EM78P911A

8-BIT MICRO-CONTROLLER

Version 2.0

ELAN MICROELECTRONICS CORP.

No. 12, Innovation 1st RD., Science-Based Industrial Park
Hsin Chu City, Taiwan, R.O.C.

TEL: (03) 5639977

FAX: (03)5630118

I.General Description

The EM78P911A is an 8-bit CID (Call Identification) RISC type microprocessor with low power , high speed CMOS technology . Integrated onto a single chip are on_chip watchdog (WDT) , RAM , ROM , programmable real time clock /counter , internal interrupt , power down mode , LCD driver , FSK decoder ,CALL WAITING decoder, SDT decoder, DTMF generator, MEI(Multiple Extension Internetworking) and RTF(Request To Flash) functions, and tri-state I/O . The EM78P911A provides a single chip solution to design a CID of calling message_display .

II.Feature

CPU

- Operating voltage range : 2.5V ~ 5.5V
- 16K×13 on chip Electrical One Time Programmable Read Only Memory (OTP-ROM)
- 2.8K×8 on chip RAM
- Up to 36 bi-directional tri-state I/O ports
- 8 level stack for subroutine nesting
- 8-bit real time clock/counter (TCC)
- Two sets of 8 bit counters can be interrupt sources
- Selective signal sources and trigger edges , and with overflow interrupt
- Programmable free running on chip watchdog timer
- 99.9% single instruction cycle commands
- Four modes (internal clock 3.579MHz)
 1. Sleep mode : CPU and 3.579MHz clock turn off, 32.768KHz clock turn off
 2. Idle mode : CPU and 3.579MHz clock turn off, 32.768KHz clock turn on
 3. Green mode : 3.579MHz clock turn off, CPU and 32.768KHz clock turn on
 4. Normal mode : 3.579MHz clock turn on , CPU and 32.768KHz clock turn on
- Ring on voltage detector
- Universal Low battery detector
- Input port wake up function
- 9 interrupt source , 4 external , 5 internal
- 100 pin QFP or chip
- Port key scan function
- Clock frequency 32.768KHz
- Eight R-option pins

CID

- Operation Voltage 3.5 ~ 6V for FSK
- Operation Voltage 2.5 ~ 6V for DTMF
- Bell 202 , V.23 FSK demodulator
- DTMF generator
- Ring detector on chip

CALL WAITING

- Operation Voltage 3.6 ~ 5.5V
- Compatible with Bellcore special report SR-TSV-002476
- Call-Waiting (2130Hz plus 2750Hz) Alert Signal Detector
- Good talkdown and talkoff performance
- Sensitivity compensated by adjusting input OP gain
- Minimum access frequency deviation $\pm 0.5\%$ for U.S. Call waiting spec. (EM78P911A)

SDT

- Stuttered Dial Tone (350Hz plus 440Hz) Signal Detect

MEI/RTF

- Compatible with TIA/EIA-777(TIA SP-4078)
- MEI(Multiplex Extension Internetworking) and RTF(Request To Flash) functions

EM78P911A 8-bit Micro-controller

LCD

- LCD operation voltage chosen by software
- Common driver pins : 16
- Segment driver pins : 60
- 1/4 bias
- 1/8,1/16 duty

PACKAGE

- 100 pin QFP (EM78P911AAQ, POVD disable) (EM78P911ABQ, POVD enable),
100 pin Chip or 102 pin Chip (with MEI and RTF functions)

III.Application

1. adjunct units
2. answering machines
3. feature phones

VI.Pin Descriptions

PIN	I/O	DESCRIPTION
VDD	POWER	digital power
AVDD		analog power
GND	POWER	digital ground
AVSS		analog ground
Xtin	I	Input pin for 32.768 kHz oscillator
Xtout	O	Output pin for 32.768 kHz oscillator
COM0..COM7	O	Common driver pins of LCD drivers
COM8..COM15	O (PORT6)	
SEG0...SEG43	O	Segment driver pins of LCD drivers
SEG44..SEG51	O (PORT8)	
SEG52..SEG59	O (PORT9)	
PLLC	I	Phase loop lock capacitor, connect a capacitor 0.01u to 0.047u with AVSS
RTF	I	Return to flash input. Detect line DC voltage changed
MEI	I	Multiple extension internetworking input. 1.2 DC voltage detection can be used as on-hook/off-hook detection.
TIP	I	Should be connected with TIP side of twisted pair lines for FSK.
RING	I	Should be connected with RING side of twisted pair lines for FSK.
CWTIP	I	Should be connected with TIP side of twisted pair lines for CW.
GAIN	I	OP output pin for gain adjustment.
RDET1	I	Detect the energy on the twisted pair lines . These two pins coupled to the twisted pair lines through an attenuating network.
/RING TIME	I	Determine if the incoming ring is valid.An RC network may be connected to the pin.
INT0	PORT7(0)	PORT7(0)~PORT7(3) signal can be interrupt signals. Int2 and int3 has the same interrupt flag. IO port
INT1	PORT7(1)	
INT2	PORT7(2)	
INT3	PORT7(3)	
P5.4 ~P5.7	PORT5	PORT 5 can be INPUT or OUTPUT port each bit. Shared with LCD segment signals
P6.0 ~P6.7	PORT6	PORT 6 can be INPUT or OUTPUT port each bit. Shared with LCD common signals
P7.0 ~P7.7	PORT7	PORT 7 can be INPUT or OUTPUT port each bit. Internal Pull high function. Key scan function.
P8.0 ~P8.7	PORT8	PORT 8 can be INPUT or OUTPUT port each bit. And shared with Segment signal.
P9.0 ~P9.7	PORT9	PORT 9 can be INPUT or OUTPUT port each bit. And can be set to wake up watch dog timer. And shared with Segment signal.
TEST	I	Test pin into test mode , normal low
DTMF	O	DTMF tone output
RESET	I	

VII. Functional Descriptions

VII.1 Operational Registers

1. R0 (Indirect Addressing Register)

* R0 is not a physically implemented register. It is useful as indirect addressing pointer. Any instruction using R0 as register actually accesses data pointed by the RAM Select Register (R4).

2. R1 (TCC)

* Increased by an external signal edge applied to TCC, or by the instruction cycle clock.

Written and read by the program as any other register.

3. R2 (Program Counter)

* The structure is depicted in Fig. 4.

* Generates $16K \times 13$ on-chip ROM addresses to the relative programming instruction codes.

* "JMP" instruction allows the direct loading of the low 10 program counter bits.

* "CALL" instruction loads the low 10 bits of the PC, PC+1, and then push into the stack.

* "RET" ("RETL k", "RETI") instruction loads the program counter with the contents at the top of stack.

* "MOV R2,A" allows the loading of an address from the A register to the PC, and the ninth and tenth bits are cleared to "0".

* "ADD R2,A" allows a relative address be added to the current PC, and contents of the ninth and tenth bits are cleared to "0".

* "TBL" allows a relative address be added to the current PC, and contents of the ninth and tenth bits don't change. The most significant bit (A10~A13) will be loaded with the content of bit PS0~PS3 in the status register (R5) upon the execution of a "JMP", "CALL", "ADD R2,A", or "MOV R2,A" instruction.

Fig.4 Program counter organization

Fig.5 Data memory configuration

4. R3 (Status Register)

7	6	5	4	3	2	1	0
CAS	PAGE	/SDT	T	P	Z	DC	C

- * Bit 0 (C) Carry flag
- * Bit 1 (DC) Auxiliary carry flag
- * Bit 2 (Z) Zero flag
- * Bit 3 (P) Power down bit. Set to 1 during power on or by a "WDTC" command and reset to 0 by a "SLEP" command.
- * Bit 4 (T) Time-out bit. Set to 1 by the "SLEP" and "WDTC" command, or during power up and reset to 0 by WDT timeout.

EVENT	T	P	REMARK
WDT wake up from sleep mode	0	0	
WDT time out (not sleep mode)	0	1	
/RESET wake up from sleep	1	0	
power up	1	1	
Low pulse on /RESET	x	x	x .. don't care

- * Bit 5 (/SDT) : (Read Only)(Stuttered dial tone signal detect output), 0/1 => SDT signal valid/SDT signal invalid
- * Bit 6 (PAGE) : change IOCB ~ IOCE to another page, 0/1 => page0 / page1
- * Bit 7 (CAS) : CALL WAITING Output, 0/1= CW data valid/No data

5. R4 (RAM Select Register)

- * Bits 0 ~ 5 are used to select up to 64 registers in the indirect addressing mode.
- * Bits 6 ~ 7 determine which bank is activated among the 4 banks.
- * See the configuration of the data memory in Fig. 5.

6. R5 (Program Page Select Register)

7	6	5	4	3	2	1	0
R57	R56	R55	R54	PS3	PS2	PS1	PS0

* Bit 0 (PS0) ~ 3 (PS3) Page select bits

Page select bits

PS3	PS2	PS1	PS0	Program memory page (Address)
0	0	0	0	Page 0
0	0	0	1	Page 1
0	0	1	0	Page 2
0	0	1	1	Page 3
0	1	0	0	Page 4
0	1	0	1	Page 5
0	1	1	0	Page 6
0	1	1	1	Page 7
1	0	0	0	Page 8
1	0	0	1	Page 9
1	0	1	0	Page 10
1	0	1	1	Page 11
1	1	0	0	Page 12
1	1	0	1	Page 13
1	1	1	0	Page 14
1	1	1	1	Page 15

*User can use PAGE instruction to change page. To maintain program page by user. Otherwise, user can use far jump (FJMP) or far call (FCALL) instructions to program user's code. And the program page is maintained by EMC's compiler. It will change user's program by inserting instructions within program.

*Bit4~7 : PORT5 4-bit I/O register

6. R6 ~ R9 (Port 6 ~ Port 9)

* Four 8-bit I/O registers.

7. RA (FSK Status Register)(bit 0,1,2,4 read only)

7	6	5	4	3	2	1	0
IDLE	/358E	/LPD	/LOW_BAT	/FSKPWR	DATA	/CD	/RD

* Bit0 (Read Only) (Ring detect signal)0/1 : Ring Valid/Ring Invalid

* Bit1(Read Only)(Carrier detect signal) 0/1 : Carrier Valid/Carrier Invalid

* Bit2(Read Only)(FSK demodulator output signal)

Fsk data transmitted in a baud rate 1200 Hz.

* Bit3(read/write)(FSK block power up signal)

1/0 : FSK demodulator block power up/FSK demodulator power down

When FSK is powered on, PLL is also enabled regardless of RA bit6(/358E). When FSK is powered off, PLL status is depended on RA bit6(/358E) setting.

* The relation between Bit0 to Bit3 is shown in Fig.6.

Fig.6 The relation between Bit0 to Bit3.

* Bit4(Read Only)(Low battery signal) 0/1 = Battery voltage is low/Normal .

Low battery detect level is set by external resistors R1 and R2. The detect level $V_{bL} = 0.87V \cdot (1 + R1/R2)$. If $V_{battery}$ is under V_{bL} , then send a '0' signal to /LOW_BAT bit; otherwise a '1' signal to this bit. Select pin P77/LBD as LBD by setting IOCE PAGE0 bit1 to '0'. LBD pin is used as low battery detect input.

* Bit5(read/Write)(Low battery detect enable)

0/1 = low battery detect DISABLE/ENABLE.

The relation between /LPD,/POVD and /LOW_BAT can see Fig7.

Fig.7 Universal low battery detect with /LPD,/POVD and /LOW_BAT

* Bit6(read/write)(PLL enable signal)

0/1=DISABLE/ENABLE

The relation between 32.768kHz and 3.579MHz can see Fig.8.

Fig.8 The relation between 32.768kHz and 3.579MHz .

* Bit7 IDLE: sleep mode selection bit

0/1=sleep mode/IDLE mode. This bit will decide SLEP instruction which mode to go.

These two modes can be waken up by TCC clock or Watch Dog or PORT9 and run from "SLEP" next instruction.

Wakeup signal	SLEEP mode	IDLE mode	GREEN mode	NORMAL mode
	RA(7,6)=(0,0) + SLEP	RA(7,6)=(1,0) + SLEP	RA(7,6)=(x,0) no SLEP	RA(7,6)=(x,1) no SLEP
TCC time out	X	Wake-up + Interrupt + Next instruction	Interrupt	Interrupt
WDT time out	RESET	Wake-up + Next instruction	RESET	RESET
Port9 /RINGTIME pin	RESET	Wake-up + Next instruction	X	X
PORT70~73	X	Wake-up + Interrupt + Next instruction	Interrupt	Interrupt

*P70 ~ P73 's wakeup function is controlled by IOCF(1,2,3) and ENI instruction.

*P70 's wakeup signal is a rising or falling signal defined by CONT REGISTER bit7.

*/RINGTIME pin , Port9 ,Port71,Port72 and Port73 's wakeup signal is a falling edge signal.

8. RB(DTMF tone row and column register) (read/write)

7	6	5	4	3	2	1	0
c7	c6	c5	c4	r3	r2	r1	r0

* Bit 0 - Bit 3 are row-frequency tone.

* Bit 4 - Bit 7 are column-frequency tone.

* Initial RB is equal to high. Bit 7 ~ 0 are all "1", turn off DTMF power .

bit 3~0	Row freq				
1110	699.2Hz	1	2	3	A
1101	771.6Hz	4	5	6	B
1011	854Hz	7	8	9	C
0111	940.1Hz	*	0	#	D
Column freq		1203Hz	1331.8Hz	1472Hz	1645.2Hz
bit 7~4		1110	1101	1011	0111

9. RC(CALLER ID address)(read/write)

7	6	5	4	3	2	1	0
CIDA7	CIDA6	CIDA5	CIDA4	CIDA3	CIDA2	CIDA1	CIDA0

* Bit 0 ~ Bit 7 select CALLER ID RAM address up to 256.

10. RD(CALLER ID RAM data)(read/write)

* Bit 0 ~ Bit 8 are CALLER ID RAM data transfer register.

User can see IOCA register how to select CID RAM banks.

11. RE(LCD Driver,WDT Control)(read/write)

7	6	5	4	3	2	1	0
CWPWR	/WDTE	/WUP9H	/WUP9L	/WURING	LCD_C2	LCD_C1	LCD_M

* Bit0 (LCD_M):LCD_M decides the methods, including duty, bias, and frame frequency.

* Bit1~Bit2 (LCD_C#):LCD_C# decides the LCD display enable or blanking. change the display duty must set the "LCD_C2,LCD_C1" to "00".

LCD_C2,LCD_C1	LCD Display Control	LCD_M	duty	bias
0 0	change duty	0	1/16	1/4
	Disable(turn off LCD)	1	1/8	1/4
0 1	Blanking	:	:	:
1 1	LCD display enable	:	:	:

* Bit3 (/WURING, RING Wake Up Enable): used to enable the wake-up function of /RINGTIME input pin. (1/0=enable/disable)

* Bit4 (/WUP9L, PORT9 low nibble Wake Up Enable): used to enable the wake-up function of low nibble in PORT9.(1/0=enable/disable)

* Bit5 (/WUP9H, PORT9 high nibble Wake Up Enable): used to enable the wake-up function of high nibble in PORT9.(1/0=enable/disable)

* Bit6 (/WDTE, Watch Dog Timer Enable)

Control bit used to enable Watchdog timer.(1/0=enable/disable)

The relation between Bit3 to Bit6 can see the diagram 9.

* Bit7(Power control of Call Waiting circuit)

(1/0=enable circuit /disable circuit)

When Call waiting circuit is powered on, PLL is also enabled regardless of RA bit6(/358E). When Call waiting circuit is powered off, PLL status is depended on RA bit6(/358E) setting.

Fig.9 Wake up function and control signal

12. RF (Interrupt Status Register)

7	6	5	4	3	2	1	0
INT3	FSK/CW	C8_2	C8_1	INT2	INT1	INT0	TCIF

* "1" means interrupt request, "0" means non-interrupt

* Bit 0 (TCIF) TCC timer overflow interrupt flag. Set when TCC timer overflows .

* Bit 1 (INT0) external INT0 pin interrupt flag .

* Bit 2 (INT1) external INT1 pin interrupt flag .

* Bit 3 (INT2) external INT2pin interrupt flag .

* Bit 4 (C8_1) internal 8 bit counter interrupt flag .

* Bit 5 (C8_2) internal 8 bit counter interrupt flag .

* Bit 6 (FSK/CW) FSK data or Call waiting data interrupt flag

* Bit 7 (INT3) external INT3 pin interrupt flag.

* High to low edge trigger , Refer to the Interrupt subsection.

* IOCF is the interrupt mask register. User can read and clear.

13. R10~R3F (General Purpose Register)

* R10~R3F (Banks 0~3) all are general purpose registers.

VII.2 Special Purpose Registers

1. A (Accumulator)

* Internal data transfer, or instruction operand holding

* It's not an addressable register.

* This specification is subject to be changed without notice.

2. CONT (Control Register)

7	6	5	4	3	2	1	0
INT_EDGE	INT	TS	TE	PAB	PSR2	PSR1	PSR0

* Bit 0 (PSR0) ~ Bit 2 (PSR2) TCC/WDT prescaler bits.

PSR2	PSR1	PSR0	TCC Rate	WDT Rate
0	0	0	1:2	1:1
0	0	1	1:4	1:2
0	1	0	1:8	1:4
0	1	1	1:16	1:8
1	0	0	1:32	1:16
1	0	1	1:64	1:32
1	1	0	1:128	1:64
1	1	1	1:256	1:128

* Bit 3 (PAB) Prescaler assignment bit.

0/1 : TCC/WDT

* Bit 4 (TE) TCC signal edge

0: increment from low to high transition on TCC

1: increment from high to low transition on TCC

* Bit 5 (TS) TCC signal source

0: internal instruction cycle clock

1: 16.384KHz

* Bit 6 : (INT)INT enable flag

0: interrupt masked by DISI or hardware interrupt

1: interrupt enabled by ENI/RETI instructions

* Bit 7 : INT_EDGE

0:P70 's interruption source is a rising edge signal.

1:P70 's interruption source is a falling edge signal.

* CONT register is readable and writable.

3. IOC5 (I/O Port Control Register)

7	6	5	4	3	2	1	0
IOC57	IOC56	IOC55	IOC54	MEIO	RTFO	RTFPWR	P5S

* Bit0: P5S is switch register for I/O port or LCD signal switching.

0/1= normal I/O port/SEGMENT output .

* Bit1(RTFPWR) : power control of RTF circuit, 1/0 => power on/power off

* Bit2(RTFO) : (Read Only) RTF line DC voltage change detect output.

When line DC voltage is not changed, RTFO is low.

* Bit3(MEIO) : MEI line high or line in-use detect output

When input voltage of MEI pin is below 1.2V, MEIO is low; when input voltage of MEI pin is over 1.3V, MEIO is high.

* Bit 4 to Bit7 are PORT5 I/O direction control registers.

* "1" put the relative I/O pin into high impedance, while "0" put the relative I/O pin as output.

4. IOC6 ~ IOC9 (I/O Port Control Register)

* four I/O direction control registers.

* "1" put the relative I/O pin into high impedance, while "0" put the relative I/O pin as output.

* User can see IOCB register how to switch to normal I/O port.

5. IOCA (CALLER ID RAM,IO ,PAGE Control Register)(read/write,initial "00000000")

7	6	5	4	3	2	1	0
P8SH	P8SL	SDTPW/0	CALL_4	CALL_3	CALL_2	CALL_1	MEIPWR

* Bit 0(MEIPWR) : power control of MEI circuit, 1/0 => power on/power off

* Bit4~Bit1:"000" to "1001" are ten blocks of CALLER ID RAM area. User can use 2.5K RAM with RD ram address.

* Bit 5 (SDTPW/0) : (Power control of Stuttered dial tone circuit/disable SDT)

ps. When code option bit2(/SDTEN) is "1", SDT is disabled and IOCA bit5 is always "0".

User cannot use SDT function. When code option bit2(/SDTEN) is "0", SDT is enabled and IOCA bit5 is SDTPW. At this time, setting SDTPW 1/0 = power on circuit /power down circuit.

* Bit6: port8 low nibble switch, 0/1= normal I/O port/SEGMENT output .

* Bit7: port8 high nibble switch , 0/1= normal I/O port/SEGMENT output

6. IOCB (LCD ADDRESS)

PAGE0 : Bit6 ~ Bit0 = LCDA6 ~ LCDA0

The LCD display data is stored in the data RAM . The relation of data area and COM/SEG pin is as below:

COM15 ~ COM8	COM7 ~ COM0	
40H (Bit15 ~ Bit8)	00H (Bit7 ~ Bit0)	SEG0
41H	01H	SEG1
:	:	:
:	:	:
:	:	:
:	:	:
7AH	4AH	SEG58
7BH	3BH	SEG59
7CH	3CH	Empty
:	:	:
7FH	3FH	Empty

PAGE1 : 8 bit up-counter (COUNTER1) preset and read out register . (write = preset) . After a interruption , it will count from "00".

7. IOCC (LCD DATA)

PAGE0 : Bit7 ~ Bit0 = LCD RAM data register

PAGE1 : 8 bit up-counter (COUNTER2) preset and read out register . (write = preset) After a interruption , it will count from "00".

8. IOCD (Pull-high Control Register)

PAGE0:

7	6	5	4	3	2	1	0
PH7	PH6	PH5	PH4	PH3	PH2	PH1	PH0

* Bit 0 ~ 7 (/PH#) Control bit used to enable the pull-high of PORT7(#) pin.

1: Enable internal pull-high

0: Disable internal pull-high

PAGE1:

7	6	5	4	3	2	1	0
RO7	RO6	RO5	RO4	RO3	RO2	RO1	RO0

* Bit 7 ~ 0 (RO7~0) Control bit used to enable the R-OPTION of PORT97~PORT90 pin.

1: Enable

0: Disable

RO is used for R-OPTION . Setting RO to '1' will enable the status of R-option pin (P90 ~ P97) to read by controller. Clearing RO will disable R-option function. If the R-option function is used, user must connect PORT9 pins to GND by 560K external register . If the register is connected/disconnected , the R9 will read as " 0/1" when RO is set to '1'.

9. IOCE (Bias,PLL Control Register)

PAGE0 :

7	6	5	4	3	2	1	0
P9SH	P9SL	P6S	Bias3	Bias2	Bias1	LBD/P77	SC

* Bit 0 :SC (SCAN KEY signal) 0/1 = disable/enable. Once you enable this bit , all of the LCD signal will have a low pulse during a common period. This pulse has 30us width. Please use the procedure to implement the key scan function.

- set port7 as input port
- set IOCD page0 port7 pull high
- enable scan key signal
- Once push a key . Set RA(6)=1 and switch to normal mode.
- Blank LCD. Disable scan key signal.
- Set P6S =0. Port6 sent probe signal to port7 and read port7. Get the key.
- Note!! A probe signal should be delay a instruction at least to another probe signal.
- Set P6S =1. Port6 as LCD signal. Enable LCD.

* Bit 0 ~ 7 interrupt enable bit.

0: disable interrupt

1: enable interrupt

* IOCF Register is readable and writable.

VII.3 TCC/WDT Prescaler

There is an 8-bit counter available as prescaler for the TCC or WDT. The prescaler is available for the TCC only or WDT only at the same time.

- An 8 bit counter is available for TCC or WDT determined by the status of the bit 3 (PAB) of the CONT register.
- See the prescaler ratio in CONT register.
- Fig. 10 depicts the circuit diagram of TCC/WDT.
- Both TCC and prescaler will be cleared by instructions which write to TCC each time.
- The prescaler will be cleared by the WDTC and SLEP instructions, when assigned to WDT mode.
- The prescaler will not be cleared by SLEP instructions, when assigned to TCC mode.

Fig.10 Block diagram of TCC WDT

VII.4 I/O Ports

The I/O registers, Port 6 ~ Port 9, are bi-directional tri-state I/O ports. Port 7 can be pulled-high internally by software control. The I/O ports can be defined as "input" or "output" pins by the I/O control registers (IOC6 ~ IOC9) under program control. The I/O registers and I/O control registers are both readable and writable. The I/O interface circuit is shown in Fig.11.

Fig.11 The circuit of I/O port and I/O control register

VII.5 RESET and Wake-up

The RESET can be caused by

- (1) Power on reset, or Voltage detector
- (2) WDT timeout. (if enabled and in GREEN or NORMAL mode)

Note that only Power on reset, or only Voltage detector in Case(1) is enabled in the system by CODE Option bit. If Voltage detector is disabled, Power on reset is selected in Case (1). Refer to Fig. 12.

Fig.12 Block diagram of Reset of controller

Once the RESET occurs, the following functions are performed.

- The oscillator is running, or will be started.
- The Program Counter (R2) is set to all "0".
- When power on, the upper 3 bits of R3 and the upper 2 bits of R4 are cleared.
- The Watchdog timer and prescaler are cleared.
- The Watchdog timer is disabled.
- The CONT register is set to all "1"
- The other register (bit7..bit0)

R5 = "xxxx0000"	IOC5 = "1111xx00"	
R6 = PORT	IOC6 = "11111111"	
R7 = PORT	IOC7 = "11111111"	
R8 = PORT	IOC8 = "11111111"	
R9 = PORT	IOC9 = "11111111"	
RA = "000x0xxx"	IOCA = "00000000"	
RB = "11111111"	Page0 IOCB = "00000000"	Page1 IOCB = "00000000"
RC = "00000000"	Page0 IOCC = "0xxxxxxx"	Page1 IOCC = "00000000"
RD = "xxxxxxx"	Page0 IOCD = "00000000"	Page1 IOCD = "00000000"
RE = "00000000"	Page0 IOCE = "00000010"	Page1 IOCE = "00000000"
RF = "00000000"	IOCF = "00000000"	

The controller can be awakened from SLEEP mode or IDLE mode (execution of "SLEP" instruction, named as SLEEP MODE or IDLE mode) by (1)TCC time out (2) WDT time-out (if enabled) or, (3) external input at PORT9. The three cases will cause the controller wake up and run from next instruction. After wake-up , user should control WATCH DOG in case of reset in GREEN mode or NORMAL mode. The last two should be open RE register before into sleep mode or IDLE mode . The first one case will set a flag in RF bit0 .But it will not go to address 0x08.

VII.6 Interrupt

The CALLER ID IC has internal interrupts which are falling edge triggered, as followed : TCC timer overflow interrupt (internal) , two 8-bit counters overflow interrupt .

If these interrupt sources change signal from high to low , then RF register will generate '1' flag to corresponding register if you enable IOCF register.

RF is the interrupt status register which records the interrupt request in flag bit. IOCF is the interrupt mask register. Global interrupt is enabled by ENI instruction and is disabled by DISI instruction. When one of the interrupts (when enabled) generated, will cause the next instruction to be fetched from address 008H. Once in the interrupt service routine the source of the interrupt can be determined by polling the flag bits in the RF register. The interrupt flag bit must be cleared in software before leaving the interrupt service routine and enabling interrupts to avoid recursive interrupts.

There are four external interrupt pins including INT0 , INT1 , INT2 , INT3 . And four internal interrupt available.

Internal signals include TCC,CNT1,CNT2,FSK and CALL WAITING data. The last two will generate a interrupt when the data trasient from high to low.

External interrupt INT0 , INT1 , INT2 , INT3 signals are from PORT7 bit0 to bit3 . If IOCF is enable then these signal will cause interrupt , or these signals will be treated as general input data .

After reset, the next instruction will be fetched from address 000H and the instruction inturrept is 001H and the hardware inturrept is 008H.

TCC will go to address 0x08 in GREEN mode or NORMAL mode after time out. And it will run next instruction from "SLEP" instruction. These two cases will set a RF flag.

It is very important to save ACC,R3 and R5 when processing a interruption.

VII.7 Instruction Set

Instruction set has the following features:

- (1). Every bit of any register can be set, cleared, or tested directly.
- (2). The I/O register can be regarded as general register. That is, the same instruction can operates on I/O register.

The symbol "R" represents a register designator which specifies which one of the 64 registers (including operational registers and general purpose registers) is to be utilized by the instruction. Bits 6 and 7 in R4 determine the selected register bank. "b" represents a bit field designator which selects the number of the bit, located in the register "R", affected by the operation. "k" represents an 8 or 10-bit constant or literal value.

VII.8 Option

VII.8.1 CODE Option Register

The CALLER ID IC has one CODE option register which is not part of the normal program memory. The option bits cannot be accessed during normal program execution.

7	6	5	4	3	2	1	0
-	-	-	/RTFEN	/MEIEN	/SDTEN	/PROT	MCLK

* Bit 0 (MCLK) : main clock selection. 0/1 = 1.79MHZ / 3.58MHZ

* Bit 1 (/PROT) : Code protection bit

0 : protection enable

1 : protection disable

* Bit 2 (/SDTEN) : Stuttered dial tone disabled/enable

0: enable

1: disable

* Bit 3 (/MEIEN) : MEI function, 0/1 => enable/disable MEI function

When MEI function is disabled, MEI is always powered down and user cannot use this function.

* Bit 4 (/RTFEN) : RTF function, 0/1 => enable/disable RTF function

When RTF function is disabled, RTF is always powered down and user cannot use this function.

* This specification is subject to be changed without notice.

* Bits 5~7 : unused

VII.8.2 PAD Option

/POVD(power on voltage detect) reset can be enabled/disabled by PAD Option. This POVD pad is not shown on the pin assignment. Internally or externally connecting this pad to GND/VDD to enable/disable /POVD reset.

/POVD	2.2V reset	power on reset	Low power detect without reset	Low power detect controlled by RA(5)	sleep mode current
1	No	yes	Yes	Yes	1uA
0	yes	yes	Yes	yes	15uA

VII.9 FSK FUNCTION

VII.9.1 Functional Block Diagram

Fig.13 FSK Block Diagram

VII.9.2 Function Descriptions

The CALLER ID IC is a CMOS device designed to support the Caller Number Deliver feature which is offered by the Regional Bell Operating Companies. The FSK block comprises two paths: the signal path and the ring indicator path. The signal path consist of an input differential buffer, a band pass filter, an FSK demodulator and a data valid with carrier detect circuit. The ring detector path includes a clock generator, a ring detect circuit.

In a typical application, the ring detector maintains the line continuously while all other functions of the chip are inhibited. If a ring signal is sent, the /RINGTIME pin will has a low signal. User can use this signal to wake up whole chip or read /RD signal from RA register.

A /FSKPWR input is provided to activate the block regardless of the presence of a power ring signal. If /FSKPWR is sent low, the FSK block will power down whenever it detects a valid ring signal, it will power on when /FSKPWR is high.

The input buffer accepts a differential AC coupled input signal through the TIP and RING input and feeds this signal to a band pass filter. Once the signal is filtered, the FSK demodulator decodes the information and sends it to a post filter. The output data is then made available at DATA OUT pin. This data, as sent by the central office, includes the header information (alternate "1" and "0") and 150 ms of marking which precedes the date, time and calling number. If no data is present, the DATA OUT pin is held in a high state. This is accomplished by an carrier detect circuit which determines if the in-band energy is high enough. If the incoming signal is valid and thus the demodulated data is transferred to DATA OUT pin. If it is not, then the FSK demodulator is blocked.

VII.9.3 Ring detect circuit

When Vdd is applied to the circuit, the RC network will charge cap C1 to Vdd holding /RING TIME off. The resistor network R2 to R3 attenuates the incoming power ring applied to the top of R2. The values given have been chosen to provide a sufficient voltage at DET1 pin, to turn on the Schmitt trigger input. When V_{t+} of the Schmitt is exceeded, cap C1 will discharge.

The value of R1 and C1 must be chosen to hold the /RING TIME pin voltage below the V_{t+} of the Schmitt between the individual cycle of the power ring. With /RINGTIME enabled, this signal will be a /RD signal in RA through a buffer.

Fig.14 ring detect circuit

VII.10 DTMF (Dual Tone Multi Frequency) Tone Generator

Built-in DTMF generator can generate dialing tone signals for telephone of dialing tone type. There are two kinds of DTMF tone. One is the group of row frequency, the other is the group of column frequency, each group has 4 kinds of frequency, user can get 16 kinds of DTMF frequency totally. DTMF generator contains a row frequency sine wave generator for generating the DTMF signal which selected by low order 4 bits of RB and a column frequency sine wave generator for generating the DTMF signal which selected by high order 4 bits of RB. This block can generate single tone by filling one bit zero to this register.

If all the values are high, the power of DTMF will turn off until one or two low values.

Either high or low 4 bits must be set by an effective value, otherwise, if any ineffective value or both 4 bits are load effective value, tone output will be disable. Recommend value refer to table as follow please :

Fig.15 DTMF Block Diagram

* RB (DTMF Register)

. Bit 0 - Bit 3 are row-frequency tone.

. Bit 4 - Bit 7 are column-frequency tone.

. Initial RB is equal to HIGH.

. Except below values of RB ,the other values of RB are not effect. If RB is set by ineffective value, the DTMF output will be disable and there is no tone output.

. Bit 7 ~ 0 are all "1" , turn off DTMF power .

bit 3~0	Row freq				
1110	699.2Hz	1	2	3	A
1101	771.6Hz	4	5	6	B
1011	854Hz	7	8	9	C
0111	940.1Hz	*	0	#	D
Column freq		1203Hz	1331.8Hz	1472Hz	1645.2Hz
bit 7~4		1110	1101	1011	0111

VII.11 LCD Driver

The CALLER ID IC can drive LCD directly and has 60 segments and 16 commons that can drive 60*16 dots totally. LCD block is made up of LCD driver , display RAM, segment output pins , common output pins and LCD operating power supply pins.

Duty , bias , the number of segment , the number of common and frame frequency are determined by LCD mode register . LCD control register.

The basic structure contains a timing control which uses the basic frequency 32.768KHz to generate the proper timing for different duty and display access. RE register is a command register for LCD driver, the LCD display(disable, enable, blanking) is controlled by LCD_C and the driving duty and bias is decided by LCD_M and the display data is stored in data RAM which address and data access controlled by registers IOCB and IOCC.

Fig.16 LCD DRIVER CONTROL

VII.11.1 LCD Driver Control

RE(LCD Driver Control)(initial state "00000000")

7	6	5	4	3	2	1	0
-	-	-	-	-	LCD_C2	LCD_C1	LCD_M

*Bit0 (LCD_M):LCD_M decides the methods, including duty, bias, and frame frequency.

*Bit1~Bit2 (LCD_C#):LCD_C# decides the LCD display enable or blanking. change the display duty must set the LCD_C to "00".

LCD_C2,LCD_C1	LCD Display Control	LCD_M	duty	bias
0 0	change duty	0	1/16	1/4
	Disable(turn off LCD)	1	1/8	1/4
0 1	Blanking	:	:	:
1 1	LCD display enable	:	:	:

VII.11.2 LCD display area

The LCD display data is stored in the data RAM . The relation of data area and COM/SEG pin is as below:

COM15 ~ COM8	COM7 ~ COM0	
40H (Bit15 ~ Bit8)	00H (Bit7 ~ Bit0)	SEG0
41H	01H	SEG1
:	:	:
:	:	:
7BH	3BH	SEG59
7CH	3CH	empty
7DH	3DH	empty
7EH	3EH	empty
7FH	3FH	empty

*IOCB(LCD Display RAM address)

7	6	5	4	3	2	1	0
-	LCDA6	LCDA5	LCDA4	LCDA3	LCDA2	LCDA1	LCDA0

Bit 0 ~ Bit 6 select LCD Display RAM address up to 120.

LCD RAM can be write whether in enable or disable mode and read only in disable mode.

*IOCC(LCD Display data) : Bit 0 ~ Bit 8 are LCD data.

VII.11.3 LCD COM and SEG signal

* COM signal : The number of COM pins varies according to the duty cycle used, as following: in 1/8 duty mode COM8 ~ COM15 must be open. in 1/16 duty mode COM0 ~ COM15 pins must be used.

	COM0	COM1	COM2	COM3	COM4	COM5	COM6	COM7	COM8	..	COM15
1/8	o	o	o	o	o	o	o	o	x	..	x
1/16	o	o	o	o	o	o	o	o	o	..	o

x:open,o:select

* SEG signal: The 60 segment signal pins are connected to the corresponding display RAM address 00h to 3Bh. The high byte and the low byte bit7 down to bit0 are correlated to COM15 to COM0 respectively .

When a bit of display RAM is 1, a select signal is sent to the corresponding segment pin, and when the bit is 0 , a non-select signal is sent to the corresponding segment pin.

*COM, SEG and Select/Non-select signal is shown as following:

Fig.17 Lcd wave 1/4 bias

VII.11.4 LCD Bias control

IOCE (Bias Control Register)

7	6	5	4	3	2	1	0
			Bias3	Bias2	Bias1		

* Bit 2~4 (Bias1~Bias3) Control bits used to choose LCD operation voltage . The circuit can refer ti figure15.

LCD operate voltage	Vop (VDD 5V)	VDD=5V
000	0.60VDD	3.0V
001	0.66VDD	3.3V
010	0.74VDD	3.7V
011	0.82VDD	4.0V
100	0.87VDD	4.4V
101	0.93VDD	4.7V
110	0.96VDD	4.8V
111	1.00VDD	5.0V

* Bit 5~7 unused

Fig.18 LCD bias circuit

VII.12 CALL WAITING Function Description

Fig.19 Call Waiting Block Diagram

Call Waiting service works by alerting a customer engaged in a telephone call to a new incoming call. This way the customer can still receive important calls while engaged in a current call. The CALL WAITING DECODER can detect CAS(Call-Waiting Alerting Signal 2130Hz plus 2750Hz) and generate a valid signal on the data pins.

The call waiting decoder is designed to support the Caller Number Deliver feature, which is offered by regional Bell Operating Companies. The call waiting decoder has four blocks, including pre-amplifier, band pass filter, level detect and digital detection algorithm.

In a typical application, after enabling CW circuit (by RE BIT7 CWPWR) this IC receives Tip and Ring signals from twisted pairs. The signals as inputs of pre-amplifier, and the amplifier sends input signal to a band pass filter. Once the signal is filtered, the digital detection block decodes the information and sends it to R3 register bit7. The output data made available at R3 CAS bit.

The data is CAS signals. The CAS is normal high. When this IC detects 2130Hz and 2750Hz frequency, then CAS pin goes to low.

VII.13 Stuttered dial tone (SDT) Function Description

Fig.17 Stuttered dial tone block diagram

SDT(Stuttered dial tone) circuit and FSK circuit use the same input OP Amp. When SDTPW bit (bit5 of register IOCA) is set, SDT circuit is powered on and SDT detection is enabled. SDT detection enabled means it is powered on and detect 350Hz plus 440Hz dual tone frequency. And SDT signal detection output is sent to /SDT bit (bit5 of register R3) with low enable.

If SDT circuit works, it consists of high-band and low-band band pass tone filters, level detect, frequency counting and digital algorithm to qualify correct timing.

VII.14 MEI and RTF Function Description

Based on TIA/EIA-777(or TIA SP-4078) protocol, MEI(Multiple Extension Internetworking) allows Type 2 (and 3) CPE to dynamically arbitrate responsibility for completing the CAS-ACK handshake. Also, RTF(Request to Flash) allows Type 2 (and 3) CPE to synchronize line flash signal after CAS-ACK handshaking.

For MEI part, protocol shows line voltage below 19V as line-in use(phone off-hook status) and voltage above 21V as line high(phone on-hook status). MEI circuit works as on-hook/off-hook detection and internal transition voltage is 1.2V. Use two external resistors to reduce line DC voltage into MEI input pin. These has a little voltage transition hysteresis to complete the rule.

For RTF part, protocol shows 0.5V line DC voltage change detection and timing to be followed(see the protocol for details). RTF circuit can detect this little DC voltage change and complete the same timing as protocol shown.

VIII. Absolute Operation Maximum Ratings

RATING	SYMBOL	VALUE	UNIT
DC SUPPLY VOLTAGE	Vdd	-0.3 To 6	V
INPUT VOLTAGE	Vin	-0.5 TO Vdd +0.5	V
OPERATING TEMPERATURE RANGE	Ta	0 TO 70	°C

IX DC Electrical Characteristic

(Ta=0°C ~ 70°C, VDD=5V±5%, VSS=0V)

(VDD=2.5V to 6V for CPU ; VDD=3.5V to 6V for FSK ; VDD=2.5V to 6V for DTMF)

Symbol	Parameter	Condition	Min	Typ	Max	Unit
IIL1	Input Leakage Current for input pins	VIN = VDD, VSS			±1	μA
IIL2	Input Leakage Current for bi-directional pins	VIN = VDD, VSS			±1	μA
VIH	Input High Voltage		2.5			V
VIL	Input Low Voltage				0.8	V
VIHT	Input High Threshold Voltage	/RESET, TCC, RDET1	2.0			V
VILT	Input Low Threshold Voltage	/RESET, TCC, RDET1			0.8	V
VIHX	Clock Input High Voltage	OSCI	3.5			V
VILX	Clock Input Low Voltage	OSCI			1.5	V
VHscan	Key scan Input High Voltage	Port6 for key scan	3.5			V
VLscan	Key scan Input Low Voltage	Port6 for key scan			1.5	V
VOH1	Output High Voltage (port6,7,8)	IOH = -1.6mA	2.4			V
	(port9)	IOH = -6.0mA	2.4			V
VOL1	Output Low Voltage (port6,7,8)	IOL = 1.6mA			0.4	V
	(port9)	IOL = 5.0mA			0.4	V
Vcom	Com voltage drop	Io=+/- 50 uA	-	-	2.9	V
Vseg	Segment voltage drop	Io=+/- 50 uA	-	-	3.8	V
VLcd	LCD drive reference voltage	Contrast adjustment				
IPH	Pull-high current	Pull-high active input pin at VSS		-10	-15	μA
ISB1	Power down current (SLEEP mode)	All input and I/O pin at VDD, output pin floating, WDT disabled		1	4	μA
ISB2	Low clock current (FREEM mode)	CLK=32.768KHz, FSK, DTMF, CW block disable , All input and I/O pin at VDD, output pin floating, WDT disabled, LCD enable		80	100	μA
ICC	Operating supply current (NORMAL mode)	/RESET=High, CLK=3.579MHz, output pin floating, LCD enable, FSK, DTMF, CW Fblock disable		1.5	1.8	mA

IX AC Electrical Characteristic

(Ta=0°C ~ 70°C, VDD=5V, VSS=0V)

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
Dclk	Input CLK duty cycle		45	50	55	%
Tins	Instruction cycle time	32.768K 3.579M		60 550		us ns
Tdrh	Device delay hold time			18		ms
Ttcc	TCC input period	Note 1	(Tins+20)/N			ns
Twtdt	Watchdog timer period	Ta = 25°C		18		ms

Note 1: N= selected prescaler ratio.

(FSK Band Pass Filter AC Characteristic)(Vdd=+5V,Ta=+25°C)

CHARACTERISTIC	MIN	TYP	MAX	UNIT
input sensitivity TIP and RING pin1 and pin2 Vdd=+5V	-35	-48	--	dBm

(call waiting Band Pass Filter AC Characteristic) (VDD=+5V,Ta=+25°C)

CHARACTERISTIC	MIN	TYP	MAX	UNIT
input sensitivity TIP and RING pins ,Vdd=+5V, Input G=1		-38		dBm
Minimum access frequency deviation for EM78P911A		±0.5		%

Description	Symbol	Min	Typ	Max	Unit
OSC start up(32.768KHz) (3.579MHz PLL)	Tosc	--		400 10	ms
(FSK AC Characteristic)					
Carrier detect low	Tcdl	--	10	14	ms
Data out to Carrier det low	Tdoc	--	10	20	ns
Power up to FSK(setup time)	Tsup	--	15	20	ms
/RD low to Ringtime low	Trd			50	ms
End of FSK to Carrier Detect high	Tcdh	8	--	--	ms
(Call waiting AC Characteristic)					
CAS input signal length (2130 ,2750 Hz @ -20dBm)	Tcasi		80		ms
Data detect delay time	Td		42		ms
Data release time	Tr		26		ms

(Stuttered dial tone AC Characteristic) (VDD=+3.3V,Ta=+25°C)

CHARACTERISTIC	MIN	TYP	MAX	UNIT
input sensitivity TIP and RING pins ,Vdd=+5V		-38		dBm
Input frequency tolerance		±2.0		%

Description	Symbol	Min	Typ	Max	Unit
Stuttered dial tone signal detect delay time	Tstdd		30		ms
Stuttered dial tone signal release time	Tstdr		30		ms

XI. Timing Diagrams

AC Test Input/Output Waveform

AC Testing: Input are driven at 2.4V for logic "1", and 0.45V for logic "0". Timing measurements are made at 2.0V for logic "1", and 0.8V for logic "0".

RESET Timing

TCC Input Timing

Fig1. Pin Assignment

II. Pin Descriptions

PIN	I/O	DESCRIPTION
VDD	POWER	digital power
AVDD		analog power
VSS	POWER	digital ground
AVSS		analog ground
DTMF	O	DTMF tone output
PLLC	I	Phase loop lock capacitor
RTF	I	Return to flash input. Detect line DC voltage changed
MEI	I	Multiple extension internetworking input. 1.2 DC voltage detection can be used as on-hook/off-hook detection.
/RTIME	I	Determine if the incoming ring is valid. A RC network may be connected to the pin.
RDET	I	Detect the energy on the twisted pair lines . These two pins coupled to the twisted pair lines through an attenuating network.
RING	I	Should be connected with TIP side of twisted pair lines
TIP	I	Should be connected with TIP side of twisted pair lines
CWGS	I	OP output pin for gain adjustment for call waiting decoder.
CWIN	I	Input end of call waiting decoder.
XIN	I	Input pin for 32.768 kHz oscillator
XOUT	O	Output pin for 32.768 kHz oscillator
COM0..COM7	O	Common driver pins of LCD drivers
COM8..COM15	O (PORT6)	Common driver pins of LCD drivers. Shared with PORT6
SEG0..SEG39	O	Segment driver pins of LCD drivers
SEG40..SEG43	O (PORT5)	Segment driver pins of LCD drivers. Shared with PORT5(7:4).
SEG44..SEG51	O (PORT8)	Segment driver pins of LCD drivers. Shared with PORT8.
SEG52..SEG59	O (PORT9)	Segment driver pins of LCD drivers. Shared with PORT9. PORT9 AS FUNCTION KEY CAN WAKE UP WATCHDOG.
INT0	PORT7(0)	PORT7(0)~PORT7(3) signal can be interrupt signals. INT2 and INT3 has the same interrupt flag.
INT1	PORT7(1)	
INT2	PORT7(2)	
INT3	PORT7(3)	
P5.4 ~P7.7	PORT5	PORT 5 can be INPUT or OUTPUT port each bit. Shared with LCD segment signals
P6.0 ~P6.7	PORT6	PORT 6 can be INPUT or OUTPUT port each bit. Shared with LCD common signals
P7.0 ~P7.7	PORT7	PORT 7 can be INPUT or OUTPUT port each bit. Internal Pull high function. Key scan function.
P8.0 ~P8.7	PORT8	PORT 8 can be INPUT or OUTPUT port each bit. And shared with Segment signal.
P9.0 ~P9.7	PORT9	PORT 9 can be INPUT or OUTPUT port each bit. And can be set to wake up watch dog timer. And shared with Segment signal.
TEST	I	Test pin into test mode , normal low
/RESET	I	Reset
ERS	I	Input pin used to select the external ROM data bus through bus CD0~D12 or CD0~CD7 only. HIGH/LOW = CD0~CD12 / CD0~CD7.
CA-1	O	CA-1 is used as address line to select low-order data (8 bits, through CD0~CD7) or high-order data (5 bits, through CD0~CD4) ERS=1 => CA-1 NO USE

EM78P911A 8-bit Micro-controller

		ERS=0 => CA-1=0 HIGH ORDER DATA CA-1=1 LOW ORDER DATA
CA0~CA14	O	Program code address bus. CA0~CA14 are address output pins for external programming ROM access.
CD0~CD12	I	Data access in terms of CA0 ~ CA12 addressing.
IOD0~IOD7	O	I/O data bus.
INSEND	O	Used to indicate the instruction completion and ready for next instruction.
IRSEL	O	IRSEL is an output pin used to select an external EVEN/ODD ROM.
PH1OUT	O	Phase 1 output
X2OUT	O	System clock output.
/HOLD	I	Microcontroller hold request.
/POVD	I	Input pin used to enable Power on voltage detector. Power on voltage detector is enabled if /POVD is low. Power on voltage detector is disabled if /POVD is high. Also see the following table.
ENTCC	I	TCC control pin with internal pull-high (560KΩ). TCC works normally when ENTCC is high, and TCC counting is stopped when ENTCC is low.
MCLK	I	Input pin for main clock selection. Internal pull low through a register.
CWFS	I	Minimum access frequency range for call waiting CAS tone. Frequency range is +/-0.5% if CWFS is low. Frequency range is +/- 1.5% if CWFS is high.
R32k	I	R5 register setting option 4-bit page selection and 4-bit PORT5 I/O can be access if R32k is low. 5-bit page selection and 5-bit PORT5 I/O can be access if R32k is high Also see section III for operational register R5 in the following.

POVD status table

/POVD	2.2V reset	power on reset	Low power detect without reset	Low power detect controlled by RA(5)	sleep mode current
1	No	yes	Yes	Yes	1uA
0	Yes	yes	Yes	yes	15uA

III. Operational registers

R5 (Program Page Select Register)

(1) If R32k pin is low level, the R5 register is as follows.

7	6	5	4	3	2	1	0
R57	R56	R55	R54	PS3	PS2	PS1	PS0

* Bit 0 (PS0) ~ 3 (PS3) Page select bits

Page select bits

PS3	PS2	PS1	PS0	Program memory page (Address)
0	0	0	0	Page 0
0	0	0	1	Page 1
0	0	1	0	Page 2

* This specification is subject to be changed without notice.

0	0	1	1	Page 3
:	:	:	:	:
:	:	:	:	:
1	1	0	1	Page 13
1	1	1	0	Page 14
1	1	1	1	Page 15

*User can use PAGE instruction to change page. To maintain program page by user. Otherwise, user can use far jump (FJMP) or far call (FCALL) instructions to program user's code. And the program page is maintained by EMC's compiler. It will change user's program by inserting instructions within program.

* Bit 7 (R57) ~ Bit 4 (R54) : 4-bit I/O register for PORT5(7:4).

(2) If R32k pin is high level, the R5 register is as follows.

7	6	5	4	3	2	1	0
R57	R56	R55	PS4	PS3	PS2	PS1	PS0

* Bit 0 (PS0) ~ 4 (PS4) Page select bits

Page select bits

PS4	PS3	PS2	PS1	PS0	Program memory page (Address)
0	0	0	0	0	Page 0
0	0	0	0	1	Page 1
0	0	0	1	0	Page 2
0	0	0	1	1	Page 3
:	:	:	:	:	:
:	:	:	:	:	:
1	1	1	0	1	Page 29
1	1	1	1	0	Page 30
1	1	1	1	1	Page 31

*User can use PAGE instruction to change page. To maintain program page by user. Otherwise, user can use far jump (FJMP) or far call (FCALL) instructions to program user's code. And the program page is maintained by EMC's compiler. It will change user's program by inserting instructions within program.

* Bit 7 (R57) ~ Bit 5 (R55) : 3-bit I/O register for PORT5(7:5).

IOCA

* Bit 5 (SDTPW) : (Power control of Stuttered dial tone circuit/disable SDT)
1/0 → power on circuit /power down circuit.

IV. AC Electrical Characteristic

Tdiea	Delay from Phase 3 end to INSEND active	Cl=100pF			30	ns
Tdiei	Delay from Phase 4 end to INSEND inactive	Cl=100pF			30	ns
Tiew	INSEND pulse width		30			ns
Tdca	Delay from Phase 4 end to CA Bus valid	C1=100pF			30	ns
Tacc	ROM data access time		100			ns
Tcds	ROM data setup time		20			ns
Tcdh	ROM data hold time		20			ns
Tdca-1	Delay time of CA-1	C1=100pF			30	ns

Note 1: N= selected prescaler ratio.
