

CHT-LDOS Datasheet

Version: 2.4
25-Mar-15
(Last Modification Date)

High-Temperature, 1A Low-Dropout Voltage Regulator for symmetrical voltage applications. 2.5V; 3.3V; 5V; 5.5V; 9V; 10V; 12V; 13V or 15V

General Description

The CHT-LDOS is a 1A, low-dropout linear voltage regulator compatible with high-temperature environments. Typical operation temperature range extends from -55°C to 225°C.

The circuit is stable throughout the whole temperature range and under a large choice of capacitive loads.

The minimum dropout voltage ($V_{in}-V_{out}$) is 2V with a 1A load current at 225°C and 1V for load currents lower than 400mA. The dropout voltage can span from 1 Volts to 20 Volts⁽¹⁾.

The circuit is a one-die solution.

CHT-LDOS is available in TO-254 package and in bare die.

Applications

Power supplies for high-temperature electronic systems used in Automotive, Aeronautics, Aerospace or Oil&Gas applications

Features

- 1V to 20V dropout Voltage @400mA⁽¹⁾
- 2V to 20V dropout Voltage @1A⁽¹⁾
- Max 1A output current @ 225°C
- 60dB input ripple rejection (0-100Hz)
- C_{load} from 100nF to 1000μF, large ESR range
- Output voltage programmable by bonding option (bare die version)
- Available in TO-254 package and bare die form (contact CISSOID) (for other package options, please contact CISSOID)
- The start-up is operative over the whole temperature range
- Latch-up free
- Validated at 225°C for 43800 hours (and still on-going)

Available voltages:

- CHT-LDOS-025: 2.5V
- CHT-LDOS-033: 3.3V
- CHT-LDOS-050: 5.0V
- CHT-LDOS-055 : 5.5V
- CHT-LDOS-090 : 9.0V
- CHT-LDOS-100 : 10.0V
- CHT-LDOS-120: 12.0V
- CHT-LDOS-130: 13.0V
- CHT-LDOS-150: 15.0V

Typical application

Absolute Maximum Ratings

Supply Voltage V_{in} -0.3V...40V
Junction Temperature⁽²⁾ (Tj) 315°C
Power dissipation⁽³⁾

Operating Conditions

Supply Voltage V_{in} to GND $V_{out}+(1V \text{ to } 20V)^{(1)}$
Junction temperature -55°C to +225°C
Power dissipation⁽³⁾

ESD Rating (expected)

Human Body Model <1kV

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Frequent or extended exposure to absolute maximum rating conditions or above may affect device reliability.

Electrical Characteristics

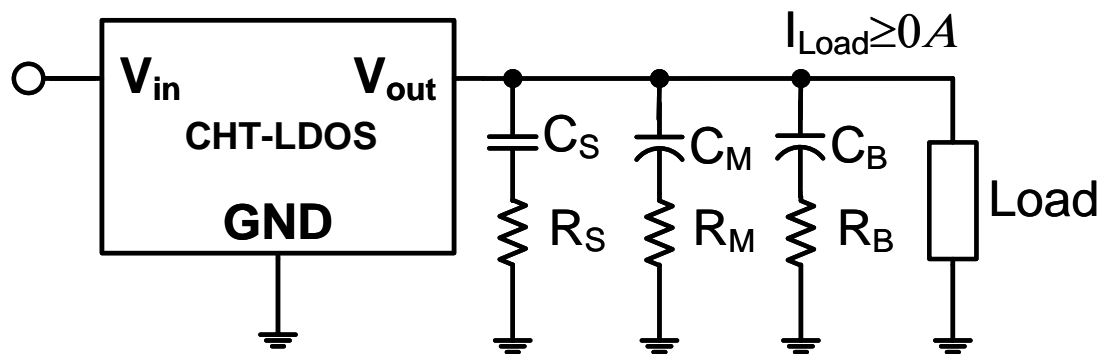

Unless otherwise stated, the following table is relative to the 5V mode (CHT-LDOS-050) with $V_{in}=7V$ ($V_{out}+2V$). For other nominal voltages, see notes under this table.

Parameter	Condition	Min	Typ	Max	Units	Note
Output voltage accuracy	$I_L=10mA$ -55°C <Tj <225°C	-2	0	2	%	
Output voltage Temperature drift	$I_L=10mA$ 25°C <Tj <225°C	0	40	80	ppm	(4)
Output voltage line regulation	dropout=2V to 15V $I_L=60mA$, -55°C <Tj <225°C	-1		1	mV/V	(5)
Output voltage load regulation (i.e. R_{out})	$I_L=10mA$ to 1A @2V dropout -55°C <Tj <225°C		0.04	0.1	V/A	(6)
(Vin-Vout) (drouput)	$I_L\leq 400mA$, -55°C <Tj <225°C	1			V	
	$I_L=1A$, -55°C <Tj <225°C	2			V	
Quiescent Ground Pin current	$0 < I_L < 1A$ -55°C 225°C		3.2 2.9		mA	(7)
Power supply rejection ratio	$f=0Hz \dots 100Hz$ $I_{load}=100mA$		60		dB	
Foldback current			2.5		A	
Short-circuit current	20°C <Tj <225°C		300		mA	
Output noise	10Hz-10kHz $I_L=100mA$, -30°C <Tj <225°C		tbd		μV_{RMS}	

Notes:

- (1) $V_{in} \max=30V$
- (2) Above 225°C (Tj), a minimum load current of few mA could be required.
- (3) Max Power dissipation depends on packaging. CHT-LDOS in TO-3 or TO-254 packages presents a "junction-to-case" thermal resistance of maximum 5°C/W (Rth).
- (4) ppm are defined as $[d(V_{out})/d(T)]/V_{out}$. For 5V mode, 40ppm corresponds to 200 $\mu V/V$.
- (5) Defining "x" as the nominal voltage, the line regulation is better than x/5 mV/V.
- (6) This includes the packaging parasitic resistor.
- (7) Defining "x" as the nominal voltage, the typical quiescent current at 2V dropout can be approximated as 2.8+x/13 mA @ -30°C and 2.5+x/13 mA at 225°C.

Output Load (recommended specifications)

Resistances in series with capacitors represent the internal ESR of these capacitors.

For large capacitors:

$C_B = 0$ to $1000\mu\text{F}$

$R_B = 0.2$ to $\infty \Omega$

For medium capacitors:

$C_M = 0$ to $6\mu\text{F}$

$R_M = 0.1$ to 1Ω

For small Capacitors:

$C_S = 100\text{n}$ to 220nF

$R_S = 10\text{m}$ to $50\text{m} \Omega$

Operating Conditions

Start-up conditions

The start-up is operative over the whole temperature range as long as the current flowing from a positive voltage and the negative voltage is below 500mA.

Please refer to our application notes for more details:

- **AN-06016:** "Selecting correct CIS-SOID regulator depending on your application"
- **AN-06002:** "Voltage regulator short-circuit protection and associated potential startup problem".

Power dissipation considerations

When determining the maximum power dissipated by the regulator, not only the dissipation during normal operation must be considered, but also the power dissipated during any eventual short circuit or overload.

During short circuit or overload, worst case conditions are normally found for maximum V_{in} and a shorting resistance in the order of few Ohms.

Entering into short-circuit or overload conditions with high input voltages V_{in} may lead to extreme overheating, placing the

part above Absolute Maximum Rating conditions.

Please refer to our application note for more detail:

- **AN-090477:** "Power Dissipation Considerations During Short Circuit Conditions"

Shorting the regulator input

If the input terminal is shorted to ground once the output capacitance has been charged, a large current corresponding to the discharge of the output capacitor will flow from the output to the input through the drain-body diode of the internal pass transistor. This large current may cause the permanent damage of the part.

Sinking current or raising the output voltage above the input voltage can cause permanent damage to the part.

Regulator floating ground

When the ground becomes disconnected, the output voltage gets unregulated, causing possible damage to other circuits connected to V_{out} . If the ground terminal is reconnected while V_{in} is applied, permanent damage may also occur to the regulator. If a regulator needs to be reconnected with the power supply on, then connect the ground terminal first.
