

## Four Channel Energy Measurement IC

### Features

- Superior Analog Performance with Ultra-low Noise Level and High SNR
- Energy Measurement Accuracy of 0.1% over 4000:1 Dynamic Range
- Current RMS Measurement Accuracy of 0.1% over 1000:1 Dynamic Range
- 4 Independent 24-bit, 4<sup>th</sup>-order, Delta-Sigma Modulators for Voltage and Current Measurements
- 4 Configurable Digital Outputs for Energy Pulses, Zero-crossing, or Energy Direction
- Supports Shunt Resistor, CT, and Rogowski Coil Current Sensors
- On-chip Measurements/Calculations:
  - Active, Reactive, and Apparent Power
  - RMS Voltage and Current
  - Power Factor and Line Frequency
  - Instantaneous Voltage, Current, and Power
- Overcurrent, Voltage Sag, and Voltage Swell Detection
- Ultra-fast On-chip Digital Calibration
- Internal Register Protection via Checksum and Write Protection
- UART/SPI™ Serial Interface
- On-chip Temperature Sensor
- On-chip Voltage Reference (25ppm/°C Typ.)
- Single 3.3V Power Supply
- Ultra-fine Phase Compensation
- Low Power Consumption: <13mW
- Power Supply Configurations
  - GNDA = GNDD = 0V, VDDA = +3.3V
- 5mmx5mm 28-pin QFN Package

### ORDERING INFORMATION

See [Page 68](#).

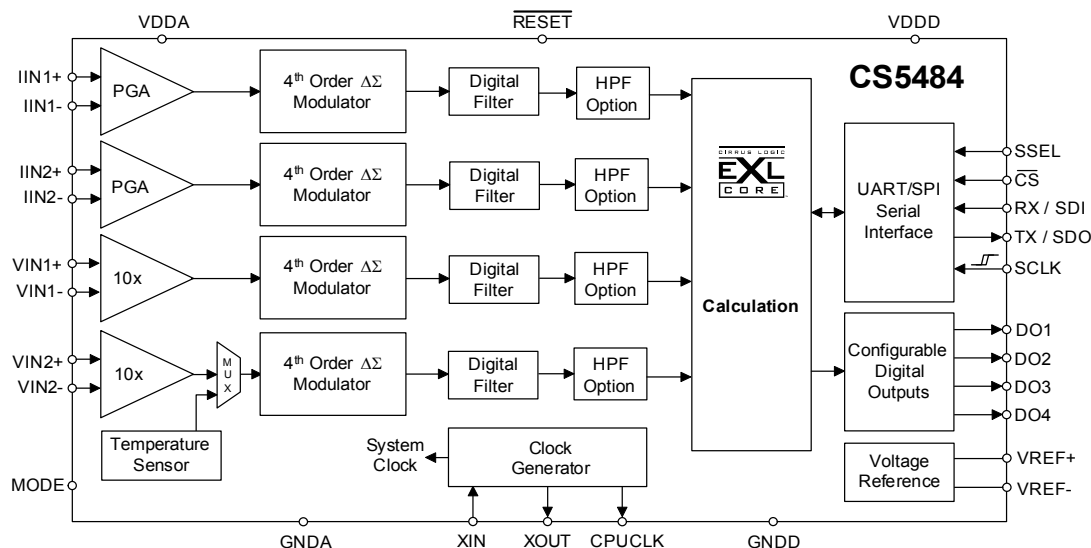

### Description

The CS5484 is a high-accuracy, four-channel, energy measurement analog front end.

The CS5484 incorporates independent 4<sup>th</sup> order Delta-Sigma analog-to-digital converters for every channel, reference circuitry, and the proven EXL signal processing core to provide active, reactive, and apparent energy measurement. In addition, RMS and power factor calculations are available. Calculations are output through a configurable energy pulse, or direct UART/SPI™ serial access to on-chip registers. Instantaneous current, voltage, and power measurements are also available over the serial port. Multiple serial options are offered to allow customer flexibility. The SPI provides higher speed, and the 2-wire UART minimizes the cost of isolation where required.

Four configurable digital outputs provide energy pulses, zero-crossing, energy direction, and interrupt functions. Interrupts can be generated for a variety of conditions including voltage sag or swell, overcurrent, and more. On-chip register integrity is assured via checksum and write protection. The CS5484 is designed to interface to a variety of voltage and current sensors including shunt resistors, current transformers, and Rogowski coils.

On-chip functionality makes digital calibration simple and ultra-fast, minimizing the time required at the end of the customer production line. Performance across temperature is ensured with an on-chip voltage reference with low drift. A single 3.3V power supply is required, and power consumption is low at <13mW. To minimize space requirements, the CS5484 is offered in a low-cost, 5mm x5mm 28-pin QFN package.

## 1. OVERVIEW

The CS5484 is a CMOS power measurement integrated circuit using four  $\Delta\Sigma$  analog-to-digital converters to measure two line voltages and two currents. Optionally, voltage2 channel can be used for temperature measurement. It calculates active, reactive, and apparent power as well as RMS voltage and current and peak voltage and current. It handles other system-related functions, such as energy pulse generation, voltage sag and swell, overcurrent and zero-crossing detection, and line frequency measurement.

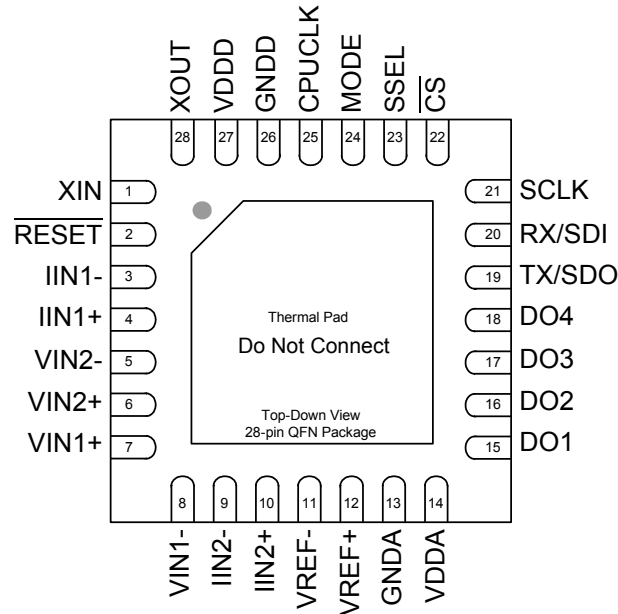

The CS5484 is optimized to interface to current transformers, shunt resistors, or Rogowski coils for current measurement and to resistive dividers or voltage transformers for voltage measurement. Two full-scale ranges are provided on the current inputs to accommodate different types of current sensors. The CS5484's four differential inputs have a common-mode input range from analog ground (GNDA) to the positive analog supply (VDDA).

An on-chip voltage reference (typically 2.4 volts) is generated and provided at analog output, VREF $\pm$ .

Four digital outputs (DO1, DO2, DO3, and DO4) provide a variety of output signals, and depending on the mode selected, provide energy pulses, zero-crossings, or other choices.

The CS5484 includes a UART/SPI™ serial host interface to an external microcontroller. The serial select (SSEL) pin is used to configure the serial port to be a SPI or UART. SPI signals include serial data input (SDI), serial data output (SDO), and serial clock (SCLK). UART signals include serial data input (RX) and serial data output (TX). A chip select ( $\overline{\text{CS}}$ ) signal allows multiple CS5484s to share the same serial interface with the microcontroller.

## 2. PIN DESCRIPTIONS

### Digital Pins and Serial Data I/O

<b>Digital Outputs</b>	15,16, 17,18	<b>DO1, DO2, DO3, DO4</b> — Configurable digital outputs for energy pulses, interrupt, energy direction, and zero-crossings.
<b>Reset</b>	2	<b>RESET</b> — An active-low Schmitt-trigger input used to reset the chip.
<b>Serial Data I/O</b>	19,20	<b>TX/SDO, RX/SDI</b> — UART/SPI serial data output/input.
<b>Serial Clock Input</b>	21	<b>SCLK</b> — Serial clock for the SPI.
<b>Chip Select</b>	22	<b>CS</b> — Chip select for the UART/SPI.
<b>Serial Mode Select</b>	23	<b>SSEL</b> — Selects the type of serial interface, UART or SPI™. Logic level one - UART selected. Logic level zero - SPI selected.
<b>Operating Mode Select</b>	24	<b>MODE</b> — Connect to VDDA for proper operation.

### Analog Inputs/Outputs

<b>Voltage Inputs</b>	7,8,6,5	<b>VIN1+, VIN1-, VIN2+, VIN2-</b> — Differential analog inputs for the voltage channels.
<b>Current Inputs</b>	4,3,10,9	<b>IIN1+, IIN1-, IIN2+, IIN2-</b> — Differential analog inputs for the current channels.
<b>Voltage Reference Input</b>	12,11	<b>VREF+, VREF-</b> — The internal voltage reference. A 0.1 µF bypass capacitor is required between these two pins.

### Power Supply Connections

<b>Internal Digital Supply</b>	27	<b>VDDD</b> — Decoupling pin for the internal 1.8V digital supply. A 0.1 µF bypass capacitor is required between this pin and GNDD.
<b>Digital Ground</b>	26	<b>GNDD</b> — Digital ground.
<b>Positive Analog Supply</b>	14	<b>VDDA</b> — The positive 3.3V analog supply.
<b>Analog Ground</b>	13	<b>GNDA</b> — Analog ground.

### Clock Generator

<b>Crystal In Crystal Out</b>	1,28	<b>XIN, XOUT</b> — Connect to an external quartz crystal. Alternatively, an external clock can be supplied to the XIN pin to provide the system clock for the device.
<b>CPU Clock Output</b>	25	<b>CPUCLK</b> — Output of on-chip oscillator which can drive one standard CMOS load.

<b>Thermal Pad</b>	-	No Electrical Connection.
--------------------	---	---------------------------

## 2.1 Analog Pins

The CS5484 has two differential inputs (VIN1±, VIN2±) for voltage input and two differential inputs (IIN1±, IIN2±) for current1 and current2 inputs. The CS5484 also has two voltage reference pins (VREF±) between which a bypass capacitor should be placed.

### 2.1.1 Voltage Inputs

The output of the line voltage resistive divider or transformer is connected to the VIN1± or VIN2± input pins of the CS5484. The voltage channel is equipped with a 10x, fixed-gain amplifier. The full-scale signal level that can be applied to the voltage channel is ±250mV. If the input signal is a sine wave, the maximum RMS voltage is  $250\text{mVp}/\sqrt{2} \approx 176.78\text{mV}_{\text{RMS}}$ , which is approximately 70.7% of maximum peak voltage.

### 2.1.2 Current Inputs

The output of the current-sensing shunt resistor, transformer, or Rogowski coil is connected to the IIN1± or IIN2± input pins of the CS5484. To accommodate different current-sensing elements, the current channel incorporates a programmable gain amplifier (PGA) with two selectable input gains, as described in the *Config0* register description (see section [6.6.1 Configuration 0 \(Config0\) – Page 0, Address 0](#) on page 35.) There is a 10x gain setting and a 50x gain setting. The full-scale signal level for current channels is ±50mV and ±250mV for 50x and 10x gain settings, respectively. If the input signal is a sine wave, the maximum RMS voltage is 35.35mV<sub>RMS</sub> or 176.78mV<sub>RMS</sub>, which is approximately 70.7% of maximum peak voltage.

### 2.1.3 Voltage Reference

The CS5484 generates a stable voltage reference of 2.4V between the VREF± pins. The reference system also requires a filter capacitor of at least 0.1 μF between the VREF± pins.

The reference system is capable of providing a reference for the CS5484 but has limited ability to drive external circuitry. It is strongly recommended that nothing other than the required filter capacitor be connected to the VREF± pins.

### 2.1.4 Crystal Oscillator

An external, 4.096MHz quartz crystal can be connected to the XIN and XOUT pins, as shown in [Figure 1](#). To reduce system cost, each pin is supplied with an on-chip load capacitor.

**Figure 1. Oscillator Connections**

Alternatively, an external clock source can be connected to the XIN pin.

## 2.2 Digital Pins

### 2.2.1 Reset Input

The active-low  $\overline{\text{RESET}}$  pin, when asserted for longer than 120μs, will halt all CS5484 operations and reset internal hardware registers and states. When de-asserted, an initialization sequence begins, setting default register values. To prevent erroneous noise-induced resets to the CS5484, an external pull-up resistor and a decoupling capacitor are necessary on the  $\overline{\text{RESET}}$  pin.

### 2.2.2 CPU Clock Output

A logic-level clock output (CPUCLK) is provided at the crystal frequency to drive another CS5484 IC or external microcontroller. Writing '1' to bit CPUCLK\_ON of the *Config0* register enables the CPU clock output. After the CPU clock output is enabled, it can be disabled only by a power-on reset (POR) or by writing '0' to the CPUCLK\_ON bit. A hardware reset through pin/ $\overline{\text{RESET}}$  or a software reset instruction through the serial interface will not disable the CPU clock output. Two phase choices are available on the CPUCLK pin through bit iCPUCLK of the *Config0* register. Different from the CPUCLK\_ON bit, the iCPUCLK bit can be cleared by a POR, a hardware reset, a software reset instruction, or a register write.

### 2.2.3 Digital Outputs

The CS5484 provides four configurable digital outputs (DO1-DO4). They can be configured to output energy pulses, interrupt, zero-crossings, or energy directions. Refer to section [6.6.2 Configuration 1 \(Config1\) – Page 0, Address 1](#) on page 36 for more details.

### 2.2.4 UART/SPI™ Serial Interface

The CS5484 provides five pins—SSEL, RX/SDI, TX/SDO,  $\overline{\text{CS}}$ , and SCLK—for communication between a host microcontroller and the CS5484.

SSEL is an input that, when low, indicates to the CS5484 to use the SPI port as the serial interface to communicate with the host microcontroller. The SSEL pin has an internal weak pull-up. When the SSEL pin is left unconnected or pulled high externally, the UART port is used as the serial interface.

### 2.2.5 SPI

The CS5484 provides a Serial Peripheral Interface (SPI) that operates as a slave device in 4-wire mode and supports multiple slaves on the SPI bus. The 4-wire SPI includes  $\overline{\text{CS}}$ , SCLK, SDI, and SDO signals.

$\overline{\text{CS}}$  is the chip select input for the CS5484 SPI port. A high logic level de-asserts it, tri-stating the SDO pin and clearing the SPI interface. A low logic level enables the SPI port. Although the  $\overline{\text{CS}}$  pin may be tied low for systems that do not require multiple SDO drivers, using the  $\overline{\text{CS}}$  signal is strongly recommended to achieve more reliable SPI communications.

SCLK is the serial clock input for the CS5484 SPI port. Serial data changes as a result of the falling edge of SCLK and is valid at the rising edge. The SCLK pin is a Schmitt-trigger input.

SDI is the serial data input to the CS5484.

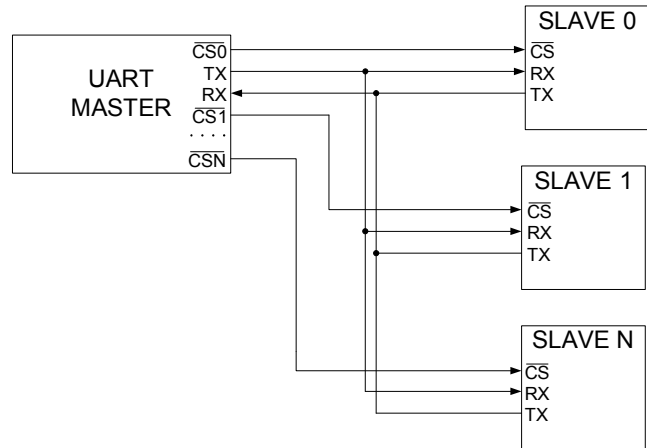

SDO is the serial data output from the CS5484.

The CS5484 SPI transmits and receives data MSB first. Refer to [Switching Characteristics](#) on page 14 and [Figure 7](#) on page 15 for more detailed information about SPI timing.

### 2.2.6 UART

The CS5484 device contains an asynchronous, full-duplex UART. The UART may be used in either standard 2-wire communication mode (RX/TX) for connecting a single device or 3-wire communication mode (RX/TX/ $\overline{\text{CS}}$ ) for connecting multiple devices. When connecting a single CS5484 device,  $\overline{\text{CS}}$  should be held low to enable the UART. Multiple CS5484 devices can communicate to the same master UART in the 3-wire mode by pulling a slave  $\overline{\text{CS}}$  pin low during data transmissions. Common RX and TX signals are provided to all the slave devices, and each slave device

requires a separate  $\overline{\text{CS}}$  signal for enabling communication to that slave. The multi-device UART mode connections are shown in [Figure 2](#).

**Figure 2. Multi-device UART Connections**

The multi-device UART mode timing diagram provides the timing requirements for the  $\overline{\text{CS}}$  control (see [Figure 8. Multi-Device UART Timing](#) on Page 15).

The CS5484 UART operates in 8-bit mode, which transmits a total of 10 bits per byte. Data is transmitted and received LSB first, with one start bit, eight data bits, and one stop bit.

**Figure 3. UART Serial Frame Format**

The baud rate is defined in the *SerialCtrl* register. After chip reset, the default baud rate is 600, if MCLK is 4.096MHz. The baud rate is based on the contents of bits BR[15:0] in the *SerialCtrl* register and is calculated as follows:

$$\text{BR}[15:0] = \text{Baud Rate} \times (524288 / \text{MCLK})$$

$$\text{Baud Rate} = \text{BR}[15:0] / (524288 / \text{MCLK})$$

The maximum baud rate is 512K if MCLK is 4.096MHz.

### 2.2.7 MODE Pin

The MODE pin must be tied to VDDA for normal operation. The MODE pin is used primarily for factory test procedures.

### 3. CHARACTERISTICS AND SPECIFICATIONS

#### RECOMMENDED OPERATING CONDITIONS

Parameter	Symbol	Min	Typ	Max	Unit
Positive Analog Power Supply	VDDA	3.0	3.3	3.6	V
Specified Temperature Range	T <sub>A</sub>	-40	-	+85	°C

#### POWER MEASUREMENT CHARACTERISTICS

Parameter	Symbol	Min	Typ	Max	Unit
Active Energy (Note 1 and 2) All Gain Ranges Current Channel Input Signal Dynamic Range 4000:1	P <sub>Avg</sub>	-	±0.1	-	%
Reactive Energy (Note 1 and 2) All Gain Ranges Current Channel Input Signal Dynamic Range 4000:1	Q <sub>Avg</sub>	-	±0.1	-	%
Apparent Power (Note 1 and 3) All Gain Ranges Current Channel Input Signal Dynamic Range 1000:1	S	-	±0.1	-	%
Current RMS (Note 1, 3, and 4) All Gain Ranges Current Channel Input Signal Dynamic Range 1000:1	I <sub>RMS</sub>	-	±0.1	-	%
Voltage RMS (Note 1 and 3) Voltage Channel Input Signal Dynamic Range 20:1	V <sub>RMS</sub>	-	±0.1	-	%
Power Factor (Note 1 and 3) All Gain Ranges Current Channel Input Signal Dynamic Range 1000:1	PF	-	±0.1	-	%

- Notes:
- Specifications guaranteed by design and characterization.
  - Active energy is tested with power factor (PF) = 1.0. Reactive energy is tested with Sin(φ) = 1.0. Energy error measured at system level using a single energy pulse. Where: 1) One energy pulse = 0.5Wh or 0.5Varh; 2) VDDA = +3.3V, T<sub>A</sub> = 25°C, MCLK = 4.096MHz; 3) System is calibrated.
  - Calculated using register values; N ≥ 4000.
  - I<sub>RMS</sub> error calculated using register values. 1) VDDA = +3.3V; T<sub>A</sub> = 25°C; MCLK = 4.096MHz; 2) AC offset calibration applied.

#### TYPICAL LOAD PERFORMANCE

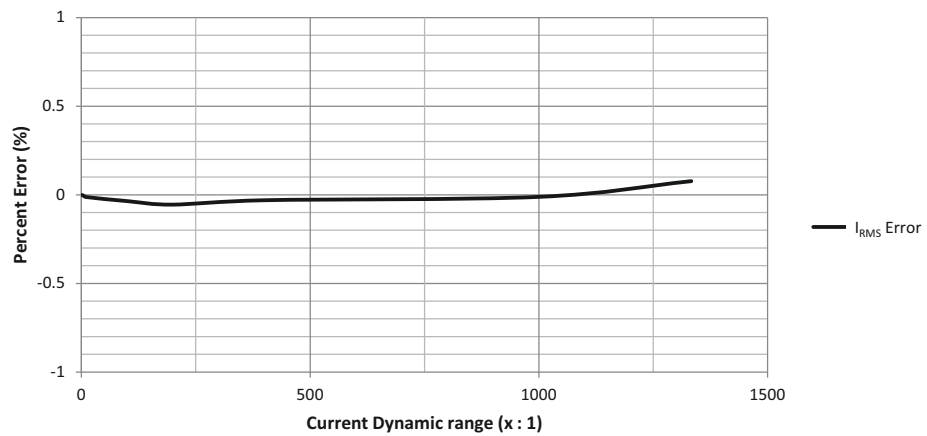

- Energy error measured at system level using single energy pulse; where one energy pulse = 0.5Wh or 0.5Varh
- I<sub>RMS</sub> error calculated using register values
- VDDA = +3.3V; T<sub>A</sub> = 25°C; MCLK = 4.096MHz

**Figure 4. Active Energy Load Performance**

Parameter	Symbol	Min	Typ	Max	Unit
<b>Power Supplies</b>					
Power Supply Currents (Active State) $I_{A+}$ (VDDA = +3.3V)	PSCA	-	3.9	-	mA
Power Consumption (Note 5)	PC	-	12.9	-	mW
		-	4.5	-	mW

- Notes:
5. All outputs unloaded. All inputs CMOS level.
  6. Temperature accuracy measured after calibration is performed.
  7. Measurement method for PSRR: VDDA = +3.3V, a 150mV (zero-to-peak) (60Hz) sine wave is imposed onto the +3.3V DC supply voltage at the VDDA pin. The "+" and "-" input pins of both input channels are shorted to GNDA. The CS5484 is then commanded to continuous conversion acquisition mode, and digital output data is collected for the channel under test. The (zero-to-peak) value of the digital sinusoidal output signal is determined, and this value is converted into the (zero-to-peak) value of the sinusoidal voltage (measured in mV) that would need to be applied at the channel's inputs in order to cause the same digital sinusoidal output. This voltage is then defined as  $V_{eq}$ . PSRR is (in dB):

$$PSRR = 20 \cdot \log \left[ \frac{150}{V_{eq}} \right]$$

## VOLTAGE REFERENCE

Parameter	Symbol	Min	Typ	Max	Unit
<b>Reference</b> (Note 8)					
Output Voltage	VREF	+2.3	+2.4	+2.5	V
Temperature Coefficient (Note 9)	$TC_{VREF}$	-	25	-	ppm/°C
Load Regulation (Note 10)	$\Delta V_R$	-	30	-	mV

- Notes:
8. It is strongly recommended that no connection other than the required filter capacitor be made to VREF±.
  9. The voltage at VREF± is measured across the temperature range. From these measurements the following formula is used to calculate the VREF temperature coefficient:

$$TC_{VREF} = \left( \frac{VREF_{MAX} - VREF_{MIN}}{VREF_{AVG}} \right) \left( \frac{1}{T_{A MAX} - T_{A MIN}} \right) (1.0 \times 10^6)$$

10. Specified at maximum recommended output of 1µA sourcing. VREF is a sensitive signal; the output of the VREF circuit has a high output impedance so that the 0.1µF reference capacitor provides attenuation even to low-frequency noise, such as 50Hz noise on the VREF output. Therefore VREF intended for the CS5484 only and should not be connected to any external circuitry. The output impedance is sufficiently high that standard digital multi-meters can significantly load this voltage. The accuracy of the metrology IC cannot be guaranteed when a multimeter or any component other than the 0.1µF capacitor is attached to VREF. If it is desired to measure VREF for any reason other than a very coarse indicator of VREF functionality, Cirrus recommends a very high input impedance multimeter such as the Keithley Model 2000 Digital Multimeter be used. Cirrus cannot guarantee the accuracy of the metrology with this meter connected to VREF.

## DIGITAL CHARACTERISTICS

- Min / Max characteristics and specifications are guaranteed over all [Recommended Operating Conditions](#).
- Typical characteristics and specifications are measured at nominal supply voltages and  $T_A = 25^\circ\text{C}$ .
- $V_{DDA} = +3.3\text{V} \pm 10\%$ ;  $G_{NDA} = G_{NDD} = 0\text{V}$ . All voltages with respect to 0V.
- $MCLK = 4.096\text{MHz}$ .

Parameter	Symbol	Min	Typ	Max	Unit
<b>Master Clock Characteristics</b>					
XIN Clock Frequency Internal Gate Oscillator	MCLK	2.5	4.096	5	MHz
<b>Filter Characteristics</b>					
Phase Compensation Range (60Hz, OWR = 4000Hz)		-10.79	-	+10.79	°
Input Sampling Rate		-	MCLK/8	-	Hz
Digital Filter Output Word Rate (Both channels)	OWR	-	MCLK/1024	-	Hz
High-pass Filter Corner Frequency -3dB		-	2.0	-	Hz
<b>Input/Output Characteristics</b>					
High-level Input Voltage (All Pins)	$V_{IH}$	0.6( $V_{DDA}$ )	-	-	V
Low-level Input Voltage (All Pins)	$V_{IL}$	-	-	0.6	V
High-level Output Voltage (Note 12) DO1-DO4, $I_{out} = +10\text{mA}$ All Other Outputs, $I_{out} = +5\text{mA}$	$V_{OH}$	$V_{DDA}-0.3$ $V_{DDA}-0.3$	- -	- -	V V

- Notes:
11. All measurements performed under static conditions.
  12. XOUT pin used for crystal only. Typical drive current  $< 1\text{mA}$ .

## SWITCHING CHARACTERISTICS

- Min / Max characteristics and specifications are guaranteed over all [Recommended Operating Conditions](#).
- Typical characteristics and specifications are measured at nominal supply voltages and  $T_A = 25^\circ\text{C}$ .
- $V_{DDA} = +3.3\text{V} \pm 10\%$ ;  $G_{NDA} = G_{NDD} = 0\text{V}$ . All voltages with respect to 0V.
- Logic Levels: Logic 0 = 0V, Logic 1 =  $V_{DDA}$ .

Parameter	Symbol	Min	Typ	Max	Unit
Rise Times (Note 13) DO1-DO4 Any Digital Output Except DO1-DO4	$t_{\text{rise}}$	- -	- 50	1.0 -	$\mu\text{s}$ ns
Fall Times (Note 13) DO1-DO4 Any Digital Output Except DO1-DO4	$t_{\text{fall}}$	- -	- 50	1.0 -	$\mu\text{s}$ ns
<b>Start-up</b>					
Oscillator Start-up Time XTAL = 4.096 MHz (Note 14)	$t_{\text{ost}}$	-	60	-	ms
<b>SPI Timing</b>					
Serial Clock Frequency (Note 15)	SCLK	-	-	2	MHz
Serial Clock Pulse Width High Pulse Width Low	$t_1$	200	-	-	ns
	$t_2$	200	-	-	ns
$\overline{\text{CS}}$ Enable to SCLK Falling	$t_3$	50	-	-	ns
Data Set-up Time prior to SCLK Rising	$t_4$	50	-	-	ns
Data Hold Time After SCLK Rising	$t_5$	100	-	-	ns
SCLK Rising Prior to $\overline{\text{CS}}$ Disable	$t_6$	1	-	-	$\mu\text{s}$
SCLK Falling to New Data Bit	$t_7$	-	-	150	ns
$\overline{\text{CS}}$ Rising to SDO Hi-Z	$t_8$	-	-	250	ns
<b>UART Timing</b>					
$\overline{\text{CS}}$ Enable to RX START bit	$t_9$	5	-	-	ns
STOP bit to $\overline{\text{CS}}$ Disable	$t_{10}$	1	-	-	$\mu\text{s}$
$\overline{\text{CS}}$ Disable to TX IDLE Hold Time	$t_{11}$	-	-	250	ns

- Notes:
- Specified using 10% and 90% points on waveform of interest. Output loaded with 50pF.
  - Oscillator start-up time varies with crystal parameters. This specification does not apply when using an external clock source.
  - The maximum SCLK is 2MHz during a byte transaction. The minimum 1 $\mu\text{s}$  idle time is required on the SCLK between two consecutive bytes.

**Figure 7. SPI Data and Clock Timing**

\* Reading registers during the optional overlap instruction requires the start to occur during the last byte transmitted by the part

Storage Temperature	T <sub>stg</sub>	-65	-	150	°C

- Notes:
- 16. VDDA and GNDA must satisfy [(VDDA) – (GNDA)] ≤ + 4.0V.
  - 17. Applies to all pins, including continuous overvoltage conditions at the analog input pins.
  - 18. Transient current of up to 100mA will not cause SCR latch-up.
  - 19. Applies to all pins, except VREF±.
  - 20. Total power dissipation, including all input currents and output currents.
  - 21. Applies to all pins.

**WARNING:**

Operation at or beyond these limits may result in permanent damage to the device.  
Normal operation is not guaranteed at these extremes.

**Figure 9. Signal Flow for V1, I1, P1, and Q1 Measurements**

## 4. SIGNAL FLOW DESCRIPTION

The signal flow for voltage measurement, current measurement, and the other calculations is shown in [Figures 9, 10, and 11](#).

The signal flow consists of two current channels and two voltage channels. The current and voltage channels have differential input pins.

### 4.1 Analog-to-Digital Converters

All four input channels use fourth-order delta-sigma modulators to convert the analog inputs to single-bit digital data streams. The converters sample at a rate of  $MCLK/8$ . This high sampling provides a wide dynamic range and simplifies anti-alias filter design.

### 4.2 Decimation Filters

The single-bit modulator output data is widened to 24 bits and down sampled to  $MCLK/1024$  with low-pass decimation filters. These decimation filters are

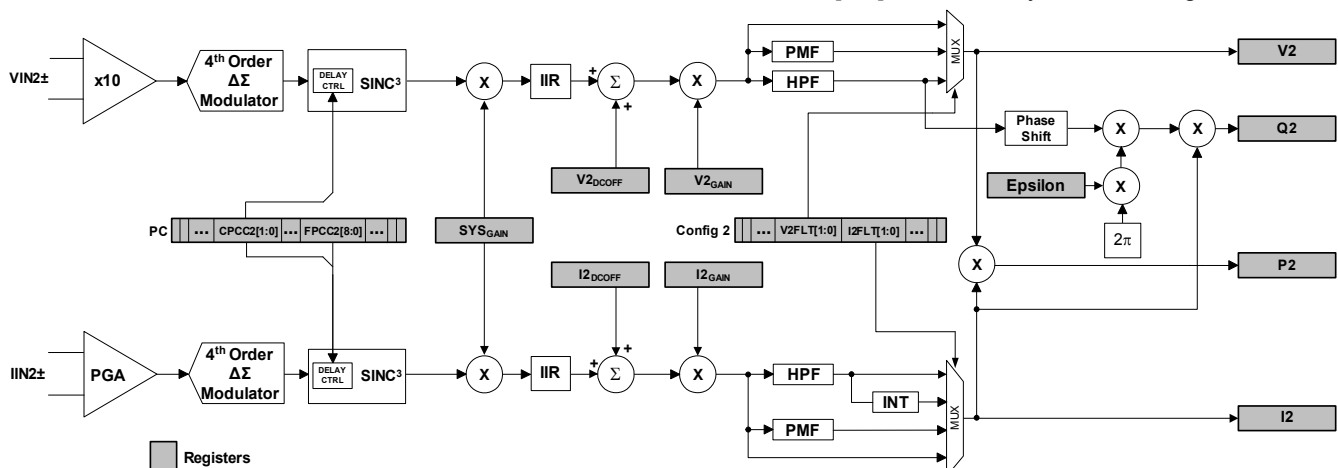

third-order Sinc filters. The filter outputs pass through an IIR "anti-sinc" filter.

### 4.3 IIR Filters

The IIR filters are used to compensate for the amplitude roll-off of the decimation filters. The droop-correction filter flattens the magnitude response of the channel out to the Nyquist frequency, thus allowing for accurate measurements of up to 2 kHz ( $MCLK = 4.096$  MHz). By default, the IIR filters are enabled. The IIR filters can be bypassed by setting the IIR\_OFF bit in the *Config2* register.

### 4.4 Phase Compensation

Phase compensation changes the phase of voltage relative to current by adding a delay in the decimation filters. The amount of phase shift is set by the PC register bits CPCCx[1:0] and FPCCx[8:0] for current channels. Bits CPCCx[1:0] set the delay for the voltage channels.

**Figure 10. Signal Flow for V2, I2, P2, and Q2 Measurements**

Fine phase compensation control bits,  $FPCCx[8:0]$ , provide up to  $1/OWR$  delay in the current channel. Coarse phase compensation control bits,  $CPCCx[1:0]$ , provide an additional  $1/OWR$  delay in the current channels or up to  $2/OWR$  delay in the voltage channel. Negative delay in the voltage channel can be implemented by setting longer delay in the current channel than the voltage channel. For a  $OWR$  of 4000Hz, the delay range is  $\pm 500\mu s$ , a phase shift of  $\pm 8.99^\circ$  at 50Hz and  $\pm 10.79^\circ$  at 60Hz. The step size is 0.008789° at 50Hz and 0.010547° at 60Hz.

#### 4.5 DC Offset and Gain Correction

The system and CS5484 inherently have component tolerances, gain, and offset errors, which can be removed using the gain and offset registers. Each measurement channel has its own set of gain and offset registers. For every instantaneous voltage and current sample, the offset and gain values are used to correct DC offset and gain errors in the channel (see section 7. [System Calibration](#) on page 62 for more details).

#### 4.6 High-pass and Phase Matching Filters

Optional high-pass filters (HPF in [Figures 9 and 10](#)) remove any DC component from the selected signal paths. Each power calculation contains a current and voltage channel. If an HPF is enabled in only one channel, a phase-matching filter (PMF) should be applied to the other channel to match the phase response of the HPF. For AC power measurement, high-pass filters should be enabled on the voltage and current channels. For information about how to enable and disable the HPF or PMF on each channel, refer to section 6.6.3 [Configuration 2 \(Config2\) – Page 16, Address 0](#) on page 38.

#### 4.7 Digital Integrators

Optional digital integrators (INT in [Figures 9 and 10](#)) are implemented on both current channels ( $I1, I2$ ) to compensate for the  $90^\circ$  phase shift and 20dB/decade gain generated by the Rogowski coil current sensor. When a Rogowski coil is used as the current sensor, the integrator (INT) should be enabled on that current channel. For information about how to enable and disable the INT on each current channel, refer to section 6.6.3 [Configuration 2 \(Config2\) – Page 16, Address 0](#) on page 38.

#### 4.8 Low-rate Calculations

All the RMS and power results come from low-rate calculations by averaging the output word rate (OWR) instantaneous values over  $N$  samples, where  $N$  is the value stored in the *SampleCount* register. The low-rate interval or averaging period is  $N$  divided by  $OWR$  (4000Hz if  $MCLK = 4.096MHz$ ).

The CS5484 provides two averaging modes for low-rate calculations: Fixed Number of Samples Averaging mode and Line-cycle Synchronized Averaging mode. By default, the CS5484 averages with the Fixed Number of Samples Averaging mode. By setting the  $AVG\_MODE$  bit in the *Config2* register, the CS5484 will use the Line-cycle Synchronized Averaging mode.

##### 4.8.1 Fixed Number of Samples Averaging

$N$  is the preset value in the *SampleCount* register and should not be set less than 100. By default, the *SampleCount* is 4000. With  $MCLK = 4.096MHz$ , the averaging period is fixed at  $N/4000 = 1$  second, regardless of the line frequency.

**Figure 11. Low-rate Calculations**

#### 4.8.2 Line-cycle Synchronized Averaging

When operating in Line-cycle Synchronized Averaging mode, and when line frequency measurement is enabled (see section 5.4 [Line Frequency Measurement](#) on page 22), the CS5484 uses the voltage (V) channel zero crossings and measured line frequency to automatically adjust  $N$  such that the averaging period will be equal to the number of half line-cycles in the *CycleCount* register. For example, if the line frequency is 51 Hz, and the *CycleCount* register is set to 100,  $N$  will be  $4000 \times (100/2)/51 = 3921$  during continuous conversion.  $N$  is self-adjusted according to the line frequency, therefore the averaging period is always close to the whole number of half line-cycles, and the low-rate calculation results will minimize ripple and maximize resolution, especially when the line frequency varies. Before starting a low-rate conversion in the Line-cycle Synchronized Averaging mode, the *SampleCount* register should not be changed from its default value of 4000, and bit AFC of the *Config2* register must be set. During continuous conversion, the host processor should not change the *SampleCount* register.

#### 4.8.3 RMS Current and Voltage

The root mean square (RMS in [Figure 11](#)) calculations are performed on  $N$  instantaneous current and voltage samples using Equation 1:

$$\text{RMS} = \sqrt{\frac{\sum_{n=0}^{N-1} I_n^2}{N}} \quad V_{\text{RMS}} = \sqrt{\frac{\sum_{n=0}^{N-1} V_n^2}{N}} \quad [\text{Eq: 1}]$$

#### 4.8.4 Active Power

The instantaneous voltage and current samples are multiplied to obtain the instantaneous power ( $P1$ ,  $P2$ ) (see [Figures 9](#) and [10](#)). The product is then averaged over  $N$  samples to compute active power ( $P1_{\text{AVG}}$ ,  $P2_{\text{AVG}}$ ).

#### 4.8.5 Reactive Power

Instantaneous reactive power ( $Q1$ ,  $Q2$ ) are sample rate results obtained by multiplying instantaneous current ( $I1$ ,  $I2$ ) by instantaneous quadrature voltage ( $V1Q$ ,  $V2Q$ ), which are created by phase shifting instantaneous voltage ( $V1$ ,  $V2$ ) 90 degrees using first-order integrators (see [Figures 9](#) and [10](#)). The gain of these integrators is inversely related to line frequency, so their gain is corrected by the *Epsilon* register, which is based on line frequency. Reactive power ( $Q1_{\text{AVG}}$ ,  $Q2_{\text{AVG}}$ ) is generated by integrating the instantaneous quadrature power over  $N$  samples.

#### 4.8.6 Apparent Power

By default, the CS5484 calculates the apparent power ( $S1$ ,  $S2$ ) as the product of RMS voltage and current, as shown in Equation 2:

$$S = V_{\text{RMS}} \times I_{\text{RMS}} \quad [\text{Eq: 2}]$$

The CS5484 also provides an alternate apparent power calculation method. The alternate apparent power method uses real power ( $P1_{\text{AVG}}$ ,  $P2_{\text{AVG}}$ ) and reactive power ( $Q1_{\text{AVG}}$ ,  $Q2_{\text{AVG}}$ ) to calculate apparent power. See Equation 3:

$$S = \sqrt{Q_{\text{AVG}}^2 + P_{\text{AVG}}^2} \quad [\text{Eq: 3}]$$

The APCM bit in the *Config2* register controls which method is used for apparent power calculation.

#### 4.8.7 Peak Voltage and Current

Peak current ( $I1_{\text{PEAK}}$ ,  $I2_{\text{PEAK}}$ ) and peak voltage ( $V1_{\text{PEAK}}$ ,  $V2_{\text{PEAK}}$ ) are calculated over  $N$  samples and recorded in the corresponding channel peak register documented in the register map. This peak value is updated every  $N$  samples.

#### 4.8.8 Power Factor

Power factor ( $PF1$ ,  $PF2$ ) is active power divided by apparent power. The sign of the power factor is determined by the active power. See Equation 4:

$$\text{PF} = \frac{P_{\text{ACTIVE}}}{S} \quad [\text{Eq: 4}]$$

#### 4.9 Average Active Power Offset

The average active power offset registers,  $P1_{OFF}$  ( $P2_{OFF}$ ), can be used to offset erroneous power sources resident in the system not originating from the power line. Residual power offsets are usually caused by crosstalk into current channels from voltage channels, or from ripple on the meter's or chip's power supply, or from inductance from a nearby transformer.

These offsets can be either positive or negative, indicating crosstalk coupling either in phase or out of phase with the applied voltage input. The power offset registers can compensate for either condition.

To use this feature, measure the average power at no load. Take the measured result (from the  $P1_{AVG}$  ( $P2_{AVG}$ ) register), invert (negate) the value, and write it to the associated average active power offset register,  $P1_{OFF}$  ( $P2_{OFF}$ ).

#### 4.10 Average Reactive Power Offset

The average reactive power offset registers,  $Q1_{OFF}$  ( $Q2_{OFF}$ ), can be used to offset erroneous power sources resident in the system not originating from the power line. Residual reactive power offsets are usually caused by crosstalk into current channels from voltage channels, or from ripple on the meter's or chip's power supply, or from inductance from a nearby transformer.

These offsets can be either positive or negative, depending on the phase angle between the crosstalk coupling and the applied voltage. The reactive power offset registers can compensate for either condition. To use this feature, measure the average reactive power at no load. Take the measured result from the  $Q1_{AVG}$  ( $Q2_{AVG}$ ) register, invert (negate) the value and write it to the associated reactive power offset register,  $Q1_{OFF}$  ( $Q2_{OFF}$ ).

## 5. FUNCTIONAL DESCRIPTION

### 5.1 Power-on Reset

The CS5484 has an internal power supply supervisor circuit that monitors the VDDA and VDDD power supplies and provides the master reset to the chip. If any of these voltages are in the reset range, the master reset is triggered.

The CS5484 has dedicated power-on reset (POR) circuits for the analog supply and digital supply. During power-up, both supplies have to be above the rising threshold for the master reset to be de-asserted.

Each POR is divided into two blocks: rough and fine. Rough POR triggers the fine POR. Rough POR depends only on the supply voltage. The trip point for the fine POR is dependent on bandgap voltage for precise control. The POR circuit also acts as a brownout detect. The fine POR detects supply drops and asserts the master reset. The rough and fine PORs have hysteresis in their rise and fall thresholds, which prevents the reset signal from chattering.

Figure 12 shows the POR outputs for each of the power supplies. The POR\_Fine\_VDDA and POR\_Fine\_VDDD signals are AND-ed to form the actual power-on reset signal to the digital circuitry. The digital circuitry, in turn, holds the master reset signal for 130ms and then de-asserts the master reset.

**Figure 12. Power-on Reset Timing**

**Table 1. POR Thresholds**

Typical POR Threshold		Rising	Falling
VDDA	Rough	$V_{th1} = 2.34\text{ V}$	$V_{th6} = 2.06\text{ V}$
	Fine	$V_{th2} = 2.77\text{ V}$	$V_{th5} = 2.59\text{ V}$
VDDD	Rough	$V_{th3} = 1.20\text{ V}$	$V_{th8} = 1.06\text{ V}$
	Fine	$V_{th4} = 1.51\text{ V}$	$V_{th7} = 1.42\text{ V}$

### 5.2 Power Saving Modes

Power Saving modes for the CS5484 are accessed through the Host Commands (see section [6.1 Host Commands](#) on page 27).

- Standby: Powers down all the ADCs, rough buffer, and the temperature sensor. Standby mode disables the system time calculations. Use the wake-up command to come out of standby mode.
- Wake-up: Clears the ADC power-down bits and starts the system time calculations.

After any of these commands are completed, the DRDY bit is set in the *Status0* register.

### 5.3 Zero-crossing Detection

Zero-crossing detection logic is implemented in the CS5484. One current and one voltage channel can be selected for zero-crossing detection. The IZX\_CH and VZX\_CH control bits in the *Config0* register are used to select the zero-crossing channel. A low-pass filter can be enabled by setting the ZX\_LPF bit in register *Config2*. The low-pass filter has a cut-off frequency of 80Hz. It is used to eliminate any harmonics and help the zero-crossing detection on the 50Hz or 60Hz fundamental component. The zero-crossing level registers are used to set the minimum threshold over which the channel peak must exceed in order for the zero-crossing detection logic to function. There are two separate zero-crossing level registers:  $VZX_{LEVEL}$  is the threshold for the voltage channels, and  $IZX_{LEVEL}$  is the threshold for the current channels.

**Figure 13. Zero-crossing Level and Zero-crossing Output on DOx**

## 5.4 Line Frequency Measurement

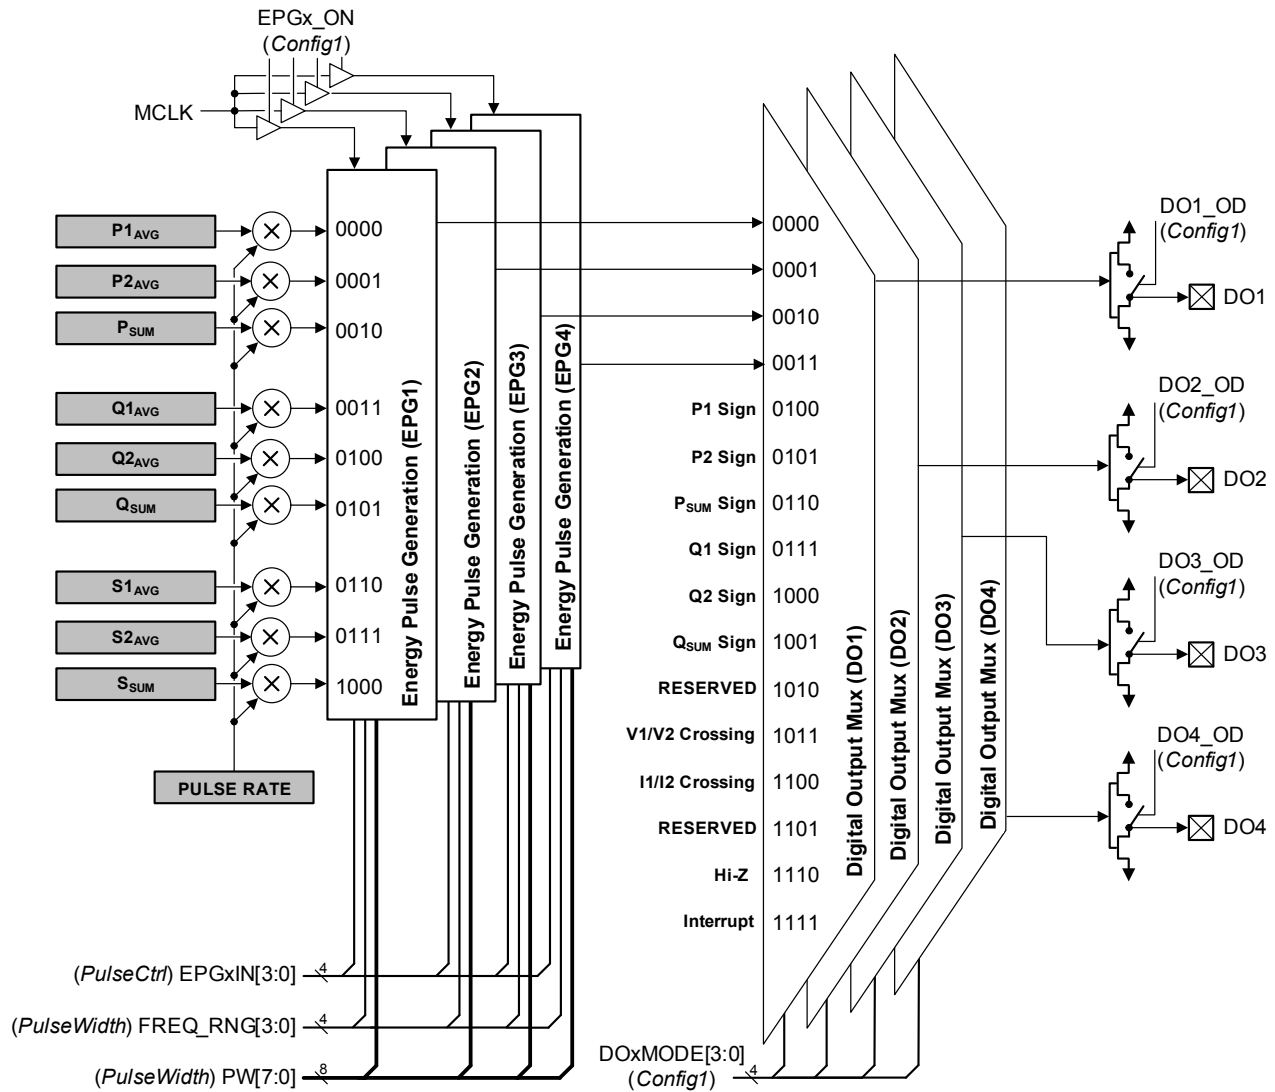

If the Automatic Frequency Calculation (AFC) bit in the *Config2* register is set, the line frequency measurement on the voltage channel will be enabled. The line frequency measurement is based on a number of voltage channel zero crossings. This number is 100 by default and configurable through the *ZX\_NUM* register (see section 6.6.76 on page 61). The *Epsilon* register will be updated automatically with the line frequency information. The Frequency Update (FUP) bit in the *Status0* interrupt status register is set when the frequency calculation is completed. When the line frequency is 50Hz and the *ZX\_NUM* register is 100, the *Epsilon* register is updated every one second with a resolution of less than 0.1%. A larger zero-crossing number in the *ZX\_NUM* register will increase line frequency measurement resolution and the period. Note that the CS5484 line frequency measurement function does not support the line frequency out of the range of 40Hz to 75Hz.

The *Epsilon* register is also used to set the gain of the 90° phase shift filter used in the quadrature power calculation. The value in the *Epsilon* register is the ratio of the line frequency to the output word rate (OWR). For 50Hz line frequency and 4000Hz OWR, *Epsilon* is 50/4000 (0.0125) (the default). For 60Hz line frequency, it is 60/4000 (0.015).

## 5.5 Energy Pulse Generation

The CS5484 provides four independent energy pulse generation blocks (EPG1, EPG2, EPG3, and EPG4) in order to simultaneously output active, reactive, and apparent energy pulses on any of the four digital output pins (DO1, DO2, DO3, and DO4). The energy pulse frequency is proportional to the magnitude of the power. The energy pulse output is commonly used as the test output of a power meter. The host microcontroller can also use the energy pulses to easily accumulate the energy. Refer to Figure 14.

**Figure 14. Energy Pulse Generation and Digital Output Control**

After reset, all four energy pulse generation blocks are disabled ( $DOxMODE[3:0] = \text{Hi-Z}$ ). To output a desired energy pulse to a  $DOx$  pin, it is necessary to follow the steps below:

1. Write to register *PulseWidth* (page 0, address 8) to select the energy pulse width and pulse frequency range.
2. Write to register *PulseRate* (page 18, address 28) to select the energy pulse rate.
3. Write to register *PulseCtrl* (page 0, address 9) to select the input to each energy pulse generation block.
4. Write '1' to bit  $EPGx\_ON$  of register *Config1* (page 0, address 1) to enable the desired energy pulse generation blocks.
5. Wait at least 0.1 seconds.
6. Write bits  $DOxMODE[3:0]$  of register *Config1* to select  $DOx$  to output pulses from the appropriate energy pulse generation block.
7. Send DSP instruction (0xD5) to begin continuous conversion.

### 5.5.1 Pulse Rate

Before configuring the *PulseRate* register, the full-scale pulse rate needs to be calculated and the frequency range needs to be specified through *FREQ\_RNG*[3:0] bits in the *PulseWidth* register. Refer to section [6.6.6 Pulse Output Width \(PulseWidth\) – Page 0, Address 8](#) on page 41. The *FREQ\_RNG*[3:0] bits should be set to b[0110]. For example, if a meter has the meter constant of 1000imp/kWh, a maximum voltage ( $U_{MAX}$ ) of 240 V, and a maximum current ( $I_{MAX}$ ) of 100A, the maximum pulse rate is:

$$[1000 \times (240 \times 100 / 1000)] / 3600 = 6.6667 \text{ Hz.}$$

Assume the meter is calibrated with  $U_{MAX}$  and  $I_{MAX}$ , and the *Scale* register contains the default value of 0.6. After gain calibration, the power register value will be 0.36, which represents  $240 \times 100 = 24 \text{ kW}$  or 6.6667 Hz pulse output rate. The full-scale pulse rate is:

$$F_{out} = 6.6667 / 0.36 = 18.5185 \text{ Hz.}$$

The CS5484 pulse generation block behaves as follows:

- The pulse rate generated by full-scale (1.0 decimal) power register is:

$$F_{OUT} = (PulseRate \times 2000) / 2^{FREQ\_RNG}$$

- The *PulseRate* register value is:

$$\begin{aligned} PulseRate &= (F_{OUT} \times 2^{FREQ\_RNG}) / 2000 \\ &= (18.5186 \times 64) / 2000 \\ &= 0.5925952 \\ &= 0x4BDA29 \end{aligned}$$

### 5.5.2 Pulse Width

The *PulseWidth* register defines the Active-low time of each energy pulse:

$$\text{Active-low} = 250 \mu\text{s} + (PulseWidth / 64000).$$

By default, the *PulseWidth* register value is 1, and the Active-low time of each energy pulse is 265.6  $\mu\text{s}$ . Note that the pulse width should never exceed the pulse period.

### 5.6 Voltage Sag, Voltage Swell, and Overcurrent Detection

Voltage sag detection is used to determine when the voltage falls below a predetermined level for a specified interval of time (duration). Voltage swell and overcurrent detection determine when the voltage or current rises above a predetermined level for the duration.

The duration is set by the value in the *V1Sag<sub>DUR</sub>* (*V2Sag<sub>DUR</sub>*), *V1Swell<sub>DUR</sub>* (*V2Swell<sub>DUR</sub>*), and *I1Over<sub>DUR</sub>* (*I2Over<sub>DUR</sub>*) registers. Setting any of these to zero (default) disables the detect feature for the given channel. The value is in output word rate (OWR) samples. The predetermined level is set by the values in the *V1Sag<sub>LEVEL</sub>* (*V2Sag<sub>LEVEL</sub>*), *V1Swell<sub>DUR</sub>* (*V2Swell<sub>DUR</sub>*), and *I1Over<sub>LEVEL</sub>* (*I2Over<sub>LEVEL</sub>*) registers.

For each enabled input channel, the measured value is rectified and compared to the associated level register. Over the duration window, the number of samples above and below the level are counted. If the number of samples below the level exceeds the number of samples above, a *Status0* register bit *V1SAG* (*V2SAG*) is set, indicating a sag condition. If the number of samples above the level exceeds the number of samples below, a *Status0* register bit *V1SWELL* (*V2SWELL*) or *I1OVER* (*I2OVER*) is set, indicating a swell or overcurrent condition (see [Figure 15](#)).

**Figure 15. Sag, Swell, and Overcurrent Detect**

## 5.7 Phase Sequence Detection

Polyphase meters using multiple CS5484 devices may be configured to sense the succession of voltage zero-crossings and determine which phase order is in service. The phase sequence detection within CS5484 involves counting the number of OWR samples from a starting point to the next voltage zero-crossing rising edge or falling for each phase. By comparing the count for each phase, the phase sequence can be easily determined: the smallest count is first, and the largest count is last.

The phase sequence detection and control (*PSDC*) register provides the count control, zero-crossing direction and count results. Writing '0' to bit DONE and '10110' to bits CODE[4:0] of the *PSDC* register followed by a falling edge on the RX pin will initiate the phase sequence detection circuit. The RX pin must be held low for a minimum of 500ns. When the device is in UART mode, it is recommended that a 0xFF command be written to all parts to start the phase sequence detection. This command is ignored by the UART interface and a checksum is not needed. Multiple CS5484 devices in a polyphase meter must receive the register writing and the RX falling edge at the same time so that all CS5484 devices start to count simultaneously. Bit DIR of the *PSDC* register specifies the direction of the next zero-crossing at which the count stops. If bit DIR is '0', the count stops at the next negative-to-positive zero crossing. If bit DIR is '1', the count stops at the next positive-to-negative zero-crossing. When the count stops, the DONE bit will be set by the CS5484, and then the count result of each phase may be read from bits PSCNT[6:0] of the *PSDC* register.

If the PSCNT[6:0] bits are equal to 0x00, 0x7F or greater than 0x64 (for 50Hz) or 0x50 (for 60Hz), then a measurement error has occurred, and the measurement results should be disregarded. This could happen when the voltage input signal amplitude is lower than the amplitude specified in the  $VZX_{LEVEL}$  register.

To determine the phase order, the PSCNT[6:0] bit count from each CS5484 is sorted in ascending order. Figure 16 and Figure 17 illustrate how phase sequence detection is performed.

Phase sequences A, B, and C for the default rising edge transition are illustrated in Figure 16. The PSCNT[6:0] bits from the CS5484 on phase A will have the lowest count, followed by the PSCNT[6:0] bits from the CS5484 on phase B with the middle count, and the PSCNT[6:0] bits from the CS5484 on phase C with the highest count.

Phase sequences C, B, and A for rising edge transition are illustrated in Figure 17. The PSCNT[6:0] bits from the CS5484 on phase C will have the lowest count, followed by the PSCNT[6:0] bits from the CS5484 on phase B with the middle count, and the PSCNT[6:0] bits from the CS5484 on phase A with the highest count.

## 5.8 Temperature Measurement

The CS5484 has an internal temperature sensor, which is designed to measure temperature and optionally compensate for temperature drift of the voltage reference. Temperature measurements are stored in the Temperature register ( $T$ ), which, by default, is configured to a range of  $\pm 128$  degrees on the Celsius ( $^{\circ}\text{C}$ ) scale.

The application program can change both the scale and range of temperature by changing the Temperature Gain ( $T_{GAIN}$ ) and Temperature Offset ( $T_{OFF}$ ) registers.

**Figure 16. Phase Sequence A, B, C for Rising Edge Transition**

**Figure 17. Phase Sequence C, B, A for Rising Edge Transition**

The temperature sensor and V2 input share the same delta-sigma modulator on the second voltage channel. By default, the temperature measurement is disabled, and the delta-sigma modulator is used for V2 measurement. To enable temperature measurement, set Config0 register bit 23, bit 22, and bit 13.

The Temperature register ( $T$ ) updates every 2240 output word rate (OWR) samples. The *Status0* register bit TUP indicates when  $T$  is updated. The temperature measurement and the second voltage channel, V2, share the same delta-sigma modulator, so the V2 measurement will be using the V1 delta-sigma modulator output when temperature measurement is enabled.

## 5.9 Anti-creep

The anti-creep (no-load threshold) is used to determine if a no-load condition is detected. The  $|P_{SUM}|$  and  $|Q_{SUM}|$  are compared to the value in the No-Load Threshold register ( $Load_{MIN}$ ). If both  $|P_{SUM}|$  and  $|Q_{SUM}|$  are less than this threshold, then  $P_{SUM}$  and  $Q_{SUM}$  are forced to zero. If  $S_{SUM}$  is less than the value in  $Load_{MIN}$  register, then  $S_{SUM}$  is forced to zero.

## 5.10 Register Protection

To prevent the critical configuration and calibration registers from unintended changes, the CS5484 provides two enhanced register protection mechanisms: write protection and automatic checksum calculation.

### 5.10.1 Write Protection

Setting the DSP\_LCK[4:0] bits in the *RegLock* register to 0x16 enables the CS5484 DSP lockable registers to be write-protected from the calculation engine. Setting

the DSP\_LCK[4:0] bits to 0x09 disables the write-protection mode.

Setting the HOST\_LCK[4:0] bits in the *RegLock* register to 0x16 enables the CS5484 HOST lockable registers to be write-protected from the serial interface. Setting the HOST\_LCK[4:0] bits to 0x09 disables the write-protection mode.

For registers that are DSP lockable, HOST lockable, or both, refer to sections [6.2 Hardware Registers Summary \(Page 0\)](#) on page 29, [6.3 Software Registers Summary \(Page 16\)](#) on page 31, and [6.4 Software Registers Summary \(Page 17\)](#) on page 33.

### 5.10.2 Register Checksum

All the configuration and calibration registers are protected by checksum, if enabled. Refer to [6.2 Hardware Registers Summary \(Page 0\)](#) on page 29, [6.3 Software Registers Summary \(Page 16\)](#) on page 31, and [6.4 Software Registers Summary \(Page 17\)](#) on page 33. The checksum for all registers marked with an asterisk symbol (\*) is calculated once every low-rate cycle. The checksum result is stored in the *RegChk* register. After the CS5484 has been fully configured and loaded with the calibrations, the host microcontroller should keep a copy of the checksum (*RegChk\_Copy*) in its memory. In normal operation, the host microcontroller can read the *RegChk* register and compare it with the saved copy of the *RegChk* register. If the two values mismatch, a reload of configurations and calibrations into the CS5484 is necessary.

The automatic checksum computation can be disabled by setting the REG\_CSUM\_OFF bit in the *Config2* register.

## 6. HOST COMMANDS AND REGISTERS

### 6.1 Host Commands

The first byte sent to the CS5484 SDI/RX pin contains the host command. Four types of host commands are required to read and write registers and instruct the calculation engine. The two most significant bits (MSBs) of the host command defines the function to be performed. The following table depicts the types of commands.

**Table 2. Command Format**

Function	Binary Value	Note
Register Read	0 0 $A_5 A_4 A_3 A_2 A_1 A_0$	$A_{[5:0]}$ specifies the register address.
Register Write	0 1 $A_5 A_4 A_3 A_2 A_1 A_0$	
Page Select	1 0 $P_5 P_4 P_3 P_2 P_1 P_0$	$P_{[5:0]}$ specifies the page.
Instruction	1 1 $C_5 C_4 C_3 C_2 C_1 C_0$	$C_{[5:0]}$ specifies the instruction.

#### 6.1.1 Memory Access Commands

The CS5484 memory has 12-bit addresses and is organized as  $P_5 P_4 P_3 P_2 P_1 P_0 A_5 A_4 A_3 A_2 A_1 A_0$  in 64 pages of 64 addresses each. The higher 6 bits specify the page number. The lower 6 bits specify the address within the selected page.

##### 6.1.1.1 Page Select

A page select command is designated by setting the two MSBs of the command to binary '10'. The page select command provides the CS5484 with the page number of the register to access. Register read and write commands access 1 of 64 registers within a specified page. Subsequent register reads and writes can be performed once the page has been selected.

**Figure 18. Byte Sequence for Page Select**

##### 6.1.1.2 Register Read

A register read is designated by setting the two MSBs of the command to binary '00'. The lower 6 bits of the register read command are the lower 6 bits of the 12-bit register address. After the register read command has been received, the CS5484 will send 3 bytes of register data onto the SDO/TX pin.

**Figure 19. Byte Sequence for Register Read**

##### 6.1.1.3 Register Write

A register write command is designated by setting the two MSBs of the command to binary '01'. The lower 6 bits of the register write command are the lower 6 bits of the 12-bit register address. A register write command must be followed by 3 bytes of data.

**Figure 20. Byte Sequence for Register Write**

#### 6.1.2 Instructions

An instruction command is designated by setting the two MSBs of the command to binary '11'. An Instruction command will interrupt any process currently running and initiate a new process in the CS5484.

**Figure 21. Byte Sequence for Instructions**

These new processes include calibration, power control, and soft reset. The following table depicts the types of instructions. These new processes include calibration, power control, and soft reset. The following table depicts the types of instructions. Note that when the CS5484 is in continuous conversion mode, an unexpected or invalid instruction command could cause the device to stop continuous conversion and enter an unexpected operation mode. The host processor should keep monitoring the CS5484 operation status and react accordingly.

**Table 3. Instruction Format**

Function	Binary Value	Note
Controls	0 <b>C<sub>4</sub></b> <b>C<sub>3</sub></b> <b>C<sub>2</sub></b> <b>C<sub>1</sub></b> <b>C<sub>0</sub></b>	
	0 00001 - Software Reset	C <sub>[5]</sub> specifies the instruction type: 0 = Controls 1 = Calibrations
	0 00010 - Standby	
	0 00011 - Wakeup	
	0 10100 - Single Conv.	
	0 10101 - Continuous Conv.	
	0 11000 - Halt Conv.	
Calibrations	1 <b>C<sub>4</sub></b> <b>C<sub>3</sub></b> <b>C<sub>2</sub></b> <b>C<sub>1</sub></b> <b>C<sub>0</sub></b>	For calibrations, C <sub>[4:3]</sub> specifies the type of calibration. *AC Offset calibration valid only for current channel
	1 00 C <sub>2</sub> C <sub>1</sub> C <sub>0</sub> DC Offset	
	1 10 C <sub>2</sub> C <sub>1</sub> C <sub>0</sub> AC Offset*	
	1 11 C <sub>2</sub> C <sub>1</sub> C <sub>0</sub> Gain	
	1 <b>C<sub>4</sub></b> <b>C<sub>3</sub></b> <b>C<sub>2</sub></b> <b>C<sub>1</sub></b> <b>C<sub>0</sub></b>	
	1 C <sub>4</sub> C <sub>3</sub> 0 0 1 I1	For calibrations, C <sub>[2:0]</sub> specifies the channel(s).
	1 C <sub>4</sub> C <sub>3</sub> 0 1 0 V1	
	1 C <sub>4</sub> C <sub>3</sub> 0 1 1 I2	
	1 C <sub>4</sub> C <sub>3</sub> 1 0 0 V2	
	1 C <sub>4</sub> C <sub>3</sub> 1 1 0 All Four	

### 6.1.3 Checksum

To improve the communication reliability on the serial interface, the CS5484 provides a checksum mechanism on transmitted and received signals. Checksum is disabled by default but can be enabled by setting the appropriate bit in the *SerialCtrl* register. When enabled, both host and CS5484 are expected to send one additional checksum byte after the normal command byte and applicable 3-byte register data has been transmitted.

The checksum is calculated by subtracting each transmit byte from 0xFF. Any overflow is truncated and the result wraps. The CS5484 executes the command only if the checksum transmitted by the host matches the checksum calculated locally. Otherwise, it sets a status bit (RX\_CSUM\_ERR in the *Status0* register), ignores the command, and clears the serial interface in preparation for the next transmission.

**Figure 22. Byte Sequence for Checksum**

### 6.1.4 Serial Time Out

In case a transaction from the host is not completed (for example, a data byte is missing in a register write), a time out circuit will reset the interface after 128ms. This will require that each byte be sent from the host within 128ms of the previous byte.

## 6.2 Hardware Registers Summary (Page 0)

<u>Address<sup>2</sup></u>	<u>RA[5:0]</u>	<u>Name</u>	<u>Description<sup>1</sup></u>	<u>DSP<sup>3</sup></u>	<u>HOST<sup>3</sup></u>	<u>Default</u>

63*	11 1111	Scale	I-Channel Gain Calibration Scale Value	Y	Y	0x 4C CCCC

Notes: (1) Warning: *Do not* write to unpublished or reserved register locations.

(2) \* Registers with checksum protection.

\*\* When setting the AVG\_MODE bit (AVG\_MODE = '1') in the *Config2* register, the device will use the Line-cycle Synchronized Averaging mode and the *CycleCount* register will be included in the checksum. Otherwise the *SampleCount* register will be included.

(3) Registers that can be set to write protect from DSP and/or HOST.

## 6.6 Register Descriptions

1. "Default" = bit states after power-on or reset
2. DO NOT write a "1" to any unpublished register bit or to a bit published as "0".
3. DO NOT write a "0" to any bit published as "1".
4. DO NOT write to any unpublished register address.

### 6.6.1 Configuration 0 (Config0) – Page 0, Address 0

23	22	21	20	19	18	17	16
TSEL	1	iCPUCLK	CPUCLK_ON	-	-	-	-
15	14	13	12	11	10	9	8
-	V2CAP[1]	V2CAP[0]	0	0	-	-	INT_POL
7	6	5	4	3	2	1	0
I2PGA[1]	I2PGA[0]	I1PGA[1]	I1PGA[0]	-	NO_OSC	IZX_CH	VZX_CH

Default = 0x40 0000

**TSEL** Selects between Voltage Channel2 and Temperature.  
0 = Selects Voltage Channel 2 (Default)  
1 = Selects Temperature Sensor

[22] Reserved.

**iCPUCLK** CPU clock inversion control.  
0 = CPU clock is same as MCLK (Default)  
1 = Invert CPU clock to pin (CPU clock is inversion of MCLK)

**CPUCLK\_ON** Enable CPUCLK to pad.  
0 = Disable CPUCLK to pin (Default)  
1 = Enable CPUCLK to pin

[19:15] Reserved.

**V2CAP[1:0]** Select the internal sampling capacitor size for V2 channel. Must be set to 00 for voltage measurement.  
00 = V2 used for voltage measurement (Default)  
01 = V2 used for temperature measurement  
10 = Reserved  
11 = Reserved

[12:9] Reserved.

**INT\_POL** Interrupt Polarity.  
0 = Active low (Default)  
1 = Active high

**I2PGA[1:0]** Select PGA gain for I2 channel.  
00 = 10x gain (Default)  
10 = 50x gain

**I1PGA[1:0]** Select PGA gain for I1 channel.  
00 = 10x gain (Default)  
10 = 50x gain

[3] Reserved.

NO_OSC	Disable crystal oscillator (making XIN a logic-level input). 0 = Crystal oscillator enabled (Default) 1 = Crystal oscillator disabled
IZX_CH	Select current channel for zero-cross detect. 0 = Selects current channel 1 for zero-cross detect (Default) 1 = Selects current channel 2 for zero-cross detect
VZX_CH	Selects voltage channel for zero-cross detect. 0 = Selects voltage channel 1 for zero-cross detect (Default) 1 = Selects voltage channel 2 for zero-cross detect

### 6.6.2 Configuration 1 (Config1) – Page 0, Address 1

23	22	21	20	19	18	17	16
EPG4_ON	EPG3_ON	EPG2_ON	EPG1_ON	DO4_OD	DO3_OD	DO2_OD	DO1_OD
15	14	13	12	11	10	9	8
DO4MODE[3]	DO4MODE[2]	DO4MODE[1]	DO4MODE[0]	DO3MODE[3]	DO3MODE[2]	DO3MODE[1]	DO3MODE[0]
7	6	5	4	3	2	1	0
DO2MODE[3]	DO2MODE[2]	DO2MODE[1]	DO2MODE[0]	DO1MODE[3]	DO1MODE[2]	DO1MODE[1]	DO1MODE[0]

Default = 0x00 EEEE

EPG4_ON	Enable EPG4 block. 0 = Disable energy pulse generation block 4 (Default) 1 = Enable energy pulse generation 4
EPG3_ON	Enable EPG3 block. 0 = Disable energy pulse generation block 3 (Default) 1 = Enable energy pulse generation block 3
EPG2_ON	Enable EPG2 block. 0 = Disable energy pulse generation block 2 (Default) 1 = Enable energy pulse generation block 2
EPG1_ON	Enable EPG1 block. 0 = Disable energy pulse generation block 1 (Default) 1 = Enable energy pulse generation block 1
DO4_OD	Allow the DO4 pin to be an open-drain output. 0 = Normal output (Default) 1 = Open-drain output
DO3_OD	Allow the DO3 pin to be an open-drain output. 0 = Normal output (Default) 1 = Open-drain output
DO2_OD	Allow the DO2 pin to be an open-drain output. 0 = Normal output (Default) 1 = Open-drain output
DO1_OD	Allow the DO1 pin to be an open-drain output. 0 = Normal output (Default) 1 = Open-drain output

DO4MODE[3:0]	<p>Output control for DO4 pin.</p> <p>0000 = Energy pulse generation block 1 (EPG1) output</p> <p>0001 = Energy pulse generation block 2 (EPG2) output</p> <p>0010 = Energy pulse generation block 3 (EPG3) output</p> <p>0011 = Energy pulse generation block 4 (EPG4) output</p> <p>0100 = P1 sign</p> <p>0101 = P2 sign</p> <p>0110 = <math>P_{SUM}</math> sign</p> <p>0111 = Q1 sign</p> <p>1000 = Q2 sign</p> <p>1001 = <math>Q_{SUM}</math> sign</p> <p>1010 = Reserved</p> <p>1011 = V1/V2 zero-crossing</p> <p>1100 = I1/I2 zero-crossing</p> <p>1101 = Reserved</p> <p>1110 = Hi-Z, pin not driven (Default)</p> <p>1111 = Interrupt</p>
DO3MODE[3:0]	<p>Output control for DO3 pin.</p> <p>0000 = Energy pulse generation block 1 (EPG1) output</p> <p>0001 = Energy pulse generation block 2 (EPG2) output</p> <p>0010 = Energy pulse generation block 3 (EPG3) output</p> <p>0011 = Energy pulse generation block 4 (EPG4) output</p> <p>0100 = P1 sign</p> <p>0101 = P2 sign</p> <p>0110 = <math>P_{SUM}</math> sign</p> <p>0111 = Q1 sign</p> <p>1000 = Q2 sign</p> <p>1001 = <math>Q_{SUM}</math> sign</p> <p>1010 = Reserved</p> <p>1011 = V1/V2 zero-crossing</p> <p>1100 = I1/I2 zero-crossing</p> <p>1101 = Reserved</p> <p>1110 = Hi-Z, pin not driven (Default)</p> <p>1111 = Interrupt</p>
DO2MODE[3:0]	<p>Output control for DO2 pin.</p> <p>0000 = Energy pulse generation block 1 (EPG1) output</p> <p>0001 = Energy pulse generation block 2 (EPG2) output</p> <p>0010 = Energy pulse generation block 3 (EPG3) output</p> <p>0011 = Energy pulse generation block 4 (EPG4) output</p> <p>0100 = P1 sign</p> <p>0101 = P2 sign</p> <p>0110 = <math>P_{SUM}</math> sign</p> <p>0111 = Q1 sign</p> <p>1000 = Q2 sign</p> <p>1001 = <math>Q_{SUM}</math> sign</p> <p>1010 = Reserved</p> <p>1011 = V1/V2 zero-crossing</p> <p>1100 = I1/I2 zero-crossing</p> <p>1101 = Reserved</p> <p>1110 = Hi-Z, pin not driven (Default)</p> <p>1111 = Interrupt</p>

DO1MODE[3:0]      Output control for DO1 pin.  
 0000 = Energy pulse generation block 1 (EPG1) output  
 0001 = Energy pulse generation block 2 (EPG2) output  
 0010 = Energy pulse generation block 3 (EPG3) output  
 0011 = Energy pulse generation block 4 (EPG4) output  
 0100 = P1 sign  
 0101 = P2 sign  
 0110 = P<sub>SUM</sub> sign  
 0111 = Q1 sign  
 1000 = Q2 sign  
 1001 = Q<sub>SUM</sub> sign  
 1010 = Reserved  
 1011 = V1/V2 zero-crossing  
 1100 = I1/I2 zero-crossing  
 1101 = Reserved  
 1110 = Hi-Z, pin not driven (Default)  
 1111 = Interrupt

### 6.6.3 Configuration 2 (Config2) – Page 16, Address 0

23	22	21	20	19	18	17	16
-	POS	-	-	-	1	1	-
15	14	13	12	11	10	9	8
-	APCM	-	ZX_LPF	AVG_MODE	REG_CSUM_OFF	AFC	I2FLT[1]
7	6	5	4	3	2	1	0
I2FLT[0]	V2FLT[1]	V2FLT[0]	I1FLT[1]	I1FLT[0]	V1FLT[1]	V1FLT[0]	IIR_OFF

Default = 0x06 0200

[23]      Reserved.

POS      Positive energy only. Suppress negative values in P1<sub>AVG</sub> and P2<sub>AVG</sub>. If a negative value is calculated, a zero result will be stored.  
 0 = Positive and negative energy (Default)  
 1 = Positive energy only

[21:15]      Reserved.

APCM      Selects the apparent power calculation method.  
 0 =  $V_{X_{RMS}} \times I_{X_{RMS}}$  (Default)  
 1 =  $SQRT(P_{X_{AVG}}^2 + Q_{X_{AVG}}^2)$

[13]      Reserved.

ZX\_LPF      Enable LPF in zero-cross detect.  
 0 = LPF disabled (Default)  
 1 = LPF enabled

AVG\_MODE      Select averaging mode for low-rate calculations.  
 0 = Use *SampleCount* (Default)  
 1 = Use *CycleCount*

REG\_CSUM\_OFF      Disable checksum on critical registers.  
 0 = Enable checksum on critical registers (Default)  
 1 = Disable checksum on critical registers

AFC	Enables automatic line frequency measurement which sets <i>Epsilon</i> every time a new line frequency measurement completes. <i>Epsilon</i> is used to control the gain of 90 degree phase shift integrator used in quadrature power calculations. 0 = Disable automatic line frequency measurement 1 = Enable automatic line frequency measurement (Default)
I2FLT[1:0]	Filter enable for current channel 2. 00 = No filter (Default) 01 = High-pass filter (HPF) on current channel 2 10 = Phase-matching filter (PMF) on current channel 2 11 = Rogowski coil integrator on current channel 2
V2FLT[1:0]	Filter enable for voltage channel 2/temperature. 00 = No filter (Default) 01 = High-pass filter (HPF) on voltage channel 2 10 = Phase-matching filter (PMF) on voltage channel 2 11 = Reserved
I1FLT[1:0]	Filter enable for current channel 1. 00 = No filter (Default) 01 = High-pass filter (HPF) on current channel 1 10 = Phase-matching filter (PMF) on current channel 1 11 = Rogowski coil integrator on current channel 1
V1FLT[1:0]	Filter enable for voltage channel 1. 00 = No filter (Default) 01 = High-pass filter (HPF) on voltage channel 1 10 = Phase-matching filter (PMF) on voltage channel 1 11 = Reserved
IIR_OFF	Bypass IIR filter. 0 = Do not bypass IIR filter (Default) 1 = Bypass IIR filter

#### 6.6.4 Phase Compensation (PC) – Page 0, Address 5

23	22	21	20	19	18	17	16
CPCC2[1]	CPCC2[0]	CPCC1[1]	CPCC1[0]	-	-	FPCC2[8]	FPCC2[7]
15	14	13	12	11	10	9	8
FPCC2[6]	FPCC2[5]	FPCC2[4]	FPCC2[3]	FPCC2[2]	FPCC2[1]	FPCC2[0]	FPCC1[8]
7	6	5	4	3	2	1	0
FPCC1[7]	FPCC1[6]	FPCC1[5]	FPCC1[4]	FPCC1[3]	FPCC1[2]	FPCC1[1]	FPCC1[0]

Default = 0x00 0000

CPCC2[1:0] Coarse phase compensation control for I2 and V2.

00 = No extra delay

01 = 1 OWR delay in current channel 2

10 = 1 OWR delay in voltage channel 2

11 = 2 OWR delay in voltage channel 2

CPCC1[1:0] Coarse phase compensation control for I1 and V1.

00 = No extra delay

01 = 1 OWR delay in current channel 1

10 = 1 OWR delay in voltage channel 1

11 = 2 OWR delay in voltage channel 1

[19:18] Reserved.

FPCC2[8:0] Fine phase compensation control for I2 and V2.

Sets a delay in current, relative to voltage.

Resolution: 0.008789° at 50Hz and 0.010547° at 60Hz (OWR = 4000)

FPCC1[8:0] Fine phase compensation control for I1 and V1.

Sets a delay in current, relative to voltage.

Resolution: 0.008789° at 50Hz and 0.010547° at 60Hz (OWR = 4000)

#### 6.6.5 UART Control (SerialCtrl) – Page 0, Address 7

23	22	21	20	19	18	17	16
-	-	-	-	-	RX_PU_OFF	RX_CSUM_OFF	-
15	14	13	12	11	10	9	8
BR[15]	BR[14]	BR[13]	BR[12]	BR[11]	BR[10]	BR[9]	BR[8]
7	6	5	4	3	2	1	0
BR[7]	BR[6]	BR[5]	BR[4]	BR[3]	BR[2]	BR[1]	BR[0]

Default = 0x02 004D

[23:19] Reserved.

RX\_PU\_OFF Disable the pull-up resistor on the RX input pin.

0 = Pull-up resistor enabled (Default)

1 = Pull-up resistor disabled

RX\_CSUM\_OFF Disable the checksum on serial port data.

0 = Enable checksum

1 = Disable checksum (Default)

[16] Reserved.

BR[15:0] Baud rate (serial bit rate).

BR[15:0] = Baud Rate x (524,288/MCLK)

### 6.6.6 Pulse Output Width (*PulseWidth*) – Page 0, Address 8

23	22	21	20	19	18	17	16
-	-	-	-	FREQ_RNG[3]	FREQ_RNG[2]	FREQ_RNG[1]	FREQ_RNG[0]
15	14	13	12	11	10	9	8
PW[15]	PW[14]	PW[13]	PW[12]	PW[11]	PW[10]	PW[9]	PW[8]
7	6	5	4	3	2	1	0
PW[7]	PW[6]	PW[5]	PW[4]	PW[3]	PW[2]	PW[1]	PW[0]

Default = 0x00 0001 (265.6µs at OWR = 4kHz)

*PulseWidth* sets the energy pulse frequency range and the duration of energy pulses.

The actual pulse duration is 250µs plus the contents of *PulseWidth* divided by 64,000. *PulseWidth* is an integer in the range of 1 to 65,535.

[23:20] Reserved.

FREQ\_RNG[3:0] Energy pulse (*PulseRate*) frequency range for 0.1% resolution.

0000 = Freq. range:	2kHz–0.238Hz (Default)
0001 = Freq. range:	1kHz–0.1192Hz
0010 = Freq. range:	500Hz–0.0596Hz
0011 = Freq. range:	250Hz–0.0298Hz
0100 = Freq. range:	125Hz–0.0149Hz
0101 = Freq. range:	62.5Hz–0.00745Hz
0110 = Freq. range:	31.25Hz–0.003725Hz
0111 = Freq. range:	15.625Hz–0.0018626Hz
1000 = Freq. range:	7.8125Hz–0.000931323Hz
1001 = Freq. range:	3.90625Hz–0.000465661Hz
1010 = Reserved	
...	
1111 = Reserved	

PW[15:0] Energy Pulse Width.

### 6.6.7 Pulse Output Rate (*PulseRate*) – Page 18, Address 28

MSB									LSB						
-(2 <sup>0</sup> )	2 <sup>-1</sup>	2 <sup>-2</sup>	2 <sup>-3</sup>	2 <sup>-4</sup>	2 <sup>-5</sup>	2 <sup>-6</sup>	2 <sup>-7</sup>	.....	2 <sup>-17</sup>	2 <sup>-18</sup>	2 <sup>-19</sup>	2 <sup>-20</sup>	2 <sup>-21</sup>	2 <sup>-22</sup>	2 <sup>-23</sup>

Default= 0x80 0000

*PulseRate* sets the full-scale frequency for the energy pulse outputs.

For a 4 kHz OWR rate, the maximum pulse rate is 2kHz. This is a two's complement value in the range of -1≤value<1, with the binary point to the left of the MSB.

Refer to section [5.5 Energy Pulse Generation](#) on page 22 for more information.

### 6.6.8 Pulse Output Control (PulseCtrl) – Page 0, Address 9

23	22	21	20	19	18	17	16
-	-	-	-	-	-	-	-
15	14	13	12	11	10	9	8
EPG4IN[3]	EPG4IN[2]	EPG4IN[1]	EPG4IN[0]	EPG3IN[3]	EPG3IN[2]	EPG3IN[1]	EPG3IN[0]
7	6	5	4	3	2	1	0
EPG2IN[3]	EPG2IN[2]	EPG2IN[1]	EPG2IN[0]	EPG1IN[3]	EPG1IN[2]	EPG1IN[1]	EPG1IN[0]

Default = 0x00 0000

This register controls the input to the energy pulse generation block (EPGx).

[23:16] Reserved.

EPGxIN[3:0] Selects the input to the energy pulse generation block (EPGx).

0000 = P1<sub>AVG</sub> (Default)

0001 = P2<sub>AVG</sub>

0010 = P<sub>SUM</sub>

0011 = Q1<sub>AVG</sub>

0100 = Q2<sub>AVG</sub>

0101 = Q<sub>SUM</sub>

0110 = S1

0111 = S2

1000 = S<sub>SUM</sub>

1001 = Unused

...

1111 = Unused

### 6.6.9 Register Lock Control (RegLock) – Page 0, Address 34

23	22	21	20	19	18	17	16
-	-	-	-	-	-	-	-
15	14	13	12	11	10	9	8
-	-	-	DSP_LCK[4]	DSP_LCK[3]	DSP_LCK[2]	DSP_LCK[1]	DSP_LCK[0]
7	6	5	4	3	2	1	0
-	-	-	HOST_LCK[4]	HOST_LCK[3]	HOST_LCK[2]	HOST_LCK[1]	HOST_LCK[0]

Default = 0x00 0000

[23:13] Reserved.

DSP\_LCK[4:0] DSP\_LCK[4:0] = 0x16 sets the DSP lockable registers to be write protected from the CS5484 internal calculation engine. Writing 0x09 unlocks the registers.

[7:5] Reserved.

HOST\_LCK[4:0] HOST\_LCK[4:0] = 0x16 sets all the registers except *RegLock*, *Status0*, *Status1*, and *Status2* to be write protected from the serial interface. Writing 0x09 unlocks the registers.

### 6.6.10 Phase Sequence Detection and Control (PSDC) – Page 0, Address 48

<b>23</b>	<b>22</b>	<b>21</b>	<b>20</b>	<b>19</b>	<b>18</b>	<b>17</b>	<b>16</b>
DONE	PSCNT[6]	PSCNT[5]	PSCNT[4]	PSCNT[3]	PSCNT[2]	PSCNT[1]	PSCNT[0]
<b>15</b>	<b>14</b>	<b>13</b>	<b>12</b>	<b>11</b>	<b>10</b>	<b>9</b>	<b>8</b>
-	-	-	-	-	-	-	-
<b>7</b>	<b>6</b>	<b>5</b>	<b>4</b>	<b>3</b>	<b>2</b>	<b>1</b>	<b>0</b>
-	-	DIR	CODE[4]	CODE[3]	CODE[2]	CODE[1]	CODE[0]

Default = 0x00 0000

DONE	Indicates valid count values reside in PSCNT[6:0]. 0 = Invalid values in PSCNT[6:0]. (Default) 1 = Valid values in PSCNT[6:0].
PSCNT[6:0]	Registers the number of OWR samples from the start time to the time when the next zero crossing is detected.
[15:6]	Reserved.
DIR	Set the zero-crossing edge direction which will stop PSCNT count. 0 = Stop count at negative to positive zero-crossing - Rising Edge. (Default) 1 = Stop count at positive to negative zero-crossing - Falling Edge.
CODE[4:0]	Write 10110 to this location to enable the phase sequence detection.

### 6.6.11 Checksum of Critical Registers (RegChk) – Page 16, Address 1

<b>MSB</b>										<b>LSB</b>						
2 <sup>23</sup>	2 <sup>22</sup>	2 <sup>21</sup>	2 <sup>20</sup>	2 <sup>19</sup>	2 <sup>18</sup>	2 <sup>17</sup>	2 <sup>16</sup>	.....	2 <sup>6</sup>	2 <sup>5</sup>	2 <sup>4</sup>	2 <sup>3</sup>	2 <sup>2</sup>	2 <sup>1</sup>	2 <sup>0</sup>	

Default = 0x00 0000

This register contains the checksum of critical registers.

### 6.6.12 Interrupt Status (Status0) – Page 0, Address 23

<b>23</b>	<b>22</b>	<b>21</b>	<b>20</b>	<b>19</b>	<b>18</b>	<b>17</b>	<b>16</b>
DRDY	CRDY	WOF	-	-	MIPS	V2SWELL	V1SWELL
<b>15</b>	<b>14</b>	<b>13</b>	<b>12</b>	<b>11</b>	<b>10</b>	<b>9</b>	<b>8</b>
P2OR	P1OR	I2OR	I1OR	V2OR	V1OR	I2OC	I1OC
<b>7</b>	<b>6</b>	<b>5</b>	<b>4</b>	<b>3</b>	<b>2</b>	<b>1</b>	<b>0</b>
V2SAG	V1SAG	TUP	FUP	IC	RX_CSUM_ERR	-	RX_TO

Default = 0x80 0000

The *Status0* register indicates a variety of conditions within the chip.

Writing a one to a *Status0* register bit will clear that bit. Writing a zero to any bit has no effect.

DRDY	Data Ready. During conversion, this bit indicates that low-rate results have been updated. It indicates completion of other host instruction and the reset sequence.
CRDY	Conversion Ready. Indicates that sample rate (output word rate) results have been updated.
WOF	Watchdog timer overflow.
[20:19]	Reserved.
MIPS	MIPS overflow. Sets when the calculation engine has not completed processing a sample before the next one arrives.
V2SWELL(V1SWELL)	Voltage channel 2 (voltage channel 1) swell event detected.
P2OR (P1OR)	Power out of range. Sets when the measured power would cause the <i>P2</i> ( <i>P1</i> ) register to overflow.
I2OR (I1OR)	Current out of range. Set when the measured current would cause the <i>I2</i> ( <i>I1</i> ) register to overflow.
V2OR (V1OR)	Voltage out of range. Set when the measured voltage would cause the <i>V2</i> ( <i>V1</i> ) register to overflow.
I2OC (I1OC)	<i>I2</i> ( <i>I1</i> ) overcurrent.
V2SAG (V1SAG)	Voltage channel 2 (voltage channel 1) sag event detected.
TUP	Temperature updated. Indicates when the Temperature register ( <i>T</i> ) has been updated.
FUP	Frequency updated. Indicates the <i>Epsilon</i> register has been updated.
IC	Invalid command has been received.
RX_CSUM_ERR	Received data checksum error. Sets to one automatically if checksum error is detected on serial port received data.
[1]	Reserved.
RX_TO	SDI/RX time out. Sets to one automatically when SDI/RX time out occurs.

### 6.6.13 Interrupt Mask (Mask) – Page 0, Address 3

<b>23</b>	<b>22</b>	<b>21</b>	<b>20</b>	<b>19</b>	<b>18</b>	<b>17</b>	<b>16</b>
DRDY	CRDY	WOF	-	-	MIPS	V2SWELL	V1SWELL
<b>15</b>	<b>14</b>	<b>13</b>	<b>12</b>	<b>11</b>	<b>10</b>	<b>9</b>	<b>8</b>
P2OR	P1OR	I2OR	I1OR	V2OR	V1OR	I2OC	I1OC
<b>7</b>	<b>6</b>	<b>5</b>	<b>4</b>	<b>3</b>	<b>2</b>	<b>1</b>	<b>0</b>
V2SAG	V1SAG	TUP	FUP	IC	RX_CSUM_ERR	-	RX_TO

Default = 0x00 0000

The *Mask* register is used to control the activation of the  $\overline{\text{INT}}$  pin. Writing a '1' to a *Mask* register bit will allow the corresponding *Status0* register bit to activate the  $\overline{\text{INT}}$  pin when set.

[23:0] Enable/disable (mask) interrupts.  
 0 = Interrupt disabled (Default)  
 1 = Interrupt enabled

### 6.6.14 Chip Status 1 (Status1) – Page 0, Address 24

<b>23</b>	<b>22</b>	<b>21</b>	<b>20</b>	<b>19</b>	<b>18</b>	<b>17</b>	<b>16</b>
-	-	-	-	-	-	-	-
<b>15</b>	<b>14</b>	<b>13</b>	<b>12</b>	<b>11</b>	<b>10</b>	<b>9</b>	<b>8</b>
LCOM[7]	LCOM[6]	LCOM[5]	LCOM[4]	LCOM[3]	LCOM[2]	LCOM[1]	LCOM[0]
<b>7</b>	<b>6</b>	<b>5</b>	<b>4</b>	<b>3</b>	<b>2</b>	<b>1</b>	<b>0</b>
-	-	-	-	V2OD	V1OD	I2OD	I1OD

Default = 0x80 1800

This register indicates a variety of conditions within the chip.

[23:16] Reserved.

LCOM[7:0] Indicates the value of the last serial command executed.

V2OD (V1OD) Modulator oscillation has been detected in the voltage2 (voltage1) ADC.

I2OD (I1OD) Modulator oscillation has been detected in the current2 (current1) ADC.

### 6.6.15 Chip Status 2 (Status2) – Page 0, Address 25

23	22	21	20	19	18	17	16
-	-	-	-	-	-	-	-
15	14	13	12	11	10	9	8
-	-	-	-	-	-	-	-
7	6	5	4	3	2	1	0
-	-	QSUM_SIGN	Q2_SIGN	Q1_SIGN	PSUM_SIGN	P2_SIGN	P1_SIGN

Default = 0x00 0000

This register indicates a variety of conditions within the chip.

[23:6] Reserved.

QSUM\_SIGN Indicates the sign of the value contained in  $Q_{SUM}$ .  
 0 = positive value  
 1 = negative value

Q2\_SIGN Indicates the sign of the value contained in  $Q2_{AVG}$ .  
 0 = positive value  
 1 = negative value

Q1\_SIGN Indicates the sign of the value contained in  $Q1_{AVG}$ .  
 0 = positive value  
 1 = negative value

PSUM\_SIGN Indicates the sign of the value contained in  $P_{SUM}$ .  
 0 = positive value  
 1 = negative value

P2\_SIGN Indicates the sign of the value contained in  $P2_{AVG}$ .  
 0 = positive value  
 1 = negative value

P1\_SIGN Indicates the sign of the value contained in  $P1_{AVG}$ .  
 0 = positive value  
 1 = negative value

### 6.6.16 Line to Sample Frequency Ratio (Epsilon) – Page 16, Address 49

MSB									LSB						
$-(2^0)$	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	.....	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$

Default = 0x01 999A (0.0125 or 50Hz/4.0kHz)

*Epsilon* is the ratio of the input line frequency to the OWR.

It can either be written by the application program or calculated automatically from the line frequency (from the voltage channel 1 input) using the AFC bit in the *Config2* register. It is a two's complement value in the range of  $-1.0 \leq \text{value} < 1.0$ , with the binary point to the right of the MSB. Negative values are not used.

### 6.6.17 No-Load Threshold ( $Load_{MIN}$ ) – Page 16, Address 58

MSB									LSB						
$-(2^0)$	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	.....	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$

Default = 0x00 0000

$Load_{MIN}$  is used to set the no-load threshold for the anti-creep function.

When the magnitudes of  $P_{SUM}$  and  $Q_{SUM}$  are less than  $Load_{MIN}$ ,  $P_{SUM}$  and  $Q_{SUM}$  are forced to zero. When the magnitude of  $S_{SUM}$  is less than  $Load_{MIN}$ ,  $S_{SUM}$  is forced to zero.

$Load_{MIN}$  is a two's complement value in the range of  $-1.0 \leq \text{value} < 1.0$ , with the binary point to the right of the MSB. Negative values are not used.

### 6.6.18 Sample Count (SampleCount) – Page 16, Address 51

MSB									LSB						
0	$2^{22}$	$2^{21}$	$2^{20}$	$2^{19}$	$2^{18}$	$2^{17}$	$2^{16}$	.....	$2^6$	$2^5$	$2^4$	$2^3$	$2^2$	$2^1$	$2^0$

Default = 0x00 0FA0 (4000)

Determines the number of OWR samples to use in calculating low-rate results.

*SampleCount* ( $N$ ) is an integer in the range of 100 to 8,388,607. Values less than 100 should not be used.

### 6.6.19 Cycle Count (CycleCount) – Page 18, Address 62

MSB									LSB						
0	$2^{22}$	$2^{21}$	$2^{20}$	$2^{19}$	$2^{18}$	$2^{17}$	$2^{16}$	.....	$2^6$	$2^5$	$2^4$	$2^3$	$2^2$	$2^1$	$2^0$

Default = 0x00 0064 (100)

Determines the number of half-line cycles to use in calculating low-rate results when the CS5484 is in Line-cycle Synchronized Averaging mode.

*CycleCount* is an integer in the range of 1 to 8,388,607. Zero should not be used.

### 6.6.20 Filter Settling Time for Conversion Startup ( $T_{SETTLE}$ ) – Page 16, Address 57

MSB									LSB						
$2^{23}$	$2^{22}$	$2^{21}$	$2^{20}$	$2^{19}$	$2^{18}$	$2^{17}$	$2^{16}$	.....	$2^6$	$2^5$	$2^4$	$2^3$	$2^2$	$2^1$	$2^0$

Default = 0x00 001E (30)

Sets the number of OWR samples that will be used to allow filters to settle at the beginning of Conversion and Calibration commands.

This is an integer in the range of 0 to 16,777,215 samples.

### 6.6.21 System Gain ( $Sys_{GAIN}$ ) – Page 16, Address 60

MSB									LSB						
$-(2^1)$	$2^0$	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	.....	$2^{-16}$	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$

Default = 0x50 0000 (1.25)

System Gain ( $Sys_{GAIN}$ ) is applied to all channels.

By default,  $Sys_{GAIN} = 1.25$  but can be finely adjusted to compensate for voltage reference error. It is a two's complement value in the range of  $-2.0 \leq \text{value} < 2.0$ , with the binary point to the right of the second MSB. Values should be kept within 5% of 1.25.

### 6.6.22 Rogowski Coil Integrator Gain ( $Int_{GAIN}$ ) – Page 18, Address 43

MSB									LSB						
$-(2^0)$	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	.....	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$

Default = 0x14 3958

Gain for the Rogowski coil integrator. This must be programmed accordingly for 50Hz and 60Hz (0.158 for 50Hz, 0.1875 for 60Hz).

This is a two's complement value in the range of  $-1.0 \leq \text{value} \leq 1.0$ , with the binary point to the right of the MSB. Negative values are not used.

### 6.6.23 System Time ( $Time$ ) – Page 16, Address 61

MSB									LSB						
$2^{23}$	$2^{22}$	$2^{21}$	$2^{20}$	$2^{19}$	$2^{18}$	$2^{17}$	$2^{16}$	.....	$2^6$	$2^5$	$2^4$	$2^3$	$2^2$	$2^1$	$2^0$

Default = 0x00 0000

System Time ( $Time$ ) is measured in OWR samples.

This is an unsigned integer in the range of 0 to 16,777,215 samples. At OWR = 4.0kHz, OWR will overflow every 1 hour, 9 minutes, 54 seconds.  $Time$  can be used by the application to manage real-time events.

#### 6.6.24 Voltage 1 Sag Duration ( $V1Sag_{DUR}$ ) – Page 17, Address 0

MSB									LSB						
0	$2^{22}$	$2^{21}$	$2^{20}$	$2^{19}$	$2^{18}$	$2^{17}$	$2^{16}$	.....	$2^6$	$2^5$	$2^4$	$2^3$	$2^2$	$2^1$	$2^0$

Default = 0x00 0000

Voltage sag duration,  $V1Sag_{DUR}$ , determines the count of OWR samples utilized to determine a sag event.

These are integers in the range of 0 to 8,388,607 samples. A value of zero disables the feature.

#### 6.6.25 Voltage 1 Sag Level ( $V1Sag_{LEVEL}$ ) – Page 17, Address 1

MSB									LSB						
$-(2^0)$	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	.....	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$

Default = 0x00 0000

Voltage sag level,  $V1Sag_{LEVEL}$ , establishes an input level below which a sag event is triggered.

This is a two's complement value in the range of  $-1.0 \leq \text{value} < 1.0$ , with the binary point to the right of the MSB.

Negative values are not used.

#### 6.6.26 Current 1 Overcurrent Duration ( $I1Over_{DUR}$ ) – Page 17, Address 4

MSB									LSB						
0	$2^{22}$	$2^{21}$	$2^{20}$	$2^{19}$	$2^{18}$	$2^{17}$	$2^{16}$	.....	$2^6$	$2^5$	$2^4$	$2^3$	$2^2$	$2^1$	$2^0$

Default = 0x00 0000

Overcurrent duration,  $I1Over_{DUR}$ , determines the count of OWR samples utilized to determine an overcurrent event.

These are integers in the range of 0 to 8,388,607 samples. A value of zero disables the feature.

#### 6.6.27 Current 1 Overcurrent Level ( $I1Over_{LEVEL}$ ) – Page 17, Address 5

MSB									LSB						
$-(2^0)$	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	.....	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$

Default = 0x7F FFFF

Overcurrent level,  $I1Over_{LEVEL}$ , establishes an input level above which an overcurrent event is triggered.

This is a two's complement value in the range of  $-1.0 \leq \text{value} < 1.0$ , with the binary point to the right of the MSB.

Negative values are not used.

### 6.6.28 Voltage 2 Sag Duration ( $V2Sag_{DUR}$ ) – Page 17, Address 8

MSB									LSB						
0	$2^{22}$	$2^{21}$	$2^{20}$	$2^{19}$	$2^{18}$	$2^{17}$	$2^{16}$	.....	$2^6$	$2^5$	$2^4$	$2^3$	$2^2$	$2^1$	$2^0$

Default = 0x00 0000

Voltage sag duration,  $V2Sag_{DUR}$ , determines the count of OWR samples utilized to determine a sag event. These are integers in the range of 0 to 8,388,607 samples. A value of zero disables the feature.

### 6.6.29 Voltage 2 Sag Level ( $V2Sag_{LEVEL}$ ) – Page 17, Address 9

MSB									LSB						
$-(2^0)$	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	.....	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$

Default = 0x00 0000

Voltage sag level,  $V2Sag_{LEVEL}$ , establishes an input level below which a sag event is triggered.

This is a two's complement value in the range of  $-1.0 \leq \text{value} < 1.0$ , with the binary point to the right of the MSB. Negative values are not used.

### 6.6.30 Current 2 Overcurrent Duration ( $I2Over_{DUR}$ ) – Page 17, Address 12

MSB									LSB						
0	$2^{22}$	$2^{21}$	$2^{20}$	$2^{19}$	$2^{18}$	$2^{17}$	$2^{16}$	.....	$2^6$	$2^5$	$2^4$	$2^3$	$2^2$	$2^1$	$2^0$

Default = 0x00 0000

Overcurrent duration,  $I2Over_{DUR}$ , determines the count of OWR samples utilized to determine an overcurrent event.

These are integers in the range of 0 to 8,388,607 samples. A value of zero disables the feature.

### 6.6.31 Current 2 Overcurrent Level ( $I2Over_{LEVEL}$ ) – Page 17, Address 13

MSB									LSB						
$-(2^0)$	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	.....	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$

Default = 0x7F FFFF

Overcurrent level,  $I2Over_{LEVEL}$ , establishes an input level above which an overcurrent event is triggered.

This is a two's complement value in the range of  $-1.0 \leq \text{value} < 1.0$ , with the binary point to the right of the MSB. Negative values are not used.

### 6.6.32 Voltage 1 Swell Duration ( $V1Swell_{DUR}$ ) – Page 18, Address 46

MSB									LSB						
0	$2^{22}$	$2^{21}$	$2^{20}$	$2^{19}$	$2^{18}$	$2^{17}$	$2^{16}$	.....	$2^6$	$2^5$	$2^4$	$2^3$	$2^2$	$2^1$	$2^0$

Default = 0x00 0000

Voltage swell duration,  $V1Swell_{DUR}$ , determines the count of OWR samples utilized to determine a swell event.

These are integers in the range of 0 to 8,388,607 samples. A value of zero disables the feature.

### 6.6.33 Voltage 1 Swell Level ( $V1Swell_{LEVEL}$ ) – Page 18, Address 47

MSB									LSB						
$-(2^0)$	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	.....	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$

Default = 0x7F FFFF

Voltage swell level,  $V1Swell_{LEVEL}$ , establishes an input level above which a swell event is triggered.

This is a two's complement value in the range of  $-1.0 \leq \text{value} < 1.0$ , with the binary point to the right of the MSB. Negative values are not used.

### 6.6.34 Voltage 2 Swell Duration ( $V2Swell_{DUR}$ ) – Page 18, Address 50

MSB									LSB						
0	$2^{22}$	$2^{21}$	$2^{20}$	$2^{19}$	$2^{18}$	$2^{17}$	$2^{16}$	.....	$2^6$	$2^5$	$2^4$	$2^3$	$2^2$	$2^1$	$2^0$

Default = 0x00 0000

Voltage swell duration,  $V2Swell_{DUR}$ , determines the count of OWR samples utilized to determine a swell event.

These are integers in the range of 0 to 8,388,607 samples. A value of zero disables the feature.

### 6.6.35 Voltage 2 Swell Level ( $V2Swell_{LEVEL}$ ) – Page 18, Address 51

MSB									LSB						
$-(2^0)$	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	.....	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$

Default = 0x7F FFFF

Voltage swell level,  $V2Swell_{LEVEL}$ , establishes an input level above which a swell event is triggered.

This is a two's complement value in the range of  $-1.0 \leq \text{value} < 1.0$ , with the binary point to the right of the MSB. Negative values are not used.

### 6.6.36 Instantaneous Current 1 (*I1*) – Page 16, Address 2

MSB									LSB						
$-(2^0)$	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	.....	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$

Default = 0x00 0000

*I1* contains instantaneous current measurements for current channel 1.

This is a two's complement value in the range of  $-1.0 \leq \text{value} < 1.0$ , with the binary point to the right of the MSB.

### 6.6.37 Instantaneous Voltage 1 (*V1*) – Page 16, Address 3

MSB									LSB						
$-(2^0)$	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	.....	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$

Default = 0x00 0000

*V1* contains instantaneous voltage measurements for voltage channel 1.

This is a two's complement value in the range of  $-1.0 \leq \text{value} < 1.0$ , with the binary point to the right of the MSB.

### 6.6.38 Instantaneous Active Power 1 (*P1*) – Page 16, Address 4

MSB									LSB						
$-(2^0)$	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	.....	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$

Default = 0x00 0000

*P1* contains instantaneous power measurements for current and voltage channels 1.

Values in registers *I1* and *V1* are multiplied to generate this value. This is a two's complement value in the range of  $-1.0 \leq \text{value} < 1.0$ , with the binary point to the right of the MSB.

### 6.6.39 Active Power 1 (*P1<sub>AVG</sub>*) – Page 16, Address 5

MSB									LSB						
$-(2^0)$	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	.....	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$

Default = 0x00 0000

Instantaneous power is averaged over each low-rate interval (*SampleCount* samples) and then added with power offset (*P<sub>OFF</sub>*) to compute active power (*P<sub>AVG</sub>*).

This is a two's complement value in the range of  $-1.0 \leq \text{value} < 1.0$ , with the binary point to the right of the MSB.

#### 6.6.40 RMS Current 1 ( $I1_{RMS}$ ) – Page 16, Address 6

MSB									LSB						
$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	$2^{-8}$	.....	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$	$2^{-24}$

Default = 0x00 0000

$I1_{RMS}$  contains the root mean square (RMS) values of  $I1$ , calculated during each low-rate interval.

This is an unsigned value in the range of  $0 \leq \text{value} < 1.0$ , with the binary point to the left of the MSB.

#### 6.6.41 RMS Voltage 1 ( $V1_{RMS}$ ) – Page 16, Address 7

MSB									LSB						
$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	$2^{-8}$	.....	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$	$2^{-24}$

Default = 0x00 0000

$V1_{RMS}$  contains the root mean square (RMS) value of  $V1$ , calculated during each low-rate interval.

This is an unsigned value in the range of  $0 \leq \text{value} < 1.0$ , with the binary point to the left of the MSB.

#### 6.6.42 Instantaneous Current 2 ( $I2$ ) – Page 16, Address 8

MSB									LSB						
$-(2^0)$	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	.....	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$

Default = 0x00 0000

$I2$  contains instantaneous current measurements for current channel 2.

This is a two's complement value in the range of  $-1.0 \leq \text{value} < 1.0$ , with the binary point to the right of the MSB.

#### 6.6.43 Instantaneous Voltage 2 ( $V2$ ) – Page 16, Address 9

MSB									LSB						
$-(2^0)$	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	.....	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$

Default = 0x00 0000

$V2$  contains instantaneous voltage measurements for voltage channel 2.

This is a two's complement value in the range of  $-1.0 \leq \text{value} < 1.0$ , with the binary point to the right of the MSB.

#### 6.6.44 Instantaneous Active Power 2 ( $P2$ ) – Page 16, Address 10

MSB									LSB						
$-(2^0)$	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	.....	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$

Default = 0x00 0000

$P2$  contains instantaneous power measurements for current and voltage channels 2.

Values in registers  $I2$  and  $V2$  are multiplied to generate this value. This is a two's complement value in the range of  $-1.0 \leq \text{value} < 1.0$ , with the binary point to the right of the MSB.

#### 6.6.45 Active Power 2 ( $P2_{AVG}$ ) – Page 16, Address 11

MSB									LSB						
$-(2^0)$	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	.....	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$

Default = 0x00 0000

Instantaneous power is averaged over each low-rate interval ( $SampleCount$  samples) to compute active power ( $P2_{AVG}$ ).

This is a two's complement value in the range of  $-1.0 \leq \text{value} < 1.0$ , with the binary point to the right of the MSB.

#### 6.6.46 RMS Current 2 ( $I2_{RMS}$ ) – Page 16, Address 12

MSB									LSB						
$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	$2^{-8}$	.....	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$	$2^{-24}$

Default = 0x00 0000

$I2_{RMS}$  contains the root mean square (RMS) value of  $I2$ , calculated during each low-rate interval.

This is an unsigned value in the range of  $0 \leq \text{value} < 1.0$ , with the binary point to the left of the MSB.

#### 6.6.47 RMS Voltage 2 ( $V2_{RMS}$ ) – Page 16, Address 13

MSB									LSB						
$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	$2^{-8}$	.....	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$	$2^{-24}$

Default = 0x00 0000

$V2_{RMS}$  contains the root mean square (RMS) value of  $V2$ , calculated during each low-rate interval.

This is an unsigned value in the range of  $0 \leq \text{value} < 1.0$ , with the binary point to the left of the MSB.

#### 6.6.48 Reactive Power 1 ( $Q1_{Avg}$ ) – Page 16, Address 14

MSB									LSB						
$-(2^0)$	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	.....	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$

Default = 0x00 0000

Reactive power 1 ( $Q1_{Avg}$ ) is  $Q1$  averaged over each low-rate interval ( $SampleCount$  samples) and corrected by  $Q_{OFF}$ .

This is a two's complement value in the range of  $-1.0 \leq \text{value} < 1.0$ , with the binary point to the right of the MSB.

#### 6.6.49 Instantaneous Quadrature Power 1 ( $Q1$ ) – Page 16, Address 15

MSB									LSB						
$-(2^0)$	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	.....	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$

Default = 0x00 0000

Instantaneous quadrature power,  $Q1$ , the product of  $V1$  shifted 90 degrees and  $I1$ .

This is a two's complement value in the range of  $-1.0 \leq \text{value} < 1.0$ , with the binary point to the right of the MSB.

#### 6.6.50 Reactive Power 2 ( $Q2_{Avg}$ ) – Page 16, Address 16

MSB									LSB						
$-(2^0)$	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	.....	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$

Default = 0x00 0000

Reactive power 2 ( $Q2_{Avg}$ ) is  $Q2$  averaged over each low-rate interval ( $SampleCount$  samples).

This is a two's complement value in the range of  $-1.0 \leq \text{value} < 1.0$ , with the binary point to the right of the MSB.

#### 6.6.51 Instantaneous Quadrature Power 2 ( $Q2$ ) – Page 16, Address 17

MSB									LSB						
$-(2^0)$	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	.....	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$

Default = 0x00 0000

Instantaneous quadrature power,  $Q2$ , the product of  $V2$  shifted 90 degrees and  $I2$ .

This is a two's complement value in the range of  $-1.0 \leq \text{value} < 1.0$ , with the binary point to the right of the MSB.

### 6.6.52 Peak Current 1 ( $I1_{PEAK}$ ) – Page 0, Address 37

MSB									LSB						
$-(2^0)$	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	.....	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$

Default = 0x00 0000

Peak current1 ( $I1_{PEAK}$ ) contains the value of the instantaneous current 1 sample with the greatest magnitude detected during the last low-rate interval.

This is a two's complement value in the range of  $-1.0 \leq \text{value} < 1.0$ , with the binary point to the right of the MSB.

### 6.6.53 Peak Voltage 1 ( $V1_{PEAK}$ ) – Page 0, Address 36

MSB									LSB						
$-(2^0)$	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	.....	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$

Default = 0x00 0000

Peak voltage 1 ( $V1_{PEAK}$ ) contains the value of the instantaneous voltage 1 sample with the greatest magnitude detected during the last low-rate interval.

This is a two's complement value in the range of  $-1.0 \leq \text{value} < 1.0$ , with the binary point to the right of the MSB.

### 6.6.54 Apparent Power 1 ( $S1$ ) – Page 16, Address 20

MSB									LSB						
0	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	.....	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$

Default = 0x00 0000

Apparent power 1 ( $S1$ ) is the product of  $V1_{RMS}$  and  $I1_{RMS}$  or  $\text{SQRT}(P1_{AVG}^2 + Q1_{AVG}^2)$ .

This is an unsigned value in the range of  $0 \leq \text{value} \leq 1.0$ , with the binary point to the right of the MSB.

### 6.6.55 Power Factor 1 ( $PF1$ ) – Page 16, Address 21

MSB									LSB						
$-(2^0)$	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	.....	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$

Default = 0x00 0000

Power factor 1 ( $PF1$ ) is calculated by dividing active power 1 ( $P1_{AVG}$ ) by apparent power 1 ( $S1$ ).

The sign is determined by the active power ( $P1_{AVG}$ ) sign.

This is a two's complement value in the range of  $-1.0 \leq \text{value} < 1.0$ , with the binary point to the right of the MSB.

### 6.6.56 Peak Current 2 ( $I2_{PEAK}$ ) – Page 0, Address 39

MSB									LSB						
$-(2^0)$	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	.....	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$

Default = 0x00 0000

Peak current,  $I2_{PEAK}$ , contains the value of the instantaneous current 2 sample with the greatest magnitude detected during the last low-rate interval.

This is a two's complement value in the range of  $-1.0 \leq \text{value} < 1.0$ , with the binary point to the right of the MSB.

### 6.6.57 Peak Voltage 2 ( $V2_{PEAK}$ ) – Page 0, Address 38

MSB									LSB						
$-(2^0)$	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	.....	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$

Default = 0x00 0000

Peak voltage,  $V2_{PEAK}$ , contains the value of the instantaneous voltage 2 sample with the greatest magnitude detected during the last low-rate interval.

This is a two's complement value in the range of  $-1.0 \leq \text{value} < 1.0$ , with the binary point to the right of the MSB.

### 6.6.58 Apparent Power 2 ( $S2$ ) – Page 16, Address 24

MSB									LSB						
0	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	.....	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$

Default = 0x00 0000

Apparent power 2 ( $S2$ ) is the product of  $V2_{RMS}$  and  $I2_{RMS}$  or  $\text{SQRT}(P2_{AVG}^2 + Q2_{AVG}^2)$ .

This is an unsigned value in the range of  $0 \leq \text{value} \leq 1.0$ , with the binary point to the right of the MSB.

### 6.6.59 Power Factor 2 ( $PF2$ ) – Page 16, Address 25

MSB									LSB						
$-(2^0)$	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	.....	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$

Default = 0x00 0000

Power factor 2 ( $PF2$ ) is calculated by dividing active power 2 ( $P2_{AVG}$ ) by apparent power 2 ( $S2$ ).

The sign is determined by the active power ( $P2_{AVG}$ ) sign.

This is a two's complement value in the range of  $-1.0 \leq \text{value} < 1.0$ , with the binary point to the right of the MSB.

### 6.6.60 Temperature ( $T$ ) – Page 16, Address 27

MSB								LSB							
$-(2^7)$	$2^6$	$2^5$	$2^4$	$2^3$	$2^2$	$2^1$	$2^0$	.....	$2^{-10}$	$2^{-11}$	$2^{-12}$	$2^{-13}$	$2^{-14}$	$2^{-15}$	$2^{-16}$

Default = 0x00 0000

$T$  contains results from the on-chip temperature measurement.

By default,  $T$  uses the Celsius scale and is a two's complement value in the range of  $-128.0 \leq \text{value} < 128.0$  ( $^{\circ}\text{C}$ ), with the binary point to the right of bit 16.

$T$  can be rescaled by the application using the  $T_{\text{GAIN}}$  and  $T_{\text{OFF}}$  registers.

### 6.6.61 Total Active Power ( $P_{\text{SUM}}$ ) – Page 16, Address 29

MSB								LSB							
$-(2^0)$	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	.....	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$

Default = 0x00 0000

$$P_{\text{SUM}} = P1_{\text{AVG}} + P2_{\text{AVG}}$$

This is a two's complement value in the range of  $-1.0 \leq \text{value} < 1.0$ , with the binary point to the right of the MSB.

### 6.6.62 Total Apparent Power ( $S_{\text{SUM}}$ ) – Page 16, Address 30

MSB								LSB							
0	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	.....	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$

Default = 0x00 0000

$$S_{\text{SUM}} = S1 + S2$$

This is an unsigned value in the range of  $0.0 \leq \text{value} < 1.0$ , with the binary point to the right of the MSB.

### 6.6.63 Total Reactive Power ( $Q_{\text{SUM}}$ ) – Page 16, Address 31

MSB								LSB							
$-(2^0)$	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	.....	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$

Default = 0x00 0000

$$Q_{\text{SUM}} = Q1_{\text{AVG}} + Q2_{\text{AVG}}$$

This is a two's complement value in the range of  $-1.0 \leq \text{value} < 1.0$ , with the binary point to the right of the MSB.

#### 6.6.64 DC Offset for Current ( $I1_{DCOFF}$ , $I2_{DCOFF}$ ) – Page 16, Address 32, 39

MSB									LSB						
$-(2^0)$	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	.....	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$

Default = 0x00 0000

DC offset registers  $I1_{DCOFF}$  and  $I2_{DCOFF}$  are initialized to zero on reset. During DC offset calibration, selected registers are written with the inverse of the DC offset measured. The application program can also write the DC offset register values. These are two's complement values in the range of  $-1.0 \leq \text{value} < 1.0$ , with the binary point to the right of the MSB.

#### 6.6.65 DC Offset for Voltage ( $V1_{DCOFF}$ , $V2_{DCOFF}$ ) – Page 16, Address 34, 41

MSB														LSB	
$-(2^0)$	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	.....	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$

Default = 0x00 0000

DC offset registers  $V1_{DCOFF}$  and  $V2_{DCOFF}$  are initialized to zero on reset. During DC offset calibration, selected registers are written with the inverse of the DC offset measured. The application program can also write the DC offset register values. These are two's complement values in the range of  $-1.0 \leq \text{value} < 1.0$ , with the binary point to the right of the MSB.

#### 6.6.66 Gain for Current ( $I1_{GAIN}$ , $I2_{GAIN}$ ) – Page 16, Address 33, 40

MSB														LSB	
$2^1$	$2^0$	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	.....	$2^{-16}$	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$

Default = 0x40 0000 (1.0)

Gain registers  $I1_{GAIN}$  and  $I2_{GAIN}$  are initialized to 1.0 on reset. During gain calibration, selected register are written with the multiplicative inverse of the gain measured. These are unsigned fixed-point values in the range of  $0 \leq \text{value} < 4.0$ , with the binary point to the right of the second MSB.

#### 6.6.67 Gain for Voltage ( $V1_{GAIN}$ , $V2_{GAIN}$ ) – Page 16, Address 35, 42

MSB									LSB							
2 <sup>1</sup>	2 <sup>0</sup>	2 <sup>-1</sup>	2 <sup>-2</sup>	2 <sup>-3</sup>	2 <sup>-4</sup>	2 <sup>-5</sup>	2 <sup>-6</sup>	.....	2 <sup>-16</sup>	2 <sup>-17</sup>	2 <sup>-18</sup>	2 <sup>-19</sup>	2 <sup>-20</sup>	2 <sup>-21</sup>	2 <sup>-22</sup>	

Default = 0x40 0000 (1.0)

Gain registers  $V1_{GAIN}$  and  $V2_{GAIN}$  are initialized to 1.0 on reset. During gain calibration, selected registers are written with the multiplicative inverse of the gain measured. These are unsigned fixed-point values in the range of  $0 \leq \text{value} < 4.0$ , with the binary point to the right of the second MSB.

### 6.6.68 Average Active Power Offset ( $P1_{OFF}$ , $P2_{OFF}$ ) – Page 16, Address 36, 43

MSB								LSB							
$-(2^0)$	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	.....	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$

Default = 0x00 0000

Average Active Power offset  $P1_{OFF}$  ( $P2_{OFF}$ ) is added to averaged power to yield  $P1_{AVG}$  ( $P2_{AVG}$ ) register results. It can be used to reduce systematic energy errors. These are two's complement values in the range of  $-1.0 \leq \text{value} < 1.0$ , with the binary point to the right of the MSB.

### 6.6.69 Average Reactive Offset ( $Q1_{OFF}$ , $Q2_{OFF}$ ) – Page 16, Address 38, 45

MSB								LSB							
$-(2^0)$	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	.....	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$

Default = 0x00 0000

Average Reactive Power offset  $Q1_{OFF}$  ( $Q2_{OFF}$ ) is added to averaged reactive power to yield  $Q1_{AVG}$  ( $Q2_{AVG}$ ) register results. It can be used to reduce systematic energy errors. These are two's complement values in the range of  $-1.0 \leq \text{value} < 1.0$ , with the binary point to the right of the MSB.

### 6.6.70 AC Offset for Current ( $I1_{ACOFF}$ , $I2_{ACOFF}$ ) – Page 16, Address 37, 44

MSB								LSB							
$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	$2^{-8}$	.....	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$	$2^{-24}$

Default = 0x00 0000

AC offset registers  $I1_{ACOFF}$  and  $I2_{ACOFF}$  are initialized to zero on reset. They are used to reduce systematic errors in the RMS results. These are unsigned values in the range of  $0 \leq \text{value} < 1.0$ , with the binary point to the left of the MSB.

### 6.6.71 Temperature Gain ( $T_{GAIN}$ ) – Page 16, Address 54

MSB								LSB							
$2^7$	$2^6$	$2^5$	$2^4$	$2^3$	$2^2$	$2^1$	$2^0$	.....	$2^{-10}$	$2^{-11}$	$2^{-12}$	$2^{-13}$	$2^{-14}$	$2^{-15}$	$2^{-16}$

Default = 0x 06 B716

Register  $T_{GAIN}$  is used to scale the Temperature register ( $T$ ), and is an unsigned fixed-point value in the range of  $0.0 \leq \text{value} < 256.0$ , with the binary point to the right of bit 16.

Register  $T$  can be rescaled by the application using the  $T_{GAIN}$  and  $T_{OFF}$  registers. Refer to section [7.3 Temperature Sensor Calibration](#) on page 65 for more information.

### 6.6.72 Temperature Offset ( $T_{OFF}$ ) – Page 16, Address 55

MSB								LSB							
$-(2^7)$	$2^6$	$2^5$	$2^4$	$2^3$	$2^2$	$2^1$	$2^0$	.....	$2^{-10}$	$2^{-11}$	$2^{-12}$	$2^{-13}$	$2^{-14}$	$2^{-15}$	$2^{-16}$

Default = 0x D5 3998

Register  $T_{OFF}$  is used to offset the Temperature register ( $T$ ), and is a two's complement value in the range of  $-128.0 \leq \text{value} < 128.0$  ( $^{\circ}\text{C}$ ), with the binary point to the right of bit 16.

Register  $T$  can be rescaled by the application using the  $T_{GAIN}$  and  $T_{OFF}$  registers. Refer to section [7.3 Temperature Sensor Calibration](#) on page 65 for more information.

### 6.6.73 Calibration Scale ( $Scale$ ) – Page 18, Address 63

MSB								LSB							
$-(2^0)$	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	.....	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$

Default = 0x4C CCCC (0.6)

The  $Scale$  register is used in the gain calibration to set the level of calibrated results of I-channel RMS. During gain calibration, the  $I_{X_{RMS}}$  results register is divided into the  $Scale$  register. The quotient is put into the  $I_{X_{GAIN}}$  register. This is a two's complement value in the range of  $-1.0 \leq \text{value} < 1.0$ , with the binary point to the right of the MSB. Negative values are not used.

### 6.6.74 V-Channel Zero-crossing Threshold ( $VZX_{LEVEL}$ ) – Page 18, Address 58

MSB								LSB							
$-(2^0)$	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	.....	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$

Default = 0x10 0000 (0.125)

$VZX_{LEVEL}$  is the level that the peak instantaneous voltage must exceed for the zero-crossing detection to function. This is a two's complement value in the range of  $-1.0 \leq \text{value} < 1.0$ , with the binary point to the right of the MSB. Negative values are not used.

### 6.6.75 I-Channel Zero-crossing Threshold ( $IZX_{LEVEL}$ ) – Page 18, Address 24

MSB								LSB							
$-(2^0)$	$2^{-1}$	$2^{-2}$	$2^{-3}$	$2^{-4}$	$2^{-5}$	$2^{-6}$	$2^{-7}$	.....	$2^{-17}$	$2^{-18}$	$2^{-19}$	$2^{-20}$	$2^{-21}$	$2^{-22}$	$2^{-23}$

Default = 0x10 0000 (0.125)

$IZX_{LEVEL}$  is the level that the peak instantaneous current must exceed for the zero-crossing detection to function. This is a two's complement value in the range of  $-1.0 \leq \text{value} < 1.0$ , with the binary point to the right of the MSB. Negative values are not used.

### 6.6.76 Zero-crossing Number ( $ZX_{NUM}$ ) – Page 0, Address 55

MSB								LSB							
$2^{23}$	$2^{22}$	$2^{21}$	$2^{20}$	$2^{19}$	$2^{18}$	$2^{17}$	$2^{16}$	.....	$2^6$	$2^5$	$2^4$	$2^3$	$2^2$	$2^1$	$2^0$

Default = 0x00 0064 (100)

$ZX_{NUM}$  is the number of zero crossings used for line frequency measurement. It is an integer in the range of 1 to 8,388,607. Zero should not be used.

## 7. SYSTEM CALIBRATION

Component tolerances, residual ADC offset, and system noise require a meter that needs to be calibrated before it meets a specific accuracy requirement. The CS5484 provides an on-chip calibration algorithm to operate the system calibration quickly and easily. Benefiting from the excellent linearity and low noise level of the CS5484, normally a CS5484 meter only needs one calibration at a single load point to achieve accurate measurements over the full load range.

### 7.1 Calibration in General

The CS5484 provides DC offset and gain calibration that can be applied to the instantaneous voltage and current measurements and AC offset calibration, which can be applied to the voltage and current RMS calculations.

Since the voltage and current channels have independent offset and gain registers, offset and gain calibration can be performed on any channel independently.

The data flow of the calibration is shown in Figure 23.

Note that in Figure 23 the AC offset registers and gain registers affect the output results differently than the DC offset registers. The DC offset and gain values are applied to the voltage/current signals early in the signal path; the DC offset register and gain register values affect all CS5484 results. This is not true for the AC offset correction. The AC offset registers only affect the results of the RMS voltage and current calculations.

The CS5484 must be operating in its active state and ready to accept valid commands. Refer to section 6.1.2 [Instructions](#) on page 27 for different calibration

commands. The value in the *SampleCount* register determines the number ( $N$ ) of output word rate (OWR) samples that are averaged during a calibration. The calibration procedure takes the time of  $N + T_{SETTLE}$  OWR samples. As  $N$  is increased, the calibration takes more time, but the accuracy of the calibration results tends to increase.

The DRDY bit in the *Status0* register will be set at the completion of calibration commands. If an overflow occurs during calibration, other *Status0* bits may be set as well.

#### 7.1.1 Offset Calibration

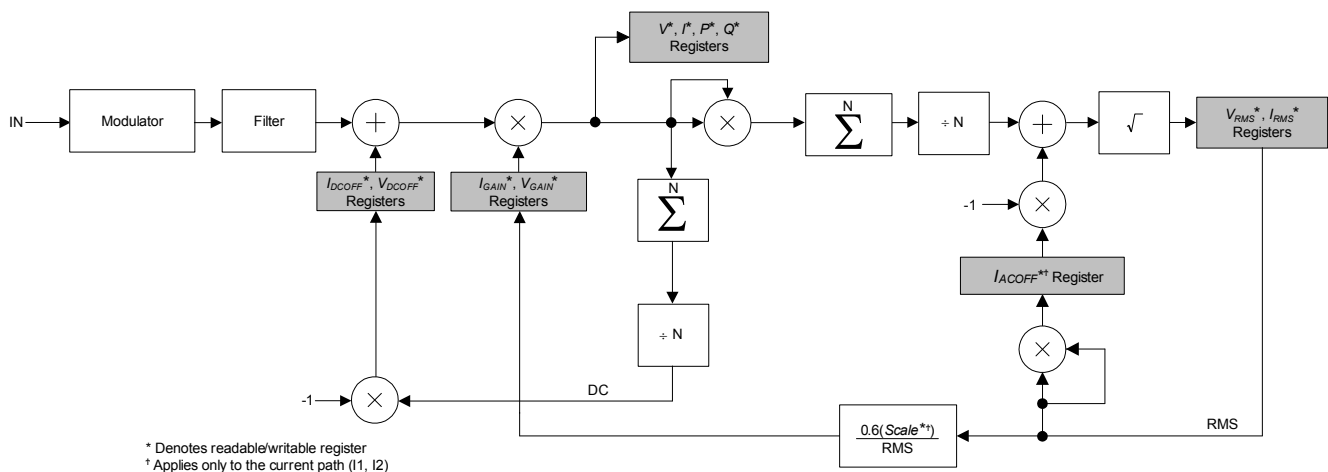

During offset calibrations, no line voltage or current should be applied to the meter; the differential signal on voltage inputs  $V1IN\pm$  ( $V2IN\pm$ ) or current inputs  $I1IN1\pm$  ( $I1IN2\pm$ ) of the CS5484 should be 0V.

##### 7.1.1.1 DC Offset Calibration

The DC offset calibration command measures and averages DC values read on specified voltage or current channels at zero input and stores the inverse result in the associated offset registers. This DC offset will be added to instantaneous measurements in subsequent conversions, removing the offset.

The gain register for the channel being calibrated should be set to 1.0 prior to performing DC offset calibration.

DC offset calibration is not required if the high-pass filter is enabled on that channel because the DC component will be removed by the high-pass filter.\*

**Figure 23. Calibration Data Flow**

### 7.1.1.2 AC Offset Calibration

The AC offset calibration command measures the residual RMS values on the current channel at zero input and stores the squared result in the associated AC offset register. This AC offset will be subtracted from RMS measurements in subsequent conversions, removing the AC offset on the associated current channel.

The AC offset register for the channel being calibrated should first be cleared prior to performing the calibration. The high-pass filter should be enabled if AC offset calibration is used. It is recommended that  $T_{SETTLE}$  be set to 2000 ms before performing an AC offset calibration. Note that the AC offset register holds the square of RMS value measured during calibration. Therefore, it can hold a maximum RMS noise of  $\sqrt{0xFFFF}$ . This is the maximum RMS noise that AC offset correction can remove.

### 7.1.2 Gain Calibration

Prior to executing the gain calibration command, gain registers for any path to be calibrated ( $V_{XGAIN}$ ,  $I_{XGAIN}$ ) should be set to 1.0, and  $T_{SETTLE}$  should be set to 2000 ms. For gain calibration, a reference signal must be applied to the meter. During gain calibration, the voltage RMS result register ( $V_{XRMS}$ ) is divided into 0.6, and the current RMS result register ( $I_{XRMS}$ ) is divided into the *Scale* register. The quotient is put into the associated gain register. The gain calibration algorithm attempts to adjust the gain register ( $V_{XGAIN}$ ,  $I_{XGAIN}$ ) such that the voltage RMS result register ( $V_{XRMS}$ ) equals 0.6, and the current RMS result register ( $I_{XRMS}$ ) equals the *Scale* register.

Note that for the gain calibration, there are limitations on choosing the reference level and the *Scale* register value. Using a reference or a scale that is too large or too small can cause register overflow during calibration or later during normal operation. Either condition can set *Status* register bits I1OR (I2OR) V1OR (V2OR). The maximum value that the gain register can attain is four. Using inappropriate reference levels or scale values may also cause the CS5484 to attempt to set the gain register higher than four, therefore the gain calibration result will be invalid.

The *Scale* register is 0.6 by default. The maximum voltage ( $U_{MAX}$  Volts) and current ( $I_{MAX}$  Amps) of the meter should be used as the reference signal level if the *Scale* register is 0.6. After gain calibration, 0.6 of the  $V_{XRMS}$  ( $I_{XRMS}$ ) register represents  $U_{MAX}$  Volts ( $I_{MAX}$  Amps) for the line voltage (load current); 0.36 of the  $P_{XAVG}$ ,  $Q_{XAVG}$ , or  $S_x$  register represents  $U_{MAX} \times I_{MAX}$

Watts, Vars, or VAs for the active, reactive, or apparent power.

If the calibration is performed with  $U_{MAX}$  Volts and  $I_{CAL}$  Amps and  $I_{CAL} < I_{MAX}$ , the *Scale* register needs to be scaled down to  $0.6 \times I_{CAL} / I_{MAX}$  before performing gain calibration. After gain calibration, 0.6 of the  $V_{XRMS}$  register represents  $U_{MAX}$  Volts,  $0.6 \times I_{CAL} / I_{MAX}$  of the  $I_{XRMS}$  register represents  $I_{CAL}$  Amps, and  $0.36 \times I_{CAL} / I_{MAX}$  of the  $P_{XAVG}$ ,  $Q_{XAVG}$ , or  $S_x$  register represents  $U_{MAX} \times I_{CAL}$  Watts, Vars, or VAs.

### 7.1.3 Calibration Order

1. If the HPF option is enabled, then any DC component that may be present in the selected signal channel will be removed, and a DC offset calibration is not required. However, if the HPF option is disabled, the DC offset calibration should be performed.

When using high-pass filters, it is recommended that the DC offset register for the corresponding channel be set to zero. Before performing DC offset calibration, the DC offset register should be set to 0, and the corresponding gain register should be set to 1.

2. If there is an AC offset in the  $I_{XRMS}$  calculation, the AC offset calibration should be performed on the current channel. Before performing AC offset calibration, the AC offset register should be set to 0. It is recommended that  $T_{SETTLE}$  be set to 2000 ms before performing an AC offset calibration.
3. Perform the gain calibration.
4. If an AC offset calibration was performed (step 2), then the AC offset may need to be adjusted to compensate for the change in gain (step 3). This can be accomplished by restoring zero to the AC offset register and then performing an AC offset calibration. The adjustment could also be done by multiplying the AC offset register value that was calculated in step 2 by the gain calculated in step 3 and updating the AC offset register with the product.

## 7.2 Phase Compensation

A phase compensation mechanism is provided to adjust for meter-to-meter variation in signal path delays. Phase offset between a voltage channel and its corresponding current channel can be calculated by using the power factor ( $PF1$ ,  $PF2$ ) register after a conversion.

- 1) Apply a reference voltage and current with a lagging power factor to the meter. The reference current waveform should lag the voltage with a 60° phase shift.
- 2) Start continuous conversion.

- 3) Accumulate multiple readings of the *PF1* or *PF2* register.
- 4) Calculate the average power factor,  $PF_{avg}$ .
- 5) Calculate phase offset =  $\arccos(PF_{avg}) - 60^\circ$ .
- 6) If the phase offset is negative, then the delay should be added only to the current channel. Otherwise, add more delay to the voltage channel than to the current channel to compensate for a positive phase offset.

Once the phase offset is known, the *CPCCx* and *FPCCx* bits for that channel are calculated and programmed in the *PC* register.

*CPCCx* bits are used if either:

- The phase offset is more than 1 output word rate (OWR) sample.
- More delay is needed on the voltage channel.

The compensation resolution is  $0.008789^\circ$  at 50Hz and  $0.010547^\circ$  at 60Hz at an OWR of 4000Hz.

### 7.3 Temperature Sensor Calibration

Temperature sensor calibration involves the adjustment of two parameters: temperature gain ( $T_{GAIN}$ ) and temperature offset ( $T_{OFF}$ ). Before calibration,  $T_{GAIN}$  must be set to 1.0 (0x 01 0000), and  $T_{OFF}$  must be set to 0.0 (0x 00 0000).

#### 7.3.1 Temperature Offset and Gain Calibration

To obtain the optimal temperature offset ( $T_{OFF}$ ) register value and temperature ( $T_{GAIN}$ ) register value, it is necessary to measure the temperature (*T*) register at a minimum of two points (*T1* and *T2*) across the meter operating temperature range. The two temperature points must be far enough apart to yield reasonable accuracy, for example  $25^\circ\text{C}$  and  $85^\circ\text{C}$ . Obtain a linear fit of these points ( $y = m \cdot x + b$ ), where the slope (*m*) and intercept (*b*) can be obtained.

**Figure 24. T Register vs. Force Temp**

$T_{OFF}$  and  $T_{GAIN}$  are calculated using the following equations:

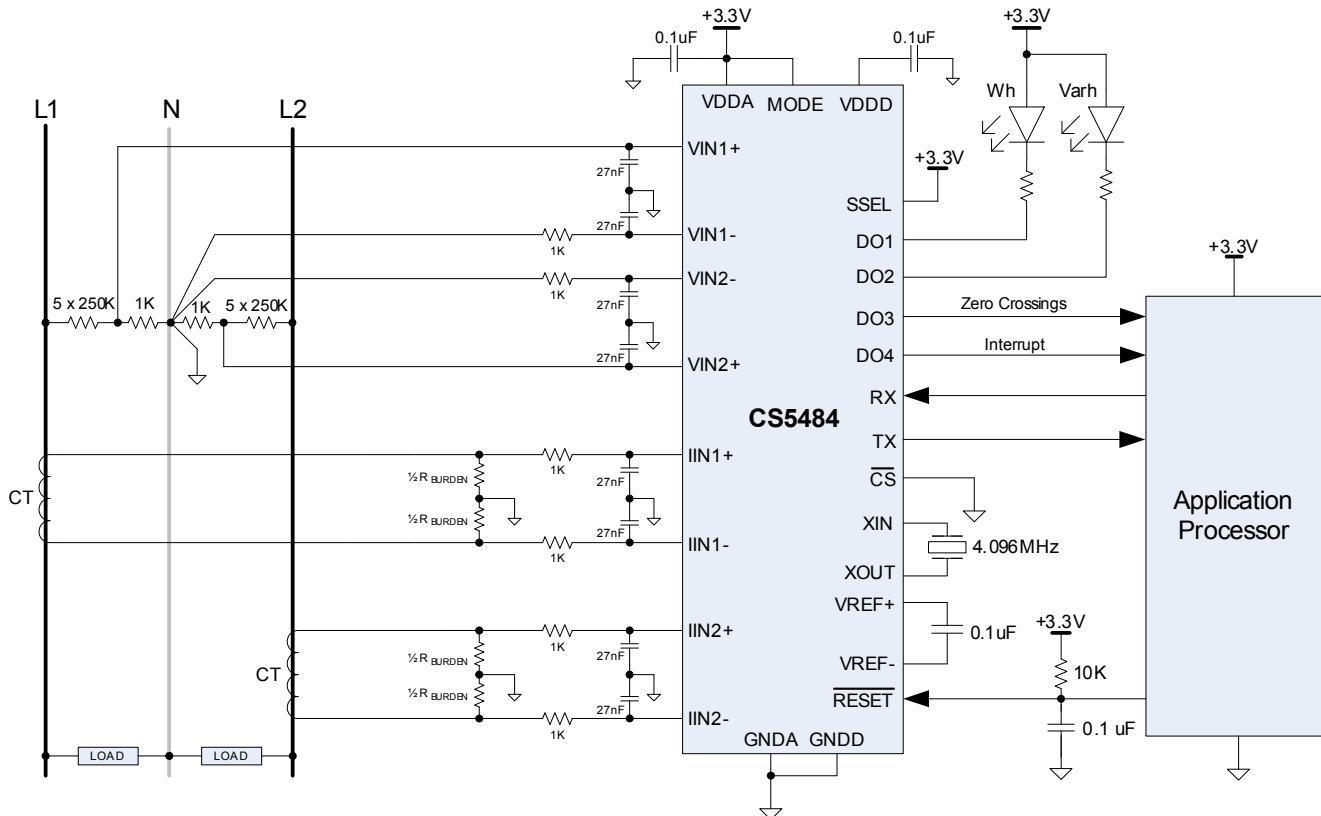

$$T_{OFF} = \frac{b}{m}$$

$$T_{GAIN} = m$$

## 8. BASIC APPLICATION CIRCUITS

Figure 25 shows the CS5484 configured to measure power in a single-phase, 3-wire system with two voltages and two currents. In this diagram, current

transformers (CTs) are used to sense the line load currents, and resistive voltage dividers are used to sense the line voltage.

**Figure 25. Typical Connection (Single-phase, 3-wire, 12S Electricity Meter)**

## 9. PACKAGE DIMENSIONS

### 28 QFN (5mmX5mm BODY with EXPOSED PAD) PACKAGE DRAWING

Dimension	mm			inch		
	MIN	NOM	MAX	MIN	NOM	MAX
A	0.80	0.90	1.00	0.031	0.035	0.039
A1	0.00	0.02	0.05	0.000	0.001	0.002
A3	0.20 REF			0.008 REF		
b	0.20	0.25	0.30	0.008	0.010	0.012
D	5.00 BSC			0.197 BSC		
D2	3.50	3.65	3.80	0.138	0.144	0.150
e	0.50 BSC			0.020 BSC		
E	5.00 BSC			0.197 BSC		
E2	3.50	3.65	3.80	0.138	0.144	0.150
L	0.35	0.40	0.45	0.014	0.016	0.018
aaa	0.15			0.006		
bbb	0.10			0.004		
ddd	0.05			0.002		
eee	0.08			0.003		

#### Notes:

- Controlling dimensions are in millimeters.
- Dimensions and tolerances per ASME Y14.5M.
- This drawing conforms to JEDEC outline MO-220, variation VHHD-3.
- Recommended reflow profile is per JEDEC/IPC J-STD-020.

## 10. ORDERING INFORMATION

Ordering Number	Container	Temperature	Package
CS5484-INZ	Bulk	-40 to +85 °C	28-pin QFN, Lead (Pb) Free
CS5484-INZR	Tape & Reel		

## 11. ENVIRONMENTAL, MANUFACTURING, AND HANDLING INFORMATION

Part Number	Peak Reflow Temp	MSL Rating*	Max Floor Life
CS5484-INZ	260°C	3	7 Days

\* MSL (Moisture Sensitivity Level) as specified by IPC/JEDEC J-STD-020.

## 12. REVISION HISTORY

Revision	Date	Changes
PP1	APR 2012	Preliminary release.
F1	APR 2012	Edited for content and clarity.
F2	JUN 2012	Updated ordering information.
F3	MAR 2013	Clarified context.
