remote loopback is independent of PHY auto-negotiation.

#### 2.4 Cable Diagnostic Test

The Cable Diagnostic Test (CDT) feature in the AR8035 device uses Time Domain Reflectometry (TDR) to identify remote and local PHY malfunctions, bad/marginal cable or patch cord segments, or connectors. Some of the possible problems that can be diagnosed include opens, shorts, cable impedance mismatch, bad connectors, termination mismatch, and bad magnetics. The CDT can be performed when there is no link partner or when the link partner is auto-negotiating.

1. Set register 0x16[9:8] to select MDI pair under test

- 2. Write register 0x16[0]=1 to enable CDT
- 3. Check register 0x1C[9:8] for fail status
- 4. Check register 0x1C[7:0] to get delta time. The distance between the fail point and PHY is delta time \*0.842

#### 2.5 LED Interface

The LED interface can either be controlled by the PHY or controlled manually, independent of the state of the PHY. Three status LEDs are available. These can be used to indicate operation speed, duplex mode, and link status. The LEDs can be programmed to different status functions from their default value. They can also be controlled directly from the MII register interface.

The reference design schematics for the AR8035's LEDs are shown

Figure 2-4 Reference Design Schematic — Active Low

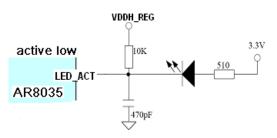

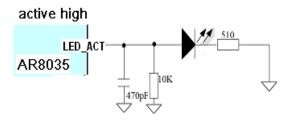

Figure 2-5 Reference Design Schematic — Active High

# Figure 2-5. Reference Design Schematic — Active High

LED\_ACT/LED\_1000 active states depend on power on strapping mode.

When strapped high, active low. When strapped low, active high.

LED\_10\_100 depends on LED\_1000 power on strapping mode.

| Table | 2-4. | LED | Status |
|-------|------|-----|--------|
|-------|------|-----|--------|

So LED\_10\_100 and LED\_1000 should have the same LED design.

| Symbol     | 10M Link | 10M Active | 100M Link | 100M Active | 1000M Link | 1000M Active |
|------------|----------|------------|-----------|-------------|------------|--------------|
| LED_10_100 | OFF      | OFF        | ON        | ON          | OFF        | OFF          |
| LED_1000   | OFF      | OFF        | OFF       | OFF         | ON         | ON           |
| LED_ACT    | ON       | BLINK      | ON        | BLINK       | ON         | BLINK        |

**NOTE:** Notes: on = active; off = inactive

#### 2.6 Power Supplies

The AR8035 device requires only one external power supply: 3.3 V.

Inside the chip there is a 3.3V rail, 2.5V rail, 1.1V rail and a 1.8V/1.5V rail.

AR8035 integrates a switch regulator which converts 3.3V to 1.1V at a high-efficiency for core power rail. (It is optional for an external regulator to provide this core voltage).

The AR8035 integrates two on chip LDOs which can support 2.5V; 1.5V/1.8V RGMII I/O

Figure 2-6 shows the AR8035 reference design for a 2.5V RGMII voltage level.

voltage. Also with 2.5V RGMII I/O voltage configuration AR8035 can work with a 3.3V MAC RGMII interface — because the input can bear 3.3V logic signal, and the output logic VoH and VoL can satisfy the 3.3V LVCMOS/ LVTTL requirement. The parameter details are in the Electrical Characteristics chapter.

Reference design for 2.5V RGMII voltage level is shown below:

0.1uF LX DVD 4.7uH VDD33 VDDIO REG 0.1uF 10uF Arctic  $\overline{+}$ ᅳ 2.5V Bead 10uF0.1uF 0.1uF AVDDL **RGMII** 0.1uF Ţ VDDH REG Ţ 1uF <u>AVDD33</u> AVDD AVDD 0.1uF 0.1uF 3.3V input 0.1uF Bead 1uF

Figure 2-6. AR8035 reference design for a 2.5V RGMII voltage level

Reference design for 1.5/1.8V RGMII voltage level is shown below:

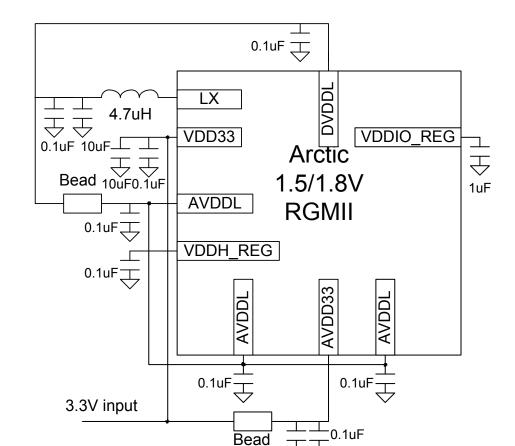

Figure 2-7 shows the AR8035 reference design for a 1.5/1.8V RGMII voltage level.

1uF

#### 2.7 Management Interface

The AR8035 integrates an MDC/MDIO management interface which is compliant with IEEE802.3u clause 22.

MDC is an input clock reference provided by the MAC.

MDIO is the management data input/output bi-directional signal that runs synchronously to MDC.

MDIO is an OD-gate, needs an external 1.5k pull-up resistor.

Definition of the management frame is shown below.

Figure 2-8 shows the AR8035 Management frame fields.

|       | Management frame fields |    |    |       |       |    |                  |      |
|-------|-------------------------|----|----|-------|-------|----|------------------|------|
|       | PRE                     | ST | OP | PHYAD | REGAD | TA | DATA             | IDLE |
| READ  | 11                      | 01 | 10 | AAAAA | RRRRR | Z0 | DDDDDDDDDDDDDDDD | Ζ    |
| WRITE | 11                      | 01 | 01 | AAAAA | RRRRR | 10 | DDDDDDDDDDDDDDDD | Z    |

- 1. PRE is a sequence of 32 contiguous logic one bits on MDIO with 32 corresponding cycles on MDC to provide the PHY with a pattern that it can use to establish synchronization.
- 2. ST is start of frame
- 3. OP is the operation code. The operation code for a read transaction is <10>, while the operation code for a write transaction is <01>.
- 4. PHYAD is 5 bits PHY address. PHY address of AR8035 is configured by power on strapping. There are three address bits can be configured in AR8035 which means 8 PHYs can be connected to the same management interface. Each PHY connected to the same bus line should have a unique PHY address. The first PHY address bit transmitted and received is the MSB of the address.
- 5. The Register Address is five bits, allowing 32 individual registers to be addressed within each PHY. The first Register Address bit transmitted and received is the MSB of the address.
- 6. TA is 2 bits to avoid contention during a read operation. For a read operation, both the MAC and PHY shall remain in a high-impedance state for the first bit time. The PHY shall drive a zero during the second bit time of the turnaround. During a write transaction, the MAC must drive 10.
- 7. Data is the 16 bits data from accessed register. MSB is transmitted first.
- 8. Idle is a high-impedance without driving state of the MDIO. At least one clocked idle state is required between frames.

There are three kinds of registers in AR8035. All can be accessed using the management frames.

- 1. IEEE defined 32 MII registers.
- 2. Atheros defined Debug registers.
- 3. IEEE defined MDIO Manageable Device (MMD) register

MII register can be access directly through the frame defined above.

Debug register access:

- 1. Write the debug offset address to 0x1D
- 2. Read/ Write the data from/to 0x1E

MMD register access:

See detail in register description

example: Write 0x8000 to Register 0 of MMD3

- 1. Write 0x3 to register 0xD: 0xD=0x0003; (function= address; set the device address)
- 2. Write 0x0 to register 0xE: 0xE=0x0; (set the register offset address)
- 3. Write 0x4003 to register 0xD:0xD=0x4003; (function = data; keep the device address)
- 4. Read register 0xE:0xE==(data from register 0x0 of MMD3)
- 5. Write 0x8000 to register 0xE:0xE = 0x8000 (write 0x8000 to register 0x0 of MMD3)

**NOTE:** Read operation please refers to process  $1 \sim 4$ 

#### 2.8 Atheros Green Ethos®

#### 2.8.1 Low Power Modes

The AR8035 device supports the software power-down low power mode. The standard IEEE power-down mode is entered by setting the POWER\_DOWN bit (bit [11]) of the register "Control" equal to one. In this mode, the AR8035 ignores all MAC interface signals except the MDC/MDIO. It does not respond to any activity on the CAT 5 cable. The AR8035 cannot wake up on its own. It can only wake up by setting the POWER\_DOWN bit of the "Control" register to 0, or a Hardware Reset See Table 4.1.1 on page 32.

#### 2.8.2 Shorter Cable Power Mode

With Atheros latest proprietary Green Ethos<sup>®</sup> power saving technology, the AR8035 can attain an additional 25% power savings when a cable length is detected that is < 30M vs. standard power consumption for a 100M Cat5 cable. The equals and additional 100mW power savings and less than 350mW total power for 1000BASE-T mode in a typical home application.

#### 2.8.3 Hibernation Mode

The AR8035 supports hibernation mode. When the cable is unplugged, the AR8035 will enter hibernation mode after about 10 seconds. The power consumption in this mode can go as low as 10mW only when compared to the normal mode of operation. When the cable is reconnected, the AR8035 wakes up and normal functioning is restored.

#### 2.9 IEEE 802.3az and Energy Efficient Ethernet

IEEE 802.3az provides a mechanism to greatly save the power consumption between data packets bursts. The link partners enter Low Power Idle state by sending short refresh signals to maintain the link.

There are two operating states, Active state for normal data transfer, and Low-power state between the data packet bursts.

In the low-power state, PHY shuts off most of the analog and digital blocks to reserve energy. Due to the bursty traffic nature of Ethernet, system will stay in low-power mode in the most of time, thus the power saving can be more than 90%.

At the link start up, both link partners exchange information via auto negotiation to Figure 2-9 shows the 802.3az operating states for the AR8035.

determine if both parties are capable of entering LPI mode.

Legacy Ethernet products are supported, and this is made transparent to the user.

#### 2.9.1 IEEE 802.3az LPI Mode

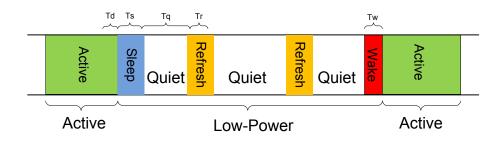

AR8035 works in the following modes when 802.3 az feature is turned on:

- Active: the regular mode to transfer data
- Sleep: send special signal to inform remote link of entry into low-power state
- Quiet: No signal transmitted on media, most of the analog and digital blocks are turned off to reduce energy.
- Refresh: send periodically special training signal to maintain timing recovery and equalizer coefficients
- Wake: send special wake-up signal to remote link to inform of the entry back into Active.

| Operatir                                  | ng States                                                                                                              |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------|
| Active                                    | Existing state used for data transmission.<br>Data packets or IPG/Idle symbols are<br>transmitted                      |
| Sieep<br>Quiet Refresh<br>Quiet Low-Power | New state used during periods of no data<br>transmission to allow system power<br>reduction between data packet bursts |

Figure 2-9. Operating States — 802.3az LPI Mode

Figure 2-10 shows the 802.3az operating power modes — 802.3az for the AR8035.

The AR8035 supports both 100BASE-TX EEE and 1000BASE-T EEE.

100BASE-TX EEE allows asymmetrical operation, which allows each link partner to enter the LPI mode independent of the other partner.

1000BASE-T EEE requires symmetrical operation, which means that both link partners must enter the LPI mode simultaneously.

#### 2.10 Atheros SmartEEE

AR8035 SmartEEE is compatible with normal 802.3az standard. It helps legacy MAC without EEE ability to work as a complete EEE power saving system.

AR8035 SmartEEE will detect egress data flow, if there are no packets to transfer after a defined time which are configurable based on system design, it will enter EEE mode. If there are packets need to transfer, AR8035 will wait typically 16.5us to wake up as 802.3az defined and send out data after the timer configuration in register. It provides a 2048\*20bit buffer for egress data before waking up to ensure no packet loss.

AR8035 default mode enables smart EEE after power on or hardware reset.

Working in smartEEE, AR8035 RX side will not generate MDI LPI pattern. So only normal packets and idle packets will appear on the RGMII interface. There is no TX LPI pattern at all if MAC has no EEE capability. LPI is generated inside PHY according to smartEEE mechanism.

If the MAC has EEE capability, can write SmartEEE control register to bypass SmartEEE function. Please Note:

- 1. Wait time before entering EEE mode is in register MMD3 0x805c,0x805d[7:0];
- 2. Adjustable wait time before sending out data is in register MMD3 0x805b, To cooperate with link partner for special requirement.

#### 2.11 Wake On LAN (WoL)

Originally Wake-on-LAN (WoL) was an Ethernet networking standard that allowed a computer to be turned on (or woken up) by a network message for administrator attention, etc. However as part of the latest industry trend towards energy savings, WoL gets wide interest to be adopted across networking systems as a mechanism to help to manage and regulate the total power consumed by the network. The AR8035 supports Wake-on-LAN (WoL):

- Able to enter the sleep/isolate state (PHY's all TX bus (including clock) are in High-Z state, but PHY can still receive packets) by ISOLATE bit in MII register configuration
- Consumes less than 50mW when in sleep/ isolate mode
- Supports automatic detection of magic packets (a specific frame containing anywhere within its payload: 6 bytes of ones (resulting in hexadecimal FF FF FF FF FF), followed by sixteen repetitions of the target computer's MAC address) and notification via hardware interrupt.
- Supports exit from the sleep state, by register configuration

# 3. Electrical Characteristics

#### 3.1 Absolute Maximum Ratings

Table 3-1 summarizes the absolute maximum ratings and Table 3-2 lists the recommended operating conditions for the AR8035. Absolute maximum ratings are those values beyond which damage to the device can occur. Functional operation under these conditions, or at any other condition beyond those indicated in the operational sections of this document, is not recommended.

| Symbol             | Parameter                                               | Max Rating | Unit |
|--------------------|---------------------------------------------------------|------------|------|
| V <sub>DD33</sub>  | 3.3V analog supply voltage                              | 3.8        | V    |
| A <sub>VDD</sub>   | 1.1V analog supply voltage                              | 1.6        | V    |
| D <sub>VDD</sub>   | 1.1V digital core supply voltage                        | 1.6        | V    |
| T <sub>store</sub> | Storage temperature                                     | -65 to 150 | °C   |
| HBM                | Electrostatic discharge tolerance - Human Body<br>Model | ±2kV       | V    |
| MM                 | Machine Model                                           | ±200V      | V    |
| CDM                | Charge Device Model                                     | ±500V      | V    |

#### Table 3-1. Absolute Maximum Rating

#### 3.2 Recommended Operating Conditions

| Table 3-2. | Recommended | Operating | Conditions |
|------------|-------------|-----------|------------|
|------------|-------------|-----------|------------|

| Symbol          | Parameter                                                                | Min  | Тур | Мах  | Unit |
|-----------------|--------------------------------------------------------------------------|------|-----|------|------|
| VDD33/AVDD33    | 3.3V supply voltage                                                      | 3.14 | 3.3 | 3.47 | V    |
| AVDDL/DVDDL     | 1.1V digital core supply voltage                                         | 1.04 | 1.1 | 1.17 | V    |
| T <sub>A</sub>  | Ambient temperature for normal<br>operation - Commercial chip<br>version | 0    |     | 70   | °C   |
| T <sub>A</sub>  | Ambient temperature for normal operation - Industrial chip version       | -40  | _   | 85   | °C   |
| T <sub>J</sub>  | Junction temperature                                                     | -40  |     | 125  | °C   |
| Ψ <sub>JT</sub> | Thermal Dissipation Coefficient                                          |      | 4   |      | °C/W |

**NOTE:** External regulators are optional for supplying AVDDL/DVDDL. For industrial version, external AVDDL/DVDDL inputs must be within the range of 1.2 V  $\pm$ 5%. For commercial version, external AVDDL/DVDDL inputs must be within the range of 1.1 V-5% and 1.2 V+5%.

**NOTE:** The following condition must be satisfied:

$$T_{Jmax} > T_{Cmax} + \Psi_{JT} x P_{Typical}$$

Where:

 $T_{Jmax}$  = maximum allowable temperature of the Junction

T<sub>Cmax</sub> = Maximum allowable case temperature

 $\Psi_{\text{JT}}$  = Thermal Dissipation Coefficient

P<sub>Typical</sub> = Typical power dissipation

#### 3.3 RGMII Characteristics

Table 3-3 shows the RGMII DC characteristics with 2.5/3.3V I/O supply.

| Symbol          | Parameter           | Min       | Max | Unit |
|-----------------|---------------------|-----------|-----|------|
| I <sub>IH</sub> | Input high current  | —         | 15  | μΑ   |
| I <sub>IL</sub> | Input low current   | -15       | _   | μΑ   |
| V <sub>IH</sub> | Input high voltage  | 1.7       | 3.5 | V    |
| V <sub>IL</sub> | Input low voltage   | _         | 0.7 | V    |
| V <sub>OH</sub> | Output high voltage | 2.4       | 2.8 | V    |
| V <sub>OL</sub> | Output low voltage  | GND - 0.3 | 0.4 | V    |

Table 3-3. RGMII Characteristics with 2.5V 3.3V Supply

Table 3-4 shows the RGMII DC characteristics with 1.8V I/O supply.

| Jitter_pk-pk | Period broadband PK-PK jitter                      |                 |      | 200             | ps   |

Table 3-11. XTAL/OSC Selection

| Symbol              | Min     | Тур                  | Max    | Unit |
|---------------------|---------|----------------------|--------|------|
| Frequency           | -50ppm  | 20, 50, 62.5,<br>125 | +50ppm | MHz  |
| Output high voltage | 2.3     | 2.62                 | 2.8    | V    |
| Output low voltage  | GND-0.3 | 0                    | 0.4    | V    |
| JitterRMS           |         |                      | 15     | ps   |
| JitterPK-PK         |         |                      | 125    | ps   |

**NOTE:** CLK\_25M default outputs 25MHz, can be configured to 50MHz, 62.5MHz, or 125MHz by register MMD7 8016[4:3].

**NOTE:** The jitter result is broadband period jitter with 100000 samples.

#### 3.6 Power Pin Consumption

*Table 3-12.* **Power Pin Consumptions** 

| Symbol    | Voltage Range         | Current  |
|-----------|-----------------------|----------|
| AVDDL     | 1.1V ±5%              | 50.8 mA  |
| DVDDL     | 1.1V ±5%              | 113.7 mA |
| AVDD33    | 3.3V ±5%              | 63.8 mA  |
| VDDIO_REG | Connect VDDH_REG 2.5V | 20.9 mA  |

**NOTE:** Data for components selection and layout guide

#### 3.7 Typical Power Consumption Parameters

The following conditions apply to the typical characteristics unless otherwise specified: VCC = 3.3V (1.1V switching regulator integrated. 1.8V RGMII power included).

| Symbol              | Condition                       | Total Current<br>(mA) | LED Consumption<br>(mA) | Total Power<br>Consumption w/o<br>LED (mW) |
|---------------------|---------------------------------|-----------------------|-------------------------|--------------------------------------------|
| P <sub>LDPS</sub>   | Link Down, Power Saving<br>Mode | 3.0                   | 0                       | 9.9                                        |

**NOTE:** power consumption test results are based on Atheros demo board.

#### 3.8 Power-on Sequence, Reset and Clock

#### 3.8.1 Power-on Sequence

The AR8035 only needs a single 3.3V power supply input. The 1.1V core and 2.5V, 1.8V/1.5V voltages are generated by AR8035's internal regulators. So the AR8035's power-on sequence to establish the power rails stability is met internally.

#### 3.8.2 Reset and Clock Timing

The AR8035 hardware reset needs the clock to take effect. Input clock including the crystal and external input clock should be stable for at least 1ms before RESET can be deasserted. For chip reliability, an external clock must be input after the power-on sequence.

Figure 3-3 shows the Reset Timing diagram.

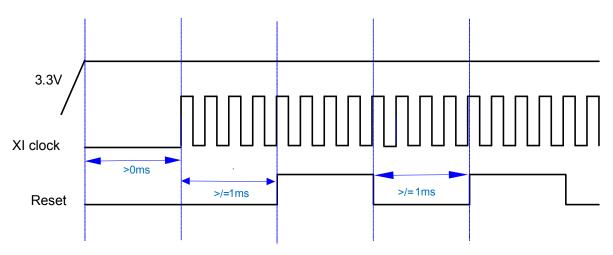

Figure 3-3. Reset Timing Diagram

When using crystal, the clock is generated internally after power is stable. For a reliable power on reset, suggest to keep asserting the reset low long enough (10ms) to ensure the clock is stable and clock-to-reset 1ms requirement is satisfied.

# 4. Register Descriptions

Table 4-1 shows the reset types used in this document.

#### Table 4-1. Reset Types

| Туре | Description                                                                                                                                                                                                                 |
|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LH   | Register field with latching high function.<br>If status is high, then the register is set to<br>one and remains set until a read operation<br>is performed through the management<br>interface or a reset occurs.          |
| LL   | Register field with latching low function. If<br>status is low, then the register is cleared to<br>a zero and remains cleared until a read<br>operation is performed through the<br>management interface or a reset occurs. |

| Table 4-1. | Reset | Types |
|------------|-------|-------|
|------------|-------|-------|

| Туре   | Description                                                                                                                                                                  |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Retain | Value written to a register field takes effect without a software reset.                                                                                                     |
| SC     | Self-Clear. Writing a one to this register<br>causes the desired function to execute<br>immediately, and the register field clears<br>to zero when the function is complete. |
| Update | The value written to the register field does<br>not take effect until a software reset is<br>executed. The value can still be read after<br>it is written.                   |

#### 4.1 Register Summary

Table 4-2 summarizes the registers for the AR8035.

| Table 4-2. <b>F</b> | Register | Summary |
|---------------------|----------|---------|
|---------------------|----------|---------|

| Offset | Register                         |  |  |  |
