

Features

- Operating voltage:
 - $V_{DD}=2.2V\sim3.6V@T_a=-40^{\circ}C\sim+85^{\circ}C$
- Complete Sub-1GHz OOK/FSK transmitter
- Frequency bands: 315MHz, 433MHz, 868MHz, 915MHz
- Supports OOK/FSK modulation
- Supports 2-wire I²C interface
- Low sleep current
- TX current consumption@433MHz:
 - 18.5mA (FSK, 10dBm)/11mA (OOK, 10dBm, 50% duty cycle)
- Programmable symbol rate
- On-chip full range VCO and Fractional-N PLL synthesizer
- Supports 16MHz low cost crystal
- 4-steps programmable TX Power: 0/5/10/13 dBm
- Fully integrated VCO, on chip loop filter and PLL synthesizer
- Hardware control mode – MCU not required for radio control
- Integrated 64×1-bit FUSE Data Memory
- Auto calibration function
- Package type: 8-pin SOP-EP

Abbreviation Notes

TX: RF Transmitter

SX: Synthesizer

XO: External Crystal

PA: Power Amplifier

OOK: On-Off Keying

FSK: Frequency Shift Keying

VCO: Voltage Control Oscillator

PLL: Phase Lock Loop

MMD: Multi-Mode Divider

XTAL: External Crystal

General Description

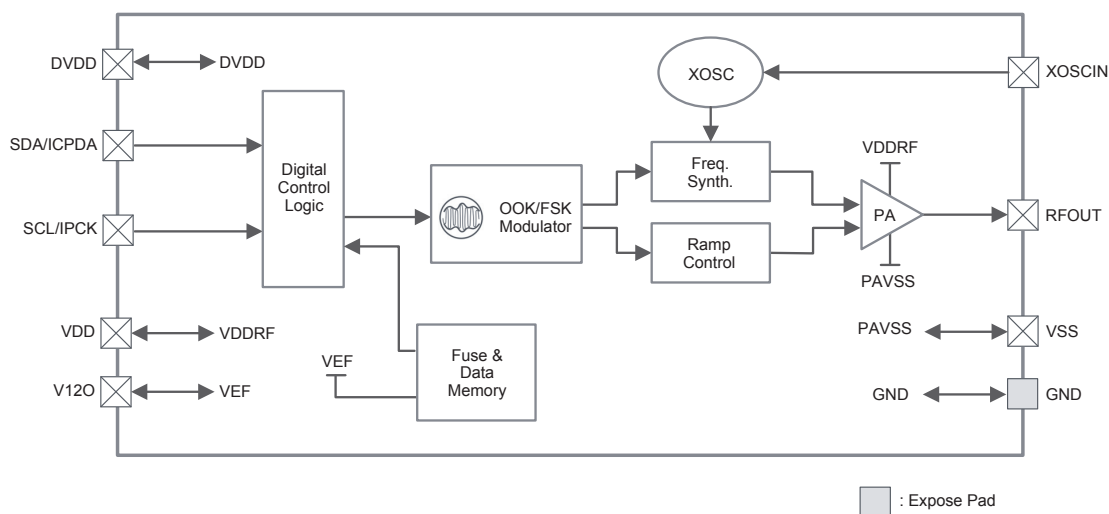

The BC2102 is a highly integrated OOK/FSK transmitter for remote wireless applications. The transmitter is a true "data-in, antenna-out" monolithic device making it very easy for users to implement wireless systems.

The BC2102 can operate at the 315MHz, 433MHz, 868MHz and 915MHz frequency bands. It supports both OOK and FSK modulation schemes and can operate with symbol rate up to 25Kbps and 50Kbps respectively.

BC2102 offers a programmable output power level. It is capable of delivering +13dBm maximum power into a 50Ω load. The BC2102 adopts an agile state machine to ease the control and minimize the power consumption. With an external crystal and a few external components, BC2102 can implement a complete solution for an effective RF transmitter.

These features can be easily programmed through I²C interface or internal Fuse. With these combined features the BC2102 can provide a power-saving and cost effective solution for a huge range of remote wireless applications.

6	DIN/SDA/ICPDA	DIN	I	RF transmitter data input
		SDA	I	I ² C data input
		ICPDA	I	ICP data input pin
7	V120	LDO_OUT	PWR	1.2V LDO output
8	DVDD	VDD	PWR	Digital positive power supply
9	GND	Ground	PWR	Expose Pad

Note: I: Digital Input

AI: Analog Input

PWR: Power

O: Digital Output

AO: Analog Output

Absolute Maximum Ratings

Supply Voltage $V_{SS}-0.3V$ to $V_{SS}+3.6V$
 Voltage on I/O pins $V_{SS}-0.3V$ to $V_{DD}+0.3V$

ESD HBM $\pm 2kV$
 Storage Temperature $-55^{\circ}C$ to $150^{\circ}C$
 Operating Temperature $-40^{\circ}C$ to $85^{\circ}C$

*This device is ESD sensitive. HBM (Human Body Mode) is based on the MIL-STD-883H Method 3015.8.

Note: These are stress ratings only. Stresses exceeding the range specified under "Absolute Maximum Ratings" may cause substantial damage to the device. Functional operation of this device at other conditions beyond those has listed in the specification is not implied and prolonged exposure to extreme conditions may affect device reliability.

D.C. Characteristics

$T_a=25^{\circ}C$, $V_{DD}=3.3V$, $f_{XTAL}=16$ MHz, OOK/FSK modulation with Matching circuit, PAOUT is powered by $V_{DD}=3.3V$, unless otherwise noted.

$T_a=25^{\circ}C$

Note: 1. This is the total tolerance including (1) Initial tolerance (2) Crystal loading (3) Aging and (4) Temperature dependence.

The acceptable crystal tolerance depends on RF frequenc and channel spacing/band width.

2. Depend on crystal property.

Functional Description

The fully integrated RF transmitter can operate in the 315MHz, 433MHz, 868MHz and 915MHz frequency bands. The additional of a crystal and a limited number of external components are all that is required to create a complete and versatile RF transmitter system. The device includes an internal power amplifier and is capable of delivering up to +13dBm into a 50Ω load. Such a power level enables a small form factor transmitter to operate near the maximum transmission regulation limits. The device can operate with OOK and FSK receiver types. The FSK data rate is up to 50kbps, allowing the device to support more complicated control protocols.

Solution Overview

To provide extra user conveniences, the BC2102 contains an area of FUSE memory, which is a kind of popular One-time Programming Non-volatile Memory.

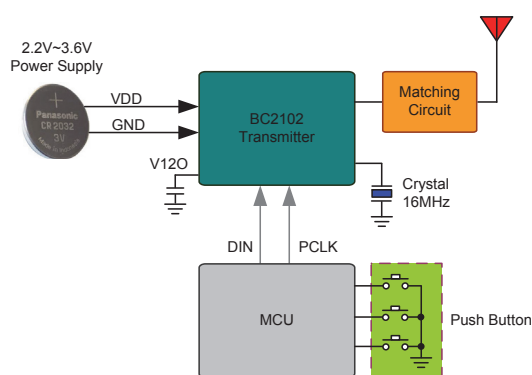

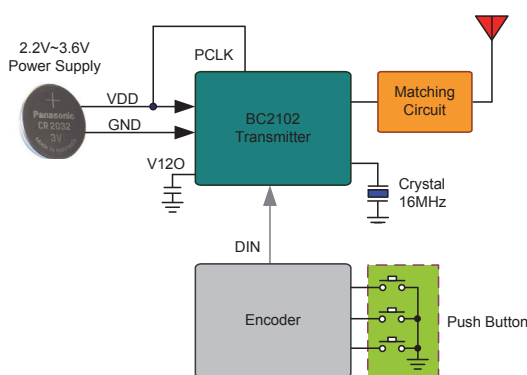

If the FUSE is un-programmed, which can be detected by checking the EFPGM bit in the CFG7 register, the user should connect the device to an MCU and

setup the relevant RF registers configuration in the I²C Mode using an I²C interface. The device can operate properly after returning to the Normal Mode. However, the registers will be reset to their initial state when the device is powered off.

For devices whose FUSE is programmed, users can implement a complete and versatile RF transmitter system to work together with an external MCU or Encoder. The corresponding application solutions are shown as below. Note that when EFPGM bit is low the device can only be connected to an external MCU.

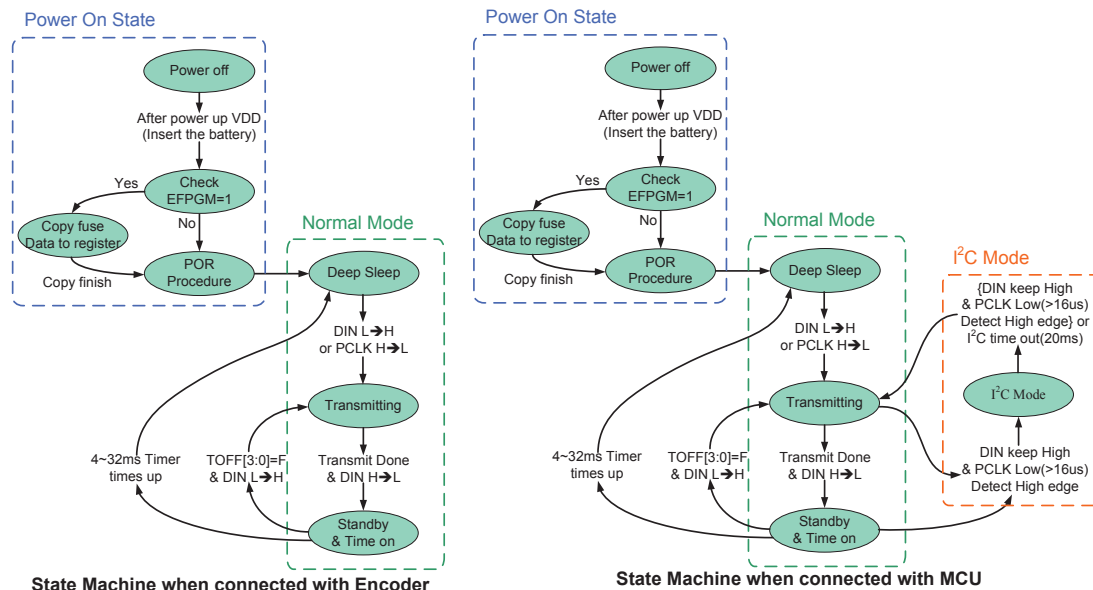

If the device is connected with an Encoder, the FUSE data will be automatically copied to the corresponding registers. After a delay time, the encoder can send data to the device through the DIN pin and thus start a transmission sequence.

If the device is connected to an MCU, the same function aforementioned can also be implemented. The difference is that the MCU can configure the frequency, power and other parameters by setting the relevant registers using an I²C interface when operating in the I²C Mode.

State Control

The BC2102 has integrated state machines that control the state transition between modes.

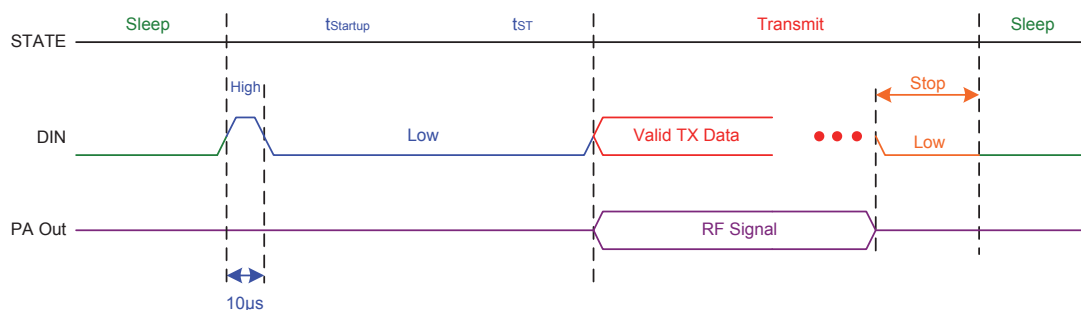

Power On State

After power-on, perhaps by the insertion of a battery, if the EFPGM bit state is high, the FUSE data will be automatically copied to the corresponding registers. When completed the device will enter the Deep Sleep Mode after a POR delay time. Note that the device will directly enter the Deep Sleep Mode after a delay time if the EFPGM bit is low.

Normal Mode

After a power-on reset operation, the device enters the Deep Sleep Mode. Data will be transmitted if the DIN pin is pulled high or the pulse on the PCLK pin changes from high to low. When data transmission is finished and the DIN pin state changes from high to low, the device will enter the Standby state and the Timer, whose timeout period is determined by DLY_TOFF bits in the CFG1 register, will turn on and start to count. The device will return to the Deep Sleep Mode when the Timer overflows. However, it should be noted that when the DLY_TOFF[3:0] bit value is "1111", the device will start to transmit again without entering the Deep Sleep Mode once the DIN pin state changes from low to high.

TX Enabled by DIN Pin

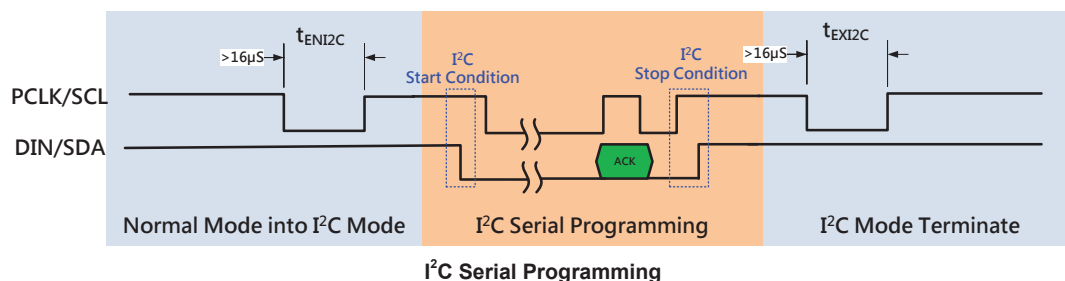

I²C Mode

If the device is connected to an external MCU, then the I²C mode can be used. When the SCL line (Pin 5) is pulled low for more than 16μs (t_{ENI2C}), the device will enter the I²C Mode from the Normal Mode, during which the external control register can configure the special function registers in the device using I²C commands. When the device receives a correct I²C STOP signal followed by the SCL line being pulled low for more than 16μs, the device will return to the Normal Mode.

In the I²C Mode, the MCU can configure the internal relevant registers using I²C serial programming. The transmitter only supports the I²C format for byte write, page write, byte read and page read format. The transmission procedure is shown as below.

Symbol definition:

- S: Start symbol
- RS: Repeat Start
- P: Stop symbol
- DADDR[6:0]: device address, 21h
- R/W: read write select, R(0): write, (1): read
- RADDR[7:0]: register address
- ACK: A(0):ACK, NA(1):NAK
- Bus Direction:
host to device: 
device to host: 

Byte Write

Page Write

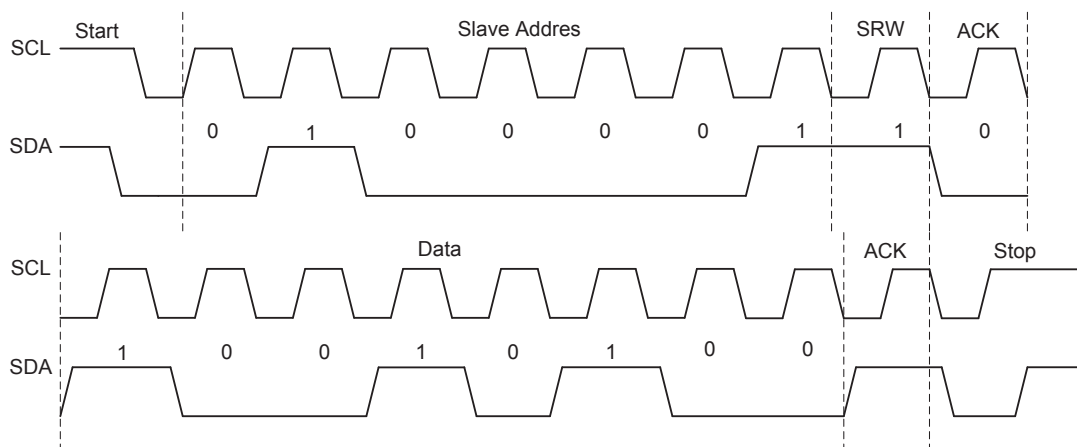

Byte Read

Page Read

S = Start (1 bit)
 SA = Slave Address (7 bits)
 SR = SRW bit (1 bit)
 M = Slave device send acknowledge bit (1 bit)
 D = Data (8 bits)
 A = ACK (RXAK bit for transmitter, TXAK for receiver, 1bit)
 P = Stop (1 bit)

Note: *When a slave address is matched, the device must be placed in either the transmit mode and then Write data to the SIMD register, or the receive mode where it must implement a dummy read from the SIMD register to release the SCL line.

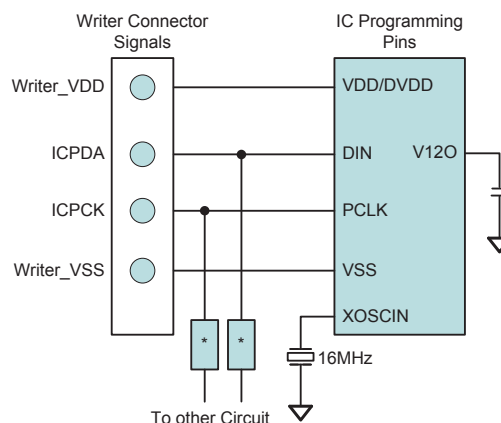

I²C Communication Timing Diagram

Programming Methodology

The device programming interface should utilise an adaptor with an integrated 16MHz crystal.

Program Function	Pin Name	Pin Description
ICPCK	PCLK (Pin5)	ICP clock
ICPDA	DIN (Pin)	ICP Data/Address
VDD	VDD (Pin3) DVDD (Pin8)	Power supply
VSS, EP	VSS (Pin2), Exposed-Pad	Ground
XTAL IN (Adaptor)	XOSCIN (Pin4)	IC system clock

When programming, the device needs to be located on a Socket with a 16MHz crystal connected between Pin XOSCIN and ground. Holtek provides an e-link or e-WriterPro tool for communication with the PC. Between the e-link and the device there are four interconnecting lines, namely VDD, VSS, PCLK and DIN pins.

Note: * may be resistor or capacitor – the resistance of * must be greater than 1kΩ and the capacitance of * must be less than 1nF.

Register Map

When connected to an external MCU, the device can be setup and operated using a series of internal registers. Device commands and data are written to and read from the device using its internal I²C bus. This list provides a summary of all internal registers. Their detailed operation is described under their relevant section in the functional description.

Address	Register Name	Bit							
		7	6	5	4	3	2	1	0
00h	CFG0	Setting0			XO_TRIM[5:0]				
01h	CFG1	DLY_TOFF[3:0]				Setting1			
02h	CFG2	FDEV[7:0]							
03h	CFG3	FSK_SEL	Setting2			TXPWR[3:0]			
04h	CFG4	D_N[5:0]					BAND_SEL[1:0]		
05h	CFG5	D_K[11:4]							
06h	CFG6	D_K[19:12]							
07h	CFG7	EFPGM	Setting3						

If the Fuse is un-programmed, the BC2102 device will have a default state described in the following, determined by register initial values.

Modulation Mode: OOK

Operating Frequency: 433.92MHz

TX Output Power: 10dBm

XTAL Capacitor Load: 16.651pF

Power Off Delay Time: 32ms

CFG0: Configuration Control Register 0

Address	Bit	7	6	5	4	3	2	1	0
00h	Name	Setting0		XO_TRIM[5:0]					
	R/W	R/W	R/W	R/W					
	Initial Value	1	0	1	0	0	0	0	0

Bit 7~6 **Setting0**: Must be [0b10]

Bit 5~0 **XO_TRIM[5:0]**: Trim value for the internal capacitor load for the crystal

XO_TRIM[5:0]	Equiv. C _L (pF)	XO_TRIM[5:0]	Equiv. C _L (pF)
0	11.676	32	16.651
4	11.822	36	17.288
8	11.927	40	17.962
12	13.247	44	18.610
16	13.962	48	19.294
17	14.137	52	19.870
18	14.295	56	20.472
20	14.639	60	21.003
24	15.301	63	21.411
28	15.955		

CFG1: Configuration Control Register 1

Address	Bit	7	6	5	4	3	2	1	0
01h	Name	DLY_TOFF[3:0]				Setting1			
	R/W	R/W				R/W			
	Initial Value	1	1	1	0	0	0	0	1

Bit 7~4 **DLY_TOFF[3:0]**: Transmitter Auto Power Off Delay Time

$$t = 2\text{ms} \times (\text{DLY_TOFF}[3:0] + 2)$$

0000: 4ms

0001: 6ms

0010: 8ms

:

1110: 32ms

1111: Infinite – Never enter the Deep Sleep Mode

Bit 3~0 **Setting1**: Must be [0b0001]

CFG2: Configuration Control Register 2

Address	Bit	7	6	5	4	3	2	1	0
02h	Name	FDEV[7:0]							
	R/W	R/W							
	Initial Value	0	1	1	0	0	1	1	0

Bit 7~0 **FDEV[7:0]**: Frequency deviation for FSK

$$\text{External Crystal} = 16\text{MHz}, \text{FDEV} = (f_{\text{dev}} \times 2^{15} / \text{Fxtal}); f_{\text{XTAL}} = 16\text{MHz}$$

Examples are as follows:

Default FDEV[7:0] = 01100110 → Decimal 102

External Crystal = 16MHz

$$f_{\text{dev}} (\text{Frequency deviation}) = \text{FDEV} \times (16\text{M} / 2^{15})$$

$$f_{\text{dev}} (\text{Frequency deviation}) = 102 \times (16\text{M} / 32768) = 49.8\text{kHz}$$

CFG3: Configuration Control Register 3

Address	Bit	7	6	5	4	3	2	1	0
03h	Name	FSK_SEL	Setting2			TXPWR[3:0]			
	R/W	R/W	R/W			R/W			
	Initial Value	0	1	0	0	1	0	0	0

Bit 7 **FSK_SEL**: FSK Mode Enable

0: OOK

1: FSK

Bit 6~4 **Setting 2**: Must be [0b100]

Bit 3~0 **TXPWR[3:0]**: RF Output Power

The device has several output power values which are 0, 5, 10, and 13 dBm.

TXPWR[3:0]	RF Output Power	TXPWR[3:0]	RF Output Power
0000	0dBm	XX00	0
0100	5dBm	XX01	1
1000	10dBm	XX10	2
1100	13dBm	XX11	3

Note that the adjust range: Level 3 > Level 2 > Level 1 > Level 0.

CFG4: Configuration Control Register 4

Address	Bit	7	6	5	4	3	2	1	0
04h	Name	D_N[5:0]						BAND_SEL[1:0]	
	R/W	R/W						R/W	
	Initial Value	0	1	0	1	1	0	0	1

Bit 7~2 **D_N[5:0]**: Integer of dividend for MMD

Bit 1~0 **BAND_SEL[1:0]**: Band Frequency Coarse Control

BAND_SEL	Frequency
00	315MHz
01	433MHz
10	868MHz
11	915MHz

Note that the BAND_SEL only select an approximate frequency range while the exact frequency value is determined by the D_N and D_K bit fields.

CFG5: Configuration Control Register 5

Address	Bit	7	6	5	4	3	2	1	0
05h	Name	D_K[11:4]							
	R/W	R/W							
	Initial Value	0	1	1	1	0	0	0	0

CFG6: Configuration Control Register 6

Address	Bit	7	6	5	4	3	2	1	0
06h	Name	D_K[19:12]							
	R/W	R/W							
	Initial Value	0	0	1	1	1	1	0	1

D_K[19:4]: 16-bit Fractional of dividend for MMD

D_N&D_K example.

X'TAL=16MHz and TX band =433MHz

1. $D_N \rightarrow (433M \times \text{Divider}) / 16M = 54.125$

Take the integer part $\rightarrow D_N = 54 - 32 = 22 \rightarrow 010110$

2. $D_K \rightarrow (433M \times \text{Divider}) / 16M = 54.125$

Take the fractional part $\rightarrow D_K = 0.125 \times 2^{20} = 131072 \rightarrow 0010-0000-0000-0000$

3. The example frequency can be referred in the following table.

Band_SEL	Frequency	Divider	X'TAL	D_N[5:0]	D_K[19:4]
315MHz	315MHz	2	16MHz	000111	0110-0000-0000-0000
433MHz	433MHz	2	16MHz	010110	0010-0000-0000-0000
433MHz	433.92MHz	2	16MHz	010110	0011-1101-0111-0000
868MHz	868MHz	1	16MHz	010110	0100-0000-0000-0000
915MHz	915MHz	1	16MHz	011001	0011-0000-0000-0000

CFG7: Configuration Control Register 7

Address	Bit	7	6	5	4	3	2	1	0
07h	Name	Setting3							
	R/W	R/W							
	Initial Value	0	1	0	0	1	0	1	1

Bit 7 **EFPGM**: Fuse programmed, read only for I²C

0: FUSE is not programmed – FUSE data is not mapped to the configuration register

1: FUSE is programmed – FUSE data is mapped to the configuration register

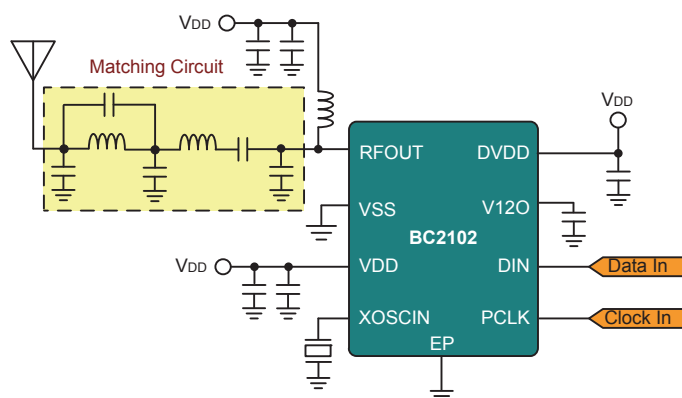

Bit 6~0 **Setting3**: Must be [0b1001011]
