3.3 Volt Synchronous x18 First-In/First-Out Queue

Memory Configuration	Device
262,144 x 18	FQV2105
131,072 x 18	FQV295
65,536 x 18	FQV285
32,768 x 18	FQV275
16,384 x 18	FQV265
8,192 x 18	FQV255

Key Features

- **Industry leading First-In/First-Out Queues (up to 133MHz)**
- **Write cycle time of 7.5ns independent of Read cycle time**
- **Read cycle time of 7.5ns independent of Write cycle time**
- **3.3V power supply**
- **5V input tolerant on all control and data input pins**
- **5V output tolerant on all flags and data output pins**
- **Master Reset clears all previously programmed configurations including Write and Read pointers**
- **Partial Reset clears Write and Read pointers but maintains all previously programmed configurations**
- **First Word Fall Through (FWFT) and Standard Timing modes**
- **Presets for eight different Almost Full and Almost Empty offset values**
- **Parallel/Serial programming of $\overline{\text{PRAF}}$ and $\overline{\text{PRAE}}$ offset values**
- **Full, Empty, Almost Full, Almost Empty, and Half Full indicators**
- **Asynchronous output enable tri-state data output drivers**
- **Data retransmission**
- **Available package: 64 - pin Plastic Thin Quad Flat Pack (TQFP), 64 - pin Slim Thin Quad Flat Pack (STQFP)**
- **(0°C to 70°C) Commercial operating temperature available for cycle time of 7.5ns and above**
- **(-40°C to 85°C) Industrial operating temperature available for cycle time of 7.5ns and above**

Product Description

HBA's FlexQ™ II offers industry leading FIFO queuing bandwidth (up to 3.0 Gbps), with a wide range of memory configurations (from 8,192 x 18 to 262,144 x 18). System designer has full flexibility of implementing deeper and wider queues using FWFT mode and width expansion features. Full, Empty, and Half-Full indicators allow easy handshaking between transmitters and receivers. User programmable Almost Full and Almost Empty (Parallel/Serial) indicators allow implementation of virtual queue depths.

5V tolerant on all input and output pins allow easy interfacing with devices operating at higher voltage levels. Asynchronous Output Enable pin configures the tri-state data output drivers. Independent Write and Read controls provide rate-matching capability.

Master Reset clears all previously programmed configurations by providing a low pulse on $\overline{\text{MRST}}$ pin. In addition, Write and Read pointers to the queue are initialized to zero. Partial Reset will not alter previously programmed configurations but will initialize Write and Read pointers to zero.

In FWFT mode, first data written into the queue appears on output data bus after the specified latency period at the low to high transition of RCLK. Subsequent reads from the queue will require asserting $\overline{\text{REN}}$. This feature is useful when implementing depth expansion functions. In this mode, $\overline{\text{DRDY}}$ and $\overline{\text{QRDY}}$ are used instead of $\overline{\text{FULL}}$ and $\overline{\text{EMPTY}}$ respectively.

In Standard mode, always assert $\overline{\text{REN}}$ for read operation. $\overline{\text{FULL}}$ and $\overline{\text{EMPTY}}$ are used instead of $\overline{\text{DRDY}}$ and $\overline{\text{QRDY}}$ respectively.

$\overline{\text{PRAF}}$, $\overline{\text{PRAE}}$, and $\overline{\text{HALF}}$ are available in either FWFT or Standard mode.

Product Description (Continued)

At any time, data previously read from the queue can be retransmitted by asserting $\overline{RET}$ pin at the low to high transition of RCLK for a retransmit operation. Retransmit initializes the Read pointer to zero. Hence, all re-reads will always start from the physical 0^{th} (Read pointer = zero) location of the queue. Both zero and normal latency timing modes are available for retransmit operation.

These FlexQ™ II devices have low power consumption, hence minimizing system power requirements. In addition, industry standard 64 - pin Plastic TQFP and 64 - pin STQFP are offered to save system board space.

These queues are ideal for applications such as data communication, telecommunication, graphics, multiprocessing, test equipment, network switching, etc.

Figure 3. Device Pin Out

Pin #	Pin Name	Pin Symbol	Input/Output	Description
62	Master Reset	$\overline{MRST}$	Input	Master Reset is required to initialize Write and Read pointers to the first position of the queue by setting $\overline{MRST}$ low. In Standard mode, $\overline{FULL}$ and $\overline{PRAF}$ will go high; $\overline{EMPTY}$ and $\overline{PRAE}$ will go low. In FWFT mode, $\overline{DRDY}$ will go low and $\overline{QRDY}$ will go high. $\overline{PRAF}$ and $\overline{PRAE}$ will go to the same state as Standard mode. In both modes, all data outputs will go low. Previous programmed configurations will not be maintained.
63	Partial Reset	$\overline{PRST}$	Input	Partial Reset is required to initialize Write and Read pointers to the first position of the queue by setting $\overline{PRST}$ low. In Standard mode, $\overline{FULL}$ and $\overline{PRAF}$ will go high; $\overline{EMPTY}$ and $\overline{PRAE}$ will go low. In FWFT mode, $\overline{DRDY}$ will go low and $\overline{QRDY}$ will go high. $\overline{PRAF}$ and $\overline{PRAE}$ will go to the same state as Standard mode. In both modes, all data outputs will go low. Previous programmed configurations will be maintained.
64	Write Clock	WCLK	Input	Writes data into queue during low to high transitions of WCLK if $\overline{WEN}$ is set to low.
1	Write Enable	$\overline{WEN}$	Input	Controls write operation into queue or offset registers during low to high transition of WCLK.
61	Load Enable	$\overline{LOAD}$	Input	During Master Reset, set $\overline{LOAD}$ low to select parallel programming or one of eight default offset values. Set $\overline{LOAD}$ high to select serial programming or one of eight default offset values. After Master Reset, $\overline{LOAD}$ controls write/read, to/from offset registers during low to high transition of WCLK/RCLK respectively. Use in conjunction with $\overline{WEN}$ / $\overline{REN}$.
6,7,8,9, 10,11,12,13, 14,15,16,17, 18,19,20,21, 22,23	Data Inputs	D_{17-0}	Input	18 - bit wide input data bus.
52	Read Clock	RCLK	Input	Reads data from queue during low to high transitions of RCLK if $\overline{REN}$ is set to low.
51	Read Enable	$\overline{REN}$	Input	Controls read operation from queue or offset registers during low to high transition of RCLK.
49	Output Enable	$\overline{OE}$	Input	Setting $\overline{OE}$ low activates the data output drivers. Setting $\overline{OE}$ high deactivates the data output drivers (High-Z).
48,47,45,44, 42,41,40,38, 37,36,35,34, 32,31,29,28, 26,25	Data Outputs	Q_{17-0}	Output	18 - bit wide output data bus.
60	First Word Fall Through/Serial Data Input	FWFT/SDI	Input	Selects FWFT timing or Standard timing mode during Master Reset. After Master Reset, if serial programming is selected ($\overline{LOAD}$ = high), FWFT/SDI is used as the serial data input for the offset registers. Serial data is written during the low to high transition of WCLK. Use in conjunction with $\overline{SDEN}$.

Table 1. Pin Descriptions

Pin #	Pin Name	Pin Symbol	Input/Output	Description
2	Serial Data Input Enable	$\overline{SDEN}$	Input	If serial programming is selected, setting $\overline{SDEN}$ low and $\overline{LOAD}$ low enables serial data input to be written into offset registers during the low to high transition of WCLK.
50	Retransmit	$\overline{RET}$	Input	Data previously read from the queue can be retransmitted by asserting $\overline{RET}$ pin at the low to high transition of RCLK for a retransmit operation. Retransmit initializes the Read pointer to zero. Hence, all re-reads will always start from the physical 0^{th} (Read pointer = zero) location of the queue.
58	Full/Data Input Ready Flag	$\overline{FULL}$ / $\overline{DRDY}$	Output	Queue is full when $\overline{FULL}$ goes low during the low to high transition of WCLK. This prohibits further writes into the queue. In FWFT mode, queue is full when $\overline{DRDY}$ goes high during low to high transition of WCLK. This prohibits further writes into the queue.
53	Empty/Data Output Ready Flag	$\overline{EMPTY}$ / $\overline{QRDY}$	Output	Queue is empty when $\overline{EMPTY}$ goes low during the low to high transition of RCLK. This prohibits further reads from the queue. In FWFT mode, queue is empty when $\overline{QRDY}$ goes high during the low to high transition of RCLK. This prohibits further reads from the queue.
57	Almost Full	$\overline{PRAF}$	Output	Queue is almost full when $\overline{PRAF}$ goes low during the low to high transition of WCLK. Default (Full-offset) or programmed offset values determine the status of $\overline{PRAF}$.
54	Almost Empty	$\overline{PRAE}$	Output	Queue is almost empty when $\overline{PRAE}$ goes low during the low to high transition of RCLK. Default (Empty +offset) or programmed offset values determine the status of $\overline{PRAE}$.
56	Half Full	$\overline{HALF}$	Output	Queue is more than half full when $\overline{HALF}$ goes low. Triggered by both WCLK and RCLK.
3	Don't Care	DC	N/A	This pin can be tied high or low, cannot be left open.
4, 30, 43, 55	Power	Vcc	N/A	3.3V power supply.
5, 24, 27, 33, 39, 46, 57	Ground	GND	N/A	0V Ground.

Pin Functions

$\overline{\text{MRST}}$ — Master Reset is required to initialize Write and Read pointers to the first position of the queue by setting $\overline{\text{MRST}}$ low. In Standard mode, $\overline{\text{FULL}}$ and $\overline{\text{PRAF}}$ will go high; $\overline{\text{EMPTY}}$ and $\overline{\text{PRAE}}$ will go low. In FWFT mode, $\overline{\text{DRDY}}$ will go low and $\overline{\text{QRDY}}$ will go high. $\overline{\text{PRAF}}$ and $\overline{\text{PRAE}}$ will go to the same state as Standard mode. In both modes, all data outputs will go low. Previous programmed configurations will not be maintained.

$\overline{\text{PRST}}$ — Partial Reset is required to initialize Write and Read pointers to the first position of the queue by setting $\overline{\text{PRST}}$ low. In Standard mode, $\overline{\text{FULL}}$ and $\overline{\text{PRAF}}$ will go high; $\overline{\text{EMPTY}}$ and $\overline{\text{PRAE}}$ will go low. In FWFT mode, $\overline{\text{DRDY}}$ will go low and $\overline{\text{QRDY}}$ will go high. $\overline{\text{PRAF}}$ and $\overline{\text{PRAE}}$ will go to the same state as Standard mode. In both modes, all data outputs will go low. Previous programmed configurations will be maintained.

WCLK — Writes data into queue during low to high transitions of WCLK if $\overline{\text{WEN}}$ is activated. Synchronizes $\overline{\text{FULL}}$ / $\overline{\text{DRDY}}$ and $\overline{\text{PRAF}}$ flags. WCLK and RCLK are independent of each other.

$\overline{\text{WEN}}$ — Controls write operation into queue or offset registers during low to high transition of WCLK.

$\overline{\text{LOAD}}$ — During Master Reset, set $\overline{\text{LOAD}}$ low to select parallel programming or one of eight default offset values. Set $\overline{\text{LOAD}}$ high to select serial programming or one of eight default offset values. After Master Reset, $\overline{\text{LOAD}}$ controls write/read, to/from offset registers during low to high transition of WCLK/RCLK respectively for parallel programming. Use in conjunction with $\overline{\text{WEN}}$ / $\overline{\text{REN}}$. During programming of offset registers, $\overline{\text{PRAF}}$ and $\overline{\text{PRAE}}$ flag status is invalid. For Serial programming, $\overline{\text{LOAD}}$ is used to enable serial loading of offset registers together with $\overline{\text{SDEN}}$. Refer to Figure 6 for details.

D_{17-0} — 18 - bit wide input data bus.

RCLK — Reads data from queue during low to high transitions of RCLK if $\overline{\text{REN}}$ is set low. Synchronizes the $\overline{\text{EMPTY}}$ / $\overline{\text{QRDY}}$ and $\overline{\text{PRAE}}$ flags. RCLK and WCLK are independent of each other.

$\overline{\text{REN}}$ — Reads data from queue during low to high transitions of RCLK if $\overline{\text{REN}}$ is set to low. This also advances the Read pointer of the queue.

$\overline{\text{OE}}$ — Setting $\overline{\text{OE}}$ low activates the data output drivers. Setting $\overline{\text{OE}}$ high deactivates the data output drivers (High-Z). $\overline{\text{OE}}$ does not control advancement of Read pointer.

Q_{17-0} — 18 - bit wide output data bus.

FWFT/SDI — Selects FWFT timing or Standard timing mode during Master Reset. After Master Reset, if serial programming is selected ($\overline{\text{LOAD}}$ = high), FWFT/SDI is used as the serial data input for the offset registers. Serial data is written during the low to high transition of WCLK. Use in conjunction with $\overline{\text{SDEN}}$. In FWFT mode, $\overline{\text{DRDY}}$ and $\overline{\text{QRDY}}$ is used instead of $\overline{\text{FULL}}$ and $\overline{\text{EMPTY}}$. Refer to Table 10 for all flags status. In Standard mode, $\overline{\text{FULL}}$ and $\overline{\text{EMPTY}}$ are used instead of $\overline{\text{DRDY}}$ and $\overline{\text{QRDY}}$. Refer to Table 9 for all flags status.

$\overline{\text{SDEN}}$ — If serial programming is selected, setting $\overline{\text{SDEN}}$ and $\overline{\text{LOAD}}$ low enables serial data to be written into offset registers during the low to high transition of WCLK. During serial programming, $\overline{\text{PRAF}}$ and $\overline{\text{PRAE}}$ flags status is invalid. Refer to Figure 6 for details.

$\overline{\text{RET}}$ — Data previously read from the queue can be retransmitted by asserting $\overline{\text{RET}}$ pin at the low to high transition of RCLK for a retransmit operation. Retransmit initializes the Read pointer to zero. Hence, all re-reads will always start from the physical 0^{th} (Read pointer = zero), location of the queue. Refer to Diagram 7 & 8 for details.

Pin Functions (Continued)

$\overline{\text{FULL}}$ / $\overline{\text{DRDY}}$ In Standard mode, queue is full when $\overline{\text{FULL}}$ goes low during the low to high transition of WCLK. This prohibits further writes into the queue and prevents advancement of Write pointer. In FWFT mode, queue is full when $\overline{\text{DRDY}}$ goes high during the low to high transition of WCLK. This prohibits further writes into the queue and prevents advancement of Write pointer. Refer to Table 8 & 9 for behavior of $\overline{\text{FULL}}$ / $\overline{\text{DRDY}}$.

$\overline{\text{EMPTY}}$ / $\overline{\text{QRDY}}$ In Standard mode, queue is empty when $\overline{\text{EMPTY}}$ goes low during the low to high transition of RCLK. This prohibits further reads from the queue and prevents advancement of Read pointer. In FWFT mode, queue is empty when $\overline{\text{QRDY}}$ goes low during the low to high transition of RCLK. This prohibits further reads from the queue and prevents advancement of Read pointer. Refer to Table 8 & 9 for behavior of $\overline{\text{EMPTY}}$ / $\overline{\text{QRDY}}$.

$\overline{\text{PRAF}}$ In Synchronous mode, queue is almost full when $\overline{\text{PRAF}}$ goes low during the low to high transition of WCLK. Default (Full-offset) or programmed offset values determine the status of $\overline{\text{PRAF}}$. In Asynchronous timing mode, $\overline{\text{PRAF}}$ is triggered by both WCLK and RCLK. Refer to Table 8 & 9 for behavior of $\overline{\text{PRAF}}$.

$\overline{\text{PRAE}}$ In Synchronous mode, queue is almost empty when $\overline{\text{PRAE}}$ goes low during the low to high transition of RCLK. Default (Empty+offset) or programmed offset values determine the status of $\overline{\text{PRAE}}$. In Asynchronous timing mode, $\overline{\text{PRAF}}$ is triggered by both WCLK and RCLK. Refer to Table 8 & 9 for behavior of $\overline{\text{PRAE}}$.

$\overline{\text{HALF}}$ Queue is more than half full when $\overline{\text{HALF}}$ goes low during the low to high transition of WCLK. $\overline{\text{HALF}}$ goes high during low to high transition of RCLK when queue is less than half full. Refer to Table 8 & 9 for details.

Parallel Offset Write/Read Cycles for x18 Width

# of Bits for Offset Registers
18 bits for FQV2105 17 bits for FQV295 16 bits for FQV285 15 bits for FQV275 14 bits for FQV265 13 bits for FQV255
Note: Don't Care applies to all unused bits

Figure 7. Parallel Offset Write/Read Cycles Diagram

FQV2105	$\overline{FULL}$	$\overline{PRAF}$	$\overline{HALF}$	$\overline{PRAE}$	$\overline{EMPTY}$
0	H	H	H	L	L
1 to y[1]	H	H	H	L	H
(y+1) to 131,072	H	H	H	H	H
131,073 to [262,144-(x+1)]	H	H	L	H	H
(262,144-x[2]) to 262,143	H	L	L	H	H
262,144	L	L	L	H	H

FQV295	$\overline{FULL}$	$\overline{PRAF}$	$\overline{HALF}$	$\overline{PRAE}$	$\overline{EMPTY}$
0	H	H	H	L	L
1 to y[1]	H	H	H	L	H
(y+1) to 65,536	H	H	H	H	H
65,537 to [131,072-(x+1)]	H	H	L	H	H
(131,072-x[2]) to 131,071	H	L	L	H	H
131,072	L	L	L	H	H

FQV285	$\overline{FULL}$	$\overline{PRAF}$	$\overline{HALF}$	$\overline{PRAE}$	$\overline{EMPTY}$
0	H	H	H	L	L
1 to y[1]	H	H	H	L	H
(y+1) to 32,768	H	H	H	H	H
32,769 to [65,536-(x+1)]	H	H	L	H	H
(65,536-x[2]) to 65,535	H	L	L	H	H
65,536	L	L	L	H	H

FQV275	$\overline{FULL}$	$\overline{PRAF}$	$\overline{HALF}$	$\overline{PRAE}$	$\overline{EMPTY}$
0	H	H	H	L	L
1 to y[1]	H	H	H	L	H
(y+1) to 16,384	H	H	H	H	H
16,385 to [32,768-(x+1)]	H	H	L	H	H
(32,768-x[2]) to 32,767	H	L	L	H	H
32,768	L	L	L	H	H

FQV265	$\overline{FULL}$	$\overline{PRAF}$	$\overline{HALF}$	$\overline{PRAE}$	$\overline{EMPTY}$
0	H	H	H	L	L
1 to y[1]	H	H	H	L	H
(y+1) to 8,192	H	H	H	H	H
8,193 to [16,384-(x+1)]	H	H	L	H	H
(16,384 -x[2]) to 16,383	H	L	L	H	H
16,384	L	L	L	H	H

FQV255	$\overline{FULL}$	$\overline{PRAF}$	$\overline{HALF}$	$\overline{PRAE}$	$\overline{EMPTY}$
0	H	H	H	L	L
1 to y[1]	H	H	H	L	H
(y+1) to 4,096	H	H	H	H	H
4,097 to [8,192-(x+1)]	H	H	L	H	H
(8,192-x[2]) to 8,191	H	L	L	H	H
8,192	L	L	L	H	H

NOTES:
1. y = $\overline{PRAE}$ offset; Default Values: y = 127 when parallel offset loading is selected or y =1,023 when serial offset loading is selected.
2. x = $\overline{PRAF}$ offset; Default Values: x = 127 when parallel offset loading is selected or x =1,023 when serial offset loading is selected.

Table 8. Status Flags (Standard Mode)

FQV2105	$\overline{DRDY}$	$\overline{PRAF}$	$\overline{HALF}$	$\overline{PRAE}$	$\overline{QRDY}$
0	L	H	H	L	H
1 to y[1]+1	L	H	H	L	L
(y+2) to 131,073	L	H	H	H	L
131,074 to [262,145-(x+1)]	L	H	L	H	L
(262,145-x[2]) to 262,144	L	L	L	H	L
262,145	H	L	L	H	L

FQV295	$\overline{DRDY}$	$\overline{PRAF}$	$\overline{HALF}$	$\overline{PRAE}$	$\overline{QRDY}$
0	L	H	H	L	H
1 to y[1]+1	L	H	H	L	L
(y+2) to 65,537	L	H	H	H	L
65,538 to [131,073-(x+1)]	L	H	L	H	L
(131,073-x[2]) to 131,072	L	L	L	H	L
131,073	H	L	L	H	L

0	L	H	H	L	H
1 to y[1]+1	L	H	H	L	L
(y+2) to 32,769	L	H	H	H	L
32,770 to [65,537-(x+1)]	L	H	L	H	L
(65,537-x[2]) to 65,536	L	L	L	H	L
65,537	H	L	L	H	L

FQV275	$\overline{DRDY}$	$\overline{PRAF}$	$\overline{HALF}$	$\overline{PRAE}$	$\overline{QRDY}$
0	L	H	H	L	H
1 to y[1]+1	L	H	H	L	L
(y+2) to 16,385	L	H	H	H	L
16,386 to [32,769-(x+1)]	L	H	L	H	L
(32,769-x[2]) to 32,768	L	L	L	H	L
32,769	H	L	L	H	L

FQV265	$\overline{DRDY}$	$\overline{PRAF}$	$\overline{HALF}$	$\overline{PRAE}$	$\overline{QRDY}$
0	L	H	H	L	H
1 to y[1]+1	L	H	H	L	L
(y+2) to 8,193	L	H	H	H	L
8,194 to [16,385-(x+1)]	L	H	L	H	L
(16,385 -x[2]) to 16,384	L	L	L	H	L
16,385	H	L	L	H	L

FQV255	$\overline{DRDY}$	$\overline{PRAF}$	$\overline{HALF}$	$\overline{PRAE}$	$\overline{QRDY}$
0	L	H	H	L	H
1 to y[1]+1	L	H	H	L	L
(y+2) to 4,097	L	H	H	H	L
4,098 to [8,193-(x+1)]	L	H	L	H	L
(8,193-x[2]) to 8,192	L	L	L	H	L
8,193	H	L	L	H	L

NOTES:
1. y = $\overline{PRAE}$ offset; Default Values: y = 127 when parallel offset loading is selected or y =1,023 when serial offset loading is selected.
2. x = $\overline{PRAF}$ offset; Default Values: x = 127 when parallel offset loading is selected or x =1,023 when serial offset loading is selected.

Table 9. Status Flags (FWFT Mode)

Timing Diagrams

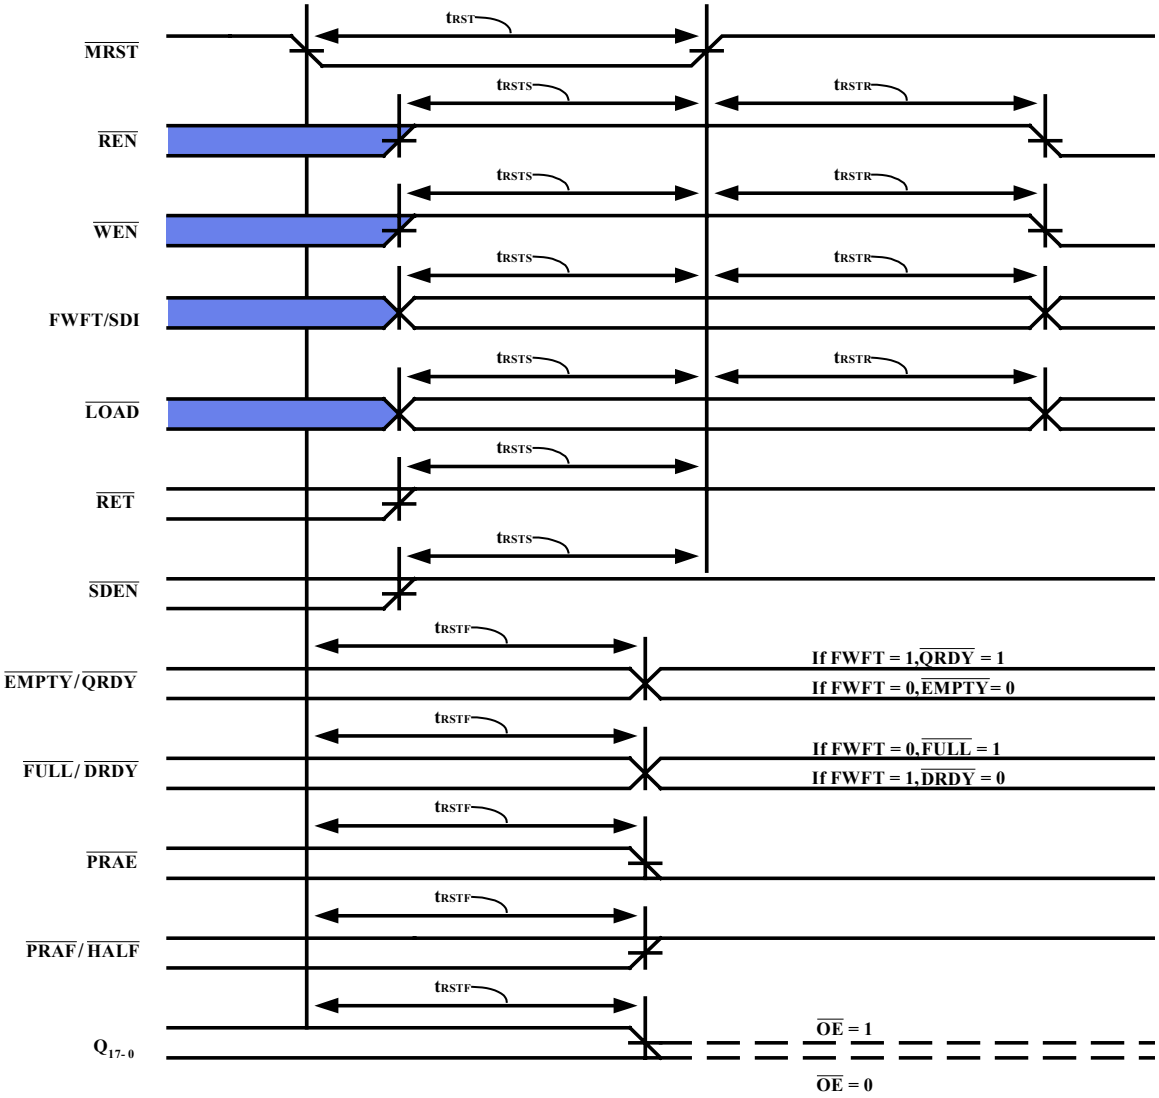

Diagram 1. Master Reset Timing

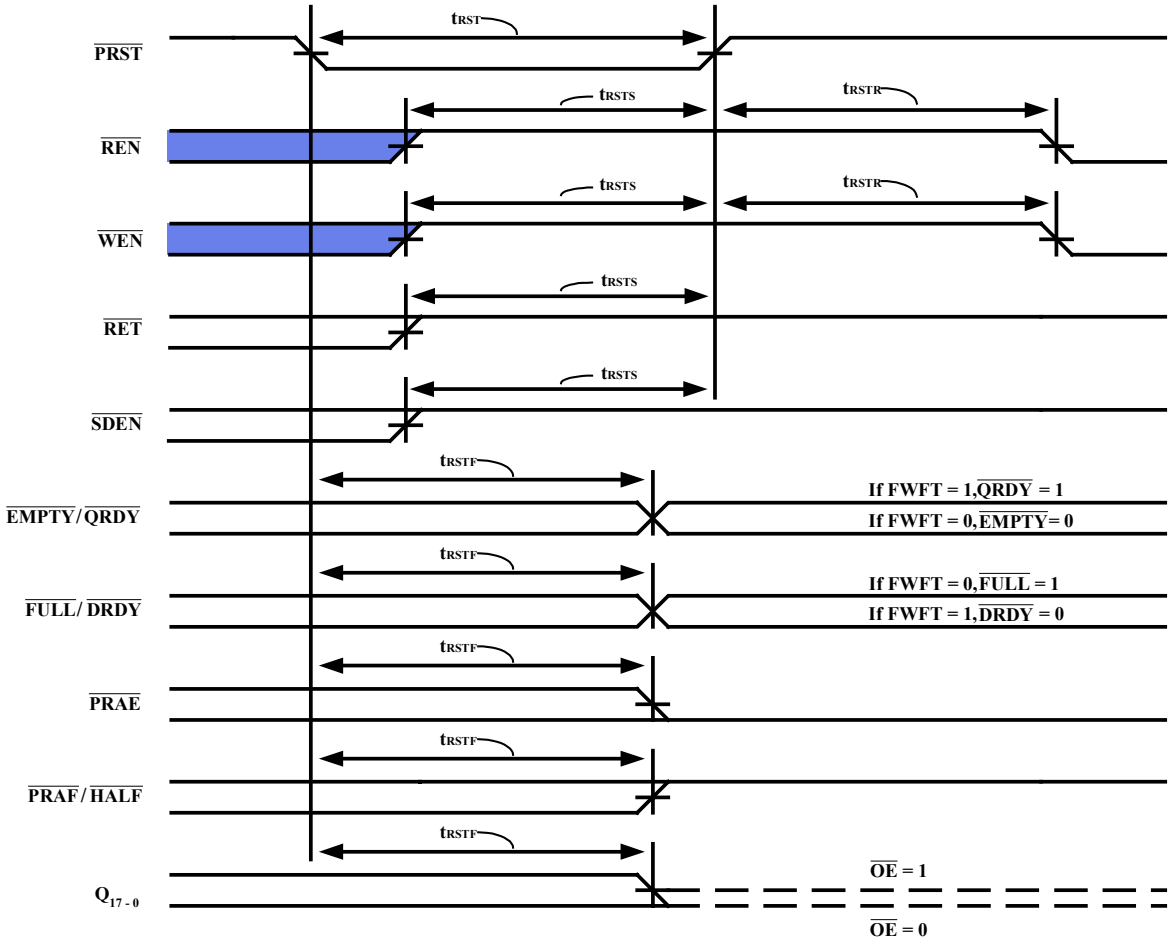

Diagram 2. Partial Reset Timing

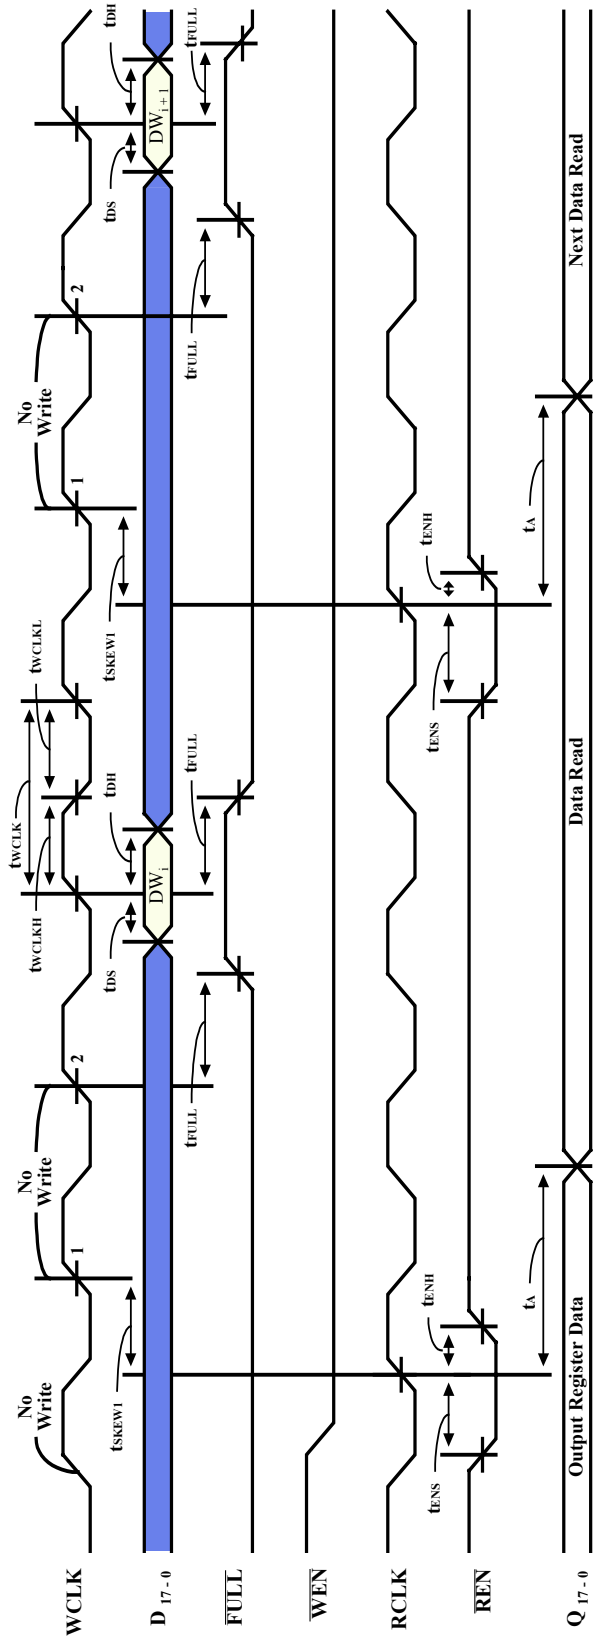

Diagram 3. Write Cycle and Full Flag Timing (Standard Mode)

NOTES:

1. If the time between a rising edge of RCLK to the rising edge of WCLK is greater than or equal to t_{SKEW1}, $\overline{FULL}$ will go high (after one WCLK cycle plus t_{FULL}). If t_{SKEW1} is not met, then $\overline{FULL}$ will assert 1 or more WCLK cycles.
2. $\overline{LOAD}$ = High, $\overline{OE}$ = Low.

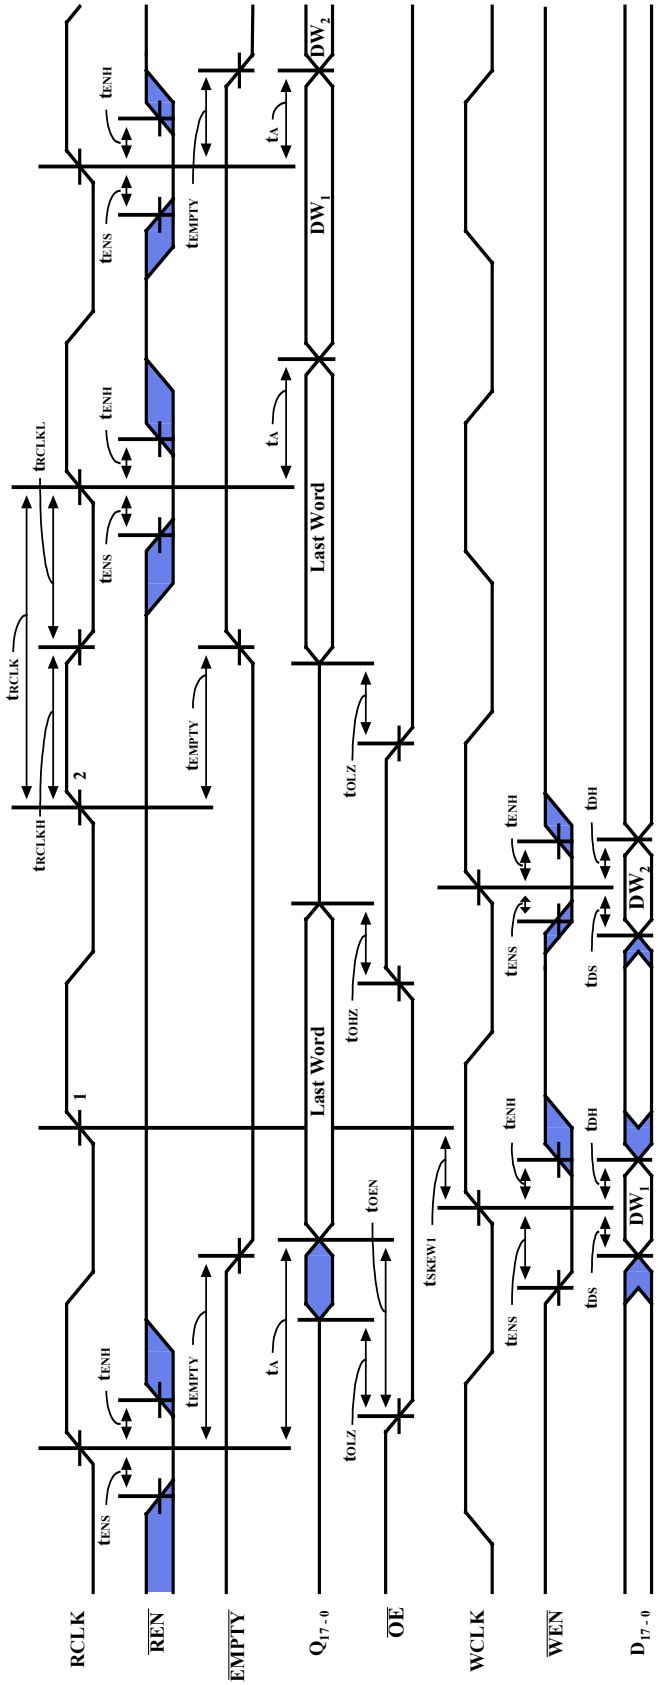

Diagram 4. Read Cycle, Empty Flag and First Data Word Latency Timing (Standard Mode)

NOTES:

1. If the time between a rising edge of WCLK to the rising edge of RCLK is greater than or equal to t_{SKEW11}, $\overline{EMPTY}$ will go high (after RCLK cycle plus t_{EMPTY}). If t_{SKEW1} is not met, then $\overline{EMPTY}$ will assert 1 or more RCLK cycles.
2. $\overline{LOAD}$ = High.
3. First word latency: $t_{SKEW1} + t_{EMPTY} + 1 * t_{RCLK}$.

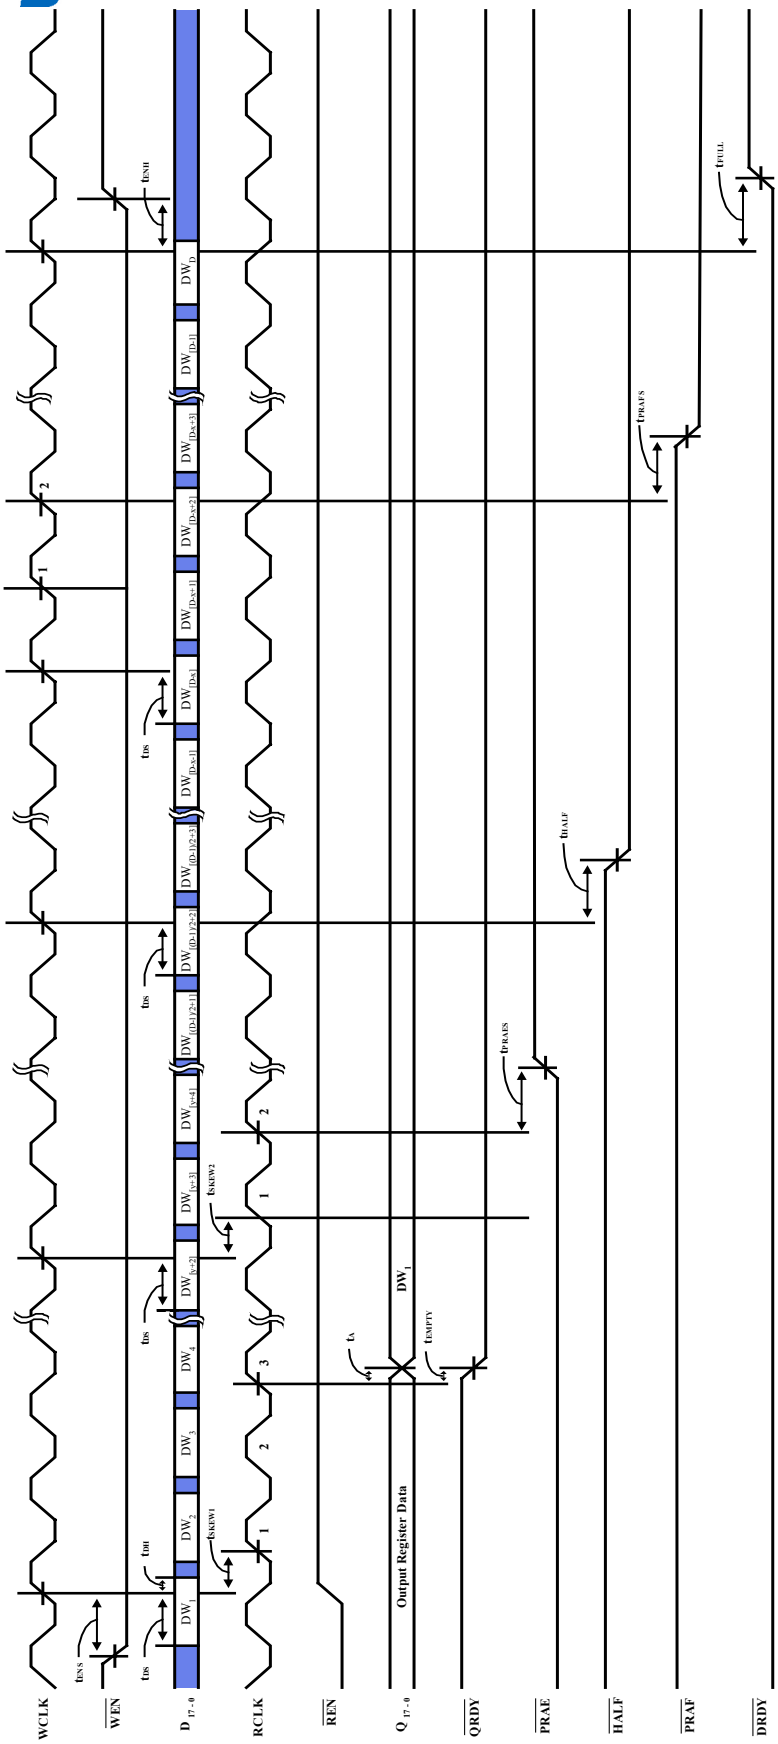

Diagram 5. Write Timing (FWFT Mode)

NOTES:

1. If the time between a rising edge of WCLK to the rising edge of RCLK is greater than or equal to tSKEW1, $\overline{QRDY}$ will go low (after two RCLK cycle plus tEMPTY). If tSKEW1 is not met, then $\overline{QRDY}$ will assert 1 or more RCLK cycles.
2. If the time between a rising edge of WCLK to the rising edge of RCLK is greater than or equal to tSKEW2, $\overline{PRAE}$ will go high (after one RCLK cycle plus tPRAES). If tSKEW2 is not met, then $\overline{PRAE}$ will assert 1 or more RCLK cycles.
3. $\overline{LOAD}$ = High, $\overline{OE}$ = Low.
4. y = $\overline{PRAE}$ offset, x = $\overline{PRAF}$ offset.
5. D = maximum queue depth. Please refer to Table 7 for Depth.
6. First word latency: tSKEW1 + tEMPTY + 2 * tRCLK

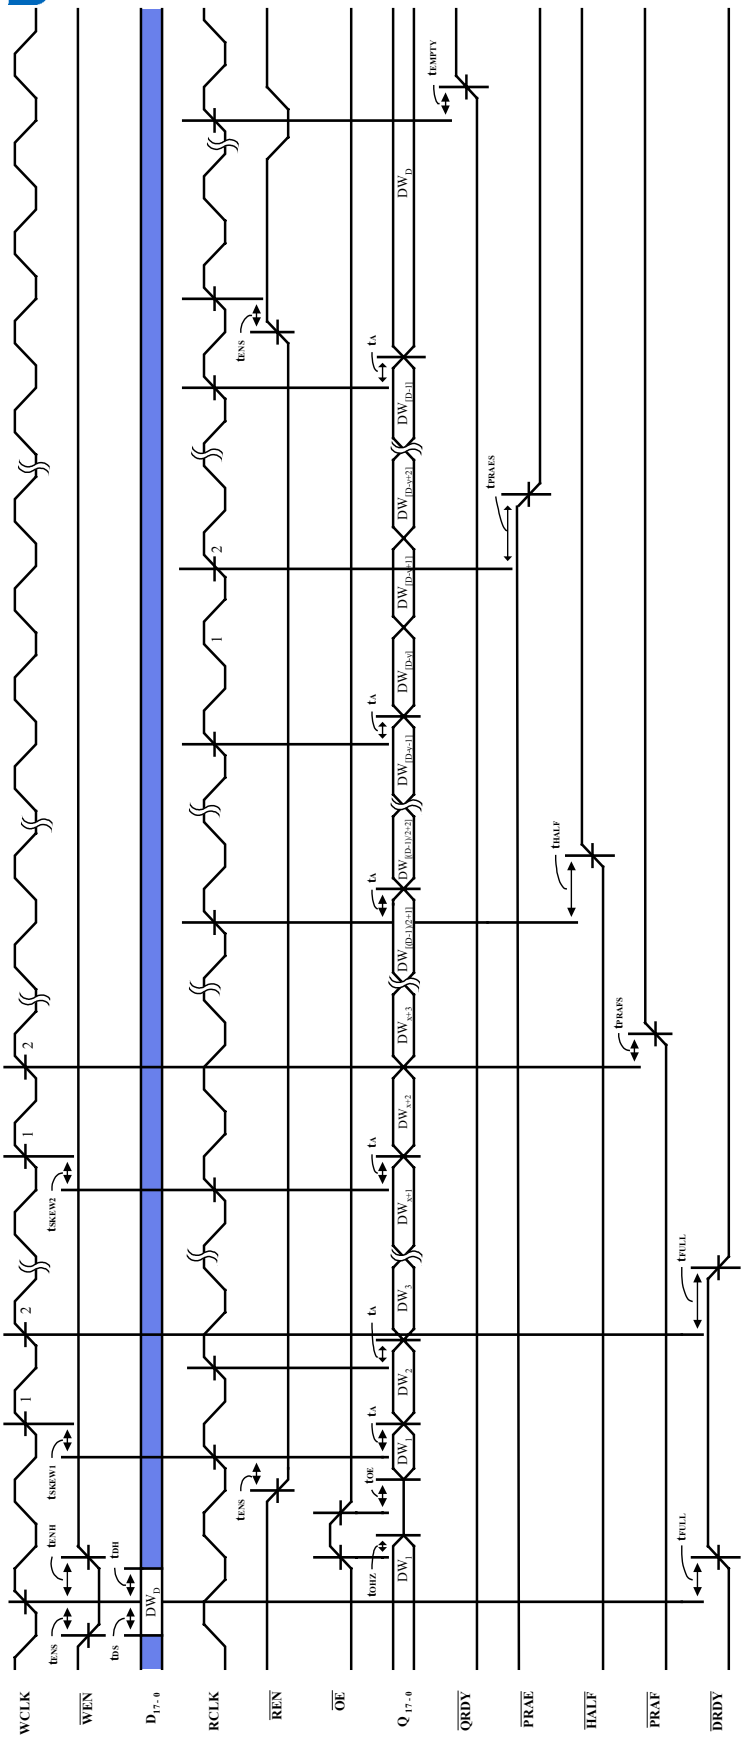

Diagram 6. Read Timing (FWFT Mode)

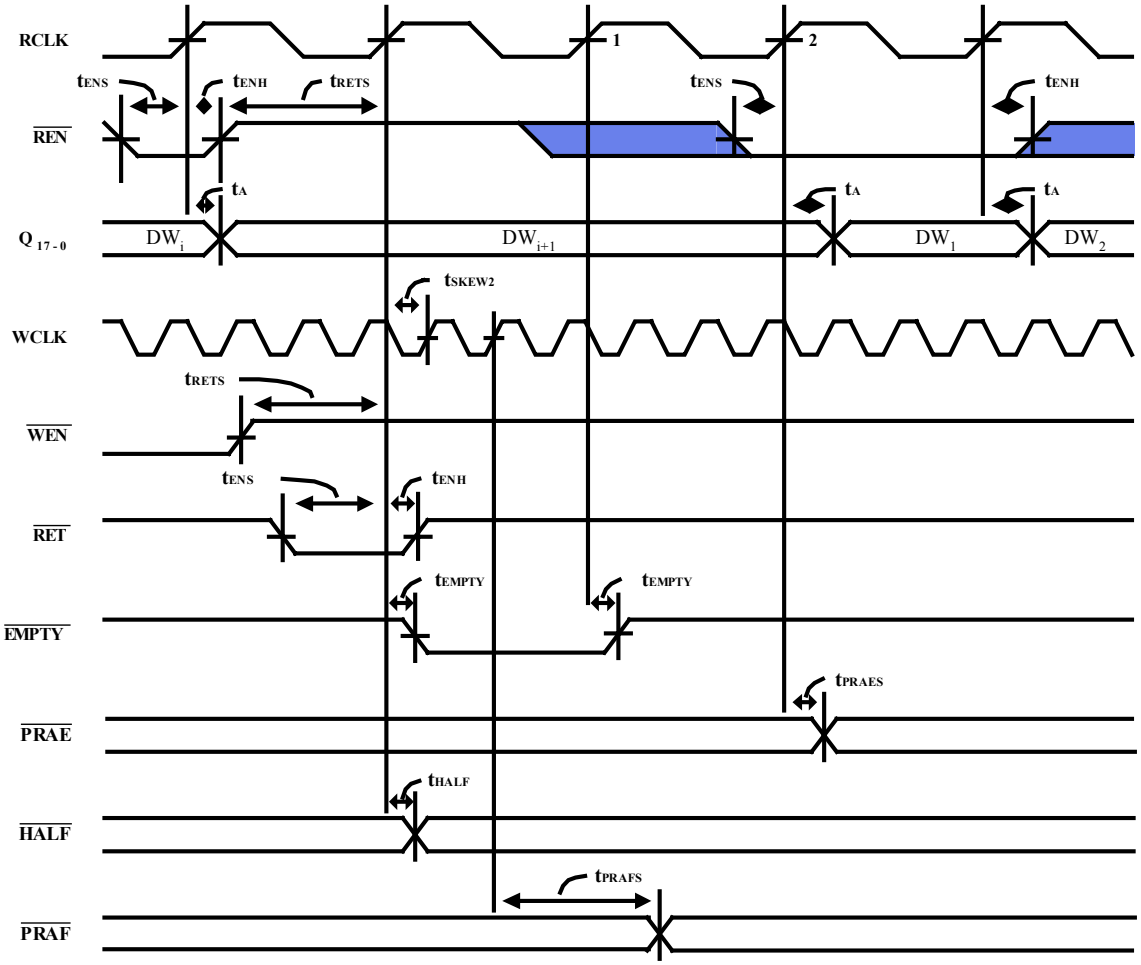
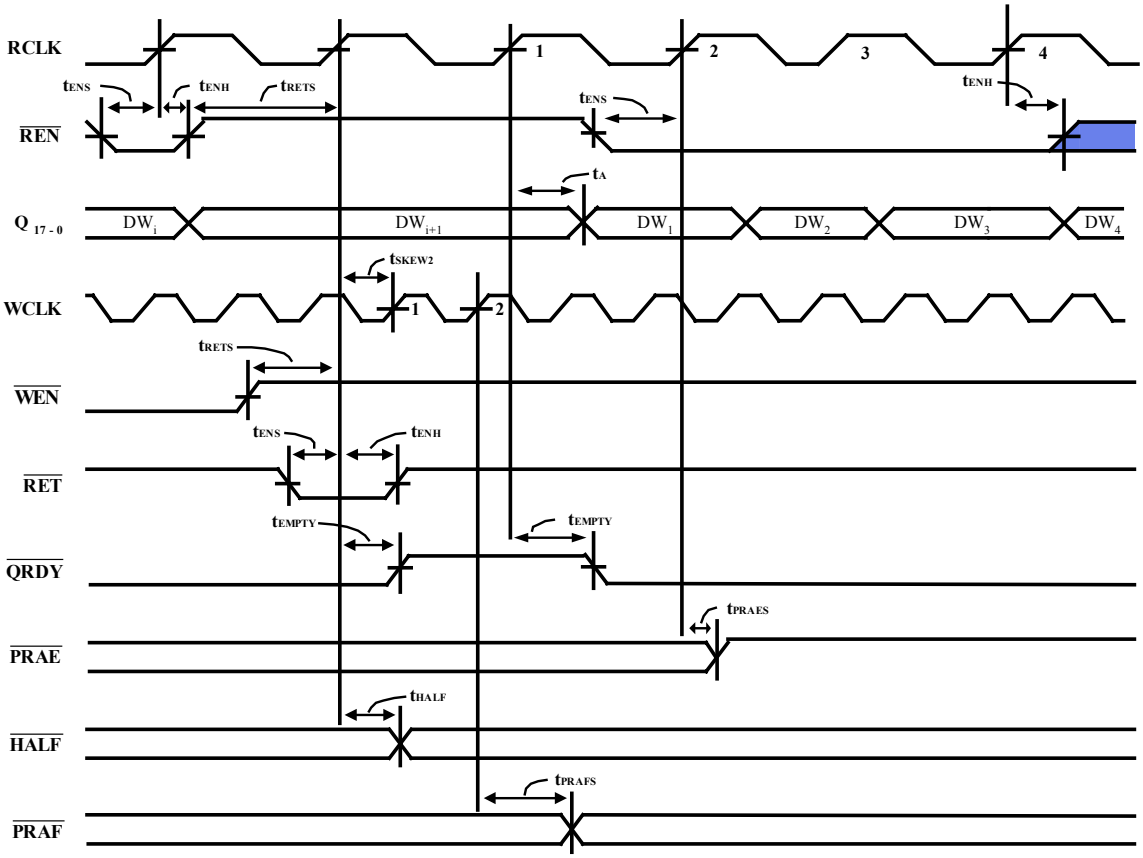
NOTES:

1. If the time between a rising edge of RCLK to the rising edge of WCLK is greater than or equal to tSKEW1, $\overline{DRDY}$ will go low (after one WCLK cycle plus tFULL) . If tSKEW1 is not met, then $\overline{DRDY}$ will assert 1 or more WCLK cycles.
2. If the time between a rising edge of RCLK to the rising edge of WCLK is greater than or equal to tSKEW2, $\overline{PRAF}$ will go high (after one WCLK cycle plus tPRAFS) If tSKEW2 is not met, then $\overline{PRAF}$ will assert 1 or more WCLK cycles.
3. $\overline{LOAD}$ = High
4. y = $\overline{PRAE}$ Offset, x = $\overline{PRAF}$ offset.
5. D = maximum queue depth. Please refer to Table 7 for Depth.



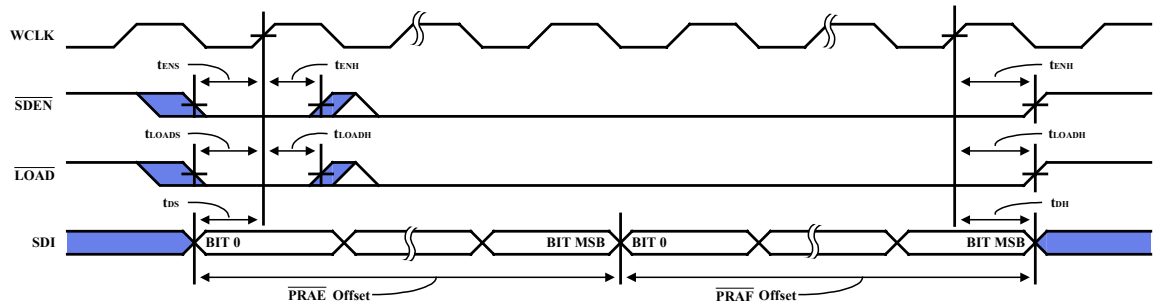
NOTES:
1. Upon completion of retransmit setup, a read operation can begin only after $\overline{\text{EMPTY}}$ returns high.
2. $\overline{\text{OE}}$ = Low.
3. DW_i = Words written to the queue after $\overline{\text{MRST}}$. Where i = 1,2,3… depth.
4. Upon reset completion, there must be more than 2 words written to the queue for a retransmit setup to be valid.

Diagram 7. Retransmit Timing (Standard Mode)



NOTES:
1. Upon completion of retransmit setup, a read operation can begin only after $\overline{QRDY}$ returns low.
2. $\overline{OE}$ = Low.
3. DW_i = Words written to the queue after $\overline{MRST}$. Where i = 1,2,3… depth.
4. Upon reset completion, there must be more than 2 words written to the queue for a retransmit setup to be valid.
5. Please refer to Table 7 for Depth.

Diagram 8. Retransmit Timing (FWFT Mode)



* Refer to Table 10.

Diagram 9. Serial Loading of Programmable Flag Registers (Standard and FWFT Mode)

	FQV2105	FQV295	FQV285	FQV275	FQV265	FQV255
MSB	17	16	15	14	13	12

Table 10. Reference Table for Diagram 9

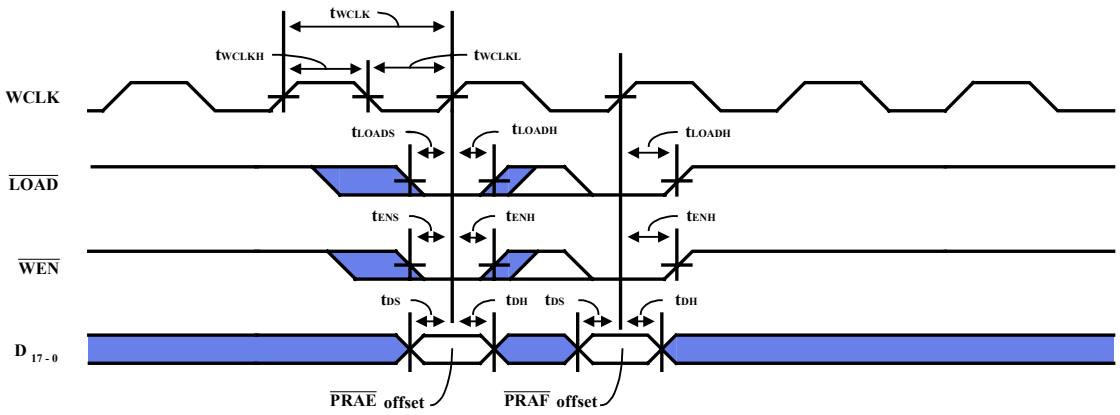


Diagram 10. Parallel Loading of Programmable Flag Registers (Standard and FWFT Mode)

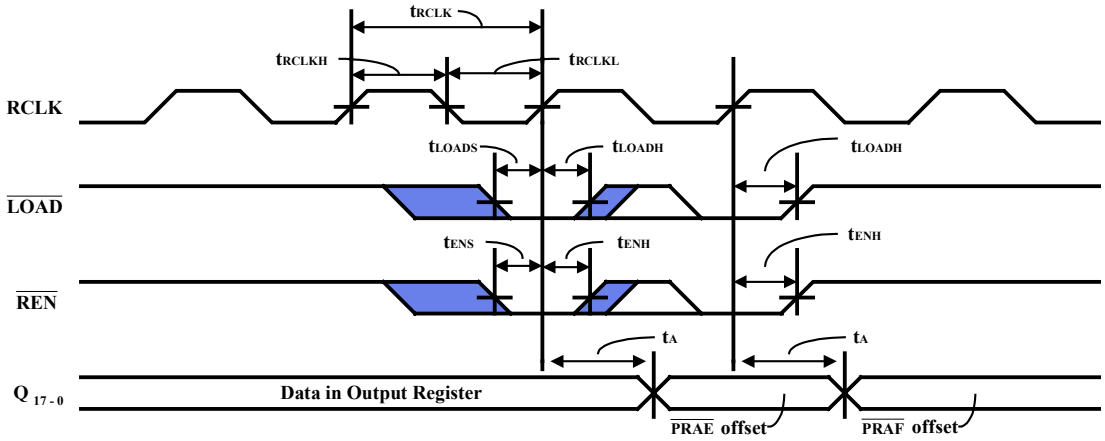

Diagram 11. Parallel Read of Programmable Flag Registers (Standard and FWFT Mode)

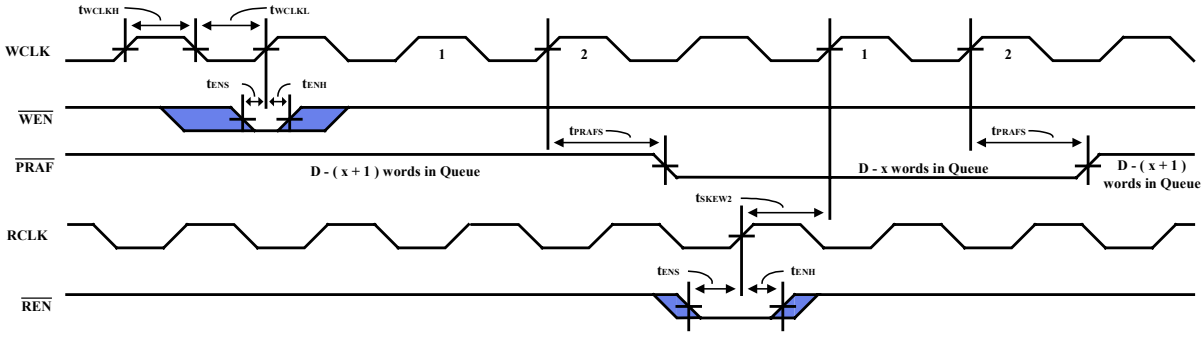
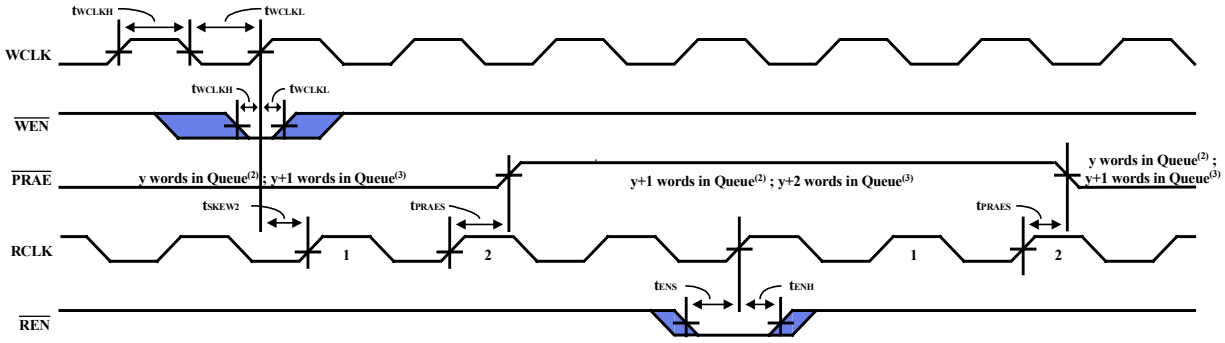


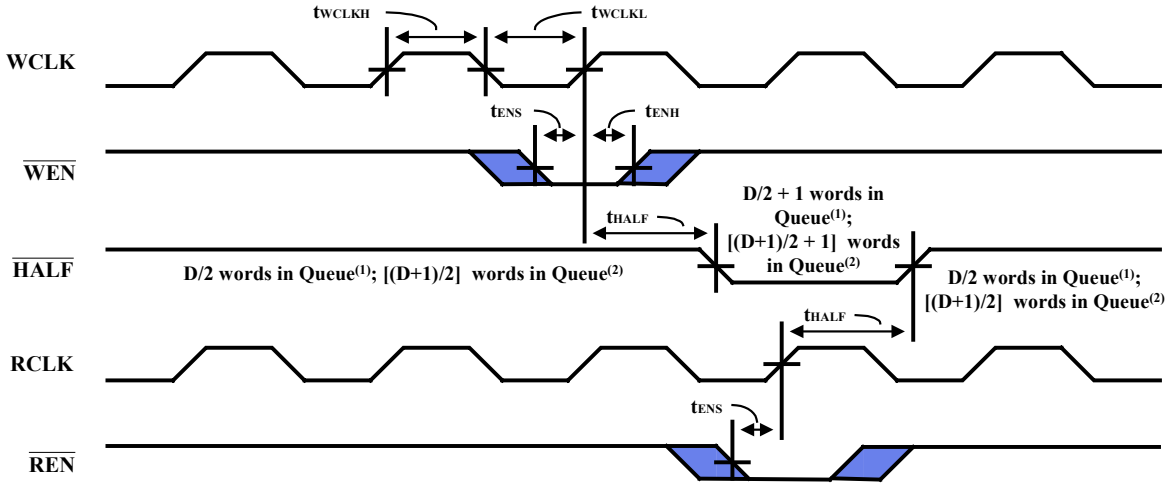
NOTES:
1. x = $\overline{\text{PRAF}}$ offset.
2. D = maximum queue depth. Please refer to Table 7 for Depth.
3. If the time between a rising edge of RCLK to the rising edge of WCLK is greater than or equal to tSKEW2, $\overline{\text{PRAF}}$ will go high (after on WCLK cycle plus tPRAFS). If tSKEW2 is not met, then $\overline{\text{PRAF}}$ will assert 1 or more WCLK cycles.
4. $\overline{\text{PRAF}}$ synchronizes to the rising edge of WCLK only.

Diagram 12. Programmable Almost-Full Flag Timing (Standard and FWFT Mode)



NOTES:
1. y = $\overline{\text{PRAE}}$ offset.
2. For Standard Mode.
3. For FWFT Mode.
4. If the time between a rising edge of WCLK to the rising edge of RCLK is greater than or equal to tSKEW2, $\overline{\text{PRAE}}$ will go high (after one RCLK cycle plus tPRAES). If tSKEW2 is not met, then $\overline{\text{PRAE}}$ will assert 1 or more RCLK cycles.
5. $\overline{\text{PRAE}}$ synchronizes to the rising edge of RCLK only.

Diagram 13. Programmable Almost-Empty Flag Timing (Standard and FWFT Mode)



NOTES:
1. For Standard Mode.
2. For FWFT Mode.
3. Please refer to Table 7 for Depth.

Diagram 14. Half-Full Flag Timing (Standard and FWFT Mode)

Order Information:

HBA Device Family	Device Type	Power	Speed (ns) *	Package**	Temperature Range
XX	XXXX	X	XX	XX	X
FQ	**V2105** (262,144 x 18)	Low	**7-5** – 133 MHz	**PF**	Blank – Commercial (0°C to 70°C)
	V295 (131,072 x 18)		**10** – 100 MHz	**TF**	**I** – Industrial (-40° to 85°C)
	V285 (65,536 x 18)		**15** – 66 MHz		
	V275 (32,768 x 18		**20** – 50 MHz		
	V265 (16,384 x 18)				
	V255 (8,192 x 18)				

***Speed –** Slower speeds available upon request.
****Package** – 64 pin Plastic Thin Quad Flat Pack (TQFP), 64 pin Slim Thin Quad Flat Pack (STQFP)

Example:

FQV275L7-5PF (32k x 18, 7.5ns, Commercial temp)
FQV265L10PFI (16k x 18, 10ns, Industrial temp)
