Charge Pump Flash LED Driver with Safety Timer

DESCRIPTION

The EUP3618 is a large-current charge pump designed specifically for white LEDs used in camera flash applications. Only one small bucket capacitor is required to develop the output drive, providing a low EMI solution compared with inductive boost regulators.

The EUP3618 has two operation modes: Flash mode and Movie mode. In Flash mode, the EUP3618 is capable of delivering 500mA of regulated current for a duration of 500ms or up to 700mA for a reduced duration. A safety timer is also included to ensure the LED can not be on indefinitely and overheat.

The EUP3618 is available in a 10-pin TDFN package.

FEATURES

- Input Voltage Range — 2.7V to 5.5V
- Flash and Movie — Two Selectable Modes
- Up to 700mA Output Current — Flash Mode
- Flash Mode Safety Timer Shut-Off
- 1X and 2X Automatic Mode for High Efficiency
- External Flash Control Pin for Synchronization to a Camera Module or Graphics Controller
- Short-Circuit, Over-Voltage, Over-Current and Over-Temperature Protection
- Soft-Start Functionality
- 3mm×3mm TDFN-10 Package
- RoHS Compliant and 100% Lead (Pb)-Free Halogen-Free

APPLICATIONS

- Mobile Camera Phones
- Digital Cameras
- PDAs with Built-In Cameras

Typical Application Circuit

Pin Configurations

Package Type	Pin Configurations
TDFN-10	
Pin Description

PIN	TDFN-10	DESCRIPTION
1	V_{IN}	Input voltage.
2	CP	Positive terminal of fly capacitor.
3	CN	Negative terminal of fly capacitor.
4	FLASH	Flash mode enable pin. Puts the device in active Flash mode when high.
5	CTRL	Control input bit. Used to enable and set the output current in Movie mode.
6	RSET	Connect a resistor from this pin to ground. In Flash mode (FLASH=High) this resistor sets the current regulation point according to the following: $V_{FB}=(1.2V/R_{SET})*12.5K\Omega$
7	FB	Current-setting reference pin. Connect to the LED cathode and the current setting resistor.
8	SGND	Ground. Control circuitry returns current to this pin.
9	PGND	Power ground. Fly capacitor current returns through this pin.
10	V_{OUT}	Output pin. Connect to the LED anode.

Absolute Maximum Ratings (1)

- V_{IN}(V),V_{OUT}(V) ---------- -0.3V to 6.5V
- CP,CN(V) ---------- -0.3V to (V_{OUT}+0.3V)
- Junction Temperature Range ---------- -40°C to 150°C
- Lead Temperature Range ---------- 260°C
- Storage Temperature Range ---------- -60°C to 150°C

Recommend Operating Conditions (2)

- Operating Temperature Range ---------- -40°C to 85°C
- Thermal Resistance θ_{JA} (TDFN-10) ---------- 69°C/W

Note(1):Stress beyond those listed under "Absolute Maximum Ratings" may damage the device.
Note(2):The device is not guaranteed to function outside the recommended operating conditions.

Electrical Characteristics

Unless otherwise specified: T_A = 25°C for TYP; C1= C_{OUT} = 1µF (ESR < 0.1Ω); C_{IN} = 10µF; V_{IN} = 3.6V.

Symbol	Parameter	Conditions	EUP3618			Units
			Min.	Typ.	Max.	
V_{IN}	Input Voltage		2.7		5.5	V
I_Q	Quiescent Current	Flash Low		0.5		mA
		Flash High, 2X mode		2		
I_{SH}	Shutdown Current	V_{EN}=0V			1	µA
V_{FB}	FB Reference Voltage	Flash High, R_{SET}=100KΩ		150		mV
		Flash Low		50		
R_{OUT}	Output Resistance (open loop)	1X mode, I_{OUT} = 200mA		0.6		Ω
		2X mode, I_{OUT} =200mA		5		
t_{FLASH}	Flash Mode Pulse Duration	3.3V < V_{IN} < 4.2V, V_{OUT} > 3.1V, I_{OUT} =500mA			500	ms
t_{START}	Flash Mode Start-Up time				1	ms
t_{SAFE}	Flash Mode Safety Timer		0.8	1	1.2	s
F_{OSC}	Charge Pump Frequency	Device Enabled		2.4		MHz
I_{SC}	Output Short Circuit Current Limit	V_{OUT} < 0.5V		850		mA
V_{HI}	Logic High Level	Flash, CTRL	1.6			V
V_{LO}	Logic Low Level	Flash, CTRL			0.4	
I_{IH}	Input Leakage	Flash, CTRL	-1		1	µA
I_{IL}	Input Leakage	Flash, CTRL	-1		1	
t_{LO}	Low Logic Hold Time		0.1		75	µs
t_{HI}	High Logic Hold Time		0.1		75	µs
t_{OFF}	Turn Off Time for CTRL Signal			500		µs
t_{LAT}	Latch Time for CTRL Signal			500		µs
T_{SD}	Thermal Shutdown			150		°C
T_{HYS}	Thermal Hysteresis			20		°C

Applications Information

General Operation

The EUP3618 is a large-current charge pump designed specifically for white LEDs used in camera flash applications. 2.4MHz fixed-frequency switching allows for tiny extermal components and low output ripple. The EUP3618 has two operation modes which are pin selectable for either Flash or Movie mode. Operation begins after the enbale pin CTRL receive a logic high, the device goes through a soft-start mode to reduce inrush current. The EUP3618 starts in the 1X mode, which acts like a linear regulator to control the output current by sensing the feedback pin FB. The load and supply conditions determine whether the charge pump operates in 1X or 2X mode.

LED Current

The LED current is set by R_{FB} and V_{FB},

$$I_{LED}=V_{FB}/R_{FB} \qquad (1)$$

The feedback voltage V_{FB} is difference between Flash and Movie mode. When in Flash mode (FLASH is high), the V_{FB} is set by the resistor R_{SET} connected between the RSET pin and SGND. The voltage of FB is

$$V_{FB}=(1.2/R_{SET})*12.5K\Omega \qquad (2)$$

Where 1.2V is the internal bandgap reference voltage and 12.5KΩ is an internal resistance used to scale the RSET current. Typical values of R_{SET} are 42KΩ to 170KΩ for a range of V_{FB}=300mV to 75mV in Flash mode.

In Movie mode (FLASH is low), the V_{FB} is programed by the pulse number of the CTRL input.

Table 1. Voltage of FB（R_{FB}＝0.33Ω）

Pulse	V_{FB} (typ)	I_{LED} (typ)
1	50mV	151mA
2	60mV	182mA
3	70mV	212mA
4	85mV	256mA
5	100mV	303mA
6	120mV	364mA
7	140mV	424mA
≥8	170mV	515mA

Timing Control

The CTRL pin timing control required to meet as shown in Figure 3. t_{HI} and t_{LO} is the duration of high and low of input pulse signal. t_{LAT} is the data latch time, when CTRL has been held in the high state for time greater than t_{LAT}, the pulse signal is valid latched. t_{OFF} is the shutdown time, when CTRL has been held in the low state for time greater than t_{OFF}, the EUP3618 enters into shutdown mode.

When the time of the high held less than t_{HI}(min.) or the low held less than t_{LO}(min.), this pulse is invalid.

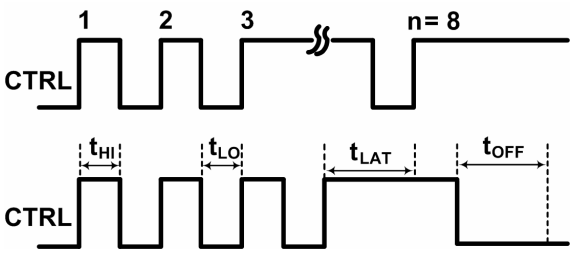

Figure 3.

Over-Temperature Protection

The OTP circuit prevents the device from overheating and experiencing a catastrophic failure. When the junction temperature exceeds 150°C the device is disable. It remains disabled until the junction temperature drops below this threshold. Hysteresis is included to prevent toggling between modes.

Over-Voltage Protection

Output OVP prevents the EUP3618 from generating an output voltage that could damage other devices connected to it such as load LEDs and bypass capacitors. When the output voltage exceeds 5.8V, the OVP circuit disables the charge pump until the voltage decreases to a level within the acceptable range. This circuit allows the device to drive LEDs with high forward voltage at a reduced level without exceding the output voltage limits specified for the device.

Over-Current Protection

When the EUP3618 is in 2X mode, the input current will be approximately double the required output. When the steady-state load requires the maximum current available in 2X mode, The OCP circuit prevents the device from overheating from excessive power dissipation. This feature protects the device when in 1X mode.

Capacitor Selection

The EUP3618 charge pump circuit requires 3 capacitors：input，output and fly capacitors. A 1μF capacitor is typically recommended. For the input capacitor, a larger value of 2.2μF or 4.7μF will help reduce input voltage ripple. All the capacitors should be ceramic to obtain low ESR for high performance. The input and output capacitors should be located as close as possible to the V_{IN} and V_{OUT} pins to obtain best bypassing, and the returns should be connected directly to the PGND pin. And the fly capacitor will be close to CP and CN pin.
