CST1608A(C) 16-bit Speech Processor

1. CST1608A(C) General Description

The **TxP16S2™** is a high performance 16-bit MCU, running up to 32MHz and provided with 512K FLASH and total 4K SRAM for high performance process of audio algorithm. It is the new generation computational kernel for Flash Speech series. It has initially aimed at the areas of speech application to demonstrate its profession. TxP16S2 furnish with a fast unit, which allows calculation instructions to be issued with access memory simultaneously during one cycle. The CST1608A(C) is equipped with TxP16S2 and integrating input/output ports, Audio PWM/DAC, Timer and Low Voltage Reset...etc on a chip.

Furthermore, CST1608A(C) extend its external device connection capability such as Serial ROM/Flash. The internal memory capacity includes 512Kx16 program/data FLASH plus 4Kx16 working SRAM.

CST1608A(C) 16-bit Speech Processor

2. CST1608A(C) Features

- ◆ **Notice: CST1608C only supports SOP16-3 and SSOP24-2 packages.**
- ◆ **Notice: CST1608A(C) do not support ultra-deep sleep.**
- ◆ **Notice: PortC2 are forbidden to be connected with VCC or pull-up resistance.**
- ◆ **Notice: CST1608A(C) does not support buzzer and speaker wake up, so MISC1 bit10, MISC2 bit 12 and MISC2 bit14 should be set to 0.**
- ◆ High-performance RISC TxP16S2 CPU
 - wide working frequency and voltage 4Mhz ~32Mhz@1.8Volt ~ 5.5Volt
 - Operation frequency is programmable by Software
 - Built-in 4096x16 SRAM
 - Embedded PC Stack Level 16
- ◆ Rich DSP function
 - Hardware Circular Buffer support
 - MAC Computation power : 32 MIPS (max.)
 - Multi-Function Support: In MAC calculation, simultaneously access two operands from memory in one cycle
 - Extend Dynamic Range: A 40-bit accumulator to ensure in 512 successive multiple+additions no overflows
- ◆ Embedded Flash 512Kx16
 - Typical 1,000 erase/program cycles
 - Greater than 10 years Data Retention
- ◆ Software-based audio processing technical
 - Subband , ADPCM , Melody
- ◆ Support 24+2(ICE PAD can be as I/O) general purpose I/O port.
- ◆ Mono 16bit PWM or 16bit DAC
- ◆ 6 IRQ include 2 external interrupt
- ◆ SPI Master interface
- ◆ Three timers: Timer1, Timer2, RTC timer
- ◆ Support Spread Spectrum clocking to reduce EMI.
- ◆ Watch dog timer (WDT)
- ◆ Low voltage reset (LVR)
- ◆ PB0, PB1, PB2, PB3 support two edge modes for wake-up function are rising and falling edge trigger.
- ◆ 2 channel comparators and a two stage OPA with class AB output
- ◆ Microphone with AGC(Auto Gain Control)
- ◆ IR
- ◆ Touch with BG Pre-Charge
- ◆ Low voltage detector
- ◆ **Notice: VCC Decoupling Cap 10uF should be close to IC within 0.5cm.**
- ◆ **Notice: VCC Decoupling Cap 0.1uF should be close to IC within 0.5cm.**

CST1608A(C) 16-bit Speech Processor

- ◆ Notice: The width of VCC and VSS power line should be greater than 30 mil in PCB layout.
- ◆ Notice: Special I/O PortC2 will cause LED flashing light when power on.
- ◆ PortA4 and PortA5 are not supported touch function.
- ◆ Notice: PortC2 / PortC6 / PortC7 are forbidden to be directly connected to inductive components. For example, motors and coils, etc.
- ◆ Notice: PWM / DAC are forbidden to be connected to 4Ω speaker.
- ◆ CST16512A 和 CST1608A(C) 的差異如下:
 - CST1608A(C) 的 I/O 增加 PortA4 和 PortA5。
 - CST1608A(C) 的 Touch 功能支援 BG Pre-Charge
 - CST1608A(C) 的 Microphone 增加 PGA gain boost(GBB)
 - CST1608A(C) 的 LVR 改為 8 種不同電壓，1.7V / 1.8V / 1.9V / 2.0V / 2.1V / 2.2V / 2.3V / 2.4V。
 - CST1608A(C) 的電壓工作範圍 1.8V~5.5V
 - CST1608A(C) 不支援 Deep sleep 功能
 - CST1608A(C) 的 PWM 可以調整趨動電流
 - CST1608A(C) 的 PortC2 和 PortC6 和 PortC7 禁止接電感性元件，例如馬達、線圈。
 - CST1608A(C)的 PWM / DAC 輸出 禁止接 4Ω 喇叭。
- ◆ CST1608A(C)的 PortA4 和 PortA5 不支援 Touch 功能
- ◆ 因為 CST16512A 沒有 PortA4 和 PortA5，所以如果從 CST16512A 的程式直接轉到 CST1608A(C)，需要注意 PortA4 和 PortA5 的設定。例如進入 sleep mode 時，要把 PortA4 和 PortA5 設定為 input 加 pull down R，以免漏電。

CST1608A(C) 16-bit Speech Processor

3. CST1608A(C) Application Field

- MCU Application
- Electronic Dictionary
- Handheld Games
- Electronic Learning Aid (ELA)
- Electronics storybook

4. CST1608A(C) Block Diagram

Figure 4.1

CST1608A(C) 16-bit Speech Processor

4.1 Pin Assignments /Description

Pin Name	I/O	State after RESET	FUNCTIONS
Chip Power			
VCC	I	High	Chip Power Input
VSS	I	Low	Digital Ground
VPD	I	High	PWM IO PAD Power Input
VPS	I	Low	PWM IO PAD Ground
General Purpose I/O Port			
PortA[5:0]	I/O	Low	PortA is programmable Input/Output port
PortB[5:0]	I/O	Low	PortB is programmable Input/Output port
PortC[11:0]	I/O	Low	PortC is programmable Input/Output port PortC[2] is programmable Input/Output port when not connected to ICE ICE_VPP: PortC[2] is embedded ICE VPP pin when connected to ICE Probe.
PortI[1]/ ICE_SCLK	I/O	Low	PortI[1] is programmable Input/Output port when not connected to ICE Probe. Internal pull-down R (50K ohm) will be enable at ICE mode. ICE_SCLK: PortI[1] is embedded ICE clock pin when connected to ICE Probe.
PortI[0]/ ICE_SD	I/O	Low	PortI[0] is programmable Input/Output port when not connected to ICE Probe. Internal pull-down R (50K ohm) will be enable at ICE mode. ICE_SD: PortI[0] is embedded ICE data pin when connected to ICE Probe.
PWM Audio			
PWMP	O	Low	Digital PWM output(+) / Analog DAC output(+)
PWMN	O	Low	Digital PWM output(-) / Analog DAC output(-)

- ◆ Notice: Special I/O PortC2 will cause LED flashing light when power on.
- ◆ Notice: PortC2 are forbidden to be connected with VCC or pull-up resistance.

CST1608A(C) 16-bit Speech Processor

5. CST1608A(C) Function Descriptions

5.1 TxP16S2

As shown in the block diagram in Figure 4.1, the TxP16S2 is a 16-bit data width processing capability and all instructions are operated in one cycle except parameter data ROM(PM) access. The TxP16S2 not only provides general arithmetic such as addition, subtraction, shifter, normalize, and other logical operations, but it also involves circular buffer operations for complexity digital signal processing.

5.2 TxP16S2 Registers

The TxP16S2 contains of register files are illustrated below:

Figure 5.1 TxP16S2 Processor Core Registers

CST1608A(C) 16-bit Speech Processor

REGISTER FILES DEFINE:

AR: Accumulator Register
 I0: Index 0 Register
 I1: Index 1 Register
 BP: Base Pointer Register
 P0: Pointer 0 Register
 P1: Pointer 1 Register
 MACOP: MAC Operation Register
 MACNT: MAC Operation Loop Counter
 MX: MUL/MAC Input X Register
 MR0: MUL/MAC Result Register 0
 MR1: MUL/MAC Result Register 1

MR2: MUL/MAC Result Register 2
 AX: General AX Register
 BX: General BX Register
 CX: General CX Register
 DX: General DX Register
 R0: General R0 Register
 R1: General R1 Register
 R2: General R2 Register
 R3: General R3 Register
 CBL: Circular Buffer Length Register
 PASR: Parser Register

5.2.1 Special Registers

Figure 5.2 TxP16S2 Special Registers

● Accumulator Register

The AR is a general-purpose 16-bit register that stores the result of last arithmetic or logical operation. In addition, any data write to AR will affect the status flag.

● Stack Pointer

The SP is a 4-bit register that is for addressing Stack position. The SP will automatically increment / decrement

● Program Counter Bank

The program memory map is divided into 16 banks by PCB register (Program Counter Bank). From BANK8 to BANK14 are system reserved. From BANK0 to BANK7 are implemented as Flash memory. The BANK15 is implemented as static RAM.

● Program Counter High

The instruction "LJMP" and "LCALL" will refer PCH and PCB registers to compose of 20-bit pointer provides the 16x64K words PM addressing range.

● Program Counter

The 20-bit PC register provides 16x64K-word addressing capability. It is responsible for MCU fetch now executing instruction.

● Circular Buffer Length Register

Many algorithms such as convolution, correlation, and digital filter require the circular data buffers. The TxP16S2 supports circular buffer operating via the I0 vs. CIL and P0 vs. CPL. The modulus logic implements automatic modulus addressing for accessing RM/PM circular buffer data.

CST1608A(C) 16-bit Speech Processor

5.2.2 Common I/O Registers

The TxP16S2 involves 32 common I/O registers are shown in Table 5.1. There are defined the peripheral IO control and system register.

Table 5.1 Common I/O registers

CST1608A(C) 16-bit Speech Processor

5.2.3 Basic System Registers

◆STATUS register

Symbol	Adr	Reset	RW	b15/b7	b14/b6	b13/b5	b12/b4	b11/b3	B10/b2	b9/b1	b8/b0	Description
STATUS.L	00H	20	R/W	INTEN	-	-	AQ	AN	AV	AC	AZ	System Status Flag
STATUS.H	00H	00	R/W	PA	FA	IntVWR	-	-	-	-	SPIM_EN	

The Status register provides two main functions, the first system flag holds the status information generated by the computational blocks of the TxP16S2, which used for program sequencer control. The second indicated that special function of hardware module is enable or not.

For program flow control:

AZ	ALU or AR Result Zero
AN	ALU or AR Result Negative
AV	ALU Overflow
AC	ALU Carry
PA	Parser Queue available(Read only)
FA	Filter buffer available(Read only)

System hardware control:

INTEN	System global interrupt control bit
IntVWR	Interrupt Vector Table access window control bit
SPIM_EN	SPI master interface control bit

- ◆ Address 01H, 02H and 0AH: Interrupt control registers, the detail are illustrated in Interrupt section.
- ◆ Address 04H~15H: GPIO registers, the detail are illustrated in GPIO section.
- ◆ Address 16H: Audio-PWM control registers, the detail are illustrated in AUDIO section.

◆System Miscellanea register #1

Symbol	Adr	Reset	RW	b15/b7	b14/b6	b13/b5	b12/b4	b11/b3	B10/b2	b9/b1	b8/b0	Description
MISC1.L	1CH	00	R/W	TCS	DAC_EN	PWM_MUTE	DAC_MUTE_B	RC_RST	EXRST	LVR	WDT	System miscellanea register #1
MISC1.H	1CH	00	R/W	CLR_RealT	-	-	RTC_WAKE	IR_EN	0	PWM_EN	MODX	

Clr_RealT	Set high to clear 32-bit RealT timer. (this bit only for TCS=1)
RTC_WAKE	RTC Wake Up Flag (Read Only)
IR_EN	IR 38K Enable
PWM_EN	Audio PWM enable
MODX	MODX=0 is chosen narrowband sound-effect filter. MODX =1 is chosen wideband sound-effect filter. Actual bandwidth is dependent on source signal sample-rate.
TCS	Enable RealT Timer
DAC_EN	Audio DAC enable
PWM_MUTE	Audio PWM mute enable
DAC_MUTE_B	Audio DAC mute enable
RC_RST	System Reset from internal RC reset

CST1608A(C) 16-bit Speech Processor

EXRST	System Reset from external reset pin
LVR	System Reset from low voltage reset
WDT	System Reset from watch dog reset

Note1: RC_RST, EXRST, LVR will clear WDT bits, except for WDT is set to 1. All of the reset status bits can be set or cleared in software. Setting one of these bits in software does not cause a device reset.

Note2: If programmer read the "RealT" register, it can get 32-bit timer based on 30.517ns(32.768MHz). An example is shown as follows. Address 1DH: RealT register.

io[RealT] = ar ; write to reset the state machine of 32-bit real timer.
ar = io[RealT] ; read low-word timer[15:0]
ar = io[RealT] ; read high-word timer[31:16]

◆System Miscellanea register #2

Symbol	Adr	Reset	RW	b15/b7	b14/b6	b13/b5	b12/b4	b11/b3	B10/b2	b9/b1	b8/b0	Description
MISC2.L	1BH	00	R/W	CMP2EN	CMP1EN	OFT_SEL	GBB	-	-	-	-	System miscellanea register #2
MISC2.H	1BH	00	R/W	ENAVS	BUZEN	PGAEN	0	RECEN	OPEN	0	DISPUR	

ENAVS	Mic OP grounding to VPS
BUZEN	Default:0 , AGC enable
PGAEN	Default:0 , Programmable Gain Amplifier
RECEN	Default:0 , Microphone Enable
OPEN	Default:0 ,
DISPUR	Default:0 ,
CMP2EN	Default:0 , Comparator 2 Enable
CMP1EN	Default:0 , Comparator 1 Enable
OFT_SEL	Default:0 , Microphone Gain 0:50, 1:100, 2:150, 3:200
GBB	Default:0 , GBB=0 for PGA gain boost

◆System Miscellanea register #3

Symbol	Adr	Reset	RW	b15/b7	b14/b6	b13/b5	b12/b4	b11/b3	B10/b2	b9/b1	b8/b0	Description

CST1608A(C) 16-bit Speech Processor

5.3 PC Stack

The PC STACK is TxP16S2 special embedded memory used to save (PC+1) value, which is composed with 16-level.

Figure 5.3 PC Stack Structure

Stack's top value is indexed by stack pointer (SP) register. When CALL instruction is executed, then the (PC+1) will PUSH onto stack addressing by SP and it will auto decrement. At the end of subroutine when RETS instruction is executed the SP will auto increment and stack content of pointer by SP will POP into PC.

The contents of STACK and SP are neither readable nor writeable by instruction. The SP is initialized to "0" after RESET.

CST1608A(C) 16-bit Speech Processor

5.4 Interrupt

5.4.1 Interrupt Vector Table

The Interrupt Vector Table is TxP16S2 special embedded memory, which is composed with 6-level of FIFO, used to store the index of interrupt service routine (ISR) address. User can access Interrupt Vector Table by read/write IntVect I/O register, which refers PCB register to compose of 20-bit address.

Figure 5.4 Interrupt Vector Structure

5.4.2 Interrupt Controller

Common I/O registers

Symbol	Adr	Reset	RW	B7	B6	B5	B4	B3	B2	B1	B0	Description

INTMASK.H	0AH	00	R/W	-	-	-	-	-	-	-	-	

This chip provides several interrupt sources, including internal Audio PWM, Timer1, Timer2, RTC, SPI master, Flash ready, Touch, and 2 external ExtINT0, ExtINT1, interrupts. More details control will describe as follows:

Interrupt Source	Interrupt Vector	Priority
Audio PWM Timer	0H	INT0_IRQ (highest)
Timer1 / ExtINT0 / SPI Master(Note)	1H	INT1_IRQ
Timer2 / ExtINT1 / SPI Master(Note)	2H	INT2_IRQ
RTC Timer / SPI Master(Note)	3H	INT3_IRQ
Flash Erase/Program Ready(Note)	4H	INT4_IRQ
Touch / SPI Master(Note)	5H	INT5_IRQ (lowest)

Table 5.3 Interrupt Sources

Note: Only one interrupt source can be selected for each interrupt vector.

CST1608A(C) 16-bit Speech Processor

(a) Global interrupt enable (INTEN)

The global interrupt INTEN controls the enable/disable of all interrupts. When INTEN is cleared to "0", all interrupts are disabled. When INTEN is set to "1", all interrupts are enabled (but still dependent on value of INTENA register). The INTEN is initialized to "0" after power on.

(b) Interrupt enable (INTENA)

The interrupt enable from ENA5 to ENA0 are shown in above. An interrupt is allowed when these control bit are set to "1", and interrupt is inhibit when these control bit are cleared to "0". They are all initialized to "0" after power on.

(c) Interrupt request (INTREQ)

If an interrupt raising edge request is generated, the related interrupt request bit is set to "1" by hardware and waits for interrupt accept. INTREQ can be cleared to "0" by software. Hardware will not clear this bit. INTREQ are all initialized to "0" after power on.

(d) Interrupt mask (INTMASK)

The interrupt can be masked by setting bit5~ bit0 of interrupt mask register as above. Each interrupt source in the system can be masked individually.

(e) Interrupt Priority

INT0_IRQ (highest) > INT1_IRQ > INT2_IRQ > INT3_IRQ > INT4_IRQ > INT5_IRQ (lowest)

5.4.3 Interrupt Processing

When any interrupt request(INTREQ) is generated, the acceptance of interrupt is decided by the interrupt enable(ENA) and global interrupt enable(INTEN). If the global interrupt enable(INTEN), related interrupt enable bit(ENA) are set to "1" and related mask bit(MASK) are cleared to 0, that interrupt will be accepted on the next clock. These following procedures will automatically be done in one clock cycle by hardware showing below:

- (1) Program Counter(PC), PCB, PCH, AR and FLAG will be stored in special hardware registers.
- (2) PC will be set to the corresponding interrupt entry address by refer to interrupt vector table.
- (3) The global interrupt enable (INTEN) is cleared to "0", which avoids the nest interrupt happened.

When interrupt service routine was finished, an RETI instruction will perform the procedures by hardware showing as follows:

- (1) Restore the stored PC, PCB, PCH, AR and FLAG.
- (2) The global interrupt enable (INTEN) is set to "1", which allows to accept the subsequent interrupt.

Before executing RETI instruction, the corresponding interrupt request (INTREQ) bit must be cleared to "0" by software. If the request bit is not cleared, the same interrupt will be accepted again.

CST1608A(C) 16-bit Speech Processor

5.5 MAC (16-bit X 16-bit Multiplier and Accumulator)

A 16 bit x 16 bit MAC is provided for digital signal processing. The core of MAC operation is multiply MX&MY with 2'S complement operand and accumulation previous 40-bit MF then rounding store result in the 40-bit MR register. The basic MAC architecture is shown as Figure 5.5.

Figure 5.5 MAC Architecture

Define MAC module registers:

MX: MAC input 16-bit X register

MR: Multiplier or MAC result 40-bit register

MACOP: MAC operation define register

Symbol	Reset	RW	B7	B6	B5	B4	B3	B2	B1	B0	Description
MACOP	00	R/W	RND1	RND0	P0/P1	POP: +/-	I0/I1	IOP: +/-	MY: SU(01)		MAC Operation Setup

MACNT: MAC equation loop counter, max to 255

Basically, multiplier operates equation:

$$MR = MX * MY(SU) \rightarrow MX: \text{signed}, MY: \text{unsigned}$$

Permission MY is AR or immediate value (-128~127), MX and MY are signed or unsigned assign by MACOP. So, actual multiplier instruction likes this:

$$MR = MX * AR \quad \text{or} \quad MR = MX * 56$$

The operation of MAC equation is:

$$MR = MR + (MX * MY(SU)) \ll RND, MX = RM[I0++], MY = PM[P1--]$$

The means of equation is signed MX multiply unsigned MY the result value shift left RND bits and add previous MR then write back to MR.

CST1608A(C) 16-bit Speech Processor

Simultaneously, load new value to MX fixed from RM[index operation]
 MY fixed from PM[pointer operation]

Therefore, MAC array operation like this:

$MR = MR + (MX * MY(SS)) \ll 1, MX = RM[I0++] , MY = PM[P1--]$

$MR = MR + (MX * MY(SS)) \ll 1, MX = RM[I0++] , MY = PM[P1--]$

·
·
·

Successive 64 times

$MR = MR + (MX * MY(SS)) \ll 1, MX = RM[I0++] , MY = PM[P1--]$

Actual just one line of instruction present in assembly coding like this:

MACNT = 63

This is very benefit for reducing code size. Of curse, we need setup MACOP register previous; at this example is like this;

Symbol	Reset	RW	B7	B6	B5	B4	B3	B2	B1	B0	Description
MACOP	00	R/W	RND1	RND0	P0/P1	POP: +/-	I0/I1	IOP: +/-	MY: SU(01)		MAC Operation Setup
			0	1	1	1	0	0	0	0	

Note: Successive MAC operation will cause MCU interrupt disable.

CST1608A(C) 16-bit Speech Processor

6. CST1608A(C) Memory Configuration

6.1 Internal Program/Parameter Memory

TxP16S2 consider both instruction and data ROM are the same as program ROM(PM), so it's very flexible and efficient for instruction and data memory allocation in PM. The total of logical PM space is 16 banks. Each bank has 64 K space. The 16 x 64K space is addressed by memory address generator unit (MAG). From BANK0 to BANK7 are implemented as Flash memory. From BANK8 to BANK14 are system reserved. The BANK15 is implemented as static RAM. More details control will describe as follows:

Figure 6.1 PM block diagram

When TxP16S2 executed an instruction, the PM address is generated from PC register. Similarity, when it access a word data, the PM address is composed with 20-bit from P0 or P1. System will auto adjust execute target space when program context switch between BANK0~7 and BANK15.

6.2 Internal Data Working SRAM

The internal data working ram space is totally 4Kx16-bit that named as RM. Addressing ranged from 0x0000 through 0x0FFF, which is generated by Data Address Generator Unit (DAG). Note: Index register (I0,I1,BP) are 16-bit width, but RM address line is only 12-bit width(0~4095); therefore, RM address will be warping when index value exceed 4095.

Note: Total SARM size is 4Kx16-bit. If PM(BANK15 / 1Kx16-bit) is used, RM will be 3Kx16-bit. If PM(BANK15) is no used, RM will be 4Kx16-bit. SARM configuration is set by option code.

CST1608A(C) 16-bit Speech Processor

Figure 6.2 RM block diagram

6.3 Data Stack

A Last In First Out (LIFO) STACK is implementation for temporary data storage in RM memory. Generally, Data Stack is start-up at the bottom of RM, so BP is usually set to 0x0FFF.

Figure 6.3 Data Stack Structure

Data Stack's top value is indexed by base pointer (BP) register. When PUSH instruction is executed, the "regs" will PUSH onto stack which address by BP and it will auto decrement. If POP instruction is performed, the BP will auto increment and stack content of pointed by BP will POP into "regs".

7.1.1 Audio PWM Timer

Audio PWM timer is fixed generate 32kHz interrupt request when INTENA0 bit is turned on, If Auto FIFO EN is setting the interrupt request rate = $F_t / \text{FIFO Length}$. **Notice: It should be avoided that INTENA bit0 is turned on/off quickly. If need to turned on/off INTENA bit0 quickly, recommend to use INTMASK bit0.**

Figure 7.1 Audio PWM Timer Structure

7.1.2 Timer1 & Timer2

The clock source of Timer1 & Timer2 comes from fixed 32.768Mhz or External Clock Input, It contains 16-bit write-only counter register. If Timer enable correspond with the INTENA bit is turned on then counting to time out, an interrupt request will be generated. At the same time, TnC will be reloaded into Timer register and up-count again. If the global interrupt enable, an interrupt signal is generated at the next clock.

CST1608A(C) 16-bit Speech Processor

Figure 7.2 Timer1 & Timer2 Structure

7.1.3 RTC(Real Time Clock) Timer

The RTC Timer input frequency is Low power RC oscillator 32768Hz [-30%@1.8V](#) ~ +30%@5.5V (LP32K). It contains 16-bit counter register. RTC generates interrupt request or wake-up MCU when in halt mode or interrupt in normal mode. The wake-up function can be disabled by option.

The frequency of Int3_Req = 32768Hz / (RTC Timer TnC+1)

Figure 7.3 RTC Timer Structure

CST1608A(C) 16-bit Speech Processor

7.2 General Purpose I/O Ports

The CST1608A(C) provides 4 I/O ports for user application. There are four I/O port, PA0~PA5, PB0~PB5, PC0~PC11 and PI0~PI1. The input/output bits programmable by IOC control register respectively. PA0~PA5, PB0~PB5, PC0~PC11 wake-up function enable or disable by user program. PA1 and PA2 are external interrupt pins. The Pull-Down 50K or 220K or 1M resistor of each pin can be programmed by user program. **If I/O pin is set to output pin, the Pull-Down 50K and Pull-Down 1M resistor will be disable.**

The basic I/O schematic is showed in Figure 7.5.

Common I/O registers

WAKEDLV_PB	1AH	00	W	PortB_WAKEDLV[3:0]								PortB Double-Enable

PB0, PB1, PB2 and PB3 support two edge mode which is rising and falling edge trigger for wake-up function. The rising and falling edge trigger is selected by user program.

The PortC4, PortC5, PortC6, PortC7 also provides 2 comparators configuration for user application that each comparator enable or disable by program. The output of comparator is bit14 and bit15 of system miscellanea register #3.

Figure 7.5 Comparator Configuration

CST1608A(C) 16-bit Speech Processor

7.3 Extension Device

CST1608A(C) built-in special hardwires for external device connection capability are listed below:

7.3.1 SPI Master Controller

In order to enable SPI Master Controller interface, user should set STATUS.b8 = 1 before SPI Master Controller operation.

7.3.1.1 Features

- Serial clock rate: 16.384 MHz / 8.192 MHz / 4.096 MHz
- Support four standard SPI modes
- Built in 1x16 bits data buffer

I/O Port	SPI interface	Direction	Description
PortB.2	SO	I/O	Serial Data output
PortB.1	SI	I/O	Serial Data input
PortB.0	SCK	O	Serial Clock
PortB.5	CS	O	Chip Select(free assign by user)

7.3.1.2 Control/Data Registers

Symbol	Adr	Reset	RW	b15/b7	B14/b6	b13/b5	b12/b4	b11/b3	B10/b2	b9/b1	b8/b0	Description

7.3.2 PortA3 for IR 38KHz Modulation

I/O Port	IR	Direction	Description
PortA.3	IR 38K	O	IR 38K Output

PA3 can provide 38 KHz modulation function. I/O port PA3 combine 38 KHz modulator with register DATA_PA bit 3, this function is enabled by bit11 of system miscellanea register #1. If bit11 of system miscellanea register #1 is set to high, I/O port PA3 will output 38 KHz clock signal when PA3 is configured as output port and DATA_PA bit3 = 1. In contrast, PA3 output low when PA3 is configured as output port and DATA_PA bit3 = 0. The PA3 output pad will be forced to low state.

CST1608A(C) 16-bit Speech Processor

7.3.3 Touch Controller

7.3.3.1 Features

- Touch controller with one dedicated comparator
- Use Real-T counter to count the output pulse width of comparator
- Provides an interrupt for efficient programming.
- *PortA4 and PortA5 are not supported touch function.*

7.3.3.2 Control Registers

7.4 Audio Output

7.4.1 Mono 16-bit PWM Output

One 16-bit of audio PWM / DAC is built-in CST1608A(C) for mono audio application. Mono output pin PWMP and PWMN are connected to speaker directly. This amplifier can be used to direct drive 8 ohm speaker without any external circuit.

Common I/O registers

MISC5.H	18H	00	R/W	InterPLY FREQ DIV								

InterPLY_FREQ_DIV	System Frequency Divisor for DAC interpolation, Default:0
-------------------	---

Setting this value defines how many System Clocks will produce a smooth interpolated value that will be output directly to the DAC. If the system generates a 32-point interpolation operation, and the DAC value is updated every 32 points. Sampling Rate is set by IDE option.

Example1:

Sampling Rate = 32k Hz, 16-point interpolation

$$D[7:0](\text{InterPLY_FREQ_DIV}) = 65536 \text{ Hz} / (16 \times 32\text{k}) = 128(\text{Dec.}) / 0x80(\text{Hex.})$$

Example2:

Sampling Rate = 64k Hz, 32-point interpolation

$$D[7:0](\text{InterPLY_FREQ_DIV}) = 65536 \text{ Hz} / (32 \times 64\text{k}) = 32(\text{Dec.}) / 0x20(\text{Hex.})$$

CST1608A(C) 16-bit Speech Processor

7.5 Auto-FIFO

The Auto-FIFO allows user transfer base on 4-level of data to Audio-PWM. In some case of frame base applications that data transfer is more efficient than sample base. It is advantageous to decrease number of context switch between main program and interrupt service routine (ISR). The FIFO structure reveal as below:

Figure 7.7 Auto FIFO Structure

An interrupt is generated when an entire 4-level FIFO is transfer completed (D\A FIFO buffer is empty), then interrupt service routine should re-load 4-level data to FIFO at ones during 32K or 64K sample period. The FIFO will automatically shift-out data to Audio-PWM at each sample period.

Note: Auto-FIFO is enable/disable by option setup.

CST1608A(C) 16-bit Speech Processor

8. CST1608A(C) Flash Control

8.1 Flash Structure

CST1608A(C) is built in 512Kx16 program/data FLASH memory. This Flash is offered with sector endurance of more than 1,000 cycles, Data retention is rated at greater than 10 years. It is suited for convenient and economical updating of program, configuration, or data memory.

The sector architecture is based on sector size of 256 words/512 bytes. The sector erase operation allows the system to erase the device on a sector. The sector architecture is shown as Figure 8.1.

Sector Select(255 sectors)								Word Select(256 words)							
A15	A14	A13	A12	A11	A10	A9	A8	A7	A6	A5	A4	A3	A2	A1	A0

Figure 8.1 The sector architecture

8.2 Flash Sector Erase

The Sector Erase instruction needs to assign erasing sector number to AR register. When “PE = AR” instruction is executed, select of sector will be erased.

Example: Erase 16th sector (0x1000 – 0x10FF)

```
AR  = 0x0010 // assign erasing sector number
PE  = AR      // sector erasing
```

Note: Erasing time of one sector is 2.6ms.

8.3 Flash Word Programming

CST1608A(C) provide one word programming instruction. The Word Programming instruction needs to assign programming data to AR register and assign programming address to P0/P1 register. When “PM[P0/P1] = AR” instruction is executed, select of flash address will be programmed.

Example: Program 16th word address (0x0010)

```
P0.hh = 0x0000
P0 = 0x0010 // assign programming address
AR = 0x5678 // assign programming data
PM[P0] = AR // word programming
```

Note: Programming time of one word is 41us.

CST1608A(C) 16-bit Speech Processor

8.4 Flash Word Read

CST1608A(C) provide word read instruction. The Word Read instruction needs to assign reading address to P0/P1 register. When “AR = PM[P0/P1]” instruction is executed, select of word will be read out to AR register.

Example: Read 16th word address (0x0010)

P0.hh = 0x0000

P0 = 0x0010 // assign reading address

AR = PM[P0] // read word data

Note: Reading time of one word is two cycles of System Clock.

8.5 Flash unlock/lock for Programming/Erase instruction

Flash unlock instruction need to be executed before flash programming/erase instruction will be executed. This flash unlock instruction is to ensure the safety of the flash operation in order to prevent flash data from being modified by mistake. After the Flash program/erase instruction is executed, the Flash lock instruction needs to be executed to ensure the flash security.

Example1: Flash unlock

ENC_DAT EQU 54H

ar = 0xdb3f

io[ENC_DAT] = ar

ar = 0x8a17

io[ENC_DAT] = ar

Example2: Flash lock

ENC_DAT EQU 54H

ar = 0x1234

io[ENC_DAT] = ar

ar = 0x5678

io[ENC_DAT] = ar

CST1608A(C) 16-bit Speech Processor

9. CST1608A(C) Others

9.1 Dynamic System Clock

Operation frequency can be adjusted by software dynamically. User can adjust operation frequency in order to reduce power consumption.

Write Data	CPU Operation frequency
2	4 MHz
3	6 MHz
4	8 MHz

Example: Change CPU Operation frequency to 4MHz.

SPEED EQU 67H

```
ar = 0x0002;  
io[SPEED] = ar;
```

9.2 Low Voltage Detector

The voltage detect range of LVD is 1.8V ~ 2.98V for D2ENB = 0 or 2.7V~4.47V for D2ENB=1. When $VCC/2$ or $VCC/3 < VBGI$, LVDO=1, otherwise LVDO=0.

CST1608A(C) 16-bit Speech Processor

10. CST1608A(C) System Control

10.1 Halt Mode & Wake up

CST1608A(C) is changed into HALT mode (system clock stop, RTC stop by Option setup) when HALT instruction executed. It provides a power saving mode for those applications requiring a very low stand-by current. The RTC timer, PA0~PA5, PB0~PB5 and PC0~PC11 are supporting the wake-up MCU function when related I/O port raising/falling edge which selects by program. The program counter will be 04H when HALT instruction executed immediately; in addition, when wake up condition is occurred, MCU will release HALT state and program counter go-to next address after difference stable clock is delayed by option. During the Halt mode period, the SRAM will keep their previous data without changing.

10.2 Watch Dog Timer Reset (WDT)

Symbol	Adr	Reset	RW	b15/b7	b14/b6	b13/b5	b12/b4	B11/b3	b10/b2	b9/b1	b8/b0	Description
ClrWDT	1DH	XX	W									Clear WDT

The watch dog timer (WDT) is used to reset whole chip when detect unexpected execution sequence of instructions caused by accident condition, avoiding dead lock of MCU program. Software shall run an "clear watch dog timer"(CLRWDT) instruction before this timer time out. It will generate a reset signal to reset whole system when WDT overflow.

WDT will be reset when wake-up from halt or after power on or software clear. In test mode, watch dog timer will be disabled no matter watch-dog-timer is time-out or not.

The reset watch dog timer code syntax is strongly recommended as: "**CLRWDT = AR**".

10.3 Low Voltage Reset

When VCC power is applied to the chip, the low voltage reset is initially enabled by default, it will be disabled when in halt mode. The internal system reset will be generated if VCC power below the voltage of LVR(option setup). The normal operation of LVR is always enable expect disable in HALT mode.

10.4 Reset System

CST1608A(C) reset is come from four signals which are power on reset, low voltage reset(LVR), external IO PB3 or PC3 pin (by option) and WDT overflow reset, as shown in Figure 10.1. A dedicated external resetb input pin (by option) is provided to reset this chip, which has 30K ohm pull up resistor. The operation frequency of MCU will go back to BANK0 mode when reset occurred.

CST1608A(C) 16-bit Speech Processor

Figure 10.1 Reset system block diagram

10.5 Clock System Architecture

CST1608A(C) clock system supports internal ROSC(65.536MHz) for System Clock, and Low power RC oscillator(32768Hz [-30%@1.8V](#) ~ +30%@5.5V) for RTC function.
