CURRENT MODE PWM CONTROLLER

AZ2842/3/4/5

General Description

The AZ2842/3/4/5 are high performance fixed frequency current-mode PWM controller series.

These integrated circuits are optimized for off-line and DC-DC converter applications with minimum external components. They feature under-voltage lockout (UVLO) circuit with low start-up current, trimmed oscillator for precise duty cycle control, current sense comparator providing maximum current limiting and a totem pole output stage for increasing output current. In addition, these ICs also feature accurate protection against over-temperature, over-current and maximal output power.

The AZ2842 and AZ2844 have UVLO thresholds of 15.5V(on) and 10V(off); The corresponding thresholds for AZ2843 and AZ2845 are 8.4 V(on) and 7.8V(off).

The AZ2842 and AZ2843 can operate approaching 100% duty cycle; AZ2844 and AZ2845 can operate from zero to 50% duty cycle.

These ICs are available in 3 packages: SOIC-8, DIP-8 and SOIC-14.

Features

- Robust V_{REF} Line/Load Regulation
Low Line Regulation : 4mV
Low Load Regulation : 4mV
- High Stability of Reference Voltage over a Full Temperature Range: 0.2mV/ °C
- Operating Frequency up to 500KHz
- High PWM Frequency Stability over a Full Temperature Range: 2.5%
- High PWM Frequency Stability under a Full Supply Voltage Range: 0.2%
- Accurate Over-temperature Protection with Hysteresis
- UVLO with Hysteresis

Applications

- Off-line Converter
- DC-DC Converter
- Voltage Adapter
- CRT Monitor Power Supply
- Desktop Power Supply
- DVD/STB Power Supply

Pin Configuration

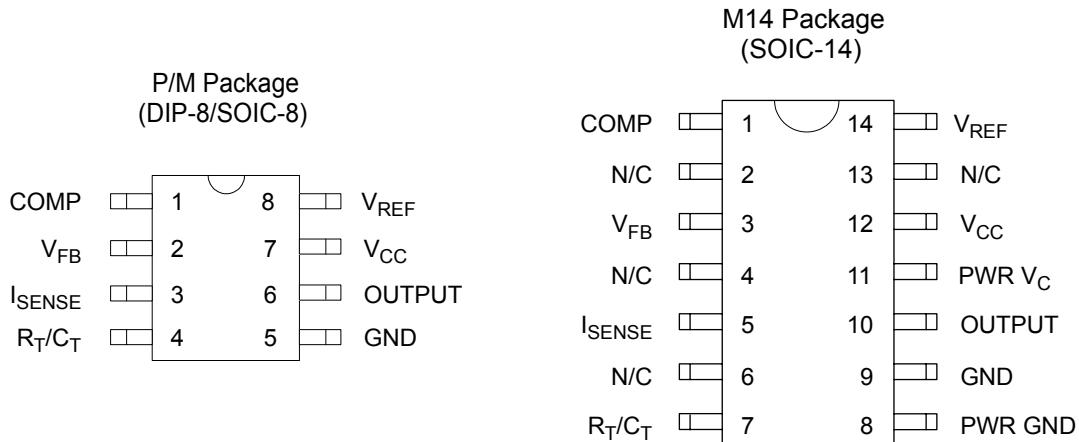

Figure 2. Pin Configuration of AZ2842/3/4/5 (Top View)

Pin Description

Pin Number		Pin Name	Function
8-pin	14-pin		
1	1	COMP	This pin is the Error Amplifier output and is made available for loop compensation.
2	3	V _{FB}	The inverting input of the Error Amplifier. It is normally connected to the switching power supply output through a resistor divider.
3	5	I _{SENSE}	A voltage proportional to inductor current is connected to this input. The PWM uses this information to terminate the output switch conduction.
4	7	R _T /C _T	The Oscillator frequency and maximum output duty cycle are programmed by connecting resistor R _T to V _{REF} and capacitor C _T to ground. Operation to 500 kHz is possible.
5		GND	The combined control circuitry and power ground.
6	10	OUTPUT	This output directly drives the gate of a power MOSFET. Peak currents up to 1.0 A are sourced and sunk by this pin.
7	12	V _{CC}	The positive supply of the control IC.
8	14	V _{REF}	This is the reference output. It provides charging current for capacitor C _T through resistor R _T .
	8	PWR GND	This pin is a separate power ground return that is connected back to the power source. It is used to reduce the effects of switching transient noise on the control circuitry.
	11	PWR V _C	The High Output Voltage (V _{OH}) is set by the voltage applied to this pin. With a separate power source connection, it can reduce the effects of switching transient noise on the control circuitry.
	9	GND	This pin is the control circuitry ground return and is connected back to the power source ground.
2,4,6,13		N/C	No connection. These pins are not internally connected.

Lead Temperature (Soldering, 10sec)	T _{LEAD}	300	°C

Note 1: Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "Recommended Operating Conditions" is not implied. Exposure to "Absolute Maximum Ratings" for extended periods may affect device reliability.

Note 2: All voltages are with respect to pin 5 and all currents are positive into specified terminal.

Note 3: Board thickness 1.6mm, board dimension 90mm X 90mm.

ELECTRICAL CHARACTERISTICS (Continued)

Figure 4 is the basic test circuit for AZ284X. In testing, the high peak currents associated with capacitive loads necessitate careful grounding techniques. Timing and bypass capacitors should be connected close to pin 5 in a single point ground. The transistor and 5k potentiometer are used to sample the oscillator waveform and apply an adjustable ramp to pin 3.
