

Features

- 8 configurable IOs supporting
 - CapSense buttons
 - LED Drive
 - Interrupt outputs
 - WAKE on interrupt input
 - User defined input or output
- 2.4V to 5.25V operating voltage
- Industrial temperature range: -40°C to +85°C
- I²C slave interface for configuration
 - Selectable to 50 kHz, 100 kHz and 400 kHz
- Reduce BOM cost
 - Internal oscillator - no external oscillators or crystal
 - Free development tool - no external tuning components
- Low operating current
 - Active current: continuous sensor scan: 1.5 mA
 - Sleep current: no scan, continuous sleep: 2.6 uA
- Available in 16-pin COL and 16-pin SOIC packages

Overview

The CapSense Express™ controller allows the control of 8 IOs configurable as capacitive sensing buttons or as GPIOs for driving LEDs or interrupt signals based on various button conditions. The GPIOs are also configurable for waking up the device from sleep based on an interrupt input.

The user has the ability to configure buttons, outputs, and parameters through specific commands sent to the I²C port. The IOs have the flexibility in mapping to capacitive buttons and as standard GPIO functions such as interrupt output or input, LED drive and digital mapping of input to output using simple logical operations. This enables easy PCB trace routing and reduces the PCB size and stack up. CapSense Express products are designed for easy integration into complex products.

Architecture

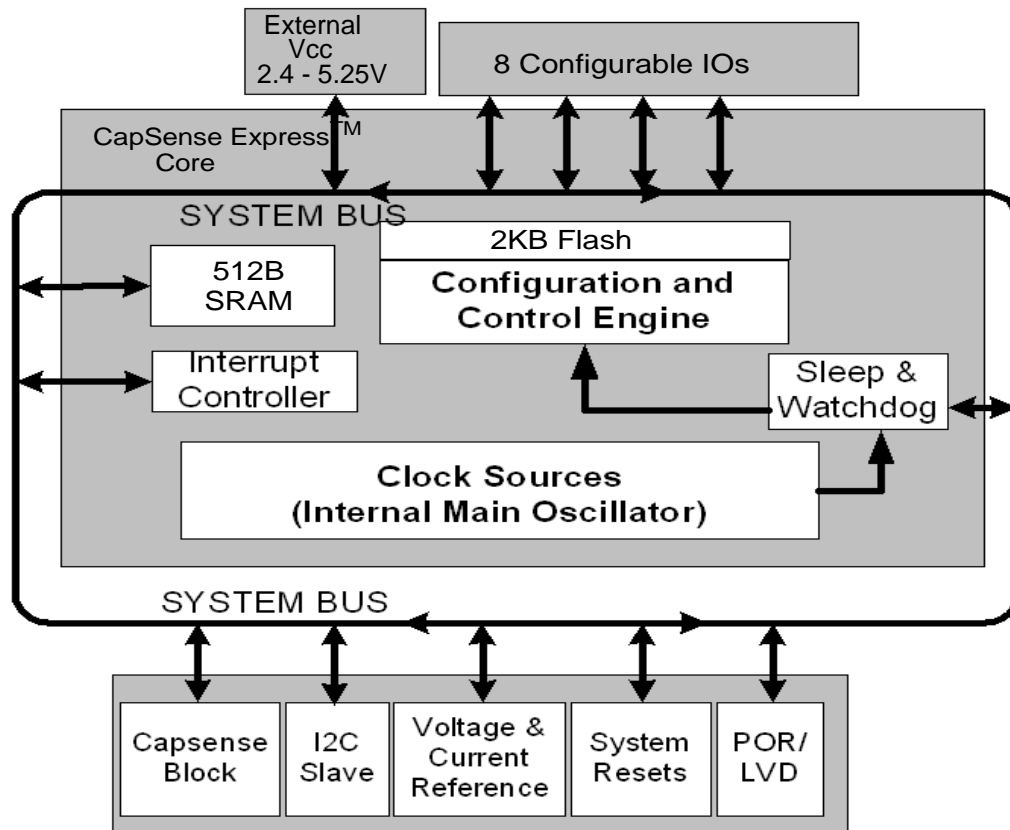

The logic block diagram illustrates the internal architecture of CY8C20180.

The user can configure registers with parameters needed to adjust the operation and sensitivity of the CapSense system. CY8C20180 supports a standard I²C serial communications interface that allows the host to configure the device and to read sensor information in real time through easy register access.

The CapSense Express Core

The CapSense Express Core has a powerful configuration and control block. It encompasses SRAM for data storage, an interrupt controller, sleep and watchdog timers. System resources provide additional capability, such as a configurable I²C slave communication interface and various system resets. The Analog System is composed of the CapSense PSoC block which supports capacitive sensing of up to eight inputs.

The CapSense Analog System

The CapSense analog system contains the capacitive sensing hardware, which supports CapSense Successive Approximation (CSA) algorithm. This hardware performs capacitive sensing and scanning without external components. Capacitive sensing is configurable on each pin.

Additional System Resources

System resources provide additional capability useful to complete systems. Additional resources are low voltage detection and power on reset (POR).

- The I²C slave provides 50, 100, or 400 kHz communication over two wires.
- Low Voltage Detection (LVD) interrupts signal the application of falling voltage levels and the advanced POR circuit eliminates the need for a system supervisor.

An internal 1.8V reference provides a stable internal reference so that capacitive sensing functionality is not affected by minor V_{DD} changes.

I²C Interface

The two modes of operation for the I²C interface are:

- Device register configuration and status read or write for controller.
- Command execution.

The I²C address is programmable during configuration. It can be locked to prevent accidental change by setting a flag in a configuration register.

CapSense Express Software Tool

An easy to use software tool integrated with PSoC Express is available for configuring and tuning CapSense Express devices. Refer to the Application Note [AN42137](#) for details of the software tool.

CapSense Express Register Map

CapSense Express supports user configurable registers through which the device functionality and parameters are configured. For details, refer to [CY8C201xx Register Reference](#) document.
