DESCRIPTION

The EZ1087 5.0A voltage regulator is a monolithic integrated circuit designed for use in applications requiring a well regulated positive output voltage with low input-output differential voltage requirements and where remote sensing of the output voltage is desired to compensate for connector, wiring and pc board trace resistances or other voltage losses. Other outstanding features include full power usage up to 5.0A of load current, internal current limiting, and thermal shutdown. Specifications guarantee 3.30 VDC output from a 4.75 VDC input.

APPLICATIONS

- GTL+ bus supplies

TYPICAL APPLICATIONS
ADJUSTABLE VOLTAGE REGULATOR⁽¹⁾⁽²⁾

(1) C1 NEEDED IF DEVICE IS FAR FROM FILTER CAPACITORS.

(2) C2 REQUIRED FOR STABILITY.

PARALLELING EZ1087 FOR HIGHER CURRENT

For paralleling more than two devices, duplicate slave section.

Minimum load current = (10mA) (# of devices in parallel).

 R_1, R_2 network can be used as a minimum load.

 $R_M = 8\text{m ohm } 10'' \text{ of } \#20 \text{ A.W.G. solid wire (copper).}$
 $R_S = 7.3\text{m ohm. } 9.1'' \text{ of } \#20 \text{ A.W.G. solid wire (copper).}$
 R_M and R_S should be non-inductive. This is easily accomplished by folding the wire back upon itself so that the fields generated by current flowing in the wire cancel.
