6 To set the custom codes (A0 - - A15)

The algorithm rule of the custom codes (A0 - - A15) can be selected by mask option , and the user can choose the CM2915-1 or CM2915-2 .

A. The CM2915-1 custom code

The value of ROM1 (8 bits) & ROM2 (8 bits) are both " 00H " , and it is decided by one mask layer . The A0 - - A7 are set by logical OR between the switches (S0 - - S7) and ROM1 . The A8 - - A15 equal some bits be inverted of A0 - - A7 , the inversion are decided by logical OR between the switches (S8 - - S15) and ROM2 .

www.DataSheet4U.com

For example :

External switch S0 - - S15 : →

S0 - - S7								S8 - - S15							
0	1	0	1	0	1	0	0	1	1	0	0	0	1	0	0

On chip ROM1 , ROM2 : →

ROM1								ROM2							
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

A0 - - A7 : →

(S0 - - S7) OR ROM1							
0	1	0	1	0	1	0	0

A8' - - A15' : →

(S8 - - S15) OR ROM2							
1	1	0	0	0	1	0	0
X	X	↓	↓	↓	X	↓	↓
A0	A1	-	-	-	A5	-	-
-	-	A2B	A3B	A4B	-	A6B	A7B

1 : non-inversion
0 : inversion

A8 - - A15 : →

0	1	1	0	1	1	1	1
---	---	---	---	---	---	---	---

Custom codes A0 - - A15 : →

LCD Driver (19*4) with Key Scan (4*8)

B. The CM2915-2 custom code

In this case , the 28 bits on chip MASK ROM (ROM2 & ROM3-0 , ROM3-1 , ROM3-2 and ROM3-3) is available and it is decided by one mask layer . The value of ROM2 is " 00H " and the value of ROM3 is show below " ROM3 option table " . The A0 - - A2 are set by S0 - - S7 (" A0 - - A2 option table ") . The A3 - - A7 are set by S14 & S15(" ROM3 option table ") . The A8 - - A15 equal some bits be inverted of A0 - - A7 and the inversion are decided by logical OR between the switches S8 - - S13 and ROM2 .

A0 - - A2 option table			
	A0	A1	A2
S0 = 1	0	0	0
S1 = 1	1	0	0
S2 = 1	0	1	0
S3 = 1	1	1	0
S4 = 1	0	0	1
S5 = 1	1	0	1
S6 = 1	0	1	1
S7 = 1	1	1	1

ROM3 option table							
S14	S15	A3	A4	A5	A6	A7	ROM3
0	0	0	0	0	0	0	ROM3-0
0	1	1	1	0	0	1	ROM3-1
1	0	0	0	0	0	1	ROM3-2
1	1	1	0	1	1	1	ROM3-3

S0 - - S7 are closed must only one.
Note : priority S7 > - - - > S0 (A0 - - A2 option table)

The vaules of the data codes (D0 - - D7)

The CM2915 contains 32 function keys . Each key corresponds to one data code . The CM2915 provide 3 double keys .

The 8-bit data codes of will define the inverse codes of the other 8-bit data codes (D8 - - D15) . D7 is defined by an external switch.

- Code D7=0 -> connect to vdd.
- Code D7=1 -> connect to vss.

7 Function Keys control

If two or more keys are depressed simultaneously (except K16+K26 & K16+K36 & K16+K46) , the transmission is disabled by the multi-depression prevention circuit . As regards the key transmission priority in the case of two depressions , with simultaneous depressions (± 36 ms) transmission is disabled and first depressions , later remainder priority is used .

When a key is pressed , reading of the custom code and key data code is started , and IRO output begins 36 ms later , so that if the key is begin depressed during this 36 ms interval one transmission is performed . If a key is held down for 108 ms or longer , consecutive transmissions of the leader code only are performed while the key is depressed . As a key interruption operation can handle an interval of up to 126 ms (from ON to ON) . It is possible to configure a system with an extremely fast response time .
