1、General Description

The AiPTB010X is an 8-bit, dual supply translating transceiver with auto direction sensing, that enables bidirectional voltage level translation. It features two 8-bit input-output ports (An and Bn), one output enable input (OE) and two supply pins ($V_{CC(A)}$ and $V_{CC(B)}$). $V_{CC(A)}$ can be supplied at any voltage between 1.2V and 3.6V and $V_{CC(B)}$ can be supplied at any voltage between 1.65V and 5.5V, making the device suitable for translating between any of the low voltage nodes (1.2V, 1.5V, 1.8V, 2.5V, 3.3V and 5.0 V).

Pins An and OE are referenced to $V_{CC(A)}$ and pins Bn are referenced to $V_{CC(B)}$. A LOW level at pin OE causes the outputs to assume a high-impedance OFF-state. This device is fully specified for partial power-down applications using I_{OFF} . The I_{OFF} circuitry disables the output, preventing the damaging backflow current through the device when it is powered down.

Features:

- Wide supply voltage range:
 $V_{CC(A)}$: 1.2V to 3.6V
 $V_{CC(B)}$: 1.65V to 5.5V
- I_{OFF} circuitry provides partial Power-down mode operation
- Inputs accept voltages up to 5.5V
- Specified from -40°C to +105°C
- Packaging information:
AiPTB0101: SOT23-6/SOT363
AiPTB0102: TSSOP8/VSSOP8
AiPTB0104: SOP14/TSSOP14/DHVQFN14
AiPTB0106: SOP16/TSSOP16
AiPTB0108: SOP20/TSSOP20

5、Typical Application Circuit And Application Note

5.1、Applications

Voltage level-translation applications. The AiPTB010X can be used to interface between devices or systems operating at different supply voltages. See Figure 5 for a typical operating circuit using the AiPTB010X.

Figure 5. Typical operating circuit

5.2、Architecture

The architecture of the AiPTB010X is shown in Figure 6. The device does not require an extra input signal to control the direction of data flow from A to B or from B to A. In a static state, the output drivers of the AiPTB010X can maintain a defined output level, but the output architecture is designed to be weak, so that they can be overdriven by an external driver when data on the bus starts flowing in the opposite direction. The output one shots detect rising or falling edges on the A or B ports. During a rising edge, the one shots turn on the PMOS transistors (T1, T3) for a short duration, accelerating the low-to-high transition. Similarly, during a falling edge, the one shots turn on the NMOS transistors (T2, T4) for a short duration, accelerating the high-to-low transition. During output transitions the typical output impedance is 70 Ω at V_{CCO}=1.2V to 1.8V, 50 Ω at V_{CCO}=1.8V to 3.3V and 40 Ω at V_{CCO}=3.3V to 5.0V.

Figure 7. Typical input current versus input voltage graph

5.4、Power Up

During operation $V_{CC(A)}$ must never be higher than $V_{CC(B)}$, however during power-up $V_{CC(A)} \geq V_{CC(B)}$ does not damage the device, so either power supply can be ramped up first. There is no special power-up sequencing required. The AiPTB010X includes circuitry that disables all output ports when either $V_{CC(A)}$ or $V_{CC(B)}$ is switched off.

5.5、Enable And Disable

An output enable input (OE) is used to disable the device. Setting OE=LOW causes all I/Os to assume the high-impedance OFF-state. The disable time (t_{dis} with no external load) indicates the delay between when OE goes LOW and when outputs actually become disabled. The enable time (t_{en}) indicates the amount of time the user must allow for one one-shot circuitry to become operational after OE is taken HIGH. To ensure the high-impedance OFF-state during power-up or power-down, pin OE should be tied to GND through a pull-down resistor, the minimum value of the resistor is determined by the current-sourcing capability of the driver.

5.6、Pull-up Or Pull-down Resistors On I/O Lines

As mentioned previously the AiPTB010X is designed with low static drive strength to drive capacitive loads of up to 70pF. To avoid output contention issues, any pull-up or pull-down resistors used must be kept higher than 50k Ω . For this reason the AiPTB010X is not recommended for use in open drain driver applications such as 1-Wire or I²C. For these applications, the AiPTB010X level translator is recommended.
