

4-Mbit (128K × 32) Pipelined Sync SRAM

Features

- Registered inputs and outputs for pipelined operation
- 128K × 32 common I/O architecture
- 3.3 V core power supply (V_{DD})
- 2.5 V/3.3 V I/O power supply (V_{DDQ})
- Fast clock-to-output times
 - 4.0 ns (for 133-MHz device)
- Provide high-performance 3-1-1-1 access rate
- User-selectable burst counter supporting Intel® Pentium® interleaved or linear burst sequences
- Separate processor and controller address strobes
- Synchronous self-timed writes
- Asynchronous output enable
- Available in Pb-free 100-pin TQFP package
- “ZZ” sleep mode option

Functional Description

The CY7C1339G SRAM integrates 128K × 32 SRAM cells with advanced synchronous peripheral circuitry and a two-bit counter for internal burst operation. All synchronous inputs are gated by registers controlled by a positive-edge-triggered clock input (CLK). The synchronous inputs include all addresses, all data inputs, address-pipelining chip enable (\overline{CE}_1), depth-expansion chip enables (\overline{CE}_2 and \overline{CE}_3), burst control inputs (ADSC, ADSP, and ADV), write enables ($BW_{[A:D]}$, and BWE), and global write (\overline{GW}). Asynchronous inputs include the output enable (\overline{OE}) and the ZZ pin.

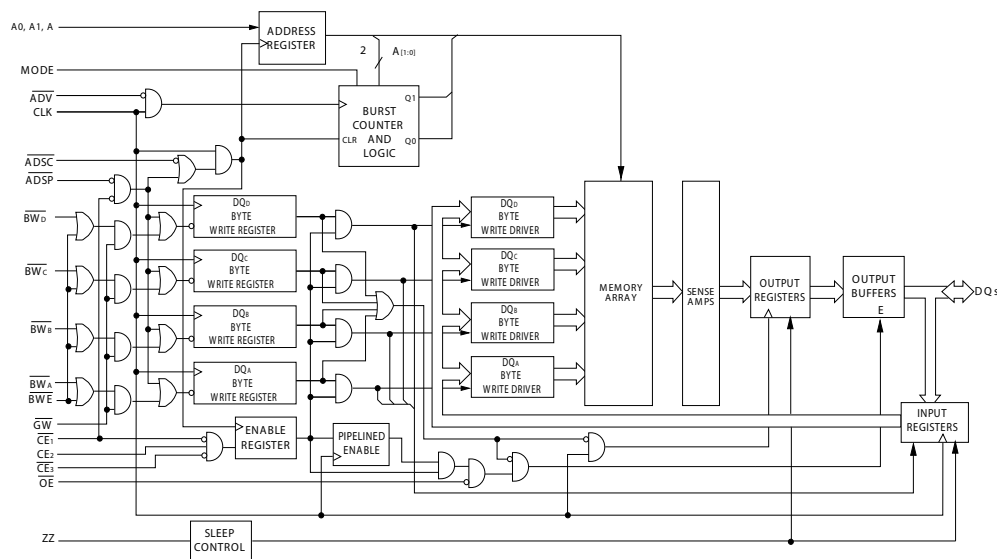

Addresses and chip enables are registered at rising edge of clock when either address strobe processor (ADSP) or address strobe controller (ADSC) are active. Subsequent burst addresses can be internally generated as controlled by the advance pin (ADV).

Address, data inputs, and write controls are registered on-chip to initiate a self-timed write cycle. This part supports byte write operations (see Pin Descriptions and Truth Table for further details). Write cycles can be one to four bytes wide as controlled by the byte write control inputs. \overline{GW} when active LOW causes all bytes to be written.

The CY7C1339G operates from a +3.3 V core power supply while all outputs may operate with either a +2.5 V or +3.3 V supply. All inputs and outputs are JEDEC-standard JESD8-5-compatible.

Pin Definitions

| Name | I/O | Description |
|---|--------------------|--|
| A ₀ , A ₁ , A | Input-synchronous | Address inputs used to select one of the 128K address locations. Sampled at the rising edge of the CLK if ADSP or ADSC is active LOW, and \overline{CE}_1 , CE ₂ , and \overline{CE}_3 are sampled active. A1:A0 are fed to the two-bit counter. |
| \overline{BW}_A , \overline{BW}_B , \overline{BW}_C , \overline{BW}_D | Input-synchronous | Byte write select inputs, active LOW. Qualified with \overline{BWE} to conduct byte writes to the SRAM. Sampled on the rising edge of CLK. |
| \overline{GW} | Input-synchronous | Global write enable input, active LOW. When asserted LOW on the rising edge of CLK, a global write is conducted (all bytes are written, regardless of the values on $\overline{BW}_{[A:D]}$ and \overline{BWE}). |
| \overline{BWE} | Input-synchronous | Byte write enable input, active LOW. Sampled on the rising edge of CLK. This signal must be asserted LOW to conduct a byte write. |
| CLK | Input-clock | Clock input. Used to capture all synchronous inputs to the device. Also used to increment the burst counter when ADV is asserted LOW, during a burst operation. |
| \overline{CE}_1 | Input-synchronous | Chip enable 1 input, active LOW. Sampled on the rising edge of CLK. Used in conjunction with CE ₂ and CE ₃ to select/deselect the device. ADSP is ignored if \overline{CE}_1 is HIGH. \overline{CE}_1 is sampled only when a new external address is loaded. |
| CE ₂ | Input-synchronous | Chip enable 2 input, active HIGH. Sampled on the rising edge of CLK. Used in conjunction with \overline{CE}_1 and CE ₃ to select/deselect the device. CE ₂ is sampled only when a new external address is loaded. |
| \overline{CE}_3 | Input-synchronous | Chip enable 3 input, active LOW. Sampled on the rising edge of CLK. Used in conjunction with \overline{CE}_1 and CE ₂ to select/deselect the device. \overline{CE}_3 is sampled only when a new external address is loaded. |
| \overline{OE} | Input-asynchronous | Output enable, asynchronous input, active LOW. Controls the direction of the I/O pins. When LOW, the I/O pins behave as outputs. When deasserted HIGH, I/O pins are tri-stated, and act as input data pins. \overline{OE} is masked during the first clock of a read cycle when emerging from a deselected state. |
| ADV | Input-synchronous | Advance input signal, sampled on the rising edge of CLK, active LOW. When asserted, it automatically increments the address in a burst cycle. |
| ADSP | Input-synchronous | Address strobe from processor, sampled on the rising edge of CLK, active LOW. When asserted LOW, addresses presented to the device are captured in the address registers. A1:A0 are also loaded into the burst counter. When ADSP and ADSC are both asserted, only ADSP is recognized. ADSP is ignored when \overline{CE}_1 is deasserted HIGH. |
| ADSC | Input-synchronous | Address strobe from controller, sampled on the rising edge of CLK, active LOW. When asserted LOW, addresses presented to the device are captured in the address registers. A1:A0 are also loaded into the burst counter. When ADSP and ADSC are both asserted, only ADSP is recognized. |
| ZZ ^[2] | Input-asynchronous | ZZ “sleep” input, active HIGH. When asserted HIGH places the device in a non-time-critical “sleep” condition with data integrity preserved. For normal operation, this pin has to be LOW or left floating. ZZ pin has an internal pull-down. |

Note

2. **Errata:** The ZZ pin (Pin 64) needs to be externally connected to ground. For more information, see “Errata” on page 20.

Pin Definitions (continued)

| Name | I/O | Description |
|--|------------------|--|
| DQs | I/O-synchronous | Bidirectional data I/O lines. As inputs, they feed into an on-chip data register that is triggered by the rising edge of CLK. As outputs, they deliver the data contained in the memory location specified by the addresses presented during the previous clock rise of the read cycle. The direction of the pins is controlled by OE. When OE is asserted LOW, the pins behave as outputs. When HIGH, DQs are placed in a tri-state condition. |
| V _{DD} | Power supply | Power supply inputs to the core of the device. |
| V _{SS} | Ground | Ground for the core of the device. |
| V _{DDQ} | I/O power supply | Power supply for the I/O circuitry. |
| V _{SSQ} | I/O ground | Ground for the I/O circuitry. |
| MODE | Input-static | Selects burst order. When tied to GND selects linear burst sequence. When tied to V _{DD} or left floating selects interleaved burst sequence. This is a strap pin and should remain static during device operation. Mode pin has an internal pull-up. |
| NC, NC/9M, NC/18M, NC/72M, NC/144M, NC/288M, NC/576M, NC/1G | – | No Connects. Not internally connected to the die. NC/9M, NC/18M, NC/72M, NC/144M, NC/288M, NC/576M and NC/1G are address expansion pins are not internally connected to the die. |

Functional Overview

All synchronous inputs pass through input registers controlled by the rising edge of the clock. All data outputs pass through output registers controlled by the rising edge of the clock. Maximum access delay from the clock rise (t_{CO}) is 4.0 ns (133-MHz device).

The CY7C1339G supports secondary cache in systems utilizing either a linear or interleaved burst sequence. The interleaved burst order supports Pentium and i486™ processors. The linear burst sequence is suited for processors that utilize a linear burst sequence. The burst order is user selectable, and is determined by sampling the MODE input. Accesses can be initiated with either the processor address strobe (ADSP) or the controller address strobe (ADSC). Address advancement through the burst sequence is controlled by the ADV input. A two-bit on-chip wraparound burst counter captures the first address in a burst sequence and automatically increments the address for the rest of the burst access.

Byte write operations are qualified with the byte write enable (BWE) and byte write select ($BW_{[A:D]}$) inputs. A global write enable (GW) overrides all byte write inputs and writes data to all four bytes. All writes are simplified with on-chip synchronous self-timed write circuitry.

Three synchronous chip selects (\overline{CE}_1 , CE_2 , \overline{CE}_3) and an asynchronous output enable (OE) provide for easy bank selection and output tri-state control. ADSP is ignored if CE_1 is HIGH.

Single Read Accesses

This access is initiated when the following conditions are satisfied at clock rise: (1) ADSP or ADSC is asserted LOW, (2) \overline{CE}_1 , CE_2 , \overline{CE}_3 are all asserted active, and (3) the write signals (GW, BWE) are all deserted HIGH. ADSP is ignored if CE_1 is HIGH. The address presented to the address inputs (A) is stored into the address advancement logic and the address register while being presented to the memory array. The corresponding data is allowed to propagate to the input of the output registers. At the rising edge of the next clock the data is allowed to propagate through the output register and onto the data bus within 2.6 ns (250-MHz device) if OE is active LOW. The only exception occurs when the SRAM is emerging from a deselected state to a selected state, its outputs are always tri-stated during the first cycle of the access. After the first cycle of the access, the outputs are controlled by the OE signal. Consecutive single read cycles are supported. Once the SRAM is deselected at clock rise by the chip select and either ADSP or ADSC signals, its output will tri-state immediately.

Single Write Accesses Initiated by ADSP

This access is initiated when both of the following conditions are satisfied at clock rise: (1) ADSP is asserted LOW, and (2) CE_1 , CE_2 , \overline{CE}_3 are all asserted active. The address presented to A is loaded into the address register and the address advancement logic while being delivered to the memory array. The Write signals (GW, BWE, and $BW_{[A:D]}$) and ADV inputs are ignored during this first cycle.

ADSP-triggered write accesses require two clock cycles to complete. If GW is asserted LOW on the second clock rise, the data presented to the DQs inputs is written into the

corresponding address location in the memory array. If \overline{GW} is HIGH, then the write operation is controlled by BWE and $BW_{[A:D]}$ signals. The CY7C1339G provides byte write capability that is described in the Write Cycle Descriptions table. Asserting the byte write enable input (BWE) with the selected byte write ($BW_{[A:D]}$) input, will selectively write to only the desired bytes. Bytes not selected during a byte write operation will remain unaltered. A synchronous self-timed Write mechanism has been provided to simplify the Write operations.

Because the CY7C1339G is a common I/O device, the output enable (OE) must be deserted HIGH before presenting data to the DQs inputs. Doing so will tri-state the output drivers. As a safety precaution, DQs are automatically tri-stated whenever a write cycle is detected, regardless of the state of OE.

Single Write Accesses Initiated by ADSC

ADSC Write accesses are initiated when the following conditions are satisfied: (1) ADSC is asserted LOW, (2) ADSP is deserted HIGH, (3) CE_1 , CE_2 , \overline{CE}_3 are all asserted active, and (4) the appropriate combination of the write inputs (\overline{GW} , BWE, and $BW_{[A:D]}$) are asserted active to conduct a write to the desired byte(s). ADSC-triggered write accesses require a single clock cycle to complete. The address presented to A is loaded into the address register and the address advancement logic while being delivered to the memory array. The ADV input is ignored during this cycle. If a global write is conducted, the data presented to the DQs is written into the corresponding address location in the memory core. If a byte write is conducted, only the selected bytes are written. Bytes not selected during a byte write operation will remain unaltered. A synchronous self-timed write mechanism has been provided to simplify the write operations.

Because the CY7C1339G is a common I/O device, the output enable (OE) must be deserted HIGH before presenting data to the DQs inputs. Doing so will tri-state the output drivers. As a safety precaution, DQs are automatically tri-stated whenever a Write cycle is detected, regardless of the state of OE.

Burst Sequences

The CY7C1339G provides a two-bit wraparound counter, fed by A1:A0, that implements either an interleaved or linear burst sequence. The interleaved burst sequence is designed specifically to support Intel Pentium applications. The linear burst sequence is designed to support processors that follow a linear burst sequence. The burst sequence is user selectable through the MODE input.

Asserting \overline{ADV} LOW at clock rise will automatically increment the burst counter to the next address in the burst sequence. Both Read and Write burst operations are supported.

Sleep Mode

The ZZ input pin is an asynchronous input. Asserting ZZ places the SRAM in a power conservation "sleep" mode. Two clock cycles are required to enter into or exit from this "sleep" mode. While in this mode, data integrity is guaranteed. Accesses pending when entering the "sleep" mode are not considered valid nor is the completion of the operation guaranteed. The device must be deselected prior to entering the "sleep" mode. \overline{CE}_1 , CE_2 , \overline{CE}_3 , ADSP, and ADSC must remain inactive for the duration of t_{ZZREC} after the ZZ input returns LOW.

Interleaved Burst Address Table

(MODE = Floating or V_{DD})

| First Address A1:A0 | Second Address A1:A0 | Third Address A1:A0 | Fourth Address A1:A0 |

Notes

- X = "Don't Care." H = Logic HIGH, L = Logic LOW.
- $\overline{WRITE} = L$ when any one or more byte write enable signals (\overline{BW}_A , \overline{BW}_B , \overline{BW}_C , \overline{BW}_D) and $\overline{BWE} = L$ or $\overline{GW} = L$. $\overline{WRITE} = H$ when all byte write enable signals (\overline{BW}_A , \overline{BW}_B , \overline{BW}_C , \overline{BW}_D), \overline{BWE} , $\overline{GW} = H$.
- The DQ pins are controlled by the current cycle and the \overline{OE} signal. \overline{OE} is asynchronous and is not sampled with the clock.
- \overline{CE}_1 , \overline{CE}_2 , and \overline{CE}_3 are available only in the TQFP package.
- The SRAM always initiates a read cycle when \overline{ADSP} is asserted, regardless of the state of \overline{GW} , \overline{BWE} , or $\overline{BW}_{[A:D]}$. Writes may occur only on subsequent clocks after the \overline{ADSP} or with the assertion of \overline{ADSC} . As a result, \overline{OE} must be driven HIGH prior to the start of the write cycle to allow the outputs to tri-state. \overline{OE} is a don't care for the remainder of the write cycle.
- \overline{OE} is asynchronous and is not sampled with the clock rise. It is masked internally during write cycles. During a read cycle all data bits are tri-state when \overline{OE} is inactive or when the device is deselected, and all data bits behave as output when \overline{OE} is active (LOW).

Partial Truth Table for Read/Write

The partial truth table for Read/Write for CY7C1339G follows. [9, 10]

| Function | \overline{GW} | \overline{BWE} | $\overline{BW_D}$ | $\overline{BW_C}$ | $\overline{BW_B}$ | $\overline{BW_A}$ |
|-----------------------|-----------------|------------------|-------------------|-------------------|-------------------|-------------------|
| Read | H | H | X | X | X | X |
| Read | H | L | H | H | H | H |

| I_{OZ} | Output leakage current | $GND \leq V_I \leq V_{DDQ}$, output disabled | –5 | 5 | μA |
| I_{DD} | V_{DD} operating supply current | $V_{DD} = \text{Max}$, $I_{OUT} = 0$ mA, $f = f_{MAX} = 1/t_{CYC}$ | – | 225 | mA |
| I_{SB1} | Automatic CE power-down current – TTL inputs | $V_{DD} = \text{Max}$, device deselected, $V_{IN} \geq V_{IH}$ or $V_{IN} \leq V_{IL}$, $f = f_{MAX} = 1/t_{CYC}$ | – | 90 | mA |
| I_{SB2} | Automatic CE power-down current – CMOS inputs | $V_{DD} = \text{Max}$, device deselected, $V_{IN} \leq 0.3 V$ or $V_{IN} \geq V_{DDQ} - 0.3 V$, $f = 0$ | – | 40 | mA |
| I_{SB3} | Automatic CE power-down current – CMOS inputs | $V_{DD} = \text{Max}$, device deselected, $V_{IN} \leq 0.3 V$ or $V_{IN} \geq V_{DDQ} - 0.3 V$, $f = f_{MAX} = 1/t_{CYC}$ | – | 75 | mA |
| I_{SB4} | Automatic CE power-down current – TTL inputs | $V_{DD} = \text{Max}$, device deselected, $V_{IN} \geq V_{IH}$ or $V_{IN} \leq V_{IL}$, $f = 0$ | – | 45 | mA |

Notes

11. Overshoot: $V_{IH(AC)} < V_{DD} + 1.5 V$ (Pulse width less than $t_{CYC}/2$), undershoot: $V_{IL(AC)} > -2 V$ (Pulse width less than $t_{CYC}/2$).

12. TPower-up: Assumes a linear ramp from 0 V to $V_{DD(min)}$ within 200 ms. During this time $V_{IH} < V_{DD}$ and $V_{DDQ} \leq V_{DD}$.

Capacitance

2.5 V I/O Test Load

Note

13. Tested initially and after any design or process change that may affect these parameters.

Switching Characteristics

Over the Operating Range

| Parameter [14, 15] | Description | -133 | | Unit |
|-----------------------|---|------|-----|------|
| | | Min | Max | |
| t_{POWER} | $V_{DD}(\text{typical})$ to the first access [16] | 1 | – | ms |
| Clock | | | | |
| t_{CYC} | Clock cycle time | 7.5 | – | ns |
| t_{CH} | Clock HIGH | 3.0 | – | ns |
| t_{CL} | Clock LOW | 3.0 | – | ns |
| Output Times | | | | |
| t_{CO} | Data output valid after CLK rise | – | 4.0 | ns |
| t_{DOH} | Data output hold after CLK rise | 1.5 | – | ns |
| t_{CLZ} | Clock to low Z [17, 18, 19] | 0 | – | ns |
| t_{CHZ} | Clock to high Z [17, 18, 19] | – | 4.0 | ns |
| $t_{OE\overline{V}}$ | \overline{OE} LOW to output valid | – | 4.0 | ns |
| $t_{OE\overline{L}Z}$ | \overline{OE} LOW to output low Z [17, 18, 19] | 0 | – | ns |
| $t_{OE\overline{H}Z}$ | \overline{OE} HIGH to output high Z [17, 18, 19] | – | 4.0 | ns |
| Set-up Times | | | | |
| t_{AS} | Address set-up before CLK rise | 1.5 | – | ns |
| t_{ADS} | ADSC, ADSP set-up before CLK rise | 1.5 | – | ns |
| t_{ADVS} | ADV set-up before CLK rise | 1.5 | – | ns |
| t_{WES} | \overline{GW} , \overline{BWE} , $\overline{BW_X}$ set-up before CLK rise | 1.5 | – | ns |
| t_{DS} | Data input set-up before CLK rise | 1.5 | – | ns |
| t_{CES} | Chip enable set-up before CLK rise | 1.5 | – | ns |
| Hold Times | | | | |
| t_{AH} | Address hold after CLK rise | 0.5 | – | ns |
| t_{ADH} | ADSP, ADSC hold after CLK rise | 0.5 | – | ns |
| t_{ADVH} | ADV hold after CLK rise | 0.5 | – | ns |
| t_{WEH} | \overline{GW} , \overline{BWE} , $\overline{BW_X}$ hold after CLK rise | 0.5 | – | ns |
| t_{DH} | Data input hold after CLK rise | 0.5 | – | ns |
| t_{CEH} | Chip enable hold after CLK rise | 0.5 | – | ns |

Notes

14. Timing reference level is 1.5 V when $V_{DDQ} = 3.3$ V and is 1.25 V when $V_{DDQ} = 2.5$ V.

15. Test conditions shown in (a) of Figure 2 on page 11 unless otherwise noted.

16. This part has a voltage regulator internally; t_{POWER} is the time that the power needs to be supplied above $V_{DD}(\text{minimum})$ initially before a read or write operation can be initiated.

17. t_{CHZ} , t_{CLZ} , $t_{OE\overline{L}Z}$, and $t_{OE\overline{H}Z}$ are specified with AC test conditions shown in part (b) of Figure 2 on page 11. Transition is measured ± 200 mV from steady-state voltage.

18. At any given voltage and temperature, $t_{OE\overline{H}Z}$ is less than $t_{OE\overline{L}Z}$ and t_{CHZ} is less than t_{CLZ} to eliminate bus contention between SRAMs when sharing the same data bus. These specifications do not imply a bus contention condition, but reflect parameters guaranteed over worst case user conditions. Device is designed to achieve high Z prior to low Z under the same system conditions.

19. This parameter is sampled and not 100% tested.

Switching Waveforms

Figure 3. Read Cycle Timing [20]

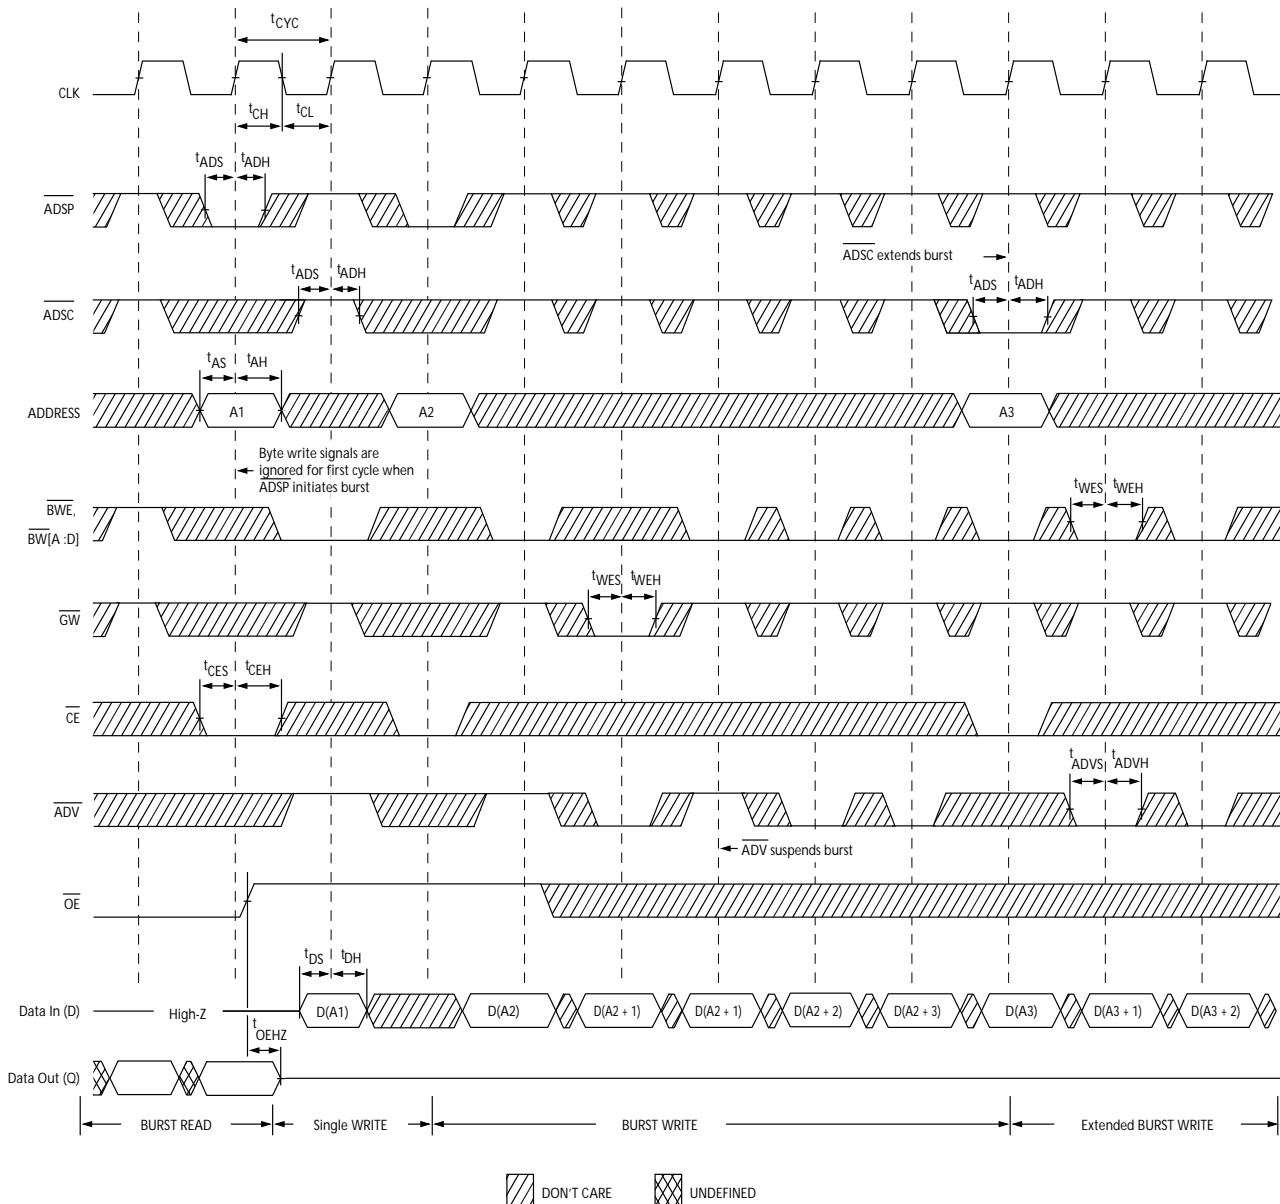

Note

20. On this diagram, when \overline{CE} is LOW, \overline{CE}_1 is LOW, CE_2 is HIGH and \overline{CE}_3 is LOW. When \overline{CE} is HIGH, \overline{CE}_1 is HIGH or CE_2 is LOW or \overline{CE}_3 is HIGH.

Switching Waveforms (continued)

Figure 4. Write Cycle Timing ^[21, 22]

Notes

22. Full width write can be initiated by either $\overline{\text{GW}} \text{ LOW}$; or by $\overline{\text{GW}} \text{ HIGH}$, $\overline{\text{BWE}} \text{ LOW}$ and $\overline{\text{BW}}_{[\text{A}, \text{D}]} \text{ LOW}$.

Switching Waveforms (continued)

Figure 5. Read/Write Cycle Timing [23, 24, 25]

Notes

23. On this diagram, when \overline{CE} is LOW, \overline{CE}_1 is LOW, \overline{CE}_2 is HIGH and \overline{CE}_3 is LOW. When \overline{CE} is HIGH, \overline{CE}_1 is HIGH or \overline{CE}_2 is LOW or \overline{CE}_3 is HIGH.
 24. The data bus (Q) remains in high Z following a WRITE cycle, unless a new read access is initiated by ADSP or ADSC.
 25. \overline{GW} is HIGH.

Switching Waveforms *(continued)*

Figure 6. ZZ Mode Timing [26, 27]

Notes

26. Device must be deselected when entering ZZ mode. See Cycle Descriptions table for all possible signal conditions to deselect the device.
27. DQs are in high Z when exiting ZZ sleep mode.

Ordering Information

Cypress offers other versions of this type of product in many different configurations and features. The following table contains only the list of parts that are currently available.

For a complete listing of all options, visit the Cypress website at www.cypress.com and refer to the product summary page at <http://www.cypress.com/products> or contact your local sales representative.

Cypress maintains a worldwide network of offices, solution centers, manufacturer's representatives and distributors. To find the office closest to you, visit us at <http://www.cypress.com/go/datasheet/offices>.

Errata

This section describes the Ram9 Sync ZZ pin issue. Details include trigger conditions, the devices affected, proposed workaround and silicon revision applicability. Please contact your local Cypress sales representative if you have further questions.

Part Numbers Affected

| Density & Revision | Package Type | Operating Range |
|---------------------------------------|--------------|-----------------|
| 4Mb-Ram9 Synchronous SRAMs: CY7C133*G | 100-pin TQFP | Commercial |

Product Status

All of the devices in the Ram9 4Mb Sync family are qualified and available in production quantities.

Ram9 Sync ZZ Pin Issues Errata Summary

The following table defines the errata applicable to available Ram9 4Mb Sync family devices.

| Item | Issues | Description | Device | Fix Status |
|------|--------|--|-----------------|--|
| 1. | ZZ Pin | When asserted HIGH, the ZZ pin places device in a "sleep" condition with data integrity preserved. The ZZ pin currently does not have an internal pull-down resistor and hence cannot be left floating externally by the user during normal mode of operation. | 4M-Ram9 (90 nm) | For the 4M Ram9 (90 nm) devices, there is no plan to fix this issue. |

1. ZZ Pin Issue

■ PROBLEM DEFINITION

The problem occurs only when the device is operated in the normal mode with ZZ pin left floating. The ZZ pin on the SRAM device does not have an internal pull-down resistor. Switching noise in the system may cause the SRAM to recognize a HIGH on the ZZ input, which may cause the SRAM to enter sleep mode. This could result in incorrect or undesirable operation of the SRAM.

■ TRIGGER CONDITIONS

Device operated with ZZ pin left floating.

■ SCOPE OF IMPACT

When the ZZ pin is left floating, the device delivers incorrect data.

■ WORKAROUND

Tie the ZZ pin externally to ground.

■ FIX STATUS

For the 4M Ram9 (90 nm) devices, there is no plan to fix this issue.

Document History Page

| Document Title: CY7C1339G, 4-Mbit (128K × 32) Pipelined Sync SRAM Document Number: 38-05520 | | | | |
|--|---------|------------|-----------------|--|
| Rev. | ECN No. | Issue Date | Orig. of Change | Description of Change |
| ** | 224368 | See ECN | RKF | New data sheet. |
| *A | 288909 | See ECN | VBL | Updated Ordering Information (Updated part numbers (Added Pb-free BGA package), changed TQFP package to Pb-free TQFP package). |
| *B | 332895 | See ECN | SYT | Updated Pin Configurations (Modified Address Expansion balls in the pinouts for 100-pin TQFP and 119-ball BGA Packages as per JEDEC standards). Updated Pin Definitions . Updated Electrical Characteristics (Updated test conditions for V_{OL} and V_{OH} parameters). Updated Thermal Resistance (Replaced TBDs for Θ_{JA} and Θ_{JC} to their respective values). Updated Ordering Information (By shading and unshading MPNs as per availability). |
| *C | 351194 | See ECN | PCI | Updated Ordering Information (Updated part numbers). |
| *D | 366728 | See ECN | PCI | Updated Electrical Characteristics (Updated test conditions for V_{DD} and V_{DDQ} parameters, updated Note 12 (Changed test condition from $V_{IH} \leq V_{DD}$ to $V_{IH} < V_{DD}$). |
| *E | 420883 | See ECN | R XU | Changed status from Preliminary to Final. Changed address of Cypress Semiconductor Corporation from "3901 North First Street" to "198 Champion Court". Updated Operating Range (Added Automotive Range). Updated Electrical Characteristics (Changed "Input Load Current except ZZ and MODE" to "Input Leakage Current except ZZ and MODE"). Updated Ordering Information (Updated part numbers, replaced Package Name column with Package Diagram in the Ordering Information table). Replaced Package Diagram of 51-85050 from *A to *B |
| *F | 480368 | See ECN | VKN | Updated Maximum Ratings (Added the Maximum Rating for Supply Voltage on V_{DDQ} Relative to GND). Updated Ordering Information (Updated part numbers). |
| *G | 2896584 | 03/19/2010 | NJY | Updated Ordering Information (Removed obsolete part numbers). Updated Package Diagrams . |
| *H | 3045943 | 10/03/2010 | NJY | Added Ordering Code Definitions . Added Acronyms and Units of Measure . Minor edits. Updated to new template. |
| *I | 3052769 | 10/08/2010 | NJY | Updated Ordering Information (Removed pruned part CY7C1339G-133AXI). |
| *J | 3365114 | 09/07/2011 | PRIT | Updated Package Diagrams . Updated to new template. |
