

300mA High PSRR, Low Noise, LDO Regulators

Features

- Low, 90 μ A No-Load Supply Current
- Guaranteed 300mA Output Current
- Dropout Voltage is 200mV @ 150mA Load
- PSRR=65dB @ 120Hz; 55dB @ 1kHz
- Over-Temperature Protection and Short-Circuit Protection
- Fixed Mode: 1.20V~5.00V (G916-XXX)
- Adjustable Mode: from 1.25V to 5.50V (G916)
- Max. Supply Current in Shutdown Mode < 1 μ A
- Low Output Noise at 28 μ V_{RMS} with bypass Capacitor
- Stable with low cost ceramic capacitors

Applications

- Notebook Computers
- Cellular Phones
- PDAs
- Digital still Camera and Video Recorders
- Hand-Held Devices
- Audio Codec

General Description

The G916 series is a low supply current, high PSRR, low noise, and low dropout linear regulator that comes in a space saving TSOT-23-5, SOT-23-5 package. The supply current at no-load is 90 μ A. In the shutdown mode, the maximum supply current is less than 1 μ A. Operating voltage range is from 2.5V to 6.0V. The over-current protection limit is set at 550mA typical. An over-temperature protection circuit is built-in in the Device to prevent thermal overload. These power saving features make the G916 series ideal for use in the battery-powered applications such as notebook computers, cellular phones, and PDA's.

The G916 has two modes of operation. When the SET pin is connected to ground, its output is a pre-set value: 3.3V. There is no external component needed. When an output other than the preset value is needed, two external resistors should be used as a voltage divider. The output voltage is then adjusted by the resistor ratio. G916-XXX is with fixed-mode output. The output voltage range is from 1.2V to 5.0V.

Pin Description

PIN		NAME	FUNCTION
G916	G916-XXX		
1	1	IN	Regulator Input. Supply voltage can range from +2.5V to +6.0V. Bypass with 1 μ F to GND.
2	2	GND	Ground. This pin also functions as a heatsink. Solder to large pads or the circuit board ground plane to maximize thermal dissipation.
3	3	$\overline{\text{SHDN}}$	Active-Low Shutdown Input. A logic low reduces the supply current to less than 1 μ A. Connect to IN for normal operation.
4		SET	Feedback Input for Setting the Output Voltage. Connect to GND to set the output voltage to the preset output voltage. Connect to an external resistor divider for adjustable-output operation.
	4	BYP	This is a reference bypass pin. It should connect external 10nF capacitor to GND to reduce output noise. Bypass capacitor must be no less than 1nF. ($C_{\text{BYP}} \geq 1\text{nF}$)
5	5	OUT	Regulator Output. Sources up to 300mA. Bypass with a 1 μ F, <0.2 Ω typical ESR capacitor to GND.

Detailed Description

The block diagram of the G916 is shown in Figure 1. It consists of an error amplifier, 1.25V bandgap reference, PMOS output transistor, internal feedback voltage divider, mode comparator, shutdown logic, over current protection circuit, and over temperature protection circuit.

The mode comparator compares the SET pin voltage with an internal 350mV reference. If the SET pin voltage is less than 350mV, the internal feedback voltage divider's central tap is connected to the non-inverting input of the error amplifier. The error amplifier compares non-inverting input with the 1.25V bandgap reference. If the feedback voltage is higher than 1.25V, the error amplifier's output becomes higher so that the PMOS output transistor has a smaller gate-to-source voltage (V_{GS}). This reduces the current carrying capability of the PMOS output transistor, as a result the output voltage decreases until the feedback voltage is equal to 1.25V. Similarly, when the feedback voltage is less than 1.25V, the error amplifier causes the output PMOS to source more current to pull the feedback voltage up to 1.25V. Thus, through this feedback action, the error amplifier, output PMOS, and the voltage dividers effectively form a unity-gain amplifier with the

feedback voltage force to be the same as the 1.25V bandgap reference. The output voltage, V_{OUT} , is then given by the following equation:

$$V_{\text{OUT}} = 1.25 (1 + R1/R2). \quad (1)$$

Alternatively, the relationship between R1 and R2 is given by:

$$R1 = R2 (V_{\text{OUT}} / 1.25 - 1). \quad (2)$$

For the reasons of reducing power dissipation and loop stability, R2 is chosen to be 100K Ω . For G916, R1 is 164K, and the pre-set V_{OUT} is 3.30V.

When external voltage divider is used, as shown in Figure 2, the SET pin voltage will be larger than 350mV. The non-inverting input of the amplifier will be connected to the external voltage divider. However, the operation of the feedback loop is the same, so that the conditions of Equations 1 and 2 are still true. The output voltage is still given by Equation 1.

For G916-XXX, adjust the internal reference and internal voltage divider. It provides a fixed mode output ranging from 1.2V to 5V.

Figure 1. Functional Diagram of Adjustable-mode & Fixed mode

Figure 2. Adjustable Output Using External Feedback Resistors

Over Current Protection

The G916 uses a current sense-resistor to monitor the output current. A portion of the PMOS output transistor's current is mirrored to a resistor such that the voltage across this resistor is proportional to the output current. Once the output current exceeds limit threshold, G916 would be protected with a limited output current. Further more, when the output is short to ground, the output current would be folded-back to a less limit.

Over Temperature Protection

To prevent abnormal temperature from occurring, the G916 has a built-in temperature monitoring circuit. When it detects the temperature is above 145°C, the output transistor is turned off. When the IC is cooled down to below 120°C, the output is turned on again. In this way, the G916 will be protected against abnormal junction temperature during operation.

Shutdown Mode

When the $\overline{\text{SHDN}}$ pin is connected a logic low voltage, the G916 enters shutdown mode. All the analog circuits are turned off completely, which reduces the current consumption to only the leakage current. The G916 output pass transistor would get into high impedance level. There is an internal discharge path to help to shorten discharge delay time.

Operating Region and Power Dissipation

Since the G916 is a linear regulator, its power dissipation is always given by $P = I_{\text{OUT}} (V_{\text{IN}} - V_{\text{OUT}})$. The maximum power dissipation is given by:

$$P_{\text{D(MAX)}} = (T_{\text{J}} - T_{\text{A}}) / \theta_{\text{JA}} = (150^{\circ}\text{C} - 25^{\circ}\text{C}) / 240^{\circ}\text{C/W} = 520\text{mW}$$

Where $(T_{\text{J}} - T_{\text{A}})$ is the temperature difference the G916 die and the ambient air, θ_{JA} is the thermal resistance of the chosen package to the ambient air. For surface

mount device, heat sinking is accomplished by using the heat spreading capabilities of the PC board and its copper traces. In the case of a SOT-23-5 package, the thermal resistance is typically 240°C/Watt. (See Recommended Minimum Footprint). Refer to Figure 3a & 3b is the G916 valid operating region (Safe Operating Area) & refer to Figure 4 is maximum power dissipation of SOT-23-5.

The die attachment area of the G916's lead frame is connected to pin 2, which is the GND pin. Therefore, the GND pin of G916 can carry away the heat of the G916 die very effectively. To improve the maximum power providing capability, connect the GND pin to ground using a large ground plane near the GND pin.

Applications Information

Capacitor Selection and Regulator Stability

Normally, use a 1μF capacitor on the input and a 1μF capacitor on the output of the G916. Larger input capacitor values and lower ESR provide better supply-noise rejection and transient response. A higher-value input capacitor (10μF) may be necessary if large, fast transients are anticipated and the device is located several inches from the power source.

Power-Supply Rejection and Operation from Sources Other than Batteries

The G916 is designed to deliver low dropout voltages and low quiescent currents in battery powered systems. Power-supply rejection is 65dB at low frequencies. As the frequency increases above 20kHz, the output capacitor is the major contributor to the rejection of power-supply noise.

When operating from sources other than batteries, improve supply-noise rejection and transient response by increasing the values of the input and output capacitors, and using passive filtering techniques.

Load Transient Considerations

The G916 load-transient response graphs show two components of the output response: a DC shift of the output voltage due to the different load currents, and the transient response. Typical overshoot for step changes in the load current from 10mA to 300mA is 8mV. Increasing the output capacitor's value and decreasing its ESR attenuates transient spikes.

Input-Output (Dropout) Voltage

A regulator's minimum input-output voltage differential (or dropout voltage) determines the lowest usable supply voltage. In battery-powered systems, this will determine the useful end-of-life battery voltage. Because the G916 use a P-channel MOSFET pass transistor, their dropout voltage is a function of $R_{\text{DS(ON)}}$ multiplied by the load current.

Layout Guide

An input capacitance of $\cong 1\mu\text{F}$ is required between the G916 input pin and ground (the amount of the capacitance may be increased without limit). This capacitor must be located a distance of not more than 1cm from the input and return to a clean analog ground.

Input capacitor can filter out the input voltage spike caused by the surge current due to the inductive effect of the package pin and the printed circuit board's routing wire. Otherwise, the actual voltage at the IN pin may exceed the absolute maximum rating.

The output capacitor also must be located a distance of not more than 1cm from output to a clean analog ground. Because it can filter out the output spike caused by the surge current due to the inductive effect of the package pin and the printed circuit board's routing wire. Figure 5 is adjustable mode of G916 PCB layout.

SOT-23-5 Package

Note:

1. Package body sizes exclude mold flash protrusions or gate burrs
2. Tolerance ± 0.1000 mm (4mil) unless otherwise specified
3. Coplanarity: 0.1000mm
4. Dimension L is measured in gage plane
