## Dual 5V and 3.3V $\mu$ P Power Supply Supervisor with Manual Reset

### General Description

The ASM1834 supervisors simultaneously monitor both 3.3V and 5V power sources and generate reset signals when either supply is out of tolerance. When an out-of-tolerance condition is detected, the output-reset signal of the affected supply becomes active and resets the system microprocessor/microcontroller. On power-up and after the supply voltage returns to an in-tolerance condition, the reset signal remains active for approximately 350ms. This allows the power supply and system microprocessor to stabilize.

Tolerance levels are independently selectable for both supplies. Tolerance options are 5% and 10% percent for the 5V supply and 10% and 20% percent for the 3.3V supply.

The ASM1834 and ASM1834D have push-pull reset output stages. The ASM1834A reset outputs are open drain devices that can both be connected to either 5V or 3.3V supply. The ASM1834 and ASM1834A have active LOW reset outputs. The ASM1834D has active HIGH reset outputs.

All devices can generate reset signals through an internally debounced pushbutton reset input that affects both reset outputs.

All devices operate over the extended industrial temperature range. Devices are available in 8-pin DIP, surface mount 8-pin SO and 8-Pin MicroSO packages. Die are also available.

### Key Features

- Monitors 5V and 3.3V supplies simultaneously
- 5V and 3.3V power-on reset
- 350ms reset time
- Debounced pushbutton reset input
- Push-pull CMOS output
  - ASM1834, ASM1834D
  - Eliminates external pull-up resistors
  - Active LOW (ASM1834), HIGH (ASM1834D)
- Open Drain Output
  - ASM1834A
  - Active LOW
- Selectable 5V and 3.3V trip point tolerance
- Internal power drawn from highest input voltage, 5V or 3.3V
- Precision temperature-compensated voltage reference and comparator
- Low cost surface mount SO, compact MicroSO and DIP packages.
- Wide operating temperature, -40°C to +85°C

### Applications

- Microprocessors
- PDAs, Hand-held PCs
- Embedded Controllers
- Telecommunication Systems
- Power Supplies
- Wireless / Cellular Systems
- Networking Hardware

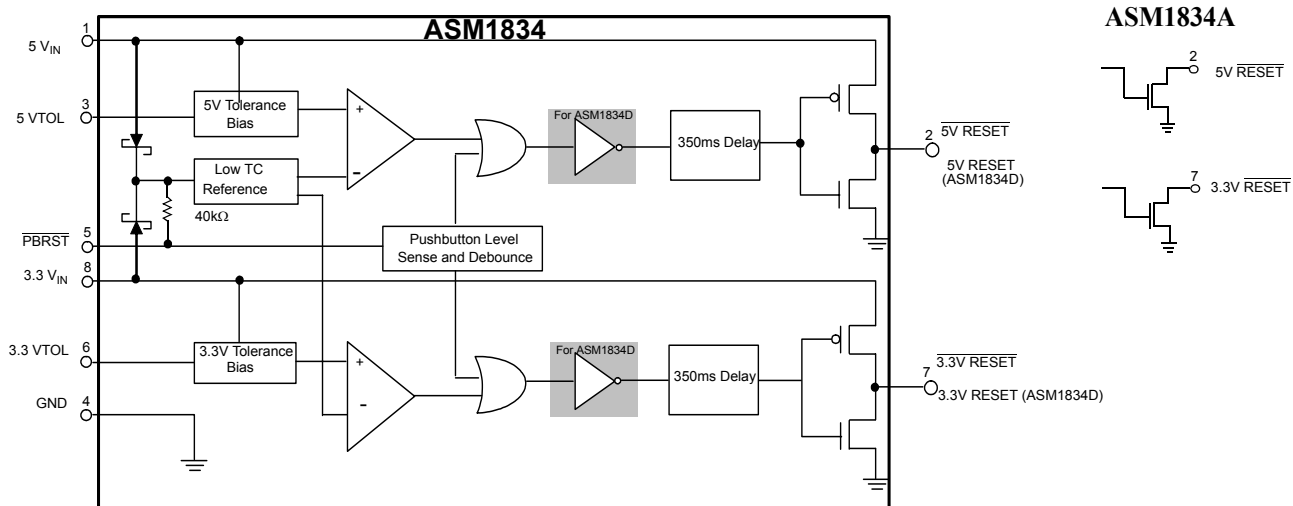

### Typical Operating Circuit

Detailed Description

Operation Power Monitor

The ASM1834 supervisors simultaneously detect out-of-tolerance power supply conditions on both 3.3V and 5V power supplies. If the voltages at 5VIN or 3.3VIN are outside the tolerance band, the reset for the falling supply voltage becomes active. When the monitored supply returns to an in-tolerance state, the reset remains active for approximately 350ms before returning to the inactive state.

On power-up, the reset signals are kept active for approximately 350ms after the power supply voltages have reached the selected tolerance. This allows the power supply and microprocessor to stabilize before the reset is removed.

All supply current for the ASM1834 devices is drawn from the input (5VIN or 3.3VIN) with the highest voltage level. The outputs draw current from their input supplies 5VIN and 3.3VIN.

### Manual Reset Operation

Push-button switch input,  $\overline{\text{PBRST}}$ , allows the user to override the internal trip point detection circuits and issue reset signals. The pushbutton input is debounced and is pulled HIGH through an internal 40k $\Omega$  resistor.

When at least one of the reset outputs is not asserted, a push button initiated reset signal can be issued by holding  $\overline{\text{PBRST}}$  LOW for at least 2ms. When  $\overline{\text{PBRST}}$  is held LOW, both resets become active and remain active for approximately 350ms after  $\overline{\text{PBRST}}$  returns HIGH. (See figures 3 and 4).

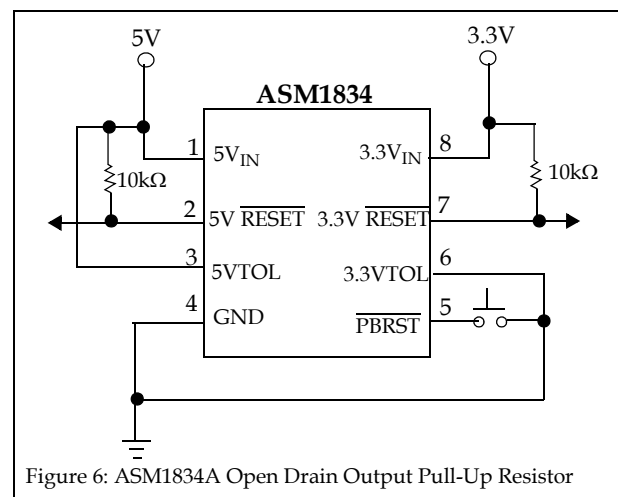

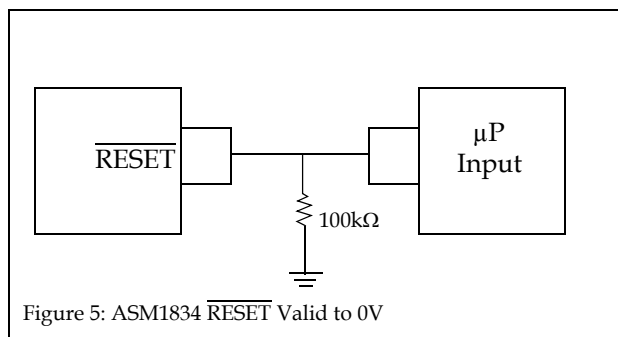

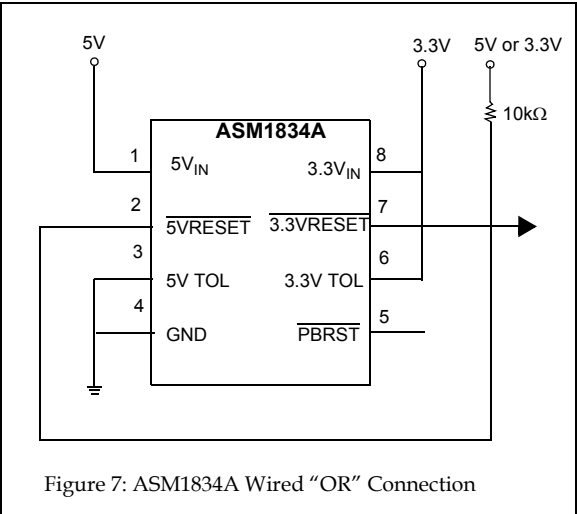

### Reset Output Signal

Reset output signals are valid as long as either voltage at 5V<sub>IN</sub> or 3.3V<sub>IN</sub> is above 1.2V. In addition, the ASM1834 has push-pull outputs that can remain valid below a 1.2V input level. To sink current below 1.2V, a resistor should be connected from the  $\overline{\text{RESET}}$  output to ground. This resistor guarantees a valid reset signal down to 0V. A 100k $\Omega$  value is suggested.

The AS1834A open drain reset outputs require pull-up resistors and must be low enough in value to pull the output into a HIGH state. Resistor value is not critical in most applications and a value of 10k $\Omega$  is suggested. (See Figures 5 and 6).

The ASM1834A open drain reset outputs can be connected to the same potential through a single pull-up resistor. In this configuration a failure on either supply will generate an active LOW reset. If the inputs are pulled-up to different voltages, the reset outputs (pin 2 and pin 7) cannot be connected to form a wired "AND" (see figure 7).

**Trip Point Tolerance Selection**

The 3.3VTOL and 5VTOL inputs allow independent selection of the reset trip points. If 5VTOL is connected to the 5V supply input, a 10% tolerance is selected. If 5VTOL is grounded, a 5% tolerance is selected.

If 3.3VTOL is connected to the 3.3V supply input, a 20% tolerance is selected. If 3.3VTOL is grounded, a 10% tolerance is selected. (Refer table below). The 3.3VTOL and 5VTOL tolerance select inputs should be tied to the ground or to the respective input supply voltage pin, 3.3VIN or 5VIN.

Tolerance Select	3.3V Input				5V Input			
	3.3V Tolerance	TRIP Point (V)			5V Tolerance	TRIP Point (V)
