AS6WA5128

## 3.0V to 3.6V 512K × 8 Intelliwatt™ low-power CMOS SRAM

### Features

- AS6WA5128
- Intelliwatt™ active power circuitry
- Industrial and commercial temperature ranges available
- Organization: 524,288 words × 8 bits
- 3.0V to 3.6V at 55 ns
- Low power consumption: ACTIVE
  - 144 mW at 3.6V and 55 ns
- Low power consumption: STANDBY
  - 72  $\mu$ W max at 3.6V
- 1.2V data retention
- Equal access and cycle times
- Easy memory expansion with  $\overline{CS}$ ,  $\overline{OE}$  inputs
- Smallest footprint packages
  - 36(48)-ball FBGA
  - 32-pin TSOP I and TSOP II packages are available on Alliance AS6UB5128 product family (available January 2001)
- ESD protection  $\geq 2000$  volts
- Latch-up current  $\geq 200$  mA

## Functional description

The AS6WA5128 is a low-power CMOS 4,194,304-bit Static Random Access Memory (SRAM) device organized as 524,288 words  $\times$  8 bits. It is designed for memory applications where slow data access, low power, and simple interfacing are desired.

Equal address access and cycle times ( $t_{AA}$ ,  $t_{RC}$ ,  $t_{WC}$ ) of 55 ns are ideal for low-power applications. Active high and low chip selects ( $\overline{CS}$ ) permit easy memory expansion with multiple-bank memory systems.

When  $\overline{CS}$  is high, the device enters standby mode: the AS6WA5128 is guaranteed not to exceed 72  $\mu$ W power consumption at 3.6V and 55ns. The device also returns data when  $V_{CC}$  is reduced to 1.5V for even lower power consumption.

A write cycle is accomplished by asserting write enable ( $\overline{WE}$ ) and chip select ( $\overline{CS}$ ) low. Data on the input pins I/O1–I/O8 is written on the rising edge of  $\overline{WE}$  (write cycle 1) or  $\overline{CS}$  (write cycle 2). To avoid bus contention, external devices should drive I/O pins only after outputs have been disabled with output enable ( $\overline{OE}$ ) or write enable ( $\overline{WE}$ ).

A read cycle is accomplished by asserting output enable ( $\overline{OE}$ ), chip select ( $\overline{CS}$ ), with write enable ( $\overline{WE}$ ) High. The chip drives I/O pins with the data word referenced by the input address. When either chip select or output enable is inactive, or write enable is active, output drivers stay in high-impedance mode.

All chip inputs and outputs are CMOS-compatible, and operation is from a single 3.0 to 3.6V supply. The device is available in the JEDEC standard 36(48)-ball FBGA package.

## Absolute maximum ratings

Parameter	Device	Symbol	Min	Max	Unit
Voltage on $V_{CC}$ relative to $V_{SS}$		$V_{IN}$	–0.5	$V_{CC} + 0.5$	V
Voltage on any I/O pin relative to GND		$V_{I/O}$	–0.5		V
Power dissipation		$P_D$	–	1.0	W
Storage temperature (plastic)		$T_{stg}$	–65	+150	°C
Temperature with $V_{CC}$ applied		$T_{bias}$	–55	+125	°C
DC output current (low)		$I_{OUT}$	–	20	mA

Note: Stresses greater than those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions outside those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

### Notes

- During  $V_{CC}$  power-up, a pull-up resistor to  $V_{CC}$  on  $\overline{CS}$  is required to meet  $I_{SB}$  specification.
- This parameter is sampled, but not 100% tested.
- For test conditions, see *AC Test Conditions*.
- $t_{CLZ}$  and  $t_{CHZ}$  are specified with  $C_L = 5pF$  as in Figure C. Transition is measured  $\pm 500$  mV from steady-state voltage.
- This parameter is guaranteed, but not tested.
- $\overline{WE}$  is HIGH for read cycle.
- $\overline{CS}$  and  $\overline{OE}$  are LOW for read cycle.
- Address valid prior to or coincident with  $\overline{CS}$  transition LOW.
- All read cycle timings are referenced from the last valid address to the first transitioning address.
- $\overline{CS}$  or  $\overline{WE}$  must be HIGH during address transitions. Either  $\overline{CS}$  or  $\overline{WE}$  asserting high terminates a write cycle.
- All write cycle timings are referenced from the last valid address to the first transitioning address.
- N/A.
- 1.2V data retention applies to commercial and industrial temperature range operations.
- $C = 30pF$ , except at high Z and low Z parameters, where  $C = 5pF$ .
