Description

The Fairchild Switch FSAL200 is a rail-to-rail quad 2:1 high-speed CMOS TTL-compatible analog multiplexer / de-multiplexer switch. The low on resistance of the switch allows inputs to be connected to outputs without adding propagation delay or generating additional ground bounce noise.

When OE is low, the select pin connects the A Port to the selected B Port output. When OE is high, the switch is open and a high-impedance state exists between the two ports.

Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

Notes:

3. Measured by the voltage drop between the A and B pins at the indicated current through the switch. On resistance is determined by the lower of the voltages on the two (A or B ports).
4. $\Delta R_{ON} = R_{ON}$ maximum – R_{ON} minimum measured at identical V_{CC}, temperature, and voltage levels.
5. Flatness is defined as the difference between the maximum and minimum value of on resistance over the specified range of conditions.
