Introduction

ESP-PSRAM16H is a 16 Mbit serial pseudo SRAM device that is fabricated using very high-performance, high-reliability CMOS technology. ESP-PSRAM16H operates at 3.3 V and can support up to 133 MHz clock rate.

ESP-PSRAM16H is accessible via a simple Serial Peripheral Interface (SPI) compatible serial bus. Additionally, Quad Peripheral Interface (QPI) is supported if the application needs faster data rates. The device also supports unlimited reads and writes to the memory array.

Pin	Signal Type	SPI Mode Function	QPI Mode Function
V _{DD}	Power	Power supply, 3.3 V.	
V _{SS}	Ground	Core supply ground	
CE#	Input	Chip select signal, active low. When CE#=1, the chip is in standby state.	
CLK	Input	Clock signal	
SI/SIO[0]	I/O	Serial input	I/O[0]
SO/SIO[1]	I/O	Serial output	I/O[1]
SIO[2]	I/O	-	I/O[2]
SIO[3]	I/O	-	I/O[3]

3. Power-up Initialization

SPI/QPI products include an on-chip voltage sensor used to start the self-initialization process. When V_{DD} reaches a stable level at or above minimum V_{DD} , the device will require 150 μs and user-issued RESET operation to complete its self-initialization process. From the beginning of power ramp to the end of the 150- μs period, CLK should remain LOW, CE# should remain HIGH (track V_{DD} within 200 mV) and SI/SO/SIO[3:0] should remain LOW.

After the 150- μs period the device is ready for normal operation.

Figure 3-1. Power-up Initialization Timing

4. Interface Description

4.1. Address Space

SPI/QPI PSRAM device is byte-addressable. 16 MB device is addressed with A[20:0].

4.2. Page Size

The page size is 512 bytes. The device reads/writes in a wrap manner by default.

4.3. Power-on Status

The device powers up in SPI Mode. It is required to have CE# high before beginning any operations.

4.4. Command/Address Latching Truth Table

The device recognizes the following commands specified by the various input methods.

Command	Code	SPI Mode (QE=0)					QPI Mode (QE=1)

Notes:

1. S=Serial I/O; Q=Quad I/O.

2. The maximum clock frequency is 133 MHz. When burst commands cross page boundaries, the maximum input clock frequency is 84 MHz.

4.5. Command Termination

All Reads & Writes must be completed by raising CE# high immediately afterwards in order to terminate the active command and set the device into standby. Not doing so will block internal refresh operations and cause memory failure.

Figure 4-1. Write Command Termination

For a memory controller to correctly latch the last piece of data prior to read termination, it is recommended to provide a long CE# hold time($t_{CHD} > t_{ACLK} + t_{CLK}$).

7. SPI Mode Operations

The device powers up into SPI mode by default but can also be switched into QPI mode.

7.1. SPI Read Operations

For all reads, MR data will be available t_{ALCK} after the falling edge of CLK.

SPI Reads can be done in four ways:

- 'h03: Serial CMD, Serial Addr/IO, slow frequency
- 'h0B: Serial CMD, Serial Addr/IO, fast frequency
- 'hEB: Serial CMD, Quad Addr/IO, fast frequency
- 'h8B: Serial CMD, Serial Addr/IO, fast frequency

Figure 7-6. Quad Mode Enable 'h35 (available only in SPI mode)

8. QPI Mode Operations

8.1. QPI Read Operations

For all reads, MR data will be available t_{ALCK} after the falling edge of CLK.

QPI Reads can be done in four ways:

- 'h0B: Quad CMD, Quad IO, slow frequency
- 'hEB: Quad CMD, Addr & IO, fast frequency
- 'h8B: Quad CMD, Addr & IO, fast frequency

Figure 8-1. QPI Fast Read 'h0B (max freq 66 MHz)

Figure 8-2. QPI Fast Quad Read 'hEB (max freq 133 MHz)

8.2. QPI Write Operations

QPI write command can be done in one of three ways:

- 'h02 or 'h38: Quad CMD, Addr & IO
- 'h82: Quad CMD, Addr & IO

Figure 8-3. QPI Write

8.3. QPI Quad Mode Exit Operation

This command will switch the device back into serial IO mode.

Figure 8-4. Quad Mode Exit 'hF5 (only available in QPI mode)

9. Reset Operation

The Reset operation is used as a system (software) reset that puts the device in SPI standby mode which is also the default mode after power-up. This operation consists of two commands: Reset-Enable (RSTEN) and Reset (RST).

Figure 9-1. SPI Reset

Figure 9-2. QPI Reset

Reset command has to immediately follow the Reset-Enable command in order for the reset operation to take effect. Any command other than the Reset command after the Reset-Enable command will cause the device to exit Reset-Enable state and abandon reset operation.

10. Toggle Burst Length Operation

The Toggle Burst Length Operation switches the device's wrapped burst boundary between the Mode Register setting (default of 512 bytes CA[8:0]) and 32 (CA[4:0]) bytes or whatever is set in MR0[6:5] and a fixed value of 32 bytes.

Figure 10-1. SPI Burst Length Toggle 'hC0

Figure 10-2. QPI Burst Length Toggle 'hC0

11. Read ID Operations

11.1. SPI Read ID Operation

This command is similar to Fast Read, but without the wait cycles and the device outputs EID value instead of data.

Figure 11-1. SPI Read ID 'h9F' (available only in SPI mode)

11.2. QPI Read ID Operation

In the QPI mode, the QPI Read ID operation is the same as the QPI MR Read operation. Note about Dout [7]. MRR data output bit [7] outputs serial ID data every two clocks.
