### Features

- UL Certified No.E209204(SPM27-BA package)
- 500V-5A 3-phase MOSFET inverter bridge including control ICs for gate driving and protection
- Divided negative dc-link terminals for inverter current sensing applications
- Single-grounded power supply due to built-in HVIC
- Isolation rating of 2500Vrms/min.
- Very low leakage current due to using ceramic substrate

### Applications

- AC 200V three-phase inverter drive for small power ac motor drives
- Home appliances applications like refrigerator.

### General Description

It is an advanced smart power module (SPM) that Fairchild has newly developed and designed to provide very compact and high performance ac motor drives mainly targeting low-power inverter-driven application like refrigerator. It combines optimized circuit protection and drive matched to low-loss MOSFETs. System reliability is further enhanced by the integrated under-voltage lock-out and short-circuit protection. The high speed built-in HVIC provides opto-coupler-less single-supply MOSFET gate driving capability that further reduce the overall size of the inverter system design. Each phase current of inverter can be monitored separately due to the divided negative dc terminals.

**Figure 8. Short-Circuit Current Protection (Low-side Operation only)**

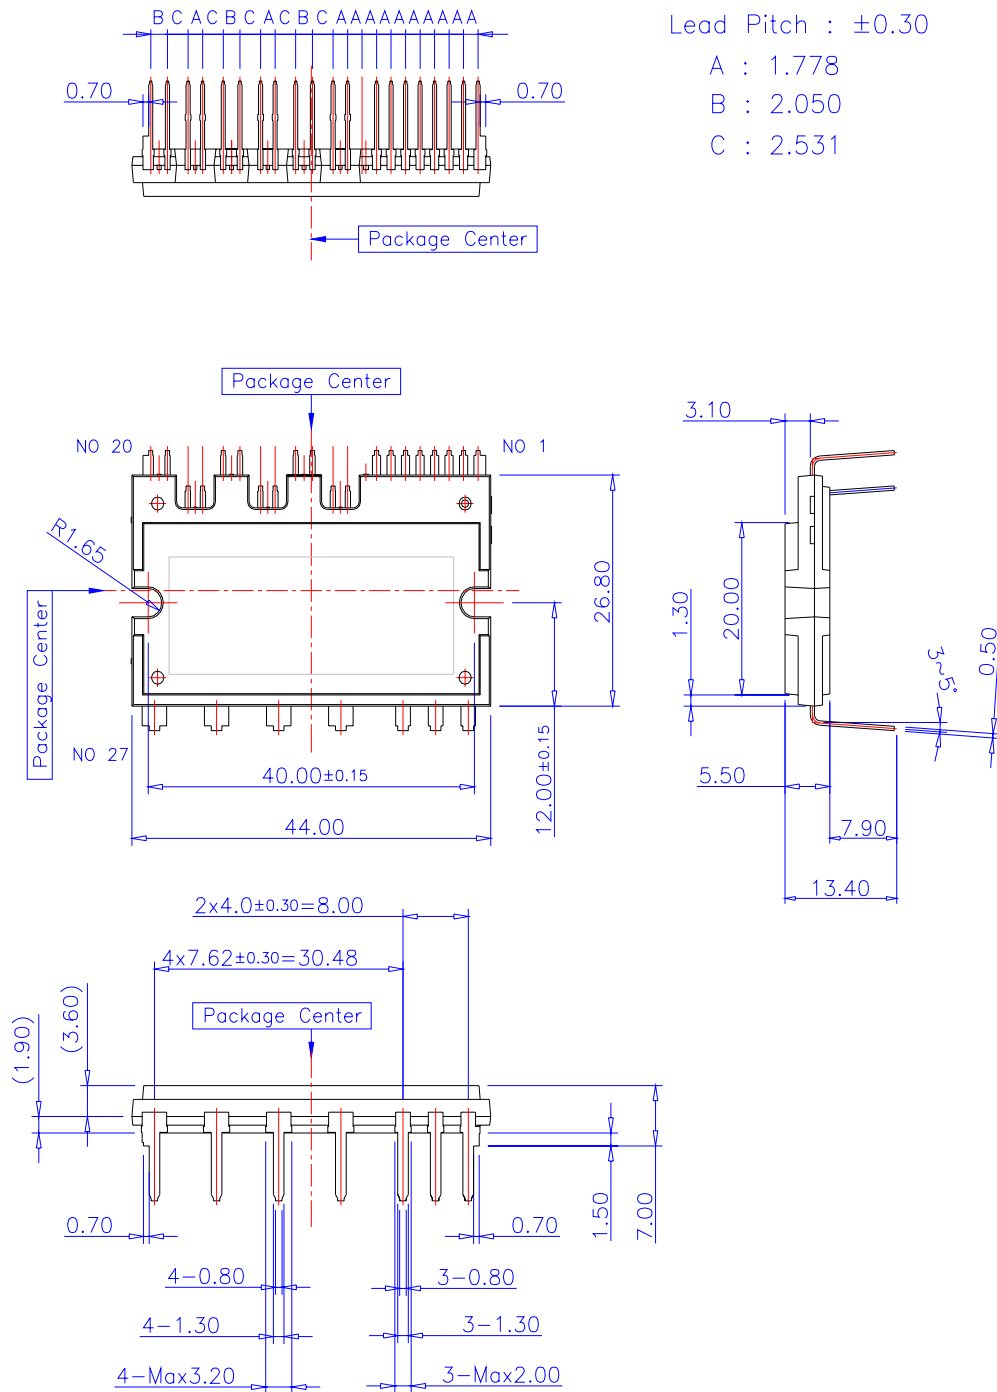

**Note:**

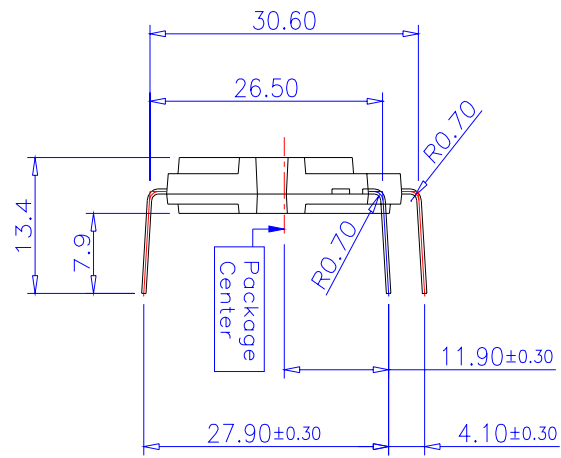

1. To avoid malfunction, the wiring of each input should be as short as possible. (less than 2-3cm)
2. By virtue of integrating an application specific type HVIC inside the SPM, direct coupling to CPU terminals without any opto-coupler or transformer isolation is possible.
3.  $V_{FO}$  output is open collector type. This signal line should be pulled up to the positive side of the 5V power supply with approximately  $4.7k\Omega$  resistance. Please refer to Figure 9.
4.  $C_{SP15}$  of around 7 times larger than bootstrap capacitor  $C_{BS}$  is recommended.
5.  $V_{FO}$  output pulse width should be determined by connecting an external capacitor ( $C_{FOD}$ ) between  $C_{FOD}$ (pin7) and COM(pin2). (Example : if  $C_{FOD} = 33 \text{ nF}$ , then  $t_{FO} = 1.8\text{ms}$  (typ.)) Please refer to the note 5 for calculation method.
6. Input signal is High-Active type. There is a  $3.3k\Omega$  resistor inside the IC to pull down each input signal line to GND. When employing RC coupling circuits, set up such RC couple that input signal agree with turn-off/turn-on threshold voltage.
7. To prevent errors of the protection function, the wiring around  $R_F$  and  $C_{SC}$  should be as short as possible.
8. In the short-circuit protection circuit, please select the  $R_F C_{SC}$  time constant in the range  $1.5 \sim 2 \mu\text{s}$ .
9. Each capacitor should be mounted as close to the pins of the SPM as possible.
10. To prevent surge destruction, the wiring between the smoothing capacitor and the P&COM pins should be as short as possible. The use of a high frequency non-inductive capacitor of around  $0.1 \sim 0.22\mu\text{F}$  between the P&COM pins is recommended.
11. Relays are used at almost every systems of electrical equipments of home appliances. In these cases, there should be sufficient distance between the CPU and the relays.
12.  $C_{SP15}$  should be over  $1\mu\text{F}$  and mounted as close to the pins of the SPM as possible.
