CY7C188

32K x 9 Static RAM

Features

- High speed
— 15 ns
- Automatic power-down when deselected
- Low active power
— 660 mW
- Low standby power
— 140 mW
- CMOS for optimum speed/power
- TTL-compatible inputs and outputs
- Easy memory expansion with \overline{CE}_1 , CE_2 , and \overline{OE} features

Functional Description

The CY7C188 is a high-performance CMOS static RAM organized as 32,768 words by 9 bits. Easy memory expansion is

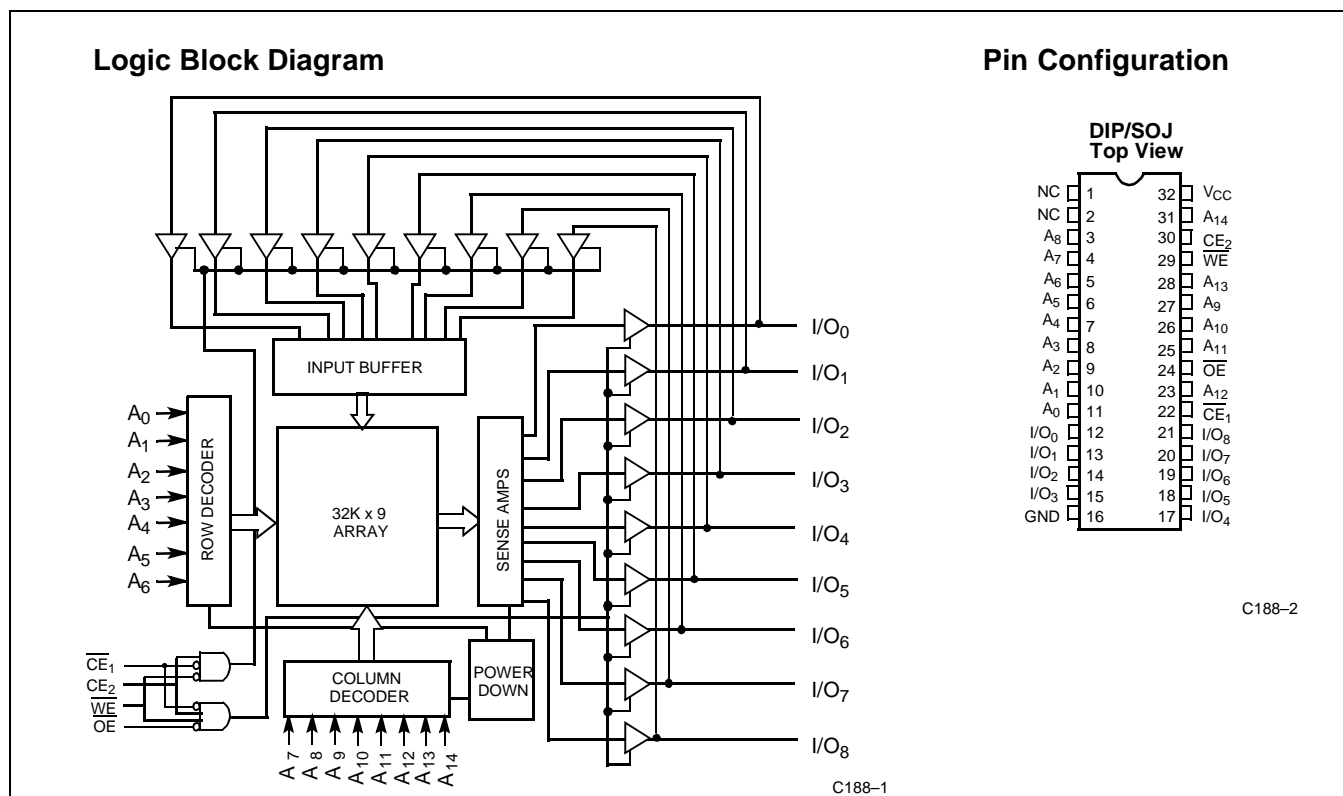

provided by an active-LOW chip enable (\overline{CE}_1), an active-HIGH chip enable (CE_2), an active-LOW output enable (\overline{OE}), and three-state drivers. The device has an automatic power-down feature that reduces power consumption by more than 75% when deselected.

Writing to the device is accomplished by taking \overline{CE}_1 and write enable (\overline{WE}) inputs LOW and CE_2 input HIGH. Data on the nine I/O pins ($I/O_0 - I/O_8$) is then written into the location specified on the address pins ($A_0 - A_{14}$).

Reading from the device is accomplished by taking \overline{CE}_1 and \overline{OE} LOW while forcing \overline{WE} and CE_2 HIGH. Under these conditions, the contents of the memory location specified by the address pins will appear on the I/O pins.

The nine input/output pins ($I/O_0 - I/O_8$) are placed in a high-impedance state when the device is deselected (\overline{CE}_1 HIGH or CE_2 LOW), the outputs are disabled (\overline{OE} HIGH), or during a write operation (\overline{CE}_1 LOW, CE_2 HIGH, and \overline{WE} LOW).

The CY7C188 is available in standard 300-mil-wide SOJs.

Notes:

1. Minimum voltage is equal to -2.0V for pulse durations less than 20 ns.
2. See the last page of this specification for Group A subgroup testing information.
3. Not more than one output should be shorted at one time. Duration of the short circuit should not exceed 30 seconds.
4. Tested initially and after any design or process changes that may affect these parameters.

Notes:

- Test conditions assume signal transition time of 3 ns or less, timing reference levels of 1.5V, input pulse levels of 0 to 3.0V, and output loading of the specified I_{OL}/I_{OH} and 30-pF load capacitance.
- t_{HZOE} , t_{HZCE} , and t_{HZWE} are specified with $C_L = 5$ pF as in part (b) of AC Test Loads. Transition is measured ± 500 mV from steady-state voltage.
- At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , t_{HZOE} is less than t_{LZOE} , and t_{HZWE} is less than t_{LZWE} for any given device.
- The internal write time of the memory is defined by the overlap of \overline{CE}_1 , LOW, \overline{CE}_2 HIGH, and \overline{WE} LOW. All three signals must be asserted to initiate a write and any signal can terminate a write by being deasserted. The data input set-up and hold timing should be referenced to the rising edge of the signal that terminates the write.
- The minimum write cycle time for write cycle #3 (\overline{WE} controlled, \overline{OE} LOW) is the sum of t_{HZWE} and t_{SD} .

Notes:

10. Device is continuously selected. \overline{OE} , $\overline{CE} = V_{IL}$.
11. \overline{WE} is HIGH for read cycle.
12. Address valid prior to or coincident with \overline{CE} transition LOW.
13. Timing parameters are the same for all chip enable signals (\overline{CE}_1 and \overline{CE}_2), so only the timing for \overline{CE}_1 is shown.
14. Data I/O is high impedance if $\overline{OE} = V_{IH}$.
15. If \overline{CE} goes HIGH simultaneously with \overline{WE} HIGH, the output remains in a high-impedance state.
16. During this period, the I/Os are in the output state and input signals should not be applied.
