

512MB Fully Buffered DIMM

EBE51FD8AGFD EBE51FD8AGFN

Specifications

- Density: 512MB
- Organization
- 64M words × 72 bits, 1 rank
- Mounting 9 pieces of 512M bits DDR2 SDRAM sealed in FBGA
- Package
- 240-pin fully buffered, socket type dual in line memory module (FB-DIMM)
 PCB height: 30.35mm
 Lead pitch: 1.00mm
- Advanced Memory Buffer (AMB): 655-ball FCBGA
- Lead-free (RoHS compliant)
- Power supply
- DDR2 SDRAM: VDD = $1.8V \pm 0.1V$
- ---- AMB: VCC = 1.5V + 0.075V/-0.045
- Data rate: 667Mbps/533Mbps (max.)
- Four internal banks for concurrent operation (components)
- Interface: SSTL_18
- Burst lengths (BL): 4, 8
- /CAS Latency (CL): 3, 4, 5
- Precharge: auto precharge option for each burst access
- Refresh: auto-refresh, self-refresh
- Refresh cycles: 8192 cycles/64ms
- Average refresh period
 7.8µs at 0°C ≤ TC ≤ +85°C
 3.9µs at +85°C < TC ≤ +95°C
- Operating case temperature range
- TC = 0°C to +95°C

Performance

Features

- JEDEC standard Raw Card A Design
- Industry Standard Advanced Memory Buffer (AMB)
- High-speed differential point-to-point link interface at 1.5V (JEDEC draft spec)
- 14 north-bound (NB) high speed serial lanes
- 10 south-bound (SB) high speed serial lanes
- Various features/modes:
- MemBIST and IBIST test functions
- Transparent mode and direct access mode for DRAM testing
- Interface for a thermal sensor and status indicator
- Channel error detection and reporting
- Automatic DDR2 SDRAM bus and channel calibration
- SPD (serial presence detect) with 1piece of 256 byte serial EEPROM

Note: Warranty void if removed DIMM heat spreader.

Advanced Memory Buffer Overview

www.DataSheet4U.com

The Advanced Memory Buffer (AMB) reference design complies with the FB-DIMM Architecture and Protocol Specification. It supports DDR2 SDRAM main memory. The AMB allows buffering of memory traffic to support large memory capacities. All memory control for the DRAM resides in the host, including memory request initiation, timing, refresh, scrubbing, sparing, configuration access, and power management. The AMB interface is responsible for handling FB-DIMM channel and memory requests to and from the local DIMM and for forwarding requests to other DIMMs on the FB-DIMM channel.

The FB-DIMM provides a high memory bandwidth, large capacity channel solution that has a narrow host interface. FB-DIMMs use commodity DRAMs isolated from the channel behind a buffer on the DIMM. The memory capacity is 288 devices per channel and total memory capacity scales with DRAM bit density.

The AMB is the buffer that isolates the DRAMs from the channel.

Advanced Memory Buffer Functionality

The AMB will perform the following FB-DIMM channel functions.

- Supports channel initialization procedures as defined in the initialization chapter of the FB-DIMM Architecture and Protocol Specification to align the clocks and the frame boundaries, verify channel connectivity, and identify AMB DIMM position.
- Supports the forwarding of southbound and northbound frames, servicing requests directed to a specific AMB or DIMM, as defined in the protocol chapter, and merging the return data into the northbound frames.
- If the AMB resides on the last DIMM in the channel, the AMB initializes northbound frames.
- Detects errors on the channel and reports them to the host memory controller.
- Support the FB-DIMM configuration register set as defined in the register chapters.
- Acts as DRAM memory buffer for all read, write, and configuration accesses addressed to the DIMM.
- Provides a read buffer FIFO and a write buffer FIFO.
- Supports an SMBus protocol interface for access to the AMB configuration registers.
- Provides logic to support MemBIST and IBIST design for test functions.
- Provides a register interface for the thermal sensor and status indicator.
- Functions as a repeater to extend the maximum length of FB-DIMM links.

Advanced Memory Buffer Block Diagram

ELPIDA

Interfaces

www.DataSheet4U.com

Figure Block Diagram AMB Interfaces shows the AMB and all of its interfaces. They consist of two FB-DIMM links, one DDR2 channel and an SMBus interface. Each FB-DIMM link connects the AMB to a host memory controller or an adjacent FB-DIMM. The DDR2 channel supports direct connection to the DDR2 SDRAMs on a FB-DIMM.

Interface Topology

The FB-DIMM channel uses a daisy-chain topology to provide expansion from a single DIMM per channel to up to 8 DIMMs per channel. The host sends data on the southbound link to the first DIMM where it is received and redriven to the second DIMM. On the southbound data path each DIMM receives the data and again re-drives the data to the next DIMM until the last DIMM receives the data. The last DIMM in the chain initiates the transmission of data in the direction on the host (a.k.a. northbound). On the northbound data path each DIMM receives the data and re-drives the data and re-drives the data to the next DIMM until the host is reached.

Block Diagram FB-DIMM Channel Southbound and Northbound Paths

High-Speed Differential Point-to-Point Link (at 1.5 V) Interfaces

www.DataSheet4U.com

The AMB supports one FB-DIMM channel consisting of two bidirectional link interfaces using high-speed differential point-to-point electrical signaling. The southbound input link is 10 lanes wide and carries commands and write data from the host memory controller or the adjacent DIMM in the host direction. The southbound output link forwards this same data to the next FB-DIMM. The northbound input link is 14 lanes wide and carries read return data or status information from the next FB-DIMM in the chain back towards the host. The northbound output link forwards this information back towards the host and multiplexes in any read return data or status information that is generated internally. Data and commands sent to the DRAMs travel southbound on 10 primary differential signal line pairs. Data received from the DRAMs and status information travel northbound on 14 primary differential pairs. Data and status information received from the adjacent DIMM upstream travel further northbound on 14 secondary differential pairs.

DDR2 Channel

The DDR2 channel on the AMB supports direct connection to DDR2 SDRAMs. The DDR2 channel supports two ranks of eight banks with 16 row/column request, 64 data, and eight check-bit signals. There are two copies of address and command signals to support DIMM routing and electrical requirements. Four transfer bursts are driven on the data and check-bit lines at 800MHz. Propagation delays between read data/check-bit strobe lanes on a given channel can differ. Each strobe can be calibrated by hardware state machines using write/read trial and error. Hardware aligns the read data and check-bits to a single core clock. The AMB provides four copies of the command clock phase references (CLK [3:0]) and write data/check-bit strobes (DQSs) for each DRAM nibble.

SMBus Slave interface

The AMB supports an SMBus interface to allow system access to configuration register independent of the FB-DIMM link. The AMB will never be a master on the SMBus, only a slave. Serial SMBus data transfer is supported at 100kHz. SMBus access to the AMB may be a requirement to boot and to set link strength, frequency and other parameters needed to insure robust configurations. It is also required for diagnostic support when the link is down. The SMBus address straps located on the DIMM connector are used by the unique ID.

www.DataSheet4U.com

Dog winnig may be changed within a byte.
 There are two physical copies of each address/command/control/clock

Pin Description

www.DataSheet4U.com

Pin name	Pin Type	Function
SCK, /SCK	Input	System clock input
PN0 to PN13, /PN0 to /PN13	Output	Primary northbound data
PS0 to PS9, /PS0 to /PS9	Input	Primary southbound data
SN0 to SN13, /SN0 to /SN13	Input	Secondary northbound data
SS0 to SS9, /SS0 to /SS9	Output	Secondary southbound data
SCL	Input	Serial presence detect (SPD) clock input
SDA	Input / Output	SPD data and AMB SMBus address/data
SA0 to SA2*1	Input	SPD address inputs
VID0 to VID1*2	Input	Voltage ID
/RESET	Input	AMB reset signal
M_TEST* ³	Input	VREF margin test input
NC	_	No connection
VCC	Power supply	AMB core power and AMB channel interface power (1.5V)
VDD	Power supply	DRAM power and AMB DRAM I/O power (1.8V)
VTT	Power supply	DRAM address, Command and clock termination voltage (VDD/2)
VDDSPD	Power supply	SPD power (3.3V)
VSS	_	Ground

Notes: 1. They are also used to select the DIMM number in the AMB.

2. These pins must be unconnected.

3. Don't connect in a system.

Electrical Specifications

www.DataSheet4U.com

• All voltages are referenced to VSS (GND).

Absolute Maximum Ratings

Parameter	Symbol	Value	Unit	Note
Voltage on any pin relative to VSS	VIN/VOUT	–0.3 to +1.75	V	
AMB core power voltage relative to VSS	VCC	–0.3 to +1.75	V	
DRAM interface power voltage relative to VSS	VDD	-0.5 to +2.30	V	
Termination voltage relative to VSS	VTT	-0.5 to +2.30	V	
Storage temperature	Tstg	–55 to +100	°C	

Caution

Exposing the device to stress above those listed in Absolute Maximum Ratings could cause permanent damage. The device is not meant to be operated under conditions outside the limits described in the operational section of this specification. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

Operating Temperature Conditions

Parameter	Symbol	Value	Unit	Note
SDRAM component case temperature	TC_DRAM	0 to +95	°C	1
AMB component case temperature	TC_AMB	110	°C	

Note: 1. Supporting 0°C to +85°C and being able to extend to +95°C with doubling auto-refresh commands in frequency to a 32ms period (tREFI = 3.9μs) and higher temperature self-refresh entry via the control of EMRS (2) bit A7 is required.

DC Operating Conditions

Parameter	Symbol	min.	typ.	max.	Unit	Note
AMB supply voltage	VCC	1.455	1.50	1.575	V	
DDR2 SDRAM supply voltage	VDD	1.7	1.8	1.9	V	
Input termination voltage	VTT	$0.48 \times \text{VDD}$	$0.50\times \text{VDD}$	$0.52 \times \text{VDD}$	V	
EEPROM supply voltage	VDDSPD	3.0	3.3	3.6	V	
SPD input high voltage	VIH (DC)	2.1	—	VDDSPD	V	1
SPD input low voltage	VIL (DC)	_	—	0.8	V	1
RESET input high voltage	VIH (DC)	1.0	—	—	V	2
RESET input low voltage	VIL (DC)	_	—	0.5	V	2
Leakage current (RESET)	IL	-90	_	90	μΑ	2
Leakage current (link)	IL	-5	_	5	μA	3

Notes: 1. Applies for SMB and SPD bus signals.

2. Applies for AMB CMOS signal /RESET.

3. For all other AMB related DC parameters, please refer to the high-speed differential link interface specification.

www.DataSheet4U.com

AMB Component Timing

For purposes of IDD testing, the following parameters are to be utilized.

	,					
Parameter	Symbol	min.	typ.	max.	Units	Note
EI Assertion pass-thru timing	tEI propagate	_	_	4	clks

Reference clock jitter (peak-to-peak) due to spectrum clocking effects	TREF-SSCp-p		30	ps	
Reference clock jitter difference between adjacent AMB	TREF-JITTER- DELTA	_	TBD	ps	

Notes: 1. For details, refer to the JEDEC specification "FB-DIMM High Speed Differential PTP Link at 1.5V".

 The nominal reference clock frequency is determined by the data frequency of the link divided by 2 times the fixed PLL multiplication factor for the FB-DIMM channel (6:1). fdata = 2000MHz for a 4.0Gbps FB-DIMM channel and so on.

- 3. Measured with SSC disabled. Enabling SSC will reduce the reference clock frequency.
- 4. Not all FB-DIMM agents will support all frequencies; compliance to the frequency specifications is only required for those data rates that are supported by the device under test.
- 5. Measurement taken from single-ended waveform.
- 6. Measurement taken from differential waveform.
- 7. Defined as the maximum instantaneous voltage including overshoot.
- 8. Defined as the minimum instantaneous voltage including undershoot.
- 9. Measured at the crossing point where the instantaneous voltage value of the rising edge of REFCLK+ equals the falling edge of REFCLK-.
- 10. Refers to the total variation from the lowest crossing point to the highest, regardless of which edge is crossing. Refers to all crossing points for this measurement.
- 11. Defined as the total variation of all crossing voltages of rising REFCLK+ and falling REFCLK-. This is the maximum allowed variance in for any particular system.
- 12. The majority of the reference clock AC common mode occurs at high frequency (i.e., the reference clock frequency).

- 13. Measured from -150mV to + 150mV on the differential waveform. The signal must be monotonic through the measurement region for rise and fall time. The 300mV measurement window is centered on the differential 0V crossing.
- 14. Edge rate matching applies to rising edge rate for REFCLK+ and falling edge rate for REFCLK-. It is measured using a ± 75mV window centered on the median cross point where REFCLK+ rising meets REFCLK- falling. The median crosspoint is used to calculate the voltage thresholds the oscilloscope uses for the edge rate calculations. The rising edge rate of REFCLK+ should be compared to the falling edge rate of REFCLK-. The maximum allowed difference should not exceed 20% of the slowest edge
- 15. Tstable is the time the differential clock must maintain a minimum ±150mV differential voltage after rising /falling edges before it is allowed to droop back into the ±100mV differential range.
- 16.Measured with a single-ended input voltage of 1V.
- 17. Applies to RefClk and RefClk#.
- 18. This parameter is not a direct clock output parameter but it indirectly determines the clock output parameter TREF-JITTER.
- 19. The net transport delay is the difference in time of flight between associated data and clock paths. The data path is defined from the reference clock source, through the TX, to data arrival at the data sampling point in the RX. The clock path is defined from the reference clock source to clock arrival at the same sampling point. The path delays are caused by copper trace routes, on-chip routing, on-chip buffering, etc. They include the time-of-flight of interpolators or other clock adjustment mechanisms. They do not include the phase delays caused by finite PLL loop bandwidth because these delays are modeled by the PLL transfer functions.
- 20. Direct measurement of phase jitter records over NSAMPLE periods may be impractical. It is expected that the jitter will be measured over a smaller, yet statistically significant, sample size and the total jitter at NSAMPLE samples extrapolated from an estimate of the sigma of the random jitter components.
- 21. Measured with SSC enabled on reference clock generator.
- 22. As "measured" after the phase jitter filter. This number is separate from the receiver jitter budget that is defined by the TRX-Total-MIN parameters.

Differential Transmitter Output Specifications*1

DC common code output voltage for large voltage swing	VTX-CM_L	_	375	mV	Defined as: VTX-CM = DC (avg) of VTX-D+ + VTX-D- /2 Measured as note 2
DC common code output voltage for small voltage swing	VTX-CM_S	135	280	mV	Defined as: VTX-CM = DC (avg) of VTX-D+ + VTX-D- /2 Measured as note 2. See also note 3
De-emphasized differential output voltage ratio for -3.5dB de-emphasis	VTX-DE-3.5-Ratio	-3.0	-4.0	dB	2, 4, 5
De-emphasized differential output voltage ratio for -6dB de-emphasis	VTX-DE-6.0-Ratio	-5.0	-7.0	dB	2, 4, 5
AC peak-to-peak common mode output voltage for large swing	VTX-CM-ACp-p L	_	90	mV	VTX-CM-AC = Max VTX-D+ + VTX-D- /2 - Min VTX-D+ + VTX-D- /2
g					Measured as note 2. See also note 6
AC peak-to-peak common mode output voltage for regular swing	VTX-CM-ACp-p R	_	80	mV	VTX-CM-AC = Max VTX-D+ + VTX-D- /2 - Min VTX-D+ + VTX-D- /2
					Measured as note 2. See also note 6
AC peak-to-peak common mode output voltage for small swing	VTX-CM-ACp-p S	_	70	mV	VTX-CM-AC = Max VTX-D+ + VTX-D- /2 – Min VTX-D+ + VTX-D- /2 Measured as note 2. See also note 6
Maximum single-ended voltage in EI condition, DC + AC	VTX-IDLE-SE	_	50	mV	7, 8
Maximum single-ended voltage in El condition, DC only	VTX-IDLE-SE-DC	_	20	mV	7, 8, 9
Maximum peak-to-peak differential voltage in El condition	VTX-IDLE-DIFFp-p	_	40	mV	8
Single-ended voltage (w.r.t.VSS) on D+/D-	VTX-SE	-75	750	mV	2, 10
Minimum TX eye width	TTX-Eye-MIN	0.7	_	UI	2, 11, 12
Maximum TX deterministic jitter	TTX-DJ-DD	_	0.2	UI	2, 11, 12, 13
Instantaneous pulse width	TTX-PULSE	0.85	_	UI	14
Differential TX output rise/fall time	TTX-RISE, TTX-FALL	30	90	ps	Given by 20%-80% voltage levels. Measured as note 2
Mismatch between rise and fall times	TTX-RF-MISMATCH	_	20	ps	
Differential return loss	RLTX-DIFF	8	_	dB	Measured over 0.1GHz to 2.4GHz. See also note 15
Common mode return loss	RLTX-CM	6	_	dB	Measured over 0.1GHz to 2.4GHz. See also note 15

Parameter	Symbol	min.	max.	Unit	Comments www.DataSheet4U.com
Transmitter termination resistance	RTX	41	55	Ω	16
D+/D- TX resistance difference	RTX-Match-DC	_	4	%	RTX-Match-DC = 2× RTX-D+ – RTX-D- / (RTX-D+ + RTX-D-) Bounds are applied separately to high and low output voltage states
Lane-to-lane skew at TX	LTX-SKEW 1	_	100 + 3UI	ps	17, 19
Lane-to-lane skew at TX	LTX-SKEW 2	_	100 + 2UI	ps	18, 19
Maximum TX Drift (resync mode)	TTX-DRIFT-RESYNC	_	240	ps	20
Maximum TX Drift (resample mode only)	TTX-DRIFT- RESAMPLE	_	120	ps	20
Bit Error Ratio	BER		10 ⁻¹²		21

Notes: 1. For details, refer to the JEDEC specification "FB-DIMM High Speed Differential PTP Link at 1.5V".

- 2. Specified at the package pins into a timing and voltage compliance test load. Common-mode measurements to be performed using a 101010 pattern.
- 3. The transmitter designer should not artificially elevate the common mode in order to meet this specification.
- 4. This is the ratio of the VTX-DIFFp-p of the second and following bits after a transition divided by the VTX-DIFFp-p of the first bit after a transition.
- 5. De-emphasis shall be disabled in the calibration state.
- 6. Includes all sources of AC common mode noise.
- 7. Single-ended voltages below that value that are simultaneously detected on D+ and D- are interpreted as the Electrical Idle condition.
- 8. Specified at the package pins into a voltage compliance test load. Transmitters must meet both singleended and differential output El specifications.
- This specification, considered with VRX-IDLE-SE-DC, implies a maximum 15mV single-ended DC offset between TX and RX pins during the electrical idle condition. This in turn allows a ground offset between adjacent FB-DIMM agents of 26mV when worst case termination resistance matching is considered.
- 10. The maximum value is specified to be at least (VTX-DIFFp-p L / 4) + VTX-CM L + (VTX-CM-ACp-p / 2)
- 11. This number does not include the effects of SSC or reference clock jitter.
- 12. These timing specifications apply to resync mode only.
- 13. Defined as the dual-dirac deterministic jitter.
- 14. Pulse width measured at 0 V differential.
- 15. One of the components that contribute to the deterioration of the return loss is the ESD structure which needs to be carefully designed.
- 16. The termination small signal resistance; tolerance across voltages from 100mV to 400mV shall not exceed $\pm 5\Omega$. with regard to the average of the values measured at 100mV and at 400mV for that pin.
- 17. Lane to Lane skew at the Transmitter pins for an end component.
- 18. Lane to Lane skew at the Transmitter pins for an intermediate component (assuming zero Lane to Lane skew at the Receiver pins of the incoming PORT).
- 19. This is a static skew. An FB-DIMM component is not allowed to change its lane to lane phase relationship after initialization.
- 20. Measured from the reference clock edge to the center of the output eye. This specification must be met across specified voltage and temperature ranges for a single component. Drift rate of change is significantly below the tracking capability of the receiver.
- 21. BER per differential lane.

Preliminary Data Sheet E0869E30 (Ver. 3.0)

Differential Receiver Input Specifications*1

www.DataSheet4U.com

Parameter	Symbol	min.	max.	Unit	Comments
Differential peak-to-peak input voltage	VRX-DIFFp-p	170	1300	mV	VRX-DIFFp-p = 2× VRX-D+ -VRX-D- Measured as note 2
Maximum single-ended voltage for EI condition (AC + DC)	VRX-IDLE-SE	_	65	mV	3, 4, 5, 6
Maximum single-ended voltage for EI condition (DC only)	VRX-IDLE-SE-DC		35	mV	3, 4, 5, 6, 7
Maximum peak-to-peak differential voltage for EI condition	VRX-IDLE-DIFFp-p	_	65	mV	4, 5, 6
Single-ended voltage (w.r.t. VSS) on D+/D-	VRX-SE	-300	900	mV	5
Single-pulse peak differential input voltage	VRX-DIFF-PULSE	85	_	mV	5, 8
Amplitude ratio between adjacent symbols, 1100mV < VRX-DIFFp-p <= 1300mV	VRX-DIFF-ADJ RATIO- HI	_	3.0		5, 9
Amplitude ratio between adjacent symbols, VRX-DIFFp-p <= 1100mV	VRX-DIFF-ADJ RATIO	_	4.0		5, 9
Maximum RX inherent timing error	TRX-TJ-MAX	_	0.4	UI	5, 10, 11
Maximum RX inherent deterministic timing error	TRX-DJ-DD	_	0.3	UI	5, 10, 11, 12
Single-pulse width at zero-voltage crossing	TRX-PW-ZC	0.55	_	UI	5, 8
Single-pulse width at minimum- level crossing	TRX-PW-ML	0.2	_	UI	5, 8
Differential RX input rise/fall time	TRX-RISE, TRX-FALL	50	_	ps	Given by 20%-80% voltage levels.
Common mode of the input voltage	VRX-CM	120	400	mV	Defined as: VRX-CM = DC (avg) of VRX-D+ + VRX-D- /2 Measured as note 2. See also note 13
AC peak-to-peak common mode of input voltage	VRX-CM-ACp-p	_	270	mV	VRX-CM-AC = Max VRX-D+ + VRX-D- /2 – Min VRX-D+ + VRX-D- /2 Measured as note 2
Ratio of VRX-CM-ACp-p to minimum VRX-DIFFp-p	VRX-CM-EH-Ratio	_	45	%	14
Differential return loss	RLRX-DIFF	9	_	dB	Measured over 0.1GHz to 2.4GHz. See also note 15
Common mode return loss	RLRX-CM	6	_	dB	Measured over 0.1GHz to 2.4GHz. See also note 15
RX termination resistance	RRX	41	55	Ω	16
D+/D- RX resistance difference	RRX-Match-DC	_	4	%	RRX-Match-DC = 2× RRX-D+ – RRX-D- / (RRX-D+ + RRX-D-)
Lane-to-lane PCB skew at Rx	LRX-PCB-SKEW	_	6	UI	Lane-to-lane PCB skew at the receiver that must be tolerated. See also note 17
Minimum RX Drift Tolerance	TRX-DRIFT	400		ps	18
Minimum data tracking 3dB bandwidth	FTRK	0.2	_	MHz	19
Electrical idle entry detect time	TEI-ENTRY - DETECT	_	60	ns	20
Electrical idle exit detect time	TEI-EXIT -DETECT	_	30	ns	
Bit Error Ratio	BER	_	10 ⁻¹²		21

- Notes: 1. For details, refer to the JEDEC specification "FB-DIMM High Speed Differential PTP Wink at 1.50 pet4U.com
 - 2. Specified at the package pins into a timing and voltage compliant test setup. Note that signal levels at the pad will be lower than at the pin.
 - Single-ended voltages below that value that are simultaneously detected on D+ and D- are interpreted as the Electrical Idle condition. Worst-case margins are determined by comparing El levels with common mode levels during normal operation for the case with transmitter using small voltage swing.
 - 4. Multiple lanes need to detect the EI condition before the device can act upon the EI detection.
 - 5. Specified at the package pins into a timing and voltage compliance test setup.
 - 6. Receiver designers may implement either single-ended or differential EI detection. Receivers must meet the specification that corresponds to the implemented detection circuit.
 - 7. This specification, considered with VTX-IDLE-SE-DC, implies a maximum 15mV single-ended DC offset between TX and RX pins during the electrical idle condition. This in turn allows a ground offset between adjacent FB-DIMM agents of 26mV when worst case termination resistance matching is considered.
 - 8. The single-pulse mask provides sufficient symbol energy for reliable RX reception. Each symbol must comply with both the single-pulse mask and the cumulative eye mask.
 - The relative amplitude ratio limit between adjacent symbols prevents excessive inter-symbol interference in the Rx. Each symbol must comply with the peak amplitude ratio with regard to both the preceding and subsequent symbols.
 - 10. This number does not include the effects of SSC or reference clock jitter.
 - 11. This number includes setup and hold of the RX sampling flop.
 - 12. Defined as the dual-dirac deterministic timing error.
 - 13. Allows for 15mV DC offset between transmit and receive devices.
 - 14. The received differential signal must satisfy both this ratio as well as the absolute maximum AC peak-topeak common mode specification. For example, if VRX-DIFFp-p is 200mV, the maximum AC peak-topeak common mode is the lesser of (200mV × 0.45 = 90mV) and VRX-CM-ACp-p.
 - 15. One of the components that contribute to the deterioration of the return loss is the ESD structure which needs to be carefully designed.
 - 16. The termination small signal resistance; tolerance across voltages from 100mV to 400mV shall not exceed $\pm 5\Omega$. with regard to the average of the values measured at 100mV and at 400mV for that pin.
 - 17. This number represents the lane-to-lane skew between TX and RX pins and does not include the transmitter output skew from the component driving the signal to the receiver. This is one component of the end-to-end channel skew in the AMB specification.
 - 18. Measured from the reference clock edge to the center of the input eye. This specification must be met across specified voltage and temperature ranges for a single component. Drift rate of change is significantly below the tracking capability of the receiver.
 - 19. This bandwidth number assumes the specified minimum data transition density. Maximum jitter at 0.2MHz is 0.05UI.
 - 20. The specified time includes the time required to forward the EI entry condition.
 - 21. BER per differential lane.

Serial PD Matrix for FB-DIMM

ΕLΡΙDΛ

CAUTION FOR HANDLING MEMORY MODULES

When handling or inserting memory modules, be sure not to touch any components on the modules, such as the memory ICs, chip capacitors and chip resistors. It is necessary to avoid undue mechanical stress on these components to prevent damaging them.

In particular, do not push module cover or drop the modules in order to protect from mechanical defects, which would be electrical defects.

When re-packing memory modules, be sure the modules are not touching each other. Modules in contact with other modules may cause excessive mechanical stress, which may damage the modules.

MDE0202

/ww.DataSheet4U.com

- NOTES FOR CMOS DEVICES -

① PRECAUTION AGAINST ESD FOR MOS DEVICES

Exposing the MOS devices to a strong electric field can cause destruction of the gate oxide and ultimately degrade the MOS devices operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it, when once it has occurred. Environmental control must be adequate. When it is dry, humidifier should be used. It is recommended to avoid using insulators that easily build static electricity. MOS devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work bench and floor should be grounded. The operator should be grounded using wrist strap. MOS devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with semiconductor MOS devices on it.

(2) HANDLING OF UNUSED INPUT PINS FOR CMOS DEVICES

No connection for CMOS devices input pins can be a cause of malfunction. If no connection is provided to the input pins, it is possible that an internal input level may be generated due to noise, etc., hence causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using a pull-up or pull-down circuitry. Each unused pin should be connected to VDD or GND with a resistor, if it is considered to have a possibility of being an output pin. The unused pins must be handled in accordance with the related specifications.

③ STATUS BEFORE INITIALIZATION OF MOS DEVICES

Power-on does not necessarily define initial status of MOS devices. Production process of MOS does not define the initial operation status of the device. Immediately after the power source is turned ON, the MOS devices with reset function have not yet been initialized. Hence, power-on does not guarantee output pin levels, I/O settings or contents of registers. MOS devices are not initialized until the reset signal is received. Reset operation must be executed immediately after power-on for MOS devices having reset function.

CME0107

The information in this document is subject to change without notice. Before using this document, confirm that this is the latest version.

No part of this document may be copied or reproduced in any form or by any means without the prior written consent of Elpida Memory, Inc.

Elpida Memory, Inc. does not assume any liability for infringement of any intellectual property rights (including but not limited to patents, copyrights, and circuit layout licenses) of Elpida Memory, Inc. or third parties by or arising from the use of the products or information listed in this document. No license, express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of Elpida Memory, Inc. or others.

Descriptions of circuits, software and other related information in this document are provided for illustrative purposes in semiconductor product operation and application examples. The incorporation of these circuits, software and information in the design of the customer's equipment shall be done under the full responsibility of the customer. Elpida Memory, Inc. assumes no responsibility for any losses incurred by customers or third parties arising from the use of these circuits, software and information.

[Product applications]

Elpida Memory, Inc. makes every attempt to ensure that its products are of high quality and reliability. However, users are instructed to contact Elpida Memory's sales office before using the product in aerospace, aeronautics, nuclear power, combustion control, transportation, traffic, safety equipment, medical equipment for life support, or other such application in which especially high quality and reliability is demanded or where its failure or malfunction may directly threaten human life or cause risk of bodily injury.

[Product usage]

Design your application so that the product is used within the ranges and conditions guaranteed by Elpida Memory, Inc., including the maximum ratings, operating supply voltage range, heat radiation characteristics, installation conditions and other related characteristics. Elpida Memory, Inc. bears no responsibility for failure or damage when the product is used beyond the guaranteed ranges and conditions. Even within the guaranteed ranges and conditions, consider normally foreseeable failure rates or failure modes in semiconductor devices and employ systemic measures such as fail-safes, so that the equipment incorporating Elpida Memory, Inc. products does not cause bodily injury, fire or other consequential damage due to the operation of the Elpida Memory, Inc. product.

[Usage environment]

This product is not designed to be resistant to electromagnetic waves or radiation. This product must be used in a non-condensing environment.

If you export the products or technology described in this document that are controlled by the Foreign Exchange and Foreign Trade Law of Japan, you must follow the necessary procedures in accordance with the relevant laws and regulations of Japan. Also, if you export products/technology controlled by U.S. export control regulations, or another country's export control laws or regulations, you must follow the necessary procedures in accordance with such laws or regulations.

If these products/technology are sold, leased, or transferred to a third party, or a third party is granted license to use these products, that third party must be made aware that they are responsible for compliance with the relevant laws and regulations.
