# 64K x 32 2M Synchronous Burst SRAM

150Mhz - 66Mhz  
9ns - 18ns  
3.3V VDD  
3.3V & 2.5V I/O

## Features

- $\overline{FT}$  pin for user configurable flow through or pipelined operation.
- Dual Cycle Deselect (DCD) Operation.
- 3.3V +10%/-5% Core power supply
- 2.5V or 3.3V I/O supply.
- $\overline{LBO}$  pin for linear or interleaved burst mode.
- Internal input resistors on mode pins allow floating mode pins.
- Default to Interleaved Pipelined Mode.
- Byte write ( $\overline{BW}$ ) and/or global write ( $\overline{GW}$ ) operation.
- Common data inputs and data outputs.
- Clock Control, registered, address, data, and control.
- Internal Self-Timed Write cycle.
- Automatic power-down for portable applications.
- JEDEC standard 100-lead TQFP or QFP package.

## Functional Description

### Applications

The GS820E32 is a 2,097,152 bit high performance synchronous SRAM with a 2 bit burst address counter. Although of a type originally developed for Level 2 Cache applications supporting high performance CPU's, the device now finds application in synchronous SRAM applications ranging from DSP main store to networking chip set support.

### Controls

Addresses, data I/O's, chip enables ( $\overline{E}_1, E_2, \overline{E}_3$ ), address burst control inputs ( $\overline{ADSP}, \overline{ADSC}, \overline{ADV}$ ) and write control inputs ( $\overline{Bx}, \overline{BW}, \overline{GW}$ ) are synchronous and are controlled by a positive edge triggered clock input (CK). Output enable ( $\overline{G}$ ) and power down control (ZZ) are asynchronous inputs. Burst cycles can be initiated with either  $\overline{ADSP}$  or  $\overline{ADSC}$  inputs. In Burst mode, subsequent burst addresses are generated internally and are controlled by  $\overline{ADV}$ . The burst address counter may be configured to count in either linear or interleave order with the Linear Burst Order ( $\overline{LBO}$ ) input. The Burst function need not be used. New addresses can be loaded on every cycle with no degradation of chip performance.

## Flow Through / Pipeline Reads

The function of the Data Output register can be controlled by the user via the  $\overline{FT}$  mode pin/bump (Pin 14 in the TQFP, bump 1F in the FP-BGA). Holding the  $\overline{FT}$  mode pin/bump low, places the RAM in Flow through mode, causing output data to bypass the Data Output Register. Holding  $\overline{FT}$  high places the RAM in Pipelined Mode, activating the rising edge triggered Data Output Register.

## DCD Pipelined Reads

The GS820E32 is a DCD (Dual Cycle Deselect) pipelined synchronous SRAM. SCD (Single Cycle Deselect) versions are also available. DCD SRAMs pipeline disable commands to the same degree as read commands. DCD RAMs hold the deselect command for one full cycle and then begin turning off their outputs just after the second rising edge of clock.

## Byte Write and Global Write

Byte write operation is performed by using byte write enable ( $\overline{BW}$ ) input combined with one or more individual byte write signals ( $\overline{Bx}$ ). In addition, Global Write ( $\overline{GW}$ ) is available for writing all bytes at one time, regardless of the Byte Write control inputs.

## Sleep Mode

Low power (Sleep mode) is attained through the assertion (High) of the ZZ signal, or by stopping the clock (CK). Memory data is retained during Sleep mode.

## Core and Interface Voltages

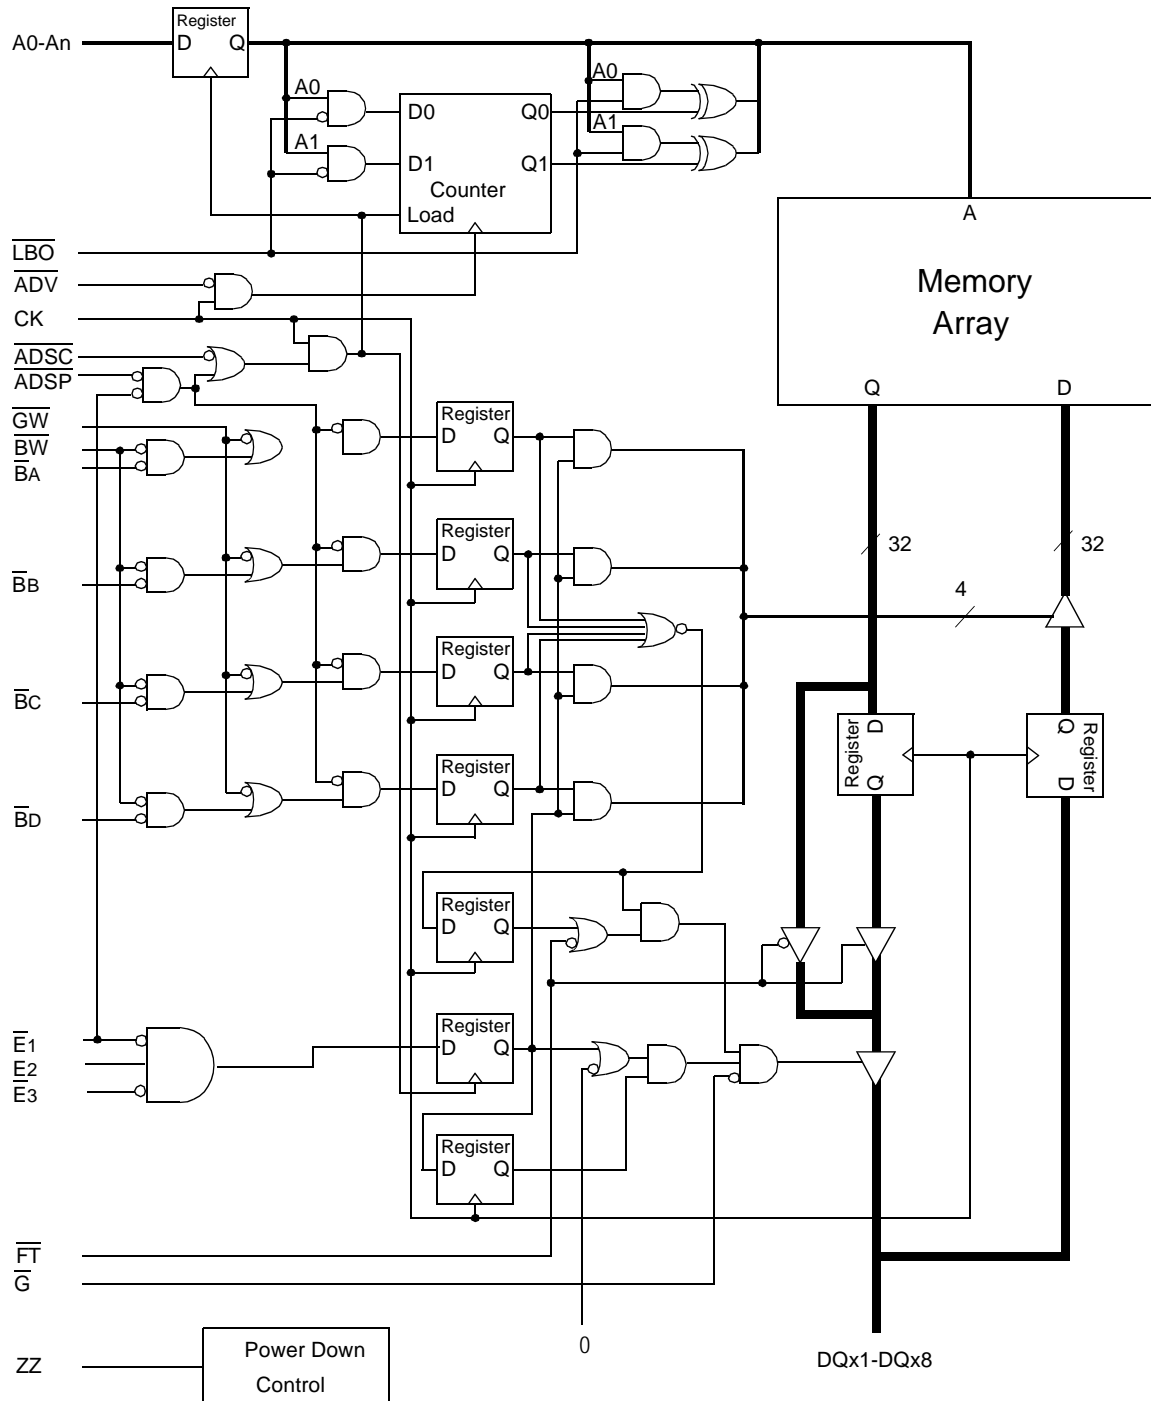

The GS820E32 operates on a 3.3V power supply and all inputs/outputs are 3.3V and 2.5V compatible. Separate output power (V<sub>DDO</sub>) pins are used to de-couple output noise from the internal circuit.

**GS820E32 100 Pin TQFP and QFP Pinout**

**TQFP Pin Description**

Pin Location	Symbol	Type	Description
37, 36	A <sub>0</sub> , A <sub>1</sub>	I	Address field LSB's and Address Counter preset Inputs
35, 34, 33, 32, 100, 99, 82, 81, 44, 45, 46, 47, 48, 49	A <sub>2-15</sub>	I	Address Inputs
52, 53, 56, 57, 58, 59, 62, 63 68, 69, 72, 73, 74, 75, 78, 79 2, 3, 6, 7, 8, 9, 12, 13 18, 19, 22, 23, 24, 25, 28, 29	DQ <sub>A1-DQ<sub>A8</sub></sub> DQ <sub>B1-DQ<sub>B8</sub></sub> DQ <sub>C1-DQ<sub>C8</sub></sub> DQ <sub>D1-DQ<sub>D8</sub></sub>	I/O	Data Input and Output pins.
16, 38, 39, 42, 43, 66, 50, 51, 80, 1, 30	NC		No Connect
87	$\overline{BW}$	I	Byte Write. Writes all enabled bytes. Active Low.
93, 94	$\overline{B_A}$ , $\overline{B_B}$	I	Byte Write Enable for DQ <sub>A</sub> , DQ <sub>B</sub> Data I/O's. Active Low.
95, 96	$\overline{B_C}$ , $\overline{B_D}$	I	Byte Write Enable for DQ <sub>C</sub> , DQ <sub>D</sub> Data I/O's. Active Low.
89	CK	I	Clock Input Signal. Active High.
88	$\overline{GW}$	I	Global Write Enable. Writes all bytes. Active Low.
98, 92	$\overline{E_1}$ , $\overline{E_3}$	I	Chip Enable. Active Low.
97	E <sub>2</sub>	I	Chip Enable. Active High.
86	$\overline{G}$	I	Output Enable. Active Low.
83	$\overline{ADV}$	I	Burst address counter advance enable. Active Low.
84, 85	$\overline{ADSP}$ , $\overline{ADSC}$	I	Address Strobe (Processor, Cache Controller). Active Low.
64	ZZ	I	Sleep Mode control. Active High.
14	$\overline{FT}$	I	Flow Through or Pipeline mode. Active Low.
31	LBO	I	Linear Burst Order mode. Active Low.

## Mode Pin Functions

Mode Name	Pin Name	State	Function
Burst Order Control	$\overline{\text{LBO}}$	L	Linear Burst
		H or NC	Interleaved Burst
Output Register Control	$\overline{\text{FT}}$	L	Flow Through
		H or NC	Pipeline
Power Down Control	ZZ	L or NC	Active
		H	Standby, $I_{DD} = I_{SB}$

Note:

There are pull up devices on  $\overline{\text{LBO}}$  and  $\overline{\text{FT}}$  pins and a pull down device on and ZZ pin, so those input pins can be unconnected and the chip will operate in the default states as specified in the above tables.

## Burst Counter Sequences

### Linear Burst Sequence

	A[1:0]	A[1:0]	A[1:0]	A[1:0]
1st address	00	01	10	11
2nd address	01	10	11	00
3rd address	10	11	00	01
4th address	11	00	01	10

Note: The burst counter wraps to initial state on the 5th clock.

### Interleaved Burst Sequence

	A[1:0]	A[1:0]	A[1:0]	A[1:0]
1st address	00	01	10	11
2nd address	01	00	11	10
3rd address	10	11	00	01
4th address	11	10	01	00

Note: The burst counter wraps to initial state on the 5th clock.

## Byte Write Truth Table

Function	$\overline{\text{GW}}$	$\overline{\text{BW}}$	$\overline{\text{B}}_A$	$\overline{\text{B}}_B$	$\overline{\text{B}}_C$	$\overline{\text{B}}_D$	Notes
Read	H	H	X	X	X	X	1
Read	H	L	H	H	H	H	1
Write byte A	H	L	L	H	H	H	2, 3
Write byte B	H	L	H	L	H	H	2, 3
Write byte C	H	L	H	H	L	H	2, 3, 4
Write byte D	H	L	H	H	H	L	2, 3, 4
Write all bytes	H	L	L	L	L	L	2, 3, 4
Write all bytes	L	X	X	X	X	X	

Note:

- All byte outputs are active in read cycles regardless of the state of Byte Write Enable inputs.
- Byte Write Enable inputs  $\overline{\text{B}}_A$ ,  $\overline{\text{B}}_B$ ,  $\overline{\text{B}}_C$  and/or  $\overline{\text{B}}_D$  may be used in any combination with  $\overline{\text{BW}}$  to write single or multiple bytes.
- All byte I/O's remain High-Z during all write operations regardless of the state of Byte Write Enable inputs.

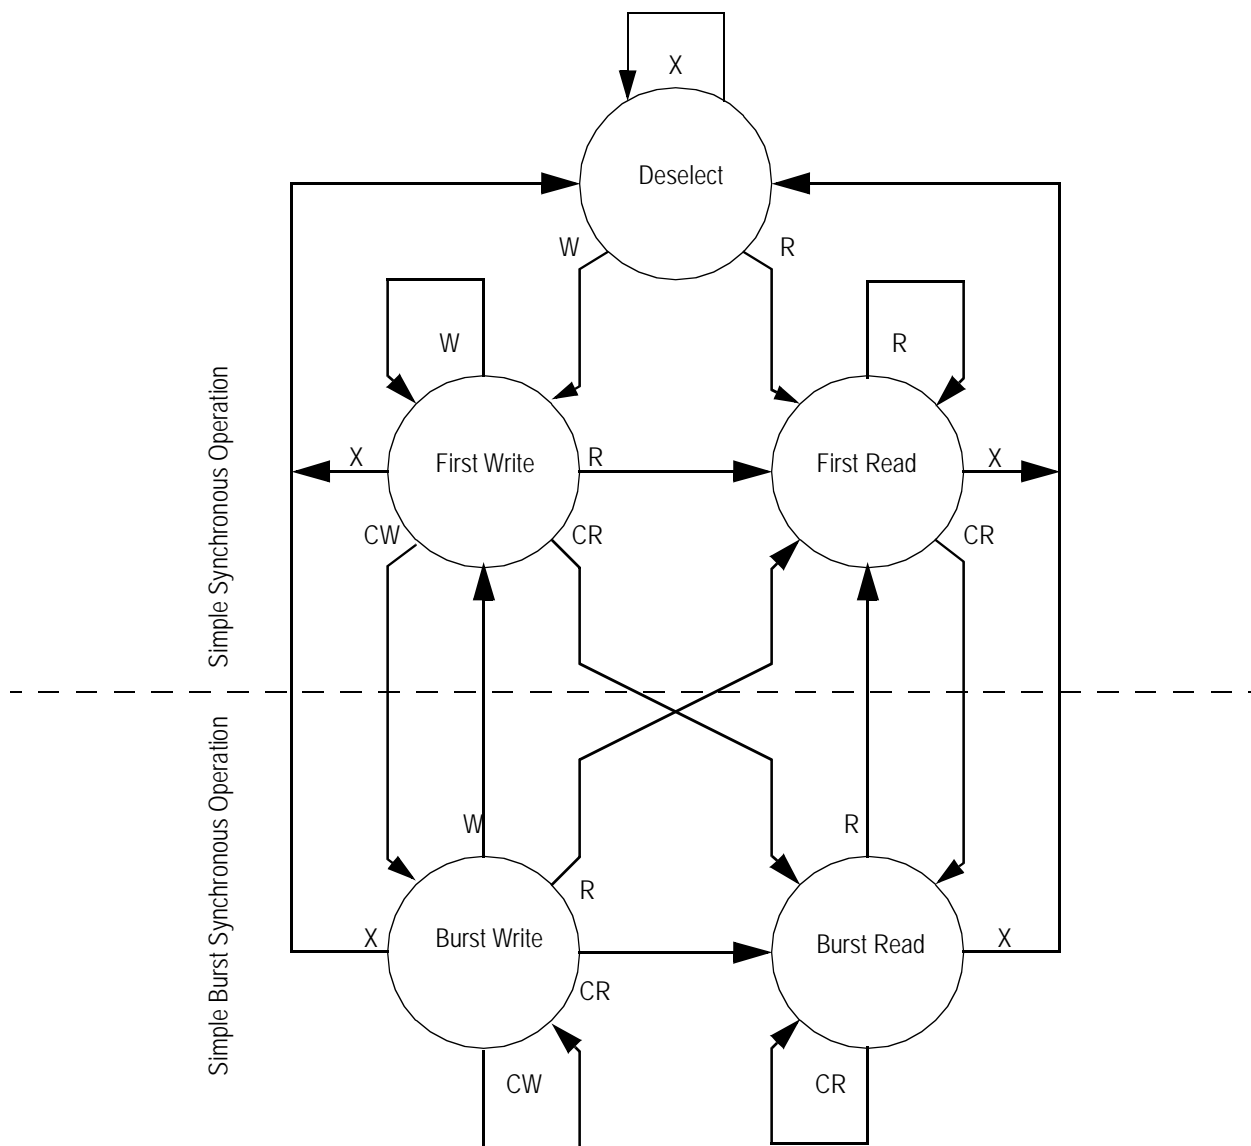

**Synchronous Truth Table**

Operation	Address Used	State Diagram Key <sup>5</sup>	$\bar{E}_1$	$E^2$	$\overline{ADSP}$	$\overline{ADSC}$	$\overline{ADV}$	$W^3$	$DQ^4$

<b>Deselect Cycle, Power Down</b>	<b>None</b>	<b>X</b>	<b>L</b>	<b>F</b>	<b>H</b>	<b>L</b>	<b>X</b>	<b>X</b>	<b>High-Z</b>
<i>Read Cycle, Begin Burst</i>	<i>External</i>	<i>R</i>	<i>L</i>	<i>T</i>	<i>L</i>	<i>X</i>	<i>X</i>	<i>X</i>	<i>Q</i>
<b>Read Cycle, Begin Burst</b>	<b>External</b>	<b>R</b>	<b>L</b>	<b>T</b>	<b>H</b>	<b>L</b>	<b>X</b>	<b>F</b>	<b>Q</b>
<b>Write Cycle, Begin Burst</b>	<b>External</b>	<b>W</b>	<b>L</b>	<b>T</b>	<b>H</b>	<b>L</b>	<b>X</b>	<b>T</b>	<b>D</b>
<i>Read Cycle, Continue Burst</i>	<i>Next</i>	<i>CR</i>	<i>X</i>	<i>X</i>	<i>H</i>	<i>H</i>	<i>L</i>	<i>F</i>	<i>Q</i>
Read Cycle, Continue Burst	Next	CR	H	X	X	H	L	F	Q
<i>Write Cycle, Continue Burst</i>	<i>Next</i>	<i>CW</i>	<i>X</i>	<i>X</i>	<i>H</i>	<i>H</i>	<i>L</i>	<i>T</i>	<i>D</i>
Write Cycle, Continue Burst	Next	CW	H	X	X	H	L	T	D
Read Cycle, Suspend Burst	Current		X	X	H	H	H	F	Q
Read Cycle, Suspend Burst	Current		H	X	X	H	H	F	Q
Write Cycle, Suspend Burst	Current		X	X	H	H	H	T	D
Write Cycle, Suspend Burst	Current		H	X	X	H	H	T	D

Note:

1. X = Don't Care, H = High, L = Low.
2. E = T (True) if  $E_2 = 1$  and  $\bar{E}_3 = 0$ ; E = F (False) if  $E_2 = 0$  or  $\bar{E}_3 = 1$ .
3.  $\bar{W}$  = T (True) and F (False) is defined in the Byte Write Truth Table preceding.
4.  $\bar{G}$  is an asynchronous input.  $\bar{G}$  can be driven high at any time to disable active output drivers.  $\bar{G}$  low can only enable active drivers (shown as "Q" in the Truth Table above).
5. All input combinations shown above are tested and supported. Input combinations shown in gray boxes need not be used to accomplish basic synchronous or synchronous burst operations and may be avoided for simplicity.
6. Tying  $\overline{ADSP}$  high and  $\overline{ADSC}$  low allows simple non-burst synchronous operations. See **BOLD** items above.
7. Tying  $\overline{ADSP}$  high and  $\overline{ADV}$  low while using  $\overline{ADSC}$  to load new addresses allows simple burst operations. See *ITALIC* items above.

## Simplified State Diagram

## Notes:

1. The diagram shows only supported (tested) synchronous state transitions. The diagram presumes  $\overline{G}$  is tied Low.
2. The upper portion of the diagram assumes active use of only the Enable ( $\overline{E}_1, \overline{E}_2, \overline{E}_3$ ) and Write ( $\overline{B}_A, \overline{B}_B, \overline{B}_C, \overline{B}_D, \overline{B}_W$  and  $\overline{G}_W$ ) control inputs and that  $\overline{ADSP}$  is tied high and  $\overline{ADSC}$  is tied low.
3. The upper and lower portions of the diagram together assume active use of only the Enable, Write and  $\overline{ADSC}$  control inputs and assumes  $\overline{ADSP}$  is tied high and  $\overline{ADV}$  is tied low.

Simplified State Diagram with  $\overline{G}$ 

## Notes:

1. The diagram shows supported (tested) synchronous state transitions plus supported transitions that depend upon the use of  $\overline{G}$ .
2. Use of "Dummy Reads" (Read Cycles with  $\overline{G}$  High) may be used to make the transition from Read cycles to Write cycles without passing through a Deselect cycle. Dummy Read cycles increment the address counter just like normal Read cycles.
3. Transitions shown in grey tone assume  $\overline{G}$  has been pulsed high long enough to turn the RAM's drivers off and for incoming data to meet Data Input Set Up Time.

## Absolute Maximum Ratings

(All voltages reference to  $V_{SS}$ )

Symbol	Description	Value	Unit
$V_{DD}$	Voltage on $V_{DD}$ Pins	-0.5 to 4.6	V
$V_{DDQ}$	Voltage in $V_{DDQ}$ Pins	-0.5 to $V_{DD}$	V
$V_{CK}$	Voltage on Clock Input Pin	-0.5 to 6	V
$V_{IO}$	Voltage on I/O Pins	-0.5 to $V_{DDQ}+0.5$ ( $\leq 4.6$ V max.)	V
$V_{IN}$	Voltage on Other Input Pins	-0.5 to $V_{DD}+0.5$ ( $\leq 4.6$ V max.)	V
$I_{IN}$	Input Current on Any Pin	+/- 20	mA
$I_{OUT}$	Output Current on Any I/O Pin	+/- 20	mA
$P_D$	Package Power Dissipation	1.5	W
$T_{STG}$	Storage Temperature	-55 to 125	$^{\circ}\text{C}$
$T_{BIAS}$	Temperature Under Bias	-55 to 125	$^{\circ}\text{C}$

### Note:

Permanent damage to the device may occur if the Absolute Maximum Ratings are exceeded. Operation should be restricted to Recommended Operating Conditions. Exposure to conditions exceeding the Absolute Maximum Ratings, for an extended period of time, may affect reliability of this component.

## Recommended Operating Conditions

Parameter	Symbol	Min.	Typ.	Max.	Unit	Notes
Supply Voltage	$V_{DD}$	3.135	3.3	3.6	V	
I/O Supply Voltage	$V_{DDQ}$	2.375	2.5	$V_{DD}$	V	1
Input High Voltage	$V_{IH}$	1.7	---	$V_{DD}+0.3$	V	2
Input Low Voltage	$V_{IL}$	-0.3	---	0.8	V	2
Ambient Temperature (Commercial Range Versions)	$T_A$	0	25	70	$^{\circ}\text{C}$	3
Ambient Temperature (Industrial Range Versions)	$T_A$	-40	25	85	$^{\circ}\text{C}$	3

### Note:

1. Unless otherwise noted, all performance specifications quoted are evaluated for worst case at both  $2.75\text{V} \leq V_{DDQ} \leq 2.375\text{V}$  (i.e. 2.5V I/O) and  $3.6\text{V} \leq V_{DDQ} \leq 3.135\text{V}$  (i.e. 3.3V I/O) and quoted at whichever condition is worst case.
2. This device features input buffers compatible with both 3.3V and 2.5V I/O drivers.
3. Most speed grades and configurations of this device are offered in both Commercial and Industrial Temperature ranges. The part number of Industrial Temperature Range versions end the character "I". Unless otherwise noted, all performance specifications quoted are evaluated for worst case in the temperature range marked on the device.
4. Input Under/overshoot voltage must be  $-2\text{V} > V_i < V_{DD}+2\text{V}$  with a pulse width not to exceed 20% tKC.

### Undershoot Measurement and Timing

### Overshoot Measurement and Timing

### Capacitance

( $T_A=25^{\circ}C$ ,  $f=1MHz$ ,  $V_{DD}=3.3V$ )

Parameter	Symbol	Test conditions	Typ.	Max.	Unit
Control Input Capacitance	$C_I$	$V_{DD}=3.3V$	3	4	pF
Input Capacitance	$C_{IN}$	$V_{IN}=0V$	4	5	pF
Output Capacitance	$C_{OUT}$	$V_{OUT}=0V$	6	7	pF

Note: This parameter is sample tested.

### Package Thermal Characteristics

Rating	Layer Board	Symbol	TQFP Max	QFP Max	Unit	Notes
Junction to Ambient (at 200 lfm)	single	$R_{\theta JA}$	40	TBD	$^{\circ}C/W$	1,2,4
Junction to Ambient (at 200 lfm)	four	$R_{\theta JA}$	24	TBD	$^{\circ}C/W$	1,2,4
Junction to Case (TOP)		$R_{\theta JC}$	9	TBD	$^{\circ}C/W$	3,4

Notes:

1. Junction temperature is a function of SRAM power dissipation, package thermal resistance, mounting board temperature, ambient. Temperature air flow, board density, and PCB thermal resistance.
2. SCMI G-38-87.
3. Average thermal resistance between die and top surface, MIL SPEC-883, Method 1012.1.

## AC Test Conditions

Parameter	Conditions
Input high level	2.3V
Input low level	0.2V
Input slew rate	1V/ns
Input reference level	1.25V
Output reference level	1.25V
Output load	Fig. 1& 2

### Notes:

1. Include scope and jig capacitance.
2. Test conditions as specified with output loading as shown in Fig. 1 unless otherwise noted.
3. Output Load 2 for  $t_{LZ}$ ,  $t_{HZ}$ ,  $t_{OLZ}$  and  $t_{OHZ}$ .
4. Device is deselected as defined by the Truth Table.

\* Distributed Test Jig Capacitance

### Flow Through Read-Write Cycle Timing

**Pipelined DCD Read Cycle Timing**

### Pipelined DCD Read-Write Cycle Timing

### Sleep Mode Timing Diagram

### Application Tips

#### Single and Dual Cycle Deselect

SCD devices force the use of "dummy read cycles" (read cycles that are launched normally but that are ended with the output drivers inactive) in a fully synchronous environment. Dummy read cycles waste performance but their use usually assures there will be no bus contention in transitions from reads to writes or between banks of RAMs. DCD SRAMs do not waste bandwidth on dummy cycles and are logically simpler to manage in a multiple bank application (wait states need not be inserted at bank address boundary crossings) but greater care must be exercised to avoid excessive bus contention.

Y	Coplanarity			0.10			0.10
$\theta$	Lead Angle	0°		7°	0°		7°

## Notes:

1. All dimensions are in millimeters (mm).
2. Package width and length do not include mold protrusion

Org	Part Number <sup>1</sup>	Type	Package	Speed <sup>2</sup> (Mhz/ ns)	T <sub>A</sub> 3	Status

**Notes:**

- Customers requiring delivery in Tape and Reel should add the character "T" to the end of the part number. Example: GS820E32T-100IT.
- The speed column indicates the cycle frequency (Mhz) of the device in Pipelined mode and the latency (ns) in Flow Through mode. Each device is Pipeline / Flow through mode selectable by the user.
- T<sub>A</sub> = C = Commercial Temperature Range. T<sub>A</sub> = I = Industrial Temperature Range.
- GSI offers other versions this type of device in many different configurations and with a variety of different features, only some of which are covered in this data sheet. See the GSI Technology web site for a complete listing of current offerings.
