Hitachi Microcomputer

H8/3032 Series

Hardware Manual

Preface

The H8/3032 Series is a series of high-performance single-chip microcontrollers that integrate system supporting functions together with an H8/300H CPU core.

The H8/300H CPU has a 32-bit internal architecture with sixteen 16-bit general registers, and a concise, optimized instruction set designed for speed. It can address a 16-Mbyte linear address space.*

The on-chip system supporting functions include ROM, RAM, a 16-bit integrated timer unit (ITU), a programmable timing pattern controller (TPC), a watchdog timer (WDT), a serial communication interface (SCI), an A/D converter, I/O ports, and other facilities.

The three operating modes offer a choice of expanded mode and single-chip mode, enabling the H8/3032 Series to adapt quickly and flexibly to a variety of conditions.

This manual describes the H8/3032 Series hardware. For details of the instruction set, refer to the H8/300H Programming Manual.

Note: * The H8/3032 Series has a maximum address space of 1 Mbyte.

Contents

Section 1   Overview

1.1 Overview

The H8/3032 Series is a series of microcontrollers (MCUs) that integrate system supporting functions together with an H8/300H CPU core having an original Hitachi architecture.

The H8/300H CPU has a 32-bit internal architecture with sixteen 16-bit general registers, and a concise, optimized instruction set designed for speed. It can address a 16-Mbyte linear address space.[1] Its instruction set is upward-compatible at the object-code level with the H8/300 CPU, enabling easy porting of software from the H8/300 Series.

The on-chip system supporting functions include ROM, RAM, a 16-bit integrated timer unit (ITU), a programmable timing pattern controller (TPC), a watchdog timer (WDT), a serial communication interface (SCI), an A/D converter, I/O ports, and other facilities.

The three members of the H8/3032 Series are the H8/3032, the H8/3031, and the H8/3030. The H8/3032 has 64 kbytes of ROM and 2 kbytes of RAM. The H8/3031 has 32 kbytes of ROM and 1 kbyte of RAM. The H8/3030 has 16 kbytes of ROM and 512 bytes of RAM.

Three MCU operating modes offer a choice of data bus width and address space size. The modes (modes 1 to 3) include a single-chip mode and expanded mode.

In addition to the masked-ROM versions of the H8/3032 Series, the H8/3032 has a ZTAT™[2] version with user-programmable on-chip PROM. This version enables users to respond quickly and flexibly to changing application specifications, growing production volumes, and other conditions.

Table 1-1 summarizes the features of the H8/3032 Series.

Notes: 1. The H8/3032 Series has a maximum address space of 1 Mbyte.
         2. ZTAT (Zero Turn-Around Time) is a trademark of Hitachi, Ltd.

Table 1-1   Features

Feature	Description
CPU	Upward-compatible with the H8/300 CPU at the object-code level
	General-register machine
	• Sixteen 16-bit general registers (also useable as sixteen 8-bit registers or eight 32-bit registers)
	High-speed operation
	• Maximum clock rate: 16 MHz • Add/subtract: 125 ns • Multiply/divide: 875 ns
	Two CPU operating modes
	• Normal mode (64-kbyte address space) • Advanced mode (1-Mbyte address space)
	Instruction features
	• 8/16/32-bit data transfer, arithmetic, and logic instructions • Signed and unsigned multiply instructions (8 bits $\times$ 8 bits, 16 bits $\times$ 16 bits) • Signed and unsigned divide instructions (16 bits $\div$ 8 bits, 32 bits $\div$ 16 bits) • Bit accumulator function • Bit manipulation instructions with register-indirect specification of bit positions
Memory	H8/3032 • ROM: 64 kbytes • RAM: 2 kbytes
	H8/3031 • ROM: 32 kbytes • RAM: 1 kbyte
	H8/3030 • ROM: 16 kbytes • RAM: 512 bytes
Interrupt controller	• Six external interrupt pins: NMI, $\overline{IRQ_0}$ to $\overline{IRQ_4}$ • 21 internal interrupts • Three selectable interrupt priority levels
Bus controller	• Address space can be partitioned into eight areas, with independent bus specifications in each area • Two-state or three-state access selectable for each area • Selection of four wait modes

Table 1-1   Features (cont)

Feature	Description
16-bit integrated timer unit (ITU)	• Five 16-bit timer channels, capable of processing up to 12 pulse outputs or 10 pulse inputs • 16-bit timer counter (channels 0 to 4) • Two multiplexed output compare/input capture pins (channels 0 to 4) • Operation can be synchronized (channels 0 to 4) • PWM mode available (channels 0 to 4) • Phase counting mode available (channel 2) • Buffering available (channels 3 and 4) • Reset-synchronized PWM mode available (channels 3 and 4) • Complementary PWM mode available (channels 3 and 4)
Programmable timing pattern controller (TPC)	• Maximum 16-bit pulse output, using ITU as time base • Up to four 4-bit pulse output groups (or one 16-bit group, or two 8-bit groups) • Non-overlap mode available
Watchdog timer (WDT), 1 channel	• Reset signal can be generated by overflow • Reset signal can be output externally • Usable as an interval timer
Serial communication interface (SCI), 2 channels	• Selection of asynchronous or synchronous mode • Full duplex: can transmit and receive simultaneously • On-chip baud-rate generator
A/D converter	• Resolution: 10 bits • Eight channels, with selection of single or scan mode • Variable analog conversion voltage range • Sample-and-hold function • Can be externally triggered
I/O ports	• 55 input/output pins • 8 input-only pins

Table 1-1 Features (cont)

Feature	Description
Operating modes	Three MCU operating modes

Mode	Address Space	Address Pins	Bus Width
Mode 1	1 Mbyte	A_0 to A_{19}	8 bits
Mode 2	64 kbytes	—	—
Mode 3	1 Mbyte	—	—

Feature	Description
Power-down state	• Sleep mode • Software standby mode • Hardware standby mode
Other features	• On-chip clock oscillator

Model	Package	ROM
HD6473032F HD6473032TF	80-pin QFP (FP-80A) 80-pin TQFP (TFP-80C)	PROM
HD6433032F HD6433032TF	80-pin QFP (FP-80A) 80-pin TQFP (TFP-80C)	Mask ROM
HD6433031F HD6433031TF	80-pin QFP (FP-80A) 80-pin TQFP (TFP-80C)	Mask ROM
HD6433030F HD6433030TF	80-pin QFP (FP-80A) 80-pin TQFP (TFP-80C)	Mask ROM

1.4 Pin Functions

Table 1-3 summarizes the pin functions.

Table 1-3 Pin Functions

Type	Symbol	Pin No.	I/O	Name and Function
Power	V_{CC}	21, 53	Input	**Power:** For connection to the power supply (+5 V). Connect all V_{CC} pins to the +5-V system power supply.
	V_{SS}	12, 30, 50	Input	**Ground:** For connection to ground (0 V). Connect all V_{SS} pins to the 0-V system power supply.
Clock	XTAL	52	Input	For connection to a crystal resonator. For examples of crystal resonator and external clock input, see section 15, Clock Pulse Generator.
	EXTAL	51	Input	For connection to a crystal resonator or input of an external clock signal. For examples of crystal resonator and external clock input, see section 15, Clock Pulse Generator.
	ø	46	Output	**System clock:** Supplies the system clock to external devices
Operating mode control	MD_1, MD_0	45, 44	Input	**Mode 1 and mode 0:** For setting the operating mode, as follows

MD_1	MD_0	Operating Mode
0	0	—
0	1	Mode 1
01	0	Mode 2
1	1	Mode 3

Type	Symbol	Pin No.	I/O	Name and Function
System control	$\overline{RES}$	48	Input	Reset input: When driven low, this pin resets the H8/3032
	$\overline{RESO}$	57	Output	**Reset output:** Outputs a reset signal to external devices
	$\overline{STBY}$	47	Input	**Standby:** When driven low, this pin forces a transition to hardware standby mode

10

Table 1-3   Pin Functions (cont)

Type	Symbol	Pin No.	I/O	Name and Function
Interrupts	NMI	49	Input	**Nonmaskable interrupt:** Requests a nonmaskable interrupt
	IRQ_4 to IRQ_0	11, 72 to 69	Input	**Interrupt request 4 to 0:** Maskable interrupt request pins
Address bus	A_{19} to A_8, A_7 to A_0	42 to 31, 29 to 22	Output	**Address bus:** Outputs address signals
Data bus	D_7 to D_0	20 to 13	Input/ output	**Data bus:** Bidirectional data bus
Bus control	$\overline{AS}$	54	Output	**Address strobe:** Goes low to indicate valid address output on the address bus
	$\overline{RD}$	55	Output	**Read:** Goes low to indicate reading from the external address space
	$\overline{WR}$	56	Output	**High write:** Goes low to indicate writing to the external address space; indicates valid data on the data bus.
	$\overline{WAIT}$	43	Input	**Wait:** Requests insertion of wait states in bus cycles during access to the external address space
16-bit integrated time unit (ITU)	TCLKD to TCLKA	76 to 73	Input	**Clock input A to D:** External clock inputs
	$TIOCA_4$ to $TIOCA_0$	3, 1, 79, 77, 75	Input/ output	**Input capture/output compare A4 to A0:** GRA4 to GRA0 output compare or input capture, or PWM output
	$TIOCB_4$ to $TIOCB_0$	4, 2, 80, 78, 76	Input/ output	**Input capture/output compare B4 to B0:** GRB4 to GRB0 output compare or input capture, or PWM output
	$TOCXA_4$	5	Output	**Output compare XA4:** PWM output
	$TOCXB_4$	6	Output	**Output compare XB4:** PWM output
Programmable timing pattern controller (TPC)	TP_{15} to TP_0	8 to 1, 80 to 73	Output	**TPC output 15 to 0:** Pulse output

11

Table 1-3   Pin Functions (cont)

Type	Symbol	Pin No.	I/O	Name and Function
Serial com-munication interface (SCI)	TxD	9	Output	**Transmit data:** SCI data output
	RxD	10	Input	**Receive data:** SCI data input
	SCK	11	Input/output	**Serial clock:** SCI clock input/output
A/D converter	AN_7 to AN_0	66 to 59	Input	**Analog 7 to 0:** Analog input pins
	$\overline{ADTRG}$	8	Input	**A/D trigger:** External trigger input for starting A/D conversion
	AV_{CC}	68	Input	Power supply pin for the A/D converter. Connect to the system power supply (+5 V) when not using the A/D converter.
	AV_{SS}	58	Input	Ground pin for the A/D converter. Connect to system ground (0 V) when not using the A/D converter.
	V_{REF}	67	Input	Reference voltage input pin for the A/D converter. Connect to the system power supply (+5 V) when not using the A/D converter.
I/O ports	$P1_7$ to $P1_0$	29 to 22	Input/output	**Port 1:** Eight input/output pins. The direction of each pin can be selected in the port 1 data direction register (P1DDR).
	$P2_7$ to $P2_0$	38 to 31	Input/output	**Port 2:** Eight input/output pins. The direction of each pin can be selected in the port 2 data direction register (P2DDR).
	$P3_7$ to $P3_0$	20 to 13	Input/output	**Port 3:** Eight input/output pins. The direction of each pin can be selected in the port 3 data direction register (P3DDR).
	$P5_3$ to $P5_0$	42 to 39	Input/output	**Port 5:** Four input/output pins. The direction of each pin can be selected in the port 5 data direction register (P5DDR).
	$P6_5$ to $P6_3$, $P6_0$	56 to 54, 43	Input/output	**Port 6:** Four input/output pins. The direction of each pin can be selected in the port 6 data direction register (P6DDR).
	$P7_7$ to $P7_0$	66 to 59	Input	**Port 7:** Eight input pins
	$P8_3$ to $P8_0$	72 to 69	Input/output	**Port 8:** Four input/output pins. The direction of each pin can be selected in the port 8 data direction register (P8DDR).

Table 1-3 Pin Functions (cont)

Type	Symbol	Pin No.	I/O	Name and Function
I/O ports	$P9_4$, $P9_2$, $P9_0$	11 to 9	Input/ output	**Port 9:** Three input/output pins. The direction of each pin can be selected in the port 9 data direction register (P9DDR).
	PA_7 to PA_0	80 to 73	Input/ output	**Port A:** Eight input/output pins. The direction of each pin can be selected in the port A data direction register (PADDR).
	PB_7 to PB_0	8 to 1	Input/ output	**Port B:** Eight input/output pins. The direction of each pin can be selected in the port B data direction register (PBDDR).

Section 2   CPU

2.1 Overview

The H8/300H CPU is a high-speed central processing unit with an internal 32-bit architecture that is upward-compatible with the H8/300 CPU. The H8/300H CPU has sixteen 16-bit general registers, can address a 16-Mbyte linear address space, and is ideal for realtime control.

2.1.1 Features

The H8/300H CPU has the following features.

• Upward compatibility with H8/300 CPU

   Can execute H8/300 series object programs without alteration

• General-register architecture

   Sixteen 16-bit general registers (also usable as sixteen 8-bit registers or eight 32-bit registers)

• Sixty-two basic instructions

   — 8/16/32-bit arithmetic and logic instructions
   — Multiply and divide instructions
   — Powerful bit-manipulation instructions

• Eight addressing modes

   — Register direct [Rn]
   — Register indirect [@ERn]
   — Register indirect with displacement [@(d:16, ERn) or @(d:24, ERn)]
   — Register indirect with post-increment or pre-decrement [@ERn+ or @–ERn]
   — Absolute address [@aa:8, @aa:16, or @aa:24]
   — Immediate [#xx:8, #xx:16, or #xx:32]
   — Program-counter relative [@(d:8, PC) or @(d:16, PC)]
   — Memory indirect [@@aa:8]

• 1-Mbyte* linear address space

Note: * The CPU, if used alone, can access a maximum address space of 16 Mbytes. However, the maximum address space of the H8/3032 Series is 1 Mbyte.

- High-speed operation

  — All frequently-used instructions execute in two to four states
  — Maximum clock frequency: 16 MHz
  — 8/16/32-bit register-register add/subtract: 125 ns
  — 8 × 8-bit register-register multiply: 875 ns
  — 16 ÷ 8-bit register-register divide: 875 ns
  — 16 × 16-bit register-register multiply: 1.375 µs
  — 32 ÷ 16-bit register-register divide: 1.375 µs

- Two CPU operating modes

  — Normal mode
  — Advanced mode

- Low-power mode

  Transition to power-down state by SLEEP instruction

2.1.2 Differences from H8/300 CPU

In comparison to the H8/300 CPU, the H8/300H has the following enhancements.

- More general registers

  Eight 16-bit registers have been added.

- Expanded address space

  — Advanced mode supports a maximum 1-Mbyte address space.
  — Normal mode supports the same 64-kbyte address space as the H8/300 CPU.

- Enhanced addressing

  The addressing modes have been enhanced to make effective use of the 1-Mbyte address space.

- Enhanced instructions

  — Data transfer, arithmetic, and logic instructions can operate on 32-bit data.
  — Signed multiply/divide instructions and other instructions have been added.

2.2 CPU Operating Modes

The H8/300H CPU has two operating modes: normal and advanced. Normal mode supports a maximum 64-kbyte address space. Advanced mode supports up to 1 Mbytes. See figure 2-1.
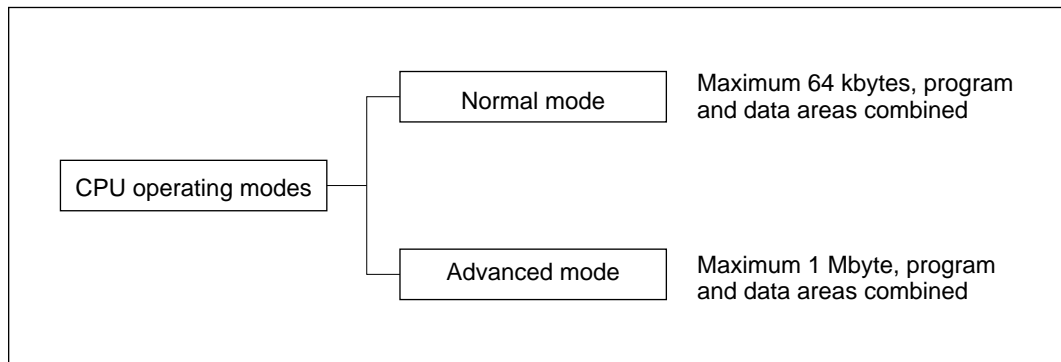

Figure 2-1   CPU Operating Modes

2.3 Address Space

Figure 2-2 shows a simple memory map for the H8/3032 Series. The H8/300H CPU can address a linear address space with a maximum size of 64 kbytes in normal mode, and 16 Mbytes in advanced mode. For further details see section 3.6, Memory Map in Each Operating Mode.

The 1-Mbyte operating mode uses 20-bit addressing. The upper 4 bits of effective addresses are ignored.
Figure 2-2   Memory Map

2.4 Register Configuration

2.4.1 Overview

The H8/300H CPU has the internal registers shown in figure 2-3. There are two types of registers: general registers and control registers.

General Registers (ERn)

	15 0	7 0	7 0
ER0	E0	R0H	R0L
ER1	E1	R1H	R1L
ER2	E2	R2H	R2L
ER3	E3	R3H	R3L
ER4	E4	R4H	R4L
ER5	E5	R5H	R5L
ER6	E6	R6H	R6L
ER7	E7 (SP)	R7H	R7L

Control Registers (CR)

```
          23                                 0
PC   [                                        ]

                              7 6 5 4 3 2 1 0
CCR  [ I UI H U N Z V C ]
```

Legend
SP: Stack pointer
PC: Program counter
CCR: Condition code register
I: Interrupt mask bit
UI: User bit or interrupt mask bit
H: Half-carry flag
U: User bit
N: Negative flag
Z: Zero flag
V: Overflow flag
C: Carry flag

Figure 2-3   CPU Registers

2.4.2 General Registers

The H8/300H CPU has eight 32-bit general registers. These general registers are all functionally alike and can be used without distinction between data registers and address registers. When a general register is used as a data register, it can be accessed as a 32-bit, 16-bit, or 8-bit register. When the general registers are used as 32-bit registers or as address registers, they are designated by the letters ER (ER0 to ER7).

The ER registers divide into 16-bit general registers designated by the letters E (E0 to E7) and R (R0 to R7). These registers are functionally equivalent, providing a maximum sixteen 16-bit registers. The E registers (E0 to E7) are also referred to as extended registers.

The R registers divide into 8-bit general registers designated by the letters RH (R0H to R7H) and RL (R0L to R7L). These registers are functionally equivalent, providing a maximum sixteen 8-bit registers.

Figure 2-4 illustrates the usage of the general registers. The usage of each register can be selected independently.
Figure 2-4   Usage of General Registers

General register ER7 has the function of stack pointer (SP) in addition to its general-register function, and is used implicitly in exception handling and subroutine calls. Figure 2-5 shows the stack.
Figure 2-5 Stack

2.4.3 Control Registers

The control registers are the 24-bit program counter (PC) and the 8-bit condition code register (CCR).

Program Counter (PC): This 24-bit counter indicates the address of the next instruction the CPU will execute. The length of all CPU instructions is 2 bytes (one word) or a multiple of 2 bytes, so the least significant PC bit is ignored. When an instruction is fetched, the least significant PC bit is regarded as 0.

Condition Code Register (CCR): This 8-bit register contains internal CPU status information, including the interrupt mask bit (I) and half-carry (H), negative (N), zero (Z), overflow (V), and carry (C) flags.

Bit 7—Interrupt Mask Bit (I): Masks interrupts other than NMI when set to 1. NMI is accepted regardless of the I bit setting. The I bit is set to 1 at the start of an exception-handling sequence.

Bit 6—User Bit or Interrupt Mask Bit (UI): Can be written and read by software using the LDC, STC, ANDC, ORC, and XORC instructions. This bit can also be used as an interrupt mask bit. For details see section 5, Interrupt Controller.

Bit 5—Half-Carry Flag (H): When the ADD.B, ADDX.B, SUB.B, SUBX.B, CMP.B, or NEG.B instruction is executed, this flag is set to 1 if there is a carry or borrow at bit 3, and cleared to 0 otherwise. When the ADD.W, SUB.W, CMP.W, or NEG.W instruction is executed, the H flag is set to 1 if there is a carry or borrow at bit 11, and cleared to 0 otherwise. When the ADD.L, SUB.L, CMP.L, or NEG.L instruction is executed, the H flag is set to 1 if there is a carry or borrow at bit 27, and cleared to 0 otherwise.

Bit 4—User Bit (U): Can be written and read by software using the LDC, STC, ANDC, ORC, and XORC instructions.

Bit 3—Negative Flag (N): Indicates the most significant bit (sign bit) of data.

Bit 2—Zero Flag (Z): Set to 1 to indicate zero data, and cleared to 0 to indicate non-zero data.

Bit 1—Overflow Flag (V): Set to 1 when an arithmetic overflow occurs, and cleared to 0 at other times.

Bit 0—Carry Flag (C): Set to 1 when a carry occurs, and cleared to 0 otherwise. Used by:

- Add instructions, to indicate a carry
- Subtract instructions, to indicate a borrow
- Shift and rotate instructions, to store the value shifted out of the end bit

The carry flag is also used as a bit accumulator by bit manipulation instructions.

Some instructions leave flag bits unchanged. Operations can be performed on CCR by the LDC, STC, ANDC, ORC, and XORC instructions. The N, Z, V, and C flags are used by conditional branch (Bcc) instructions.

For the action of each instruction on the flag bits, see appendix A.1, Instruction List. For the I and UI bits, see section 5, Interrupt Controller.

2.4.4 Initial CPU Register Values

In reset exception handling, PC is initialized to a value loaded from the vector table, and the I bit in CCR is set to 1. The other CCR bits and the general registers are not initialized. In particular, the stack pointer (ER7) is not initialized. The stack pointer must therefore be initialized by an MOV.L instruction executed immediately after a reset.

2.5 Data Formats

The H8/300H CPU can process 1-bit, 4-bit (BCD), 8-bit (byte), 16-bit (word), and 32-bit (longword) data. Bit-manipulation instructions operate on 1-bit data by accessing bit n (n = 0, 1, 2, …, 7) of byte operand data. The DAA and DAS decimal-adjust instructions treat byte data as two digits of 4-bit BCD data.

2.5.1 General Register Data Formats

Figures 2-6 and 2-7 show the data formats in general registers.

Figure 2-6   General Register Data Formats (1)
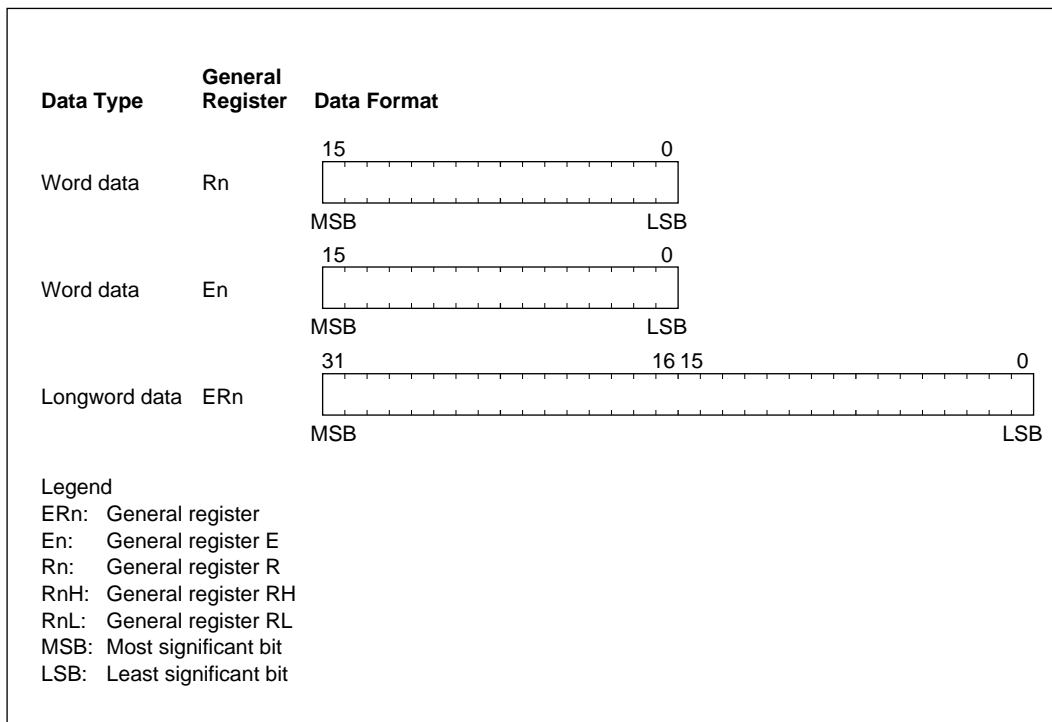

Figure 2-7 General Register Data Formats (2)

2.5.2 Memory Data Formats

Figure 2-8 shows the data formats on memory. The H8/300H CPU can access word data and longword data on memory, but word or longword data must begin at an even address. If an attempt is made to access word or longword data at an odd address, no address error occurs but the least significant bit of the address is regarded as 0, so the access starts at the preceding address. This also applies to instruction fetches.

Data Type	Address	Data Format
Figure 2-8   Memory Data Formats

When ER7 (SP) is used as an address register to access the stack, the operand size should be word size or longword size.

2.6 Instruction Set

2.6.1 Instruction Set Overview

The H8/300H CPU has 62 types of instructions, which are classified in table 2-1.

Table 2-1 Instruction Classification

Function	Instruction	Types
Data transfer	MOV, PUSH[*1], POP[*1], MOVTPE[*2], MOVFPE[*2]	3
Arithmetic operations	ADD, SUB, ADDX, SUBX, INC, DEC, ADDS, SUBS, DAA, DAS, MULXU, DIVXU, MULXS, DIVXS, CMP, NEG, EXTS, EXTU	18
Logic operations	AND, OR, XOR, NOT	4
Shift operations	SHAL, SHAR, SHLL, SHLR, ROTL, ROTR, ROTXL, ROTXR	8
Bit manipulation	BSET, BCLR, BNOT, BTST, BAND, BIAND, BOR, BIOR, BXOR, BIXOR, BLD, BILD, BST, BIST	14
Branch	Bcc[*3], JMP, BSR, JSR, RTS	5
System control	TRAPA, RTE, SLEEP, LDC, STC, ANDC, ORC, XORC, NOP	9
Block data transfer	EEPMOV	1

Total 62 types

Notes: 1. POP.W Rn is identical to MOV.W @SP+, Rn.
　　　　　 PUSH.W Rn is identical to MOV.W Rn, @−SP.
　　　　　 POP.L ERn is identical to MOV.L @SP+, Rn.
　　　　　 PUSH.L ERn is identical to MOV.L Rn, @−SP.
　　　　2. They are not available on H8/3032.
　　　　3. Bcc is a generic branching instruction.

2.6.2 Instructions and Addressing Modes

Table 2-2 indicates the instructions available in the H8/300H CPU.

Table 2-2 Instructions and Addressing Modes

Function	Instruction						Addressing Modes

2.6.3 Tables of Instructions Classified by Function

Tables 2-3 to 2-10 summarize the instructions in each functional category. The operation notation used in these tables is defined next.

Operation Notation

Rd	General register (destination)*
Rs	General register (source)*
Rn	General register*
ERn	General register (32-bit register or address register)
(EAd)	Destination operand
(EAs)	Source operand
CCR	Condition code register
N	N (negative) flag of CCR
Z	Z (zero) flag of CCR
V	V (overflow) flag of CCR
C	C (carry) flag of CCR
PC	Program counter
SP	Stack pointer
#IMM	Immediate data
disp	Displacement
+	Addition
–	Subtraction
×	Multiplication
÷	Division
∧	AND logical
∨	OR logical
⊕	Exclusive OR logical
→	Move
¬	NOT (logical complement)
:3/:8/:16/:24	3-, 8-, 16-, or 24-bit length

Note: * General registers include 8-bit registers (R0H to R7H, R0L to R7L), 16-bit registers (R0 to R7, E0 to E7), and 32-bit data or address registers (ER0 to ER7).

Table 2-3 Data Transfer Instructions

Instruction	Size*	Function
MOV	B/W/L	(EAs) → Rd, Rs → (EAd)
		Moves data between two general registers or between a general register and memory, or moves immediate data to a general register.
MOVFPE	B	(EAs) → Rd
		Cannot be used in the H8/3032.
MOVTPE	B	Rs → (EAs)
		Cannot be used in the H8/3032.
POP	W/L	@SP+ → Rn
		Pops a general register from the stack. POP.W Rn is identical to MOV.W @SP+, Rn. Similarly, POP.L ERn is identical to MOV.L @SP+, ERn.
PUSH	W/L	Rn → @−SP
		Pushes a general register onto the stack. PUSH.W Rn is identical to MOV.W Rn, @−SP. Similarly, PUSH.L ERn is identical to MOV.L ERn, @−SP.

Note: * Size refers to the operand size.
　　　　B: Byte
　　　　W: Word
　　　　L: Longword

Table 2-4 Arithmetic Operation Instructions

Instruction	Size*	Function
ADD, SUB	B/W/L	Rd ± Rs → Rd, Rd ± #IMM → Rd
		Performs addition or subtraction on data in two general registers, or on immediate data and data in a general register. (Immediate byte data cannot be subtracted from data in a general register. Use the SUBX or ADD instruction.)
ADDX, SUBX	B	Rd ± Rs ± C → Rd, Rd ± #IMM ± C → Rd
		Performs addition or subtraction with carry or borrow on data in two general registers, or on immediate data and data in a general register.
INC, DEC	B/W/L	Rd ± 1 → Rd, Rd ± 2 → Rd
		Increments or decrements a general register by 1 or 2. (Byte operands can be incremented or decremented by 1 only.)
ADDS, SUBS	L	Rd ± 1 → Rd, Rd ± 2 → Rd, Rd ± 4 → Rd
		Adds or subtracts the value 1, 2, or 4 to or from data in a 32-bit register.
DAA, DAS	B	Rd decimal adjust → Rd
		Decimal-adjusts an addition or subtraction result in a general register by referring to CCR to produce 4-bit BCD data.
MULXU	B/W	Rd × Rs → Rd
		Performs unsigned multiplication on data in two general registers: either 8 bits × 8 bits → 16 bits or 16 bits × 16 bits → 32 bits.
MULXS	B/W	Rd × Rs → Rd
		Performs signed multiplication on data in two general registers: either 8 bits × 8 bits → 16 bits or 16 bits × 16 bits → 32 bits.

Note: * Size refers to the operand size.
     B: Byte
     W: Word
     L: Longword

Table 2-4 Arithmetic Operation Instructions (cont)

Instruction	Size*	Function
DIVXU	B/W	Rd ÷ Rs → Rd
		Performs unsigned division on data in two general registers: either 16 bits ÷ 8 bits → 8-bit quotient and 8-bit remainder or 32 bits ÷ 16 bits → 16-bit quotient and 16-bit remainder.
DIVXS	B/W	Rd ÷ Rs → Rd
		Performs signed division on data in two general registers: either 16 bits ÷ 8 bits → 8-bit quotient and 8-bit remainder, or 32 bits ÷ 16 bits → 16-bit quotient and 16-bit remainder.
CMP	B/W/L	Rd – Rs, Rd – #IMM
		Compares data in a general register with data in another general register or with immediate data, and sets CCR according to the result.
NEG	B/W/L	0 – Rd → Rd
		Takes the two's complement (arithmetic complement) of data in a general register.
EXTS	W/L	Rd (sign extension) → Rd
		Extends byte data in the lower 8 bits of a 16-bit register to word data, or extends word data in the lower 16 bits of a 32-bit register to longword data, by extending the sign bit.
EXTU	W/L	Rd (zero extension) → Rd
		Extends byte data in the lower 8 bits of a 16-bit register to word data, or extends word data in the lower 16 bits of a 32-bit register to longword data, by padding with zeros.

Note: * Size refers to the operand size.
     B: Byte
     W: Word
     L: Longword

Table 2-5 Logic Operation Instructions

Instruction	Size*	Function
AND	B/W/L	Rd ∧ Rs → Rd, Rd ∧ #IMM → Rd
		Performs a logical AND operation on a general register and another general register or immediate data.
OR	B/W/L	Rd ∨ Rs → Rd, Rd ∨ #IMM → Rd
		Performs a logical OR operation on a general register and another general register or immediate data.
XOR	B/W/L	Rd ⊕ Rs → Rd, Rd ⊕ #IMM → Rd
		Performs a logical exclusive OR operation on a general register and another general register or immediate data.
NOT	B/W/L	¬ Rd → Rd
		Takes the one's complement of general register contents.

Note: * Size refers to the operand size.
      B: Byte
      W: Word
      L: Longword

Table 2-6 Shift Instructions

Instruction	Size*	Function
SHAL, SHAR	B/W/L	Rd (shift) → Rd
		Performs an arithmetic shift on general register contents.
SHLL, SHLR	B/W/L	Rd (shift) → Rd
		Performs a logical shift on general register contents.
ROTL, ROTR	B/W/L	Rd (rotate) → Rd
		Rotates general register contents.
ROTXL, ROTXR	B/W/L	Rd (rotate) → Rd
		Rotates general register contents through the carry bit.

Note: * Size refers to the operand size.
      B: Byte
      W: Word
      L: Longword

Table 2-7   Bit Manipulation Instructions

Instruction	Size*	Function
BSET	B	$1 \rightarrow$ (\<bit-No.\> of \<EAd\>)
		Sets a specified bit in a general register or memory operand to 1. The bit number is specified by 3-bit immediate data or the lower 3 bits of a general register.
BCLR	B	$0 \rightarrow$ (\<bit-No.\> of \<EAd\>)
		Clears a specified bit in a general register or memory operand to 0. The bit number is specified by 3-bit immediate data or the lower 3 bits of a general register.
BNOT	B	$\neg$ (\<bit-No.\> of \<EAd\>) $\rightarrow$ (\<bit-No.\> of \<EAd\>)
		Inverts a specified bit in a general register or memory operand. The bit number is specified by 3-bit immediate data or the lower 3 bits of a general register.
BTST	B	$\neg$ (\<bit-No.\> of \<EAd\>) $\rightarrow$ Z
		Tests a specified bit in a general register or memory operand and sets or clears the Z flag accordingly. The bit number is specified by 3-bit immediate data or the lower 3 bits of a general register.
BAND	B	$C \wedge$ (\<bit-No.\> of \<EAd\>) $\rightarrow$ C
		ANDs the carry flag with a specified bit in a general register or memory operand and stores the result in the carry flag.
BIAND	B	$C \wedge [\neg$ (\<bit-No.\> of \<EAd\>)] $\rightarrow$ C
		ANDs the carry flag with the inverse of a specified bit in a general register or memory operand and stores the result in the carry flag.
		The bit number is specified by 3-bit immediate data.

Note: * Size refers to the operand size.
          B: Byte

Table 2-7 Bit Manipulation Instructions (cont)

Instruction	Size*	Function
BOR	B	$C \vee (\text{<bit-No.> of <EAd>}) \rightarrow C$
		ORs the carry flag with a specified bit in a general register or memory operand and stores the result in the carry flag.
BIOR	B	$C \vee [\neg (\text{<bit-No.> of <EAd>})] \rightarrow C$
		ORs the carry flag with the inverse of a specified bit in a general register or memory operand and stores the result in the carry flag.
		The bit number is specified by 3-bit immediate data.
BXOR	B	$C \oplus (\text{<bit-No.> of <EAd>}) \rightarrow C$
		Exclusive-ORs the carry flag with a specified bit in a general register or memory operand and stores the result in the carry flag.
BIXOR	B	$C \oplus [\neg (\text{<bit-No.> of <EAd>})] \rightarrow C$
		Exclusive-ORs the carry flag with the inverse of a specified bit in a general register or memory operand and stores the result in the carry flag.
		The bit number is specified by 3-bit immediate data.
BLD	B	$(\text{<bit-No.> of <EAd>}) \rightarrow C$
		Transfers a specified bit in a general register or memory operand to the carry flag.
BILD	B	$\neg (\text{<bit-No.> of <EAd>}) \rightarrow C$
		Transfers the inverse of a specified bit in a general register or memory operand to the carry flag.
		The bit number is specified by 3-bit immediate data.
BST	B	$C \rightarrow (\text{<bit-No.> of <EAd>})$
		Transfers the carry flag value to a specified bit in a general register or memory operand.
BIST	B	$C \rightarrow \neg (\text{<bit-No.> of <EAd>})$
		Transfers the inverse of the carry flag value to a specified bit in a general register or memory operand.
		The bit number is specified by 3-bit immediate data.

Note: * Size refers to the operand size.
     B: Byte

Table 2-8   Branching Instructions

Instruction	Size	Function
Bcc	—	Branches to a specified address if a specified condition is true. The branching conditions are listed below.

Mnemonic	Description	Condition
BRA (BT)	Always (true)	Always
BRN (BF)	Never (false)	Never
BHI	High	$C \vee Z = 0$
BLS	Low or same	$C \vee Z = 1$
Bcc (BHS)	Carry clear (high or same)	$C = 0$
BCS (BLO)	Carry set (low)	$C = 1$
BNE	Not equal	$Z = 0$
BEQ	Equal	$Z = 1$
BVC	Overflow clear	$V = 0$
BVS	Overflow set	$V = 1$
BPL	Plus	$N = 0$
BMI	Minus	$N = 1$
BGE	Greater or equal	$N \oplus V = 0$
BLT	Less than	$N \oplus V = 1$
BGT	Greater than	$Z \vee (N \oplus V) = 0$
BLE	Less or equal	$Z \vee (N \oplus V) = 1$

Instruction	Size	Function
JMP	—	Branches unconditionally to a specified address
BSR	—	Branches to a subroutine at a specified address
JSR	—	Branches to a subroutine at a specified address
RTS	—	Returns from a subroutine

Table 2-9 System Control Instructions

Instruction	Size*	Function
TRAPA	—	Starts trap-instruction exception handling
RTE	—	Returns from an exception-handling routine
SLEEP	—	Causes a transition to the power-down state
LDC	B/W	(EAs) → CCR
		Moves the source operand contents to the condition code register. The condition code register size is one byte, but in transfer from memory, data is read by word access.
STC	B/W	CCR → (EAd)
		Transfers the CCR contents to a destination location. The condition code register size is one byte, but in transfer to memory, data is written by word access.
ANDC	B	CCR ∧ #IMM → CCR
		Logically ANDs the condition code register with immediate data.
ORC	B	CCR ∨ #IMM → CCR
		Logically ORs the condition code register with immediate data.
XORC	B	CCR ⊕ #IMM → CCR
		Logically exclusive-ORs the condition code register with immediate data.
NOP	—	PC + 2 → PC
		Only increments the program counter.

Note: * Size refers to the operand size.
    B: Byte
    W: Word

Table 2-10 Block Transfer Instruction

Instruction	Size	Function
EEPMOV.B	—	if R4L ≠ 0 then 　　repeat　@ER5+ → @ER6+, R4L − 1 → R4L 　　until　　R4L = 0 else next;
EEPMOV.W	—	if R4 ≠ 0 then 　　repeat　@ER5+ → @ER6+, R4 − 1 → R4 　　until　　R4 = 0 else next; Transfers a data block according to parameters set in general registers R4L or R4, ER5, and ER6. R4L or R4: Size of block (bytes) ER5:　　　Starting source address ER6:　　　Starting destination address Execution of the next instruction begins as soon as the transfer is completed.

2.6.4 Basic Instruction Formats

The H8/300H instructions consist of 2-byte (1-word) units. An instruction consists of an operation field (OP field), a register field (r field), an effective address extension (EA field), and a condition field (cc).

Operation Field: Indicates the function of the instruction, the addressing mode, and the operation to be carried out on the operand. The operation field always includes the first 4 bits of the instruction. Some instructions have two operation fields.

Register Field: Specifies a general register. Address registers are specified by 3 bits, data registers by 3 bits or 4 bits. Some instructions have two register fields. Some have no register field.

Effective Address Extension: Eight, 16, or 32 bits specifying immediate data, an absolute address, or a displacement. A 24-bit address or displacement is treated as 32-bit data in which the first 8 bits are 0 (H'00).

Condition Field: Specifies the branching condition of Bcc instructions.

Figure 2-9 shows examples of instruction formats.
Figure 2-9   Instruction Formats

2.6.5 Notes on Use of Bit Manipulation Instructions

The BSET, BCLR, BNOT, BST, and BIST instructions read a byte of data, modify a bit in the byte, then write the byte back. Care is required when these instructions are used to access registers with write-only bits, or to access ports.

The BCLR instruction can be used to clear flags in the on-chip registers. In an interrupt-handling routine, for example, if it is known that the flag is set to 1, it is not necessary to read the flag ahead of time.

2.7 Addressing Modes and Effective Address Calculation

2.7.1 Addressing Modes

The H8/300H CPU supports the eight addressing modes listed in table 2-11. Each instruction uses a subset of these addressing modes. Arithmetic and logic instructions can use the register direct and immediate modes. Data transfer instructions can use all addressing modes except program-counter relative and memory indirect. Bit manipulation instructions use register direct, register indirect, or absolute (@aa:8) addressing mode to specify an operand, and register direct (BSET, BCLR, BNOT, and BTST instructions) or immediate (3-bit) addressing mode to specify a bit number in the operand.

Table 2-11 Addressing Modes

No.	Addressing Mode	Symbol
1	Register direct	Rn
2	Register indirect	@ERn
3	Register indirect with displacement	@(d:16, ERn)/@d:24, ERn)
4	Register indirect with post-increment Register indirect with pre-decrement	@ERn+ @–ERn
5	Absolute address	@aa:8/@aa:16/@aa:24
6	Immediate	#xx:8/#xx:16/#xx:32
7	Program-counter relative	@(d:8, PC)/@(d:16, PC)
8	Memory indirect	@@aa:8

1 Register Direct—Rn: The register field of the instruction code specifies an 8-, 16-, or 32-bit register containing the operand. R0H to R7H and R0L to R7L can be specified as 8-bit registers. R0 to R7 and E0 to E7 can be specified as 16-bit registers. ER0 to ER7 can be specified as 32-bit registers.

2 Register Indirect—@ERn: The register field of the instruction code specifies an address register (ERn), the lower 24 bits of which contain the address of the operand.

3 Register Indirect with Displacement—@(d:16, ERn) or @(d:24, ERn): A 16-bit or 24-bit displacement contained in the instruction code is added to the contents of an address register (ERn) specified by the register field of the instruction, and the lower 24 bits of the sum specify the address of a memory operand. A 16-bit displacement is sign-extended when added.

4 Register Indirect with Post-Increment or Pre-Decrement—@ERn+ or @–ERn:

• Register indirect with post-increment—@ERn+

   The register field of the instruction code specifies an address register (ERn) the lower 24 bits of which contain the address of a memory operand. After the operand is accessed, 1, 2, or 4 is added to the address register contents (32 bits) and the sum is stored in the address register. The value added is 1 for byte access, 2 for word access, or 4 for longword access. For word or longword access, the register value should be even.

• Register indirect with pre-decrement—@–ERn

   The value 1, 2, or 4 is subtracted from an address register (ERn) specified by the register field in the instruction code, and the lower 24 bits of the result become the address of a memory operand. The result is also stored in the address register. The value subtracted is 1 for byte access, 2 for word access, or 4 for longword access. For word or longword access, the resulting register value should be even.

5 Absolute Address—@aa:8, @aa:16, or @aa:24: The instruction code contains the absolute address of a memory operand. The absolute address may be 8 bits long (@aa:8), 16 bits long (@aa:16), or 24 bits long (@aa:24). For an 8-bit absolute address, the upper 16 bits are all assumed to be 1 (H'FFFF). For a 16-bit absolute address the upper 8 bits are a sign extension. A 24-bit absolute address can access the entire address space. Table 2-12 indicates the accessible address ranges.

Table 2-12 Absolute Address Access Ranges

Absolute Address	1-Mbyte Modes	64-kbyte Modes
8 bits (@aa:8)	H'FFF00 to H'FFFFF (1048320 to 1048575)	H'FF00 to H'FFFF (65280 to 65535)
16 bits (@aa:16)	H'00000 to H'07FFF, H'F8000 to H'FFFFF (0 to 32767, 1015808 to 1048575)	H'0000 to H'FFFF (0 to 65535)
24 bits (@aa:24)	H'00000 to H'FFFFF (0 to 1048575)	H'000000 to H'00FFFF (0 to 65535)

6 Immediate—#xx:8, #xx:16, or #xx:32: The instruction code contains 8-bit (#xx:8), 16-bit (#xx:16), or 32-bit (#xx:32) immediate data as an operand.

The instruction codes of the ADDS, SUBS, INC, and DEC instructions contain immediate data implicitly. The instruction codes of some bit manipulation instructions contain 3-bit immediate data specifying a bit number. The TRAPA instruction code contains 2-bit immediate data specifying a vector address.

7 Program-Counter Relative—@(d:8, PC) or @(d:16, PC): This mode is used in the Bcc and BSR instructions. An 8-bit or 16-bit displacement contained in the instruction code is sign-extended to 24 bits and added to the 24-bit PC contents to generate a 24-bit branch address. The PC value to which the displacement is added is the address of the first byte of the next instruction, so the possible branching range is –126 to +128 bytes (–63 to +64 words) or –32766 to +32768 bytes (–16383 to +16384 words) from the branch instruction. The resulting value should be an even number.

8 Memory Indirect—@@aa:8: This mode can be used by the JMP and JSR instructions. The instruction code contains an 8-bit absolute address specifying a memory operand. This memory operand contains a branch address. The memory operand is accessed by longword access. The first byte of the memory operand is ignored, generating a 24-bit branch address. See figure 2-10. The upper bits of the 8-bit absolute address are assumed to be 0 (H'0000), so the address range is 0 to 255 (H'000000 to H'0000FF). Note that the first part of this range is also the exception vector area. For further details see section 5, Interrupt Controller.
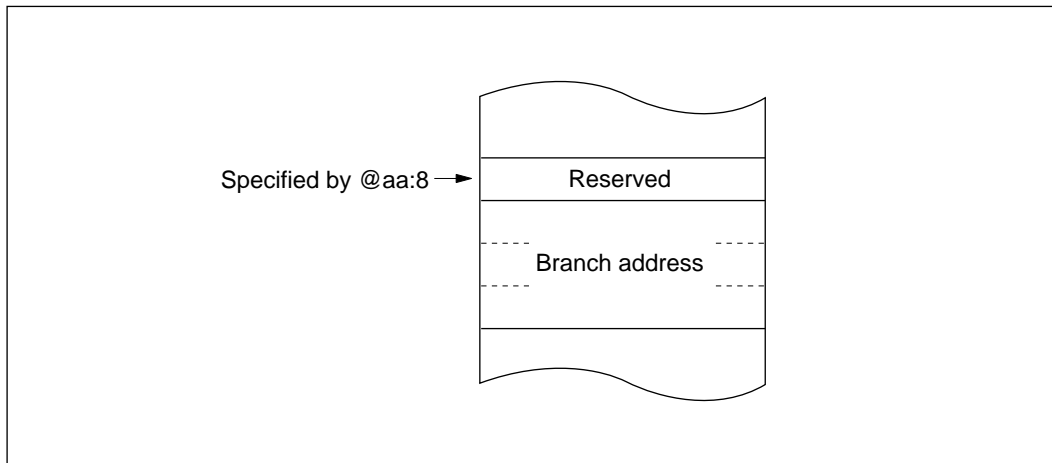

Figure 2-10   Memory-Indirect Branch Address Specification

When a word-size or longword-size memory operand is specified, or when a branch address is specified, if the specified memory address is odd, the least significant bit is regarded as 0. The accessed data or instruction code therefore begins at the preceding address. See section 2.5.2, Memory Data Formats.

2.7.2 Effective Address Calculation

Table 2-13 explains how an effective address is calculated in each addressing mode. In the 1-Mbyte operating modes the upper 4 bits of the calculated address are ignored in order to generate a 20-bit effective address.

Table 2-13 Effective Address Calculation

2.8 Processing States

2.8.1 Overview

The H8/300H CPU has five processing states: the program execution state, exception-handling state, power-down state, reset state, and bus-released state. The power-down state includes sleep mode, software standby mode, and hardware standby mode. Figure 2-11 classifies the processing states. Figure 2-13 indicates the state transitions.

```
┌─────────────────┐   ┌──────────────────────────┐
│Processing states│───│ Program execution state  │
└─────────────────┘   └──────────────────────────┘
                         The CPU executes program instructions in sequence

                      ┌──────────────────────────┐
                      │ Exception-handling state │
                      └──────────────────────────┘
                         A transient state in which the CPU executes a hardware sequence
                         (saving PC and CCR, fetching a vector, etc.) in response to a reset,
                         interrupt, or other exception

                      ┌──────────────────────────┐

```

Figure 2-11   Processing States

2.8.2 Program Execution State

In this state the CPU executes program instructions in normal sequence.

2.8.3 Exception-Handling State

The exception-handling state is a transient state that occurs when the CPU alters the normal program flow due to a reset, interrupt, or trap instruction. The CPU fetches a starting address from the exception vector table and branches to that address. In interrupt and trap exception handling the CPU references the stack pointer (ER7) and saves the program counter and condition code register.

Types of Exception Handling and Their Priority: Exception handling is performed for resets, interrupts, and trap instructions. Table 2-14 indicates the types of exception handling and their priority. Trap instruction exceptions are accepted at all times in the program execution state.

Table 2-14 Exception Handling Types and Priority

Priority	Type of Exception	Detection Timing	Start of Exception Handling
High	Reset	Synchronized with clock	Exception handling starts immediately when $\overline{RES}$ changes from low to high
	Interrupt	End of instruction execution or end of exception handling*	When an interrupt is requested, exception handling starts at the end of the current instruction or current exception-handling sequence
Low	Trap instruction	When TRAPA instruction is executed	Exception handling starts when a trap (TRAPA) instruction is executed

Note: * Interrupts are not detected at the end of the ANDC, ORC, XORC, and LDC instructions, or immediately after reset exception handling.

Figure 2-12 classifies the exception sources. For further details about exception sources, vector numbers, and vector addresses, see section 4, Exception Handling, and section 5, Interrupt Controller.
Figure 2-12   Classification of Exception Sources

Notes: 1. From any state except hardware standby mode, a transition to the reset state occurs whenever $\overline{RES}$ goes low.
2. From any state, a transition to hardware standby mode occurs when $\overline{STBY}$ goes low.
Figure 2-13   State Transitions

2.8.4 Exception-Handling Sequences

Reset Exception Handling: Reset exception handling has the highest priority. The reset state is entered when the $\overline{\text{RES}}$ signal goes low. Reset exception handling starts after that, when $\overline{\text{RES}}$ changes from low to high. When reset exception handling starts the CPU fetches a start address from the exception vector table and starts program execution from that address. All interrupts, including NMI, are disabled during the reset exception-handling sequence and immediately after it ends.

Interrupt Exception Handling and Trap Instruction Exception Handling: When these exception-handling sequences begin, the CPU references the stack pointer (ER7) and pushes the program counter and condition code register on the stack. Next, if the UE bit in the system control register (SYSCR) is set to 1, the CPU sets the I bit in the condition code register to 1. If the UE bit is cleared to 0, the CPU sets both the I bit and the UI bit in the condition code register to 1. Then the CPU fetches a start address from the exception vector table and execution branches to that address.

Figure 2-14 shows the stack after the exception-handling sequence.
Figure 2-14   Stack Structure after Exception Handling

2.8.5 Reset State

When the $\overline{\text{RES}}$ input goes low all current processing stops and the CPU enters the reset state. The I bit in the condition code register is set to 1 by a reset. All interrupts are masked in the reset state. Reset exception handling starts when the $\overline{\text{RES}}$ signal changes from low to high.

The reset state can also be entered by a watchdog timer overflow. For details see section 10, Watchdog Timer.

2.8.6 Power-Down State

In the power-down state the CPU stops operating to conserve power. There are three modes: sleep mode, software standby mode, and hardware standby mode.

Sleep Mode: A transition to sleep mode is made if the SLEEP instruction is executed while the SSBY bit is cleared to 0 in the system control register (SYSCR). CPU operations stop immediately after execution of the SLEEP instruction, but the contents of CPU registers are retained.

Software Standby Mode: A transition to software standby mode is made if the SLEEP instruction is executed while the SSBY bit is set to 1 in SYSCR. The CPU and clock halt and all on-chip supporting modules stop operating. The on-chip supporting modules are reset, but as long as a specified voltage is supplied the contents of CPU registers and on-chip RAM are retained. The I/O ports also remain in their existing states.

Hardware Standby Mode: A transition to hardware standby mode is made when the $\overline{\text{STBY}}$ input goes low. As in software standby mode, the CPU and clock halt and the on-chip supporting modules are reset, but as long as a specified voltage is supplied, on-chip RAM contents are retained.

For further information see section 16, Power-Down State.

2.9 Basic Operational Timing

2.9.1 Overview

The H8/300H CPU operates according to the system clock (ø). The interval from one rise of the system clock to the next rise is referred to as a "state." A memory cycle or bus cycle consists of two or three states. The CPU uses different methods to access on-chip memory, the on-chip supporting modules, and the external address space. Access to the external address space can be controlled by the bus controller.

2.9.2 On-Chip Memory Access Timing

On-chip memory is accessed in two states. The data bus is 16 bits wide, permitting both byte and word access. Figure 2-15 shows the on-chip memory access cycle. Figure 2-16 indicates the pin states.
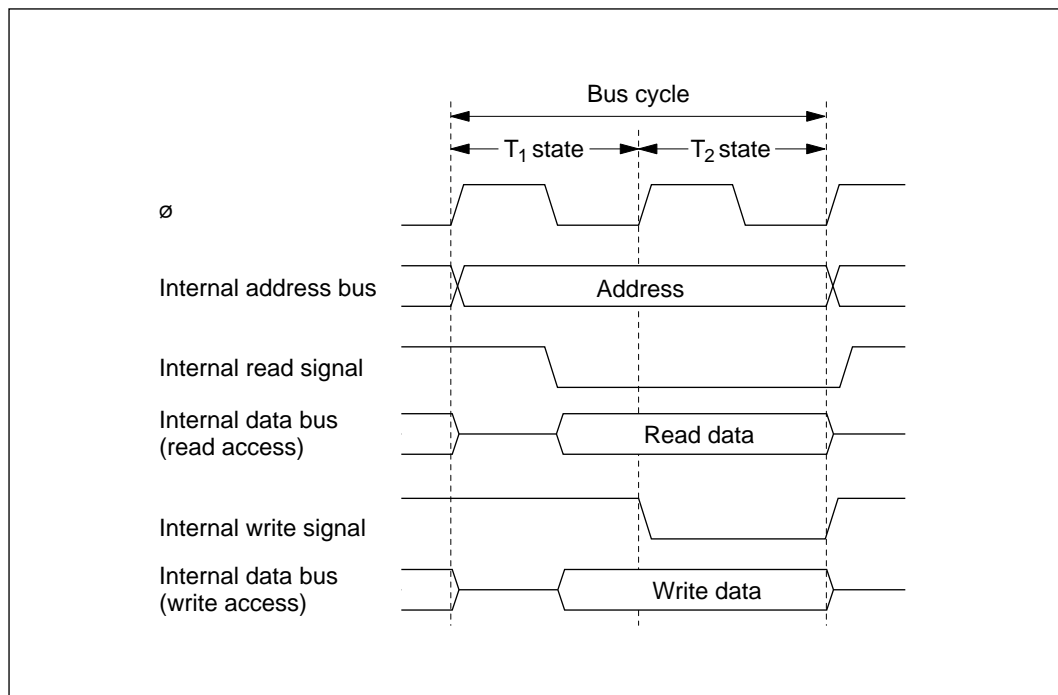

Figure 2-15   On-Chip Memory Access Cycle
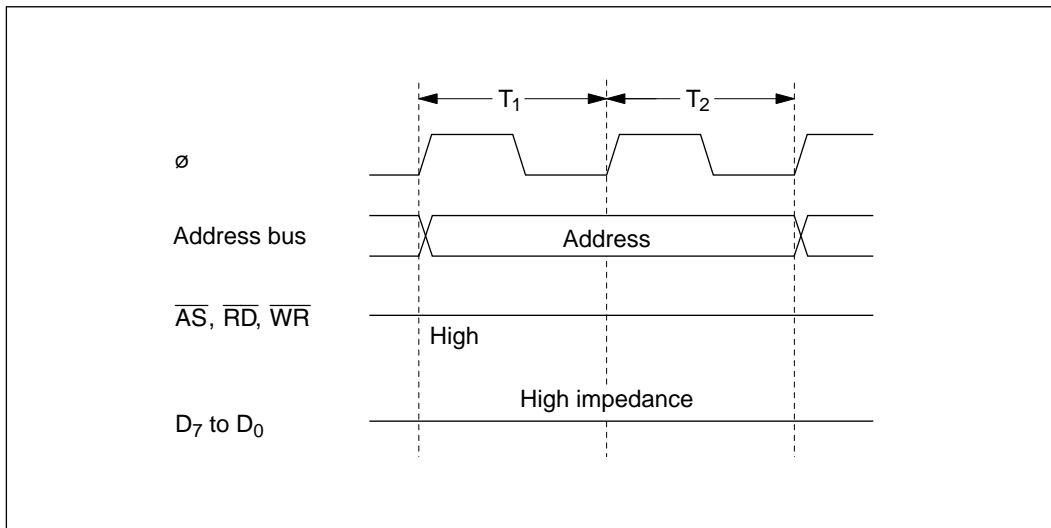

Figure 2-16   Pin States during On-Chip Memory Access

2.9.3 On-Chip Supporting Module Access Timing

The on-chip supporting modules are accessed in three states. The data bus is 8 or 16 bits wide, depending on the register being accessed. Figure 2-17 shows the on-chip supporting module access timing. Figure 2-18 indicates the pin states.
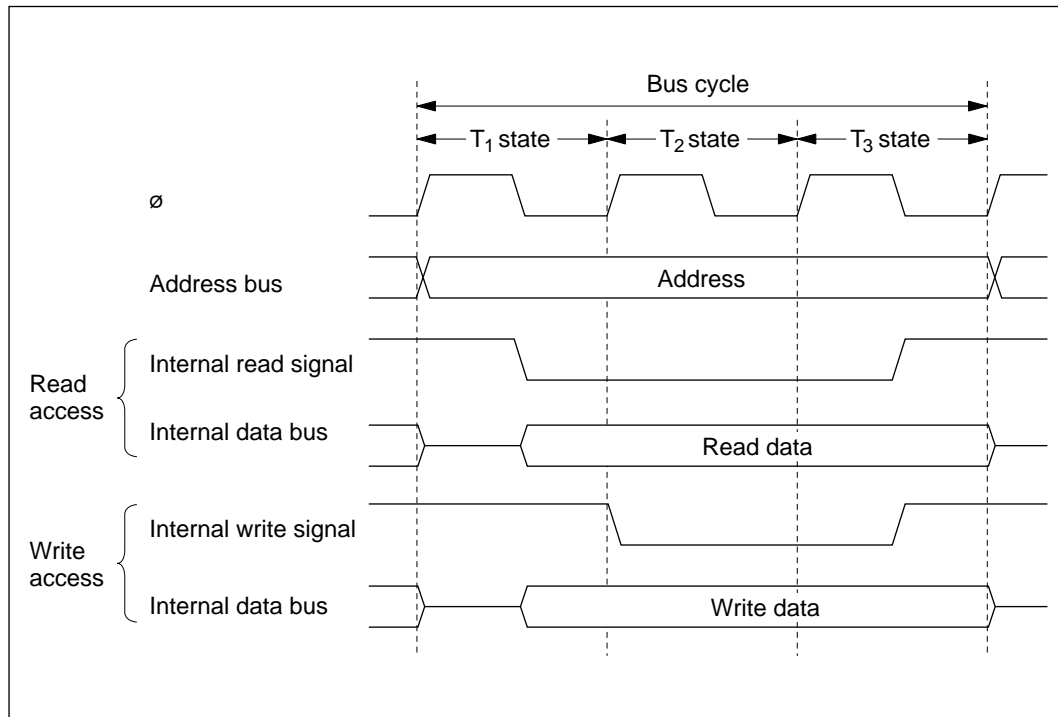

Figure 2-17   Access Cycle for On-Chip Supporting Modules
Figure 2-18   Pin States during Access to On-Chip Supporting Modules

2.9.4 Access to External Address Space

The external address space is divided into eight areas (areas 0 to 7). Bus-controller settings determine whether each area is accessed via an 8-bit or 16-bit bus, and whether it is accessed in two or three states. For details see section 6, Bus Controller.

Section 3   MCU Operating Modes

3.1 Overview

3.1.1 Operating Mode Selection

The H8/3032 Series has three operating modes (modes 1 to 3) that are selected by the mode pins (MD_1 and MD_0) as indicated in table 3-1. The input at these pins determines expanded mode or single-chip mode.

Table 3-1   Operating Mode Selection

	Mode Pins		Description		
Operating Mode	MD_1	MD_0	Address Space	Initial Bus Width[1]	On-Chip RAM
—	0	0	—	—	—
Mode 1	0	1	1 Mbyte	8 bits	Enabled[1]
Mode 2	1	0	64 kbytes	—	Enabled[2]
Mode 3	1	1	1 Mbyte	—	Enabled[2]

Notes: 1. In mode 1, if the RAM enable bit (RAME) in the system control register (SYSCR) is cleared to 0, these addresses become external addresses.
2. In modes 2 and 3, clearing bit RAME of SYSCR to 0 and reading the on-chip RAM always returns H'FF, and write access is ignored. For details, see section 13.3, Operation.

For the address space size there are two choices: 64 kbytes or 1 Mbyte.

Modes 1 and 3 support a maximum address space of 1 Mbyte. Mode 2 supports a maximum address space of 64 kbytes.

The H8/3032 Series can only be used in modes 1 to 3. The inputs at the mode pins must select one of these three modes. The inputs at the mode pins must not be changed during operation.

3.1.2 Register Configuration

The H8/3032 Series has a mode control register (MDCR) that indicates the inputs at the mode pins (MD_2 to MD_0), and a system control register (SYSCR). Table 3-2 summarizes these registers.

Table 3-2 Registers

Address*	Name	Abbreviation	R/W	Initial Value
H'FFF1	Mode control register	MDCR	R	Undetermined
H'FFF2	System control register	SYSCR	R/W	H'0B

Note: * The lower 16 bits of the address are indicated.

3.2 Mode Control Register (MDCR)

MDCR is an 8-bit read-only register that indicates the current operating mode of the H8/3032 Series.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	MDS1	MDS0
Initial value	1	1	0	0	0	1	—*	—*
Read/Write	—	—	—	—	—	—	R	R

Reserved bits → (bits 5 to 2)

Mode select 1 and 0
Bits indicating the current operating mode

Note: * Determined by pins MD_1 and MD_0.

Bits 7 and 6—Reserved: Read-only bits, always read as 1.

Bits 5 to 3—Reserved: Read-only bits, always read as 0.

Bit 2—Reserved: Read-only bit, always read as 1.

Bits 1 and 0—Mode Select 1 and 0 (MDS1 and MDS0): These bits indicate the logic levels at pins MD_1 and MD_0 (the current operating mode). MDS1 and MDS0 correspond to MD_1 and MD_0. MDS1 and MDS0 are read-only bits. The mode pin (MD_1 and MD_0) levels are latched when MDCR is read.

3.3 System Control Register (SYSCR)

SYSCR is an 8-bit register that controls the operation of the H8/3032 Series.

Bit	7	6	5	4	3	2	1	0
	SSBY	STS2	STS1	STS0	UE	NMIEG	—	RAME
Initial value	0	0	0	0	1	0	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	—	R/W

RAM enable
Enables or disables on-chip RAM

Reserved bit

NMI edge select
Selects the valid edge of the NMI input

User bit enable
Selects whether to use UI bit in CCR 6 as a user bit or an interrupt mask bit

Standby timer select 2 to 0
These bits select the waiting time at recovery from software standby mode

Software standby
Enables transition to software standby mode

Bit 7—Software Standby (SSBY): Enables transition to software standby mode. (For further information about software standby mode see section 16, Power-Down State.)

When software standby mode is exited by an external interrupt, this bit remains set to 1. To clear this bit, write 0.

Bit 7

SSBY	Description	
0	SLEEP instruction causes transition to sleep mode	(Initial value)
1	SLEEP instruction causes transition to software standby mode	

Bits 6 to 4—Standby Timer Select (STS2 to STS0): These bits select the length of time the CPU and on-chip supporting modules wait for the internal clock oscillator to settle when software standby mode is exited by an external interrupt. Set these bits so that the waiting time will be at least 8 ms at the system clock rate. For further information about waiting time selection, see section 19.4.3, Selection of Oscillator Waiting Time after Exit from Software Standby Mode.

Bit 6 STS2	Bit 5 STS1	Bit 4 STS0	Description	
0	0	0	Waiting time = 8192 states	(Initial value)
0	0	1	Waiting time = 16384 states	
0	1	0	Waiting time = 32768 states	
0	1	1	Waiting time = 65536 states	
1	0	—	Waiting time = 131072 states	
1	1	—	Illegal setting	

Bit 3—User Bit Enable (UE): Selects whether to use the UI bit in the condition code register as a user bit or an interrupt mask bit.

Bit 3 UE	Description	
0	UI bit in CCR is used as an interrupt mask bit	
1	UI bit in CCR is used as a user bit	(Initial value)

Bit 2—NMI Edge Select (NMIEG): Selects the valid edge of the NMI input.

Bit 2 NMIEG	Description	
0	An interrupt is requested at the falling edge of NMI	(Initial value)
1	An interrupt is requested at the rising edge of NMI	

Bit 1—Reserved: Read-only bit, always read as 1.

Bit 0—RAM Enable (RAME): Enables or disables the on-chip RAM. The RAME bit is initialized by the rising edge of the $\overline{\text{RES}}$ signal. It is not initialized in software standby mode.

Bit 0 RAME	Description	
0	On-chip RAM is disabled	
1	On-chip RAM is enabled	(Initial value)

3.4 Operating Mode Descriptions

3.4.1 Mode 1

1-Mbyte address space can be accessed including the on-chip ROM addresses. Port 3 pins function as data pins D_7 to D_0 and port 1, 2, and 5 pins function as address pins A_{19} to A_0. The address bus width can be selected by setting DDR of ports 1, 2, and 5.

3.4.2 Mode 2

This mode is a normal mode with a 64-kbyte address space which operates using the on-chip ROM, RAM, and registers. External addresses cannot be accessed. The vector area and stack area can be saved.

3.4.3 Mode 3

This mode is an advanced mode with a 1-Mbyte address space which operates using the on-chip ROM, RAM, and registers. External addresses cannot be accessed.

3.5 Pin Functions in Each Operating Mode

The pin functions of ports 1, 2, 3, 5, and 6 vary depending on the operating mode. Table 3-3 indicates their functions in each operating mode.

Table 3-3 Pin Functions in Each Mode

Port	Mode 1	Modes 2, 3
Port 1	$P1_7$ to $P1_0$[*1]	$P1_7$ to $P1_0$
Port 2	$P2_7$ to $P2_0$[*1]	$P2_7$ to $P2_0$
Port 3	D_7 to D_0	$P3_7$ to $P3_0$
Port 5	$P5_3$ to $P5_0$[*1]	$P5_3$ to $P5_0$
Port 6	$\overline{WR}$, $\overline{RD}$, $\overline{AS}$, $P6_6/\overline{WAIT}$[*2]	$P6_5$ to $P6_3$, $P6_0$

Notes: 1. Initial state. These pins function as an address bus by setting the corresponding DDR bit to 1.
2. The functions of these pins vary depending on the settings in the wait state controller enable register (WCER), wait control register (WCR), and port data direction register.

3.6 Memory Map in Each Operating Mode

Figure 3-1 shows a memory map of the H8/3032. Figure 3-2 shows a memory map of the H8/3031. Figure 3-3 shows a memory map of the H8/3030. The address space is divided into eight areas.

Figure 3-1   H8/3032 Memory Map in Each Operating Mode

- H'FFFFF

(8-bit memory-indirect addresses, 16-bit absolute addresses (first half), 8-bit absolute addresses, 16-bit absolute addresses (second half))

Notes: 1. External addresses can be accessed by disabling on-chip ROM.
2. Do not accessed reserved areas.

Figure 3-2   H8/3031 Memory Map in Each Operating Mode

Figure 3-3 H8/3030 Memory Map in Each Operating Mode

Section 4 Exception Handling

4.1 Overview

4.1.1 Exception Handling Types and Priority

As table 4-1 indicates, exception handling may be caused by a reset, trap instruction, or interrupt. Exception handling is prioritized as shown in table 4-1. If two or more exceptions occur simultaneously, they are accepted and processed in priority order. Trap instruction exceptions are accepted at all times in the program execution state.

Table 4-1 Exception Types and Priority

Priority	Exception Type	Start of Exception Handling
High	Reset	Starts immediately after a low-to-high transition at the $\overline{\text{RES}}$ pin
↑	Interrupt	Interrupt requests are handled when execution of the current instruction or handling of the current exception is completed
Low	Trap instruction (TRAPA)	Started by execution of a trap instruction (TRAPA)

4.1.2 Exception Handling Operation

Exceptions originate from various sources. Trap instructions and interrupts are handled as follows.

1. The program counter (PC) and condition code register (CCR) are pushed onto the stack.

2. The CCR interrupt mask bit is set to 1.

3. A vector address corresponding to the exception source is generated, and program execution starts from the address indicated in the vector address.

For a reset exception, steps 2 and 3 above are carried out.

4.1.3 Exception Vector Table

The exception sources are classified as shown in figure 4-1. Different vectors are assigned to different exception sources. Table 4-2 lists the exception sources and their vector addresses.
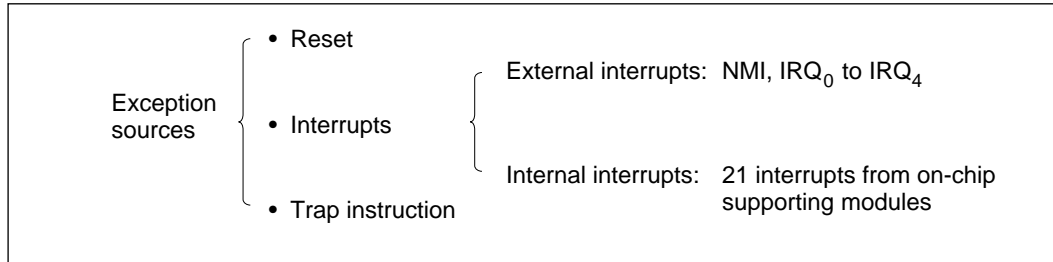

Figure 4-1 Exception Sources

Table 4-2 Exception Vector Table

Exception Source		Vector Number	Vector Address[1]	
			Advanced Mode	**Normal Mode**
Reset		0	H'0000 to H'0003	H'0000 to H'0001
Reserved for system use		1	H'0004 to H'0007	H'0002 to H'0003
		2	H'0008 to H'000B	H'0004 to H'0005
		3	H'000C to H'000F	H'0006 to H'0007
		4	H'0010 to H'0013	H'0008 to H'0009
		5	H'0014 to H'0017	H'000A to H'000B
		6	H'0018 to H'001B	H'000C to H'000D
External interrupt (NMI)		7	H'001C to H'001F	H'000E to H'000F
Trap instruction (4 sources)		8	H'0020 to H'0023	H'0010 to H'0011
		9	H'0024 to H'0027	H'0012 to H'0013
		10	H'0028 to H'002B	H'0014 to H'0015
		11	H'002C to H'002F	H'0016 to H'0017
External interrupt	IRQ_0	12	H'0030 to H'0033	H'0018 to H'0019
	IRQ_1	13	H'0034 to H'0037	H'001A to H'001B
	IRQ_2	14	H'0038 to H'003B	H'001C to H'001D
	IRQ_3	15	H'003C to H'003F	H'001E to H'001F
	IRQ_4	16	H'0040 to H'0043	H'0020 to H'0021
Reserved for system use		17	H'0044 to H'0047	H'0022 to H'0023
		18	H'0048 to H'004B	H'0024 to H'0025
		19	H'004C to H'004F	H'0026 to H'0027
Internal interrupts[2]		20 to 60	H'0050 to H'0053 to H'00F0 to H'00F3	H'0028 to H'0029 H'0078 to H'0079

Notes: 1. Lower 16 bits of the address.
    2. For the internal interrupt vectors, see section 5.3.3, Interrupt Vector Table.

4.2 Reset

4.2.1 Overview

A reset is the highest-priority exception. When the $\overline{\text{RES}}$ pin goes low, all processing halts and the H8/3032 Series enters the reset state. A reset initializes the internal state of the CPU and the registers of the on-chip supporting modules. Reset exception handling begins when the $\overline{\text{RES}}$ pin changes from low to high.

The H8/3032 Series can also be reset by overflow of the watchdog timer. For details see section 10, Watchdog Timer.

4.2.2 Reset Sequence

The H8/3032 Series enters the reset state when the $\overline{\text{RES}}$ pin goes low.

To ensure that the H8/3032 Series is reset, hold the $\overline{\text{RES}}$ pin low for at least 20 ms at power-up. To reset the H8/3032 Series during operation, hold the $\overline{\text{RES}}$ pin low for at least 10 system clock (ø) cycles. See appendix D.2, Pin States at Reset, for the states of the pins in the reset state.

When the $\overline{\text{RES}}$ pin goes high after being held low for the necessary time, the H8/3032 Series starts reset exception handling as follows.

• The internal state of the CPU and the registers of the on-chip supporting modules are initialized, and the I bit is set to 1 in CCR.

• The contents of the reset vector address (H'0000 to H'0003 in advanced mode, H'0000 to H'0001 in normal mode) are read, and program execution starts from the address indicated in the vector address.

Figure 4-2 shows the reset sequence in modes 1 and 3. Figure 4-3 shows the reset sequence in mode 2.

Figure 4-2 Reset Sequence (Modes 1 and 3)
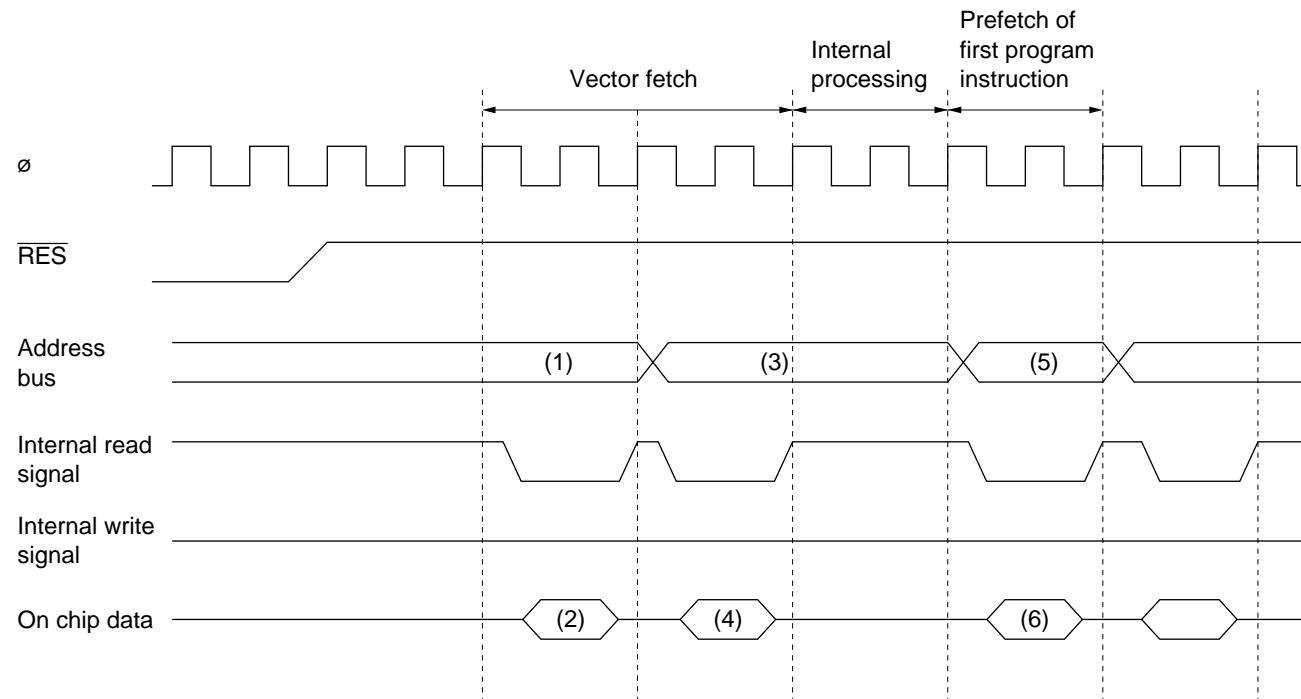

(1), (3) Address of reset vector: (1) = H'00000, (3) = H'00002
(2), (4) Start address (contents of reset vector)
(5)   Start address
(6)   First instruction of program

Note: After a reset, the wait-state controller inserts three wait states in every bus cycle.

68
Figure 4-3 Reset Sequence (Mode 2)

4.2.3 Interrupts after Reset

If an interrupt is accepted after a reset but before the stack pointer (SP) is initialized, PC and CCR will not be saved correctly, leading to a program crash. To prevent this, all interrupt requests, including NMI, are disabled immediately after a reset. The first instruction of the program is always executed immediately after the reset state ends. This instruction should initialize the stack pointer (example: MOV.L #xx:32, SP).

4.3 Interrupts

Interrupt exception handling can be requested by nine external sources (NMI, $\overline{IRQ_0}$ to $\overline{IRQ_4}$) and 21 internal sources in the on-chip supporting modules. Figure 4-4 classifies the interrupt sources and indicates the number of interrupts of each type.

The on-chip supporting modules that can request interrupts are the watchdog timer (WDT), 16-bit integrated timer unit (ITU), serial communication interface (SCI), and A/D converter. Each interrupt source has a separate vector address.

NMI is the highest-priority interrupt and is always accepted. Interrupts are controlled by the interrupt controller. The interrupt controller can assign interrupts other than NMI to two priority levels, and arbitrate between simultaneous interrupts. Interrupt priorities are assigned in interrupt priority registers A and B (IPRA and IPRB) in the interrupt controller.

For details on interrupts see section 5, Interrupt Controller.

Interrupts
- External interrupts
  - NMI (1)
  - IRQ_0 to IRQ_4 (5)
- Internal interrupts
  - WDT* (1)
  - ITU (15)
  - SCI (4)
  - A/D converter (1)

Note: Numbers in parentheses are the number of interrupt sources.
  * When the watchdog timer is used as an interval timer, it generates an interrupt request at every counter overflow.
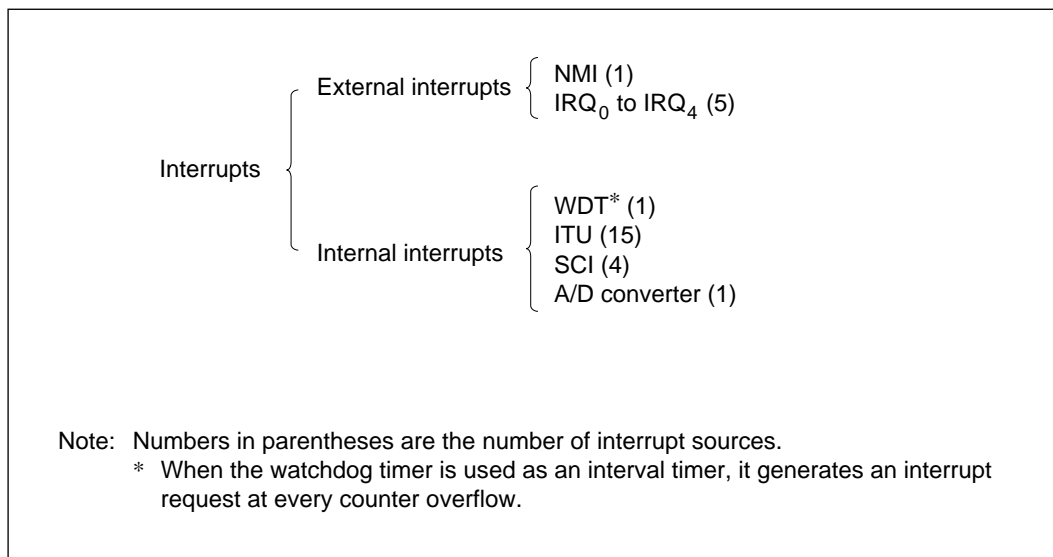

Figure 4-4   Interrupt Sources and Number of Interrupts

4.4 Trap Instruction

Trap instruction exception handling starts when a TRAPA instruction is executed. If the UE bit is set to 1 in the system control register (SYSCR), the exception handling sequence sets the I bit to 1 in CCR. If the UE bit is 0, the I and UI bits are both set to 1. The TRAPA instruction fetches a start address from a vector table entry corresponding to a vector number from 0 to 3, which is specified in the instruction code.

4.5 Stack Status after Exception Handling

Figure 4-5 shows the stack after completion of trap instruction exception handling and interrupt exception handling.
Figure 4-5   Stack after Completion of Exception Handling

4.6 Notes on Stack Usage

When accessing word data or longword data, the H8/3032 Series regards the lowest address bit as 0. The stack should always be accessed by word access or longword access, and the value of the stack pointer (SP, ER7) should always be kept even. Use the following instructions to save registers:

        PUSH.W Rn (or MOV.W Rn, @–SP)
        PUSH.L ERn (or MOV.L ERn, @–SP)

Use the following instructions to restore registers:

        POP.W Rn   (or MOV.W @SP+, Rn)
        POP.L ERn   (or MOV.L @SP+, ERn)

Setting SP to an odd value may lead to a malfunction. Figure 4-6 shows an example of what happens when the SP value is odd.
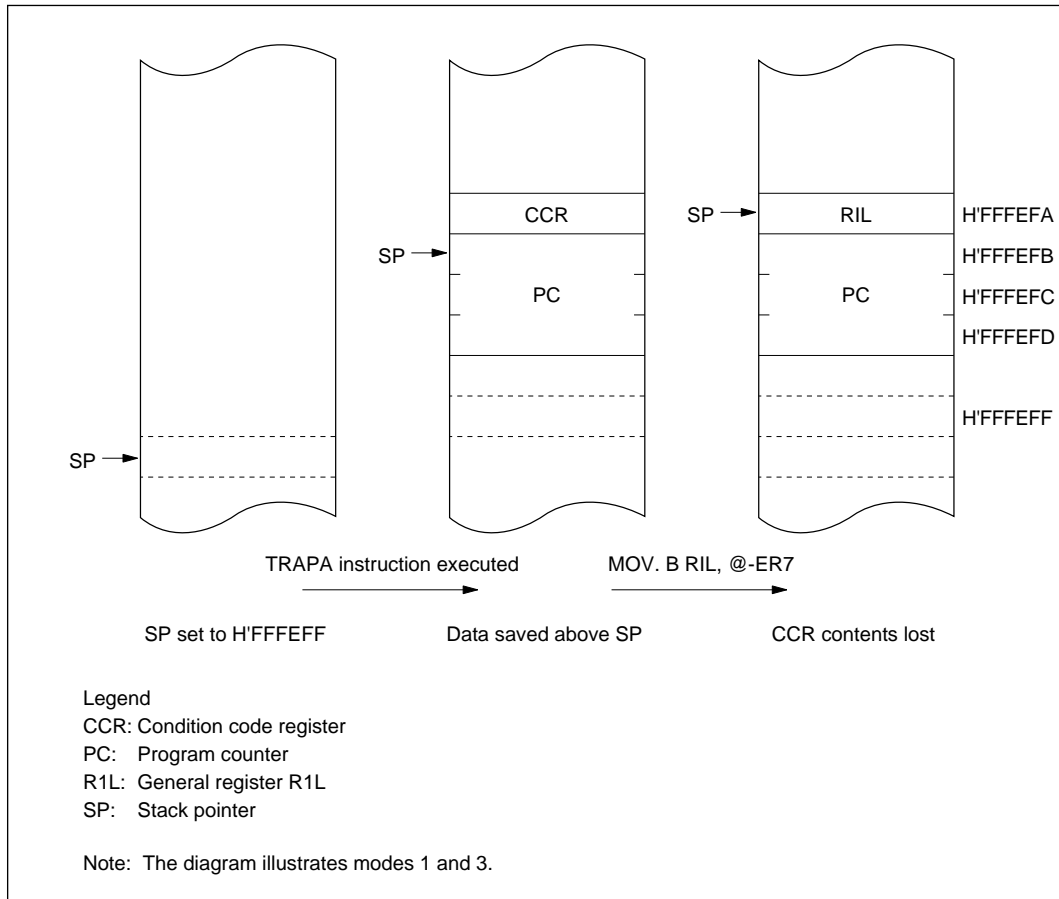

Figure 4-6   Operation when SP Value is Odd

Section 5   Interrupt Controller

5.1 Overview

5.1.1 Features

The interrupt controller has the following features:

- Interrupt priority registers (IPRs) for setting interrupt priorities

  Interrupts other than NMI can be assigned to two priority levels on a module-by-module basis in interrupt priority registers A and B (IPRA and IPRB).

- Three-level masking by the I and UI bits in the CPU condition code register (CCR)

- Independent vector addresses

  All interrupts are independently vectored; the interrupt service routine does not have to identify the interrupt source.

- Six external interrupt pins

  NMI has the highest priority and is always accepted; either the rising or falling edge can be selected. For each of IRQ_0 to IRQ_4, sensing of the falling edge or level sensing can be selected independently.

5.1.2 Block Diagram

Figure 5-1 shows a block diagram of the interrupt controller.
Figure 5-1   Interrupt Controller Block Diagram

5.1.3 Pin Configuration

Table 5-1 lists the interrupt pins.

Table 5-1 Interrupt Pins

Name	Abbreviation	I/O	Function
Nonmaskable interrupt	NMI	Input	Nonmaskable interrupt, rising edge or falling edge selectable
External interrupt request 4 to 0	$\overline{IRQ_4}$ to $\overline{IRQ_0}$	Input	Maskable interrupts, falling edge or level sensing selectable

5.1.4 Register Configuration

Table 5-2 lists the registers of the interrupt controller.

Table 5-2 Interrupt Controller Registers

Address[1]	Name	Abbreviation	R/W	Initial Value
H'FFF2	System control register	SYSCR	R/W	H'0B
H'FFF4	IRQ sense control register	ISCR	R/W	H'00
H'FFF5	IRQ enable register	IER	R/W	H'00
H'FFF6	IRQ status register	ISR	R/(W)[2]	H'00
H'FFF8	Interrupt priority register A	IPRA	R/W	H'00
H'FFF9	Interrupt priority register B	IPRB	R/W	H'00

Notes: 1. Lower 16 bits of the address.
      2. Only 0 can be written, to clear flags.

5.2 Register Descriptions

5.2.1 System Control Register (SYSCR)

SYSCR is an 8-bit readable/writable register that controls software standby mode, selects the action of the UI bit in CCR, selects the NMI edge, and enables or disables the on-chip RAM.

Only bits 3 and 2 are described here. For the other bits, see section 3.3, System Control Register (SYSCR).

SYSCR is initialized to H'0B by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bit	7	6	5	4	3	2	1	0
	SSBY	STS2	STS1	STS0	UE	NMIEG	—	RAME
Initial value	0	0	0	0	1	0	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

RAM enable

Reserved bit

NMI edge select
Selects the NMI input edge

**Standby timer
select 2 to 0**

User bit enable
Selects whether to use CCR bit 6
as a user bit or interrupt mask bit

Software standby

78
Bit 3—User Bit Enable (UE): Selects whether to use the UI bit in CCR as a user bit or an interrupt mask bit.

Bit 3 UE	Description	
0	UI bit in CCR is used as interrupt mask bit	
1	UI bit in CCR is used as user bit	(Initial value)

Bit 2—NMI Edge Select (NMIEG): Selects the NMI input edge.

Bit 2 NMIEG	Description	
0	Interrupt is requested at falling edge of NMI input	(Initial value)
1	Interrupt is requested at rising edge of NMI input	

5.2.2 Interrupt Priority Registers A and B (IPRA, IPRB)

IPRA and IPRB are 8-bit readable/writable registers that control interrupt priority.

Interrupt Priority Register A (IPRA): IPRA is an 8-bit readable/writable register in which interrupt priority levels can be set.

Bit	7	6	5	4	3	2	1	0
	IPRA7	IPRA6	IPRA5	IPRA4	IPRA3	IPRA2	IPRA1	IPRA0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Priority level A0
Selects the priority level of ITU channel 2 interrupt requests

Priority level A1
Selects the priority level of ITU channel 1 interrupt requests

Priority level A2
Selects the priority level of ITU channel 0 interrupt requests

Priority level A3
Selects the priority level of WDT interrupt requests

Priority level A4
Selects the priority level of IRQ_4 interrupt requests

Priority level A5
Selects the priority level of IRQ_2 and IRQ_3 interrupt requests

Priority level A6
Selects the priority level of IRQ_1 interrupt requests

Priority level A7
Selects the priority level of IRQ_0 interrupt requests

IPRA is initialized to H'00 by a reset and in hardware standby mode.

Bit 7—Priority Level A7 (IPRA7): Selects the priority level of IRQ_0 interrupt requests.

Bit 7 IPRA7	Description	
0	IRQ_0 interrupt requests have priority level 0 (low priority)	(Initial value)
1	IRQ_0 interrupt requests have priority level 1 (high priority)	

Bit 6—Priority Level A6 (IPRA6): Selects the priority level of IRQ_1 interrupt requests.

Bit 6 IPRA6	Description	
0	IRQ_1 interrupt requests have priority level 0 (low priority)	(Initial value)
1	IRQ_1 interrupt requests have priority level 1 (high priority)	

Bit 5—Priority Level A5 (IPRA5): Selects the priority level of IRQ_2 and IRQ_3 interrupt requests.

Bit 5 IPRA5	Description	
0	IRQ_2 and IRQ_3 interrupt requests have priority level 0 (low priority)	(Initial value)
1	IRQ_2 and IRQ_3 interrupt requests have priority level 1 (high priority)	

Bit 4—Priority Level A4 (IPRA4): Selects the priority level of IRQ_4 interrupt requests.

Bit 4 IPRA4	Description	
0	IRQ_4 interrupt requests have priority level 0 (low priority)	(Initial value)
1	IRQ_4 interrupt requests have priority level 1 (high priority)	

Bit 3—Priority Level A3 (IPRA3): Selects the priority level of WDT interrupt requests.

Bit 3 IPRA3	Description	
0	WDT interrupt requests have priority level 0 (low priority)	(Initial value)
1	WDT interrupt requests have priority level 1 (high priority)	

Bit 2—Priority Level A2 (IPRA2): Selects the priority level of ITU channel 0 interrupt requests.

Bit 2 IPRA2	Description	
0	ITU channel 0 interrupt requests have priority level 0 (low priority)	(Initial value)
1	ITU channel 0 interrupt requests have priority level 1 (high priority)	

Bit 1—Priority Level A1 (IPRA1): Selects the priority level of ITU channel 1 interrupt requests.

Bit 1 IPRA1	Description	
0	ITU channel 1 interrupt requests have priority level 0 (low priority)	(Initial value)
1	ITU channel 1 interrupt requests have priority level 1 (high priority)	

Bit 0—Priority Level A0 (IPRA0): Selects the priority level of ITU channel 2 interrupt requests.

Bit 0 IPRA0	Description	
0	ITU channel 2 interrupt requests have priority level 0 (low priority)	(Initial value)
1	ITU channel 2 interrupt requests have priority level 1 (high priority)	

Interrupt Priority Register B (IPRB): IPRB is an 8-bit readable/writable register in which interrupt priority levels can be set.

Bit	7	6	5	4	3	2	1	0
	IPRB7	IPRB6	—	—	IPRB3	—	IPRB1	—
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Reserved bit

Priority level B1
Selects the priority level of A/D converter interrupt request

Reserved bit

Priority level B3
Selects the priority level of SCI channel 0 interrupt requests

Reserved bits

Priority level B6
Selects the priority level of ITU channel 4 interrupt requests

Priority level B7
Selects the priority level of ITU channel 3 interrupt requests

IPRB is initialized to H'00 by a reset and in hardware standby mode.

83

Bit 7—Priority Level B7 (IPRB7): Selects the priority level of ITU channel 3 interrupt requests.

Bit 7 IPRB7	Description	
0	ITU channel 3 interrupt requests have priority level 0 (low priority)	(Initial value)
1	ITU channel 3 interrupt requests have priority level 1 (high priority)	

Bit 6—Priority Level B6 (IPRB6): Selects the priority level of ITU channel 4 interrupt requests.

Bit 6 IPRB6	Description	
0	ITU channel 4 interrupt requests have priority level 0 (low priority)	(Initial value)
1	ITU channel 4 interrupt requests have priority level 1 (high priority)	

Bits 5 and 4—Reserved: These bits can be written and read, but it does not affect interrupt priority.

Bit 3—Priority Level B3 (IPRB3): Selects the priority level of SCI interrupt requests.

Bit 3 IPRB3	Description	
0	SCI interrupt requests have priority level 0 (low priority)	(Initial value)
1	SCI interrupt requests have priority level 1 (high priority)	

Bit 2—Reserved: This bit can be written and read, but it does not affect interrupt priority.

Bit 1—Priority Level B1 (IPRB1): Selects the priority level of A/D converter interrupt requests.

Bit 1 IPRB1	Description	
0	A/D converter interrupt requests have priority level 0 (low priority)	(Initial value)
1	A/D converter interrupt requests have priority level 1 (high priority)	

Bit 0—Reserved: This bit can be written and read, but it does not affect interrupt priority.

5.2.3 IRQ Status Register (ISR)

ISR is an 8-bit readable/writable register that indicates the status of IRQ_0 to IRQ_4 interrupt requests.

Bit	7	6	5	4	3	2	1	0
	—	—	—	IRQ4F	IRQ3F	IRQ2F	IRQ1F	IRQ0F
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*

Reserved bits (bits 7 to 5)

IRQ_4 to IRQ_0 flags
These bits indicate IRQ_4 to IRQ_0 interrupt request status

Note: * Only 0 can be written, to clear flags.

ISR is initialized to H'00 by a reset and in hardware standby mode.

Bits 7 to 5—Reserved: Read-only bits, always read as 0.

Bits 4 to 0—IRQ_4 to IRQ_0 Flags (IRQ4F to IRQ0F): These bits indicate the status of IRQ_4 to IRQ_0 interrupt requests.

Bits 4 to 0 IRQ4F to IRQ0F	Description
0	[Clearing conditions] (Initial value) 0 is written in IRQnF after reading the IRQnF flag when IRQnF = 1. IRQnSC = 0, $\overline{IRQn}$ input is high, and interrupt exception handling is carried out. IRQnSC = 1 and IRQn interrupt exception handling is carried out.
1	[Setting conditions] IRQnSC = 0 and $\overline{IRQn}$ input is low. IRQnSC = 1 and $\overline{IRQn}$ input changes from high to low.

Note: n = 4 to 0

5.2.4 IRQ Enable Register (IER)

IER is an 8-bit readable/writable register that enables or disables IRQ_0 to IRQ_4 interrupt requests.

Bit	7	6	5	4	3	2	1	0
	—	—	—	IRQ4E	IRQ3E	IRQ2E	IRQ1E	IRQ0E
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Reserved bits

IRQ_4 to IRQ_0 enable
These bits enable or disable
IRQ_4 to IRQ_0 interrupts

IER is initialized to H'00 by a reset and in hardware standby mode.

Bits 7 to 5—Reserved: These bits can be written and read, but they do not enable or disable interrupts.

Bits 4 to 0—IRQ_4 to IRQ_0 Enable (IRQ7E to IRQ0E): These bits enable or disable IRQ_4 to IRQ_0 interrupts.

Bits 4 to 0 IRQ4E to IRQ0E	Description	
0	IRQ_4 to IRQ_0 interrupts are disabled	(Initial value)
1	IRQ_4 to IRQ_0 interrupts are enabled	

5.2.5 IRQ Sense Control Register (ISCR)

ISCR is an 8-bit readable/writable register that selects level sensing or falling-edge sensing of the inputs at pins $\overline{IRQ_4}$ to $\overline{IRQ_0}$.

Bit	7	6	5	4	3	2	1	0
	—	—	—	IRQ4SC	IRQ3SC	IRQ2SC	IRQ1SC	IRQ0SC
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Reserved bit

IRQ$_4$ to IRQ$_0$ sense control
These bits select level sensing or falling-edge sensing for IRQ_4 to IRQ_0 interrupts

ISCR is initialized to H'00 by a reset and in hardware standby mode.

Bits 7 to 5—Reserved: These bits can be written and read, but they do not select level or falling-edge sensing.

Bits 4 to 0—IRQ$_4$ to IRQ$_0$ Sense Control (IRQ4SC to IRQ0SC): These bits selects whether interrupts IRQ$_4$ to IRQ$_0$ are requested by level sensing of pins $\overline{IRQ_4}$ to $\overline{IRQ_0}$, or by falling-edge sensing.

Bits 4 to 0 IRQ4SC to IRQ0SC	Description
0	Interrupts are requested when $\overline{IRQ_4}$ to $\overline{IRQ_0}$ inputs are low (Initial value)
1	Interrupts are requested by falling-edge input at $\overline{IRQ_4}$ to $\overline{IRQ_0}$

5.3 Interrupt Sources

The interrupt sources include external interrupts (NMI, IRQ_0 to IRQ_4) and 21 internal interrupts.

5.3.1 External Interrupts

There are six external interrupts: NMI, and IRQ_0 to IRQ_4. Of these, NMI, IRQ_0, IRQ_1, and IRQ_2 can be used to exit software standby mode.

NMI: NMI is the highest-priority interrupt and is always accepted, regardless of the states of the I and UI bits in CCR. The NMIEG bit in SYSCR selects whether an interrupt is requested by the rising or falling edge of the input at the NMI pin. NMI interrupt exception handling has vector number 7.

IRQ_0 to IRQ_4 Interrupts: These interrupts are requested by input signals at pins $\overline{IRQ_0}$ to $\overline{IRQ_4}$. The IRQ_0 to IRQ_4 interrupts have the following features.

- ISCR settings can select whether an interrupt is requested by the low level of the input at pins $\overline{IRQ_0}$ to $\overline{IRQ_4}$, or by the falling edge.

- IER settings can enable or disable the IRQ_0 to IRQ_4 interrupts. Interrupt priority levels can be assigned by four bits in IPRA (IPRA7 to IPRA4).

- The status of IRQ_0 to IRQ_4 interrupt requests is indicated in ISR. The ISR flags can be cleared to 0 by software.

Figure 5-2 shows a block diagram of interrupts IRQ_0 to IRQ_4.
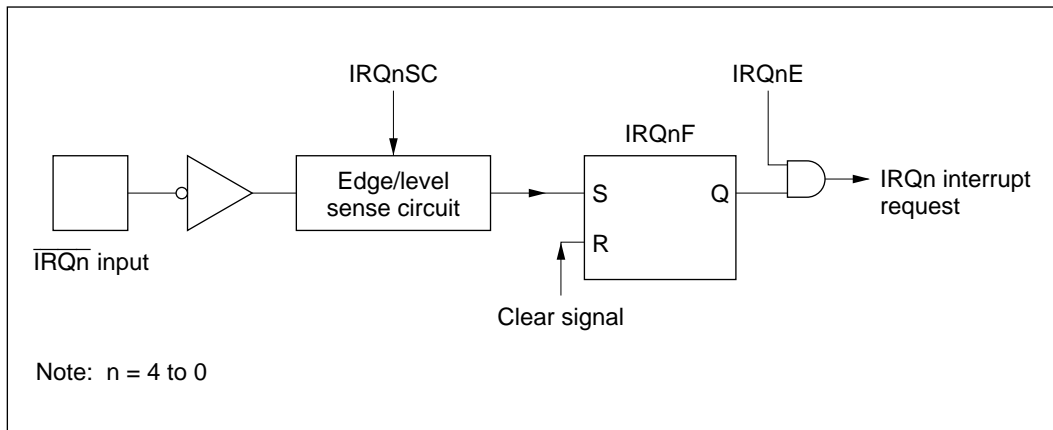

Figure 5-2 Block Diagram of Interrupts IRQ_0 to IRQ_4

Figure 5-3 shows the timing of the setting of the interrupt flags (IRQnF).
Figure 5-3   Timing of Setting of IRQnF

Interrupts IRQ_0 to IRQ_4 have vector numbers 12 to 16. These interrupts are detected regardless of whether the corresponding pin is set for input or output. When using a pin for external interrupt input, clear its DDR bit to 0 and do not use the pin for chip select output, refresh output, or SCI input or output.

5.3.2 Internal Interrupts

Twenty-one internal interrupts are requested from the on-chip supporting modules.

- Each on-chip supporting module has status flags for indicating interrupt status, and enable bits for enabling or disabling interrupts.

- Interrupt priority levels can be assigned in IPRA and IPRB.

5.3.3 Interrupt Vector Table

Table 5-3 lists the interrupt sources, their vector addresses, and their default priority order. In the default priority order, smaller vector numbers have higher priority. The priority of interrupts other than NMI can be changed in IPRA and IPRB. The priority order after a reset is the default order shown in table 5-3.

Table 5-3 Interrupt Sources, Vector Addresses, and Priority

Interrupt Source	Origin	Vector Number	Vector Address* Advanced Mode	Normal Mode	IPR	Priority
NMI	External pins	7	H'001C to H'001F	H'000E to H'000F	—	High
IRQ$_0$		12	H'0030 to H'0033	H'0018 to H'0019	IPRA7	↑
IRQ$_1$		13	H'0034 to H0037	H'001A to H'001B	IPRA6	
IRQ$_2$		14	H'0038 to H'003B	H'001C to H'001D	IPRA5	
IRQ$_3$		15	H'003C to H'003F	H'001E to H'001F

5.4 Interrupt Operation

5.4.1 Interrupt Handling Process

The H8/3032 Series handles interrupts differently depending on the setting of the UE bit. When UE = 1, interrupts are controlled by the I bit. When UE = 0, interrupts are controlled by the I and UI bits. Table 5-4 indicates how interrupts are handled for all setting combinations of the UE, I, and UI bits.

NMI interrupts are always accepted except in the reset and hardware standby states. IRQ interrupts and interrupts from the on-chip supporting modules have their own enable bits. Interrupt requests are ignored when the enable bits are cleared to 0.

Table 5-4 UE, I, and UI Bit Settings and Interrupt Handling

SYSCR	CCR		
UE	I	UI	Description
1	0	—	All interrupts are accepted. Interrupts with priority level 1 have higher priority.
	1	—	No interrupts are accepted except NMI.
0	0	—	All interrupts are accepted. Interrupts with priority level 1 have higher priority.
	1	0	NMI and interrupts with priority level 1 are accepted.
		1	No interrupts are accepted except NMI.

UE = 1: Interrupts IRQ_0 to IRQ_4 and interrupts from the on-chip supporting modules can all be masked by the I bit in the CPU's CCR. Interrupts are masked when the I bit is set to 1, and unmasked when the I bit is cleared to 0. Interrupts with priority level 1 have higher priority. Figure 5-4 is a flowchart showing how interrupts are accepted when UE = 1.
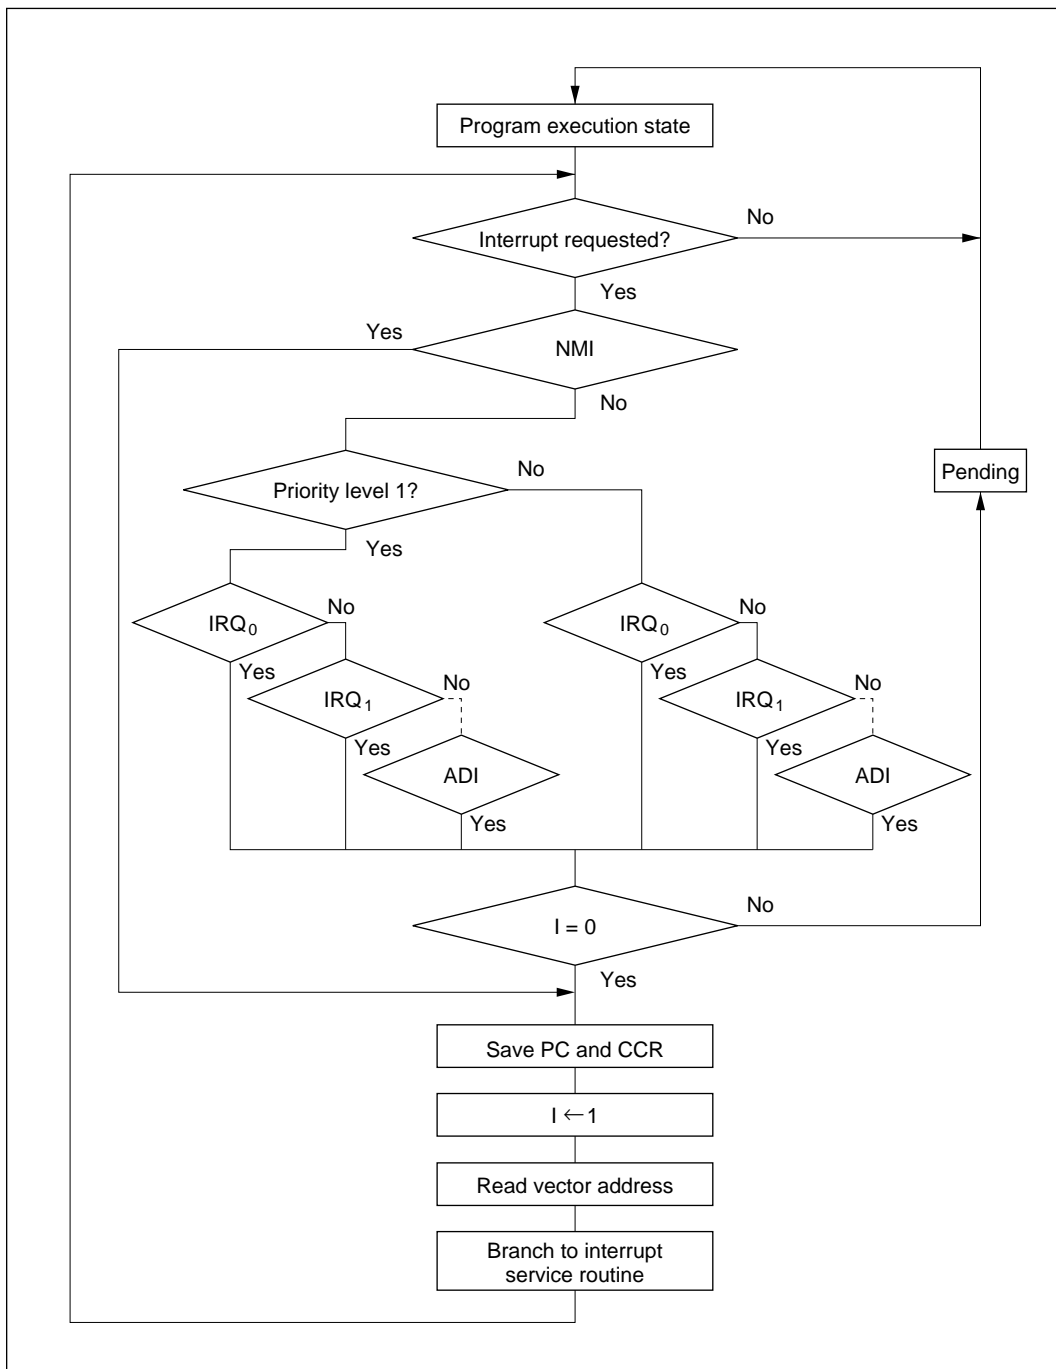

Figure 5-4   Process Up to Interrupt Acceptance when UE = 1

93

- If an interrupt condition occurs and the corresponding interrupt enable bit is set to 1, an interrupt request is sent to the interrupt controller.

- When the interrupt controller receives one or more interrupt requests, it selects the highest-priority request, following the IPR interrupt priority settings, and holds other requests pending. If two or more interrupts with the same IPR setting are requested simultaneously, the interrupt controller follows the priority order shown in table 5-3.

- The interrupt controller checks the I bit. If the I bit is cleared to 0, the selected interrupt request is accepted. If the I bit is set to 1, only NMI is accepted; other interrupt requests are held pending.

- When an interrupt request is accepted, interrupt exception handling starts after execution of the current instruction has been completed.

- In interrupt exception handling, PC and CCR are saved to the stack area. The PC value that is saved indicates the address of the first instruction that will be executed after the return from the interrupt service routine.

- Next the I bit is set to 1 in CCR, masking all interrupts except NMI.

- The vector address of the accepted interrupt is generated, and the interrupt service routine starts executing from the address indicated by the contents of the vector address.

UE = 0: The I and UI bits in the CPU's CCR and the IPR bits enable three-level masking of IRQ_0 to IRQ_4 interrupts and interrupts from the on-chip supporting modules.

- Interrupt requests with priority level 0 are masked when the I bit is set to 1, and are unmasked when the I bit is cleared to 0.

- Interrupt requests with priority level 1 are masked when the I and UI bits are both set to 1, and are unmasked when either the I bit or the UI bit is cleared to 0.

  For example, if the interrupt enable bits of all interrupt requests are set to 1, IPRA is set to H'20, and IPRB is set to H'00 (giving IRQ_2 and IRQ_3 interrupt requests priority over other interrupts), interrupts are masked as follows:

  a. If I = 0, all interrupts are unmasked (priority order: NMI > IRQ_2 > IRQ_3 >IRQ_0 …).
  b. If I = 1 and UI = 0, only NMI, IRQ_2, and IRQ_3 are unmasked.
  c. If I = 1 and UI = 1, all interrupts are masked except NMI.

Figure 5-5 shows the transitions among the above states.
Figure 5-5   Interrupt Masking State Transitions (Example)

Figure 5-6 is a flowchart showing how interrupts are accepted when UE = 0.

•   If an interrupt condition occurs and the corresponding interrupt enable bit is set to 1, an interrupt request is sent to the interrupt controller.

•   When the interrupt controller receives one or more interrupt requests, it selects the highest-priority request, following the IPR interrupt priority settings, and holds other requests pending. If two or more interrupts with the same IPR setting are requested simultaneously, the interrupt controller follows the priority order shown in table 5-3.

•   The interrupt controller checks the I bit. If the I bit is cleared to 0, the selected interrupt request is accepted regardless of its IPR setting, and regardless of the UI bit. If the I bit is set to 1 and the UI bit is cleared to 0, only NMI and interrupts with priority level 1 are accepted; interrupt requests with priority level 0 are held pending. If the I bit and UI bit are both set to 1, only NMI is accepted; all other interrupt requests are held pending.

•   When an interrupt request is accepted, interrupt exception handling starts after execution of the current instruction has been completed.

•   In interrupt exception handling, PC and CCR are saved to the stack area. The PC value that is saved indicates the address of the first instruction that will be executed after the return from the interrupt service routine.

•   The I and UI bits are set to 1 in CCR, masking all interrupts except NMI.

•   The vector address of the accepted interrupt is generated, and the interrupt service routine starts executing from the address indicated by the contents of the vector address.
Figure 5-6   Process Up to Interrupt Acceptance when UE = 0

96

5.4.2 Interrupt Sequence

Figure 5-7 shows the interrupt sequence in mode 1 when the program code and stack are in an on-chip memory area.

Interrupt accepted

| Interrupt level decision and wait for end of instruction | Instruction prefetch | Internal processing | Stack | Vector fetch | Internal processing | Prefetch of interrupt service routine instruction |

ø

Interrupt request signal

A$_{19}$ to A$_0$ — (1) (3) (5) (7) (9) (11) (13)

Internal read signal

Internal write signal — High

On-chip data — (2) (4) (6) (8) (10) (12) (14)

(1)   Instruction prefetch address (not executed; return address, same as PC contents)
(2), (4) Instruction code (not executed)
(3)   Instruction prefetch address (not executed)
(5)   SP – 2
(7)   SP – 4

(6), (8)   PC and CCR saved to stack
(9), (11)   Vector address
(10), (12) Starting address of interrupt service routine (contents of vector address)
(13)   Starting address of interrupt service routine; (13) = (10), (12)
(14)   First instruction of interrupt service routine

Note: Mode 1, with program code and stack in on-chip memory area.

Figure 5-7   Interrupt Sequence (Mode 2, Stack in External Memory)

5.4.3 Interrupt Response Time

Table 5-5 indicates the interrupt response time from the occurrence of an interrupt request until the first instruction of the interrupt service routine is executed.

Table 5-5 Interrupt Response Time

No.	Item	On-Chip Memory	External Memory 8-Bit Bus 2 States	External Memory 8-Bit Bus 3 States
1	Interrupt priority decision	2[*1]	2[*1]	2[*1]
2	Maximum number of states until end of current instruction	1 to 23	1 to 27	1 to 31[*4]
3	Saving PC and CCR to stack	4	8	12[*4]
4	Vector fetch	4	8	12[*4]
5	Instruction prefetch[*2]	4	8	12[*4]
6	Internal processing[*3]	4	4	4
Total		19 to 41	31 to 57	43 to 73

Notes: 1. 1 state for internal interrupts.
2. Prefetch after the interrupt is accepted and prefetch of the first instruction in the interrupt service routine.
3. Internal processing after the interrupt is accepted and internal processing after prefetch.
4. The number of states increases if wait states are inserted in external memory access.

5.5 Usage Notes

5.5.1 Contention between Interrupt and Interrupt-Disabling Instruction

When an instruction clears an interrupt enable bit to 0 to disable the interrupt, the interrupt is not disabled until after execution of the instruction is completed. If an interrupt occurs while a BCLR, MOV, or other instruction is being executed to clear its interrupt enable bit to 0, at the instant when execution of the instruction ends the interrupt is still enabled, so its interrupt exception handling is carried out. If a higher-priority interrupt is also requested, however, interrupt exception handling for the higher-priority interrupt is carried out, and the lower-priority interrupt is ignored. This also applies to the clearing of an interrupt flag.

Figure 5-8 shows an example in which an IMIEA bit is cleared to 0 in the ITU.
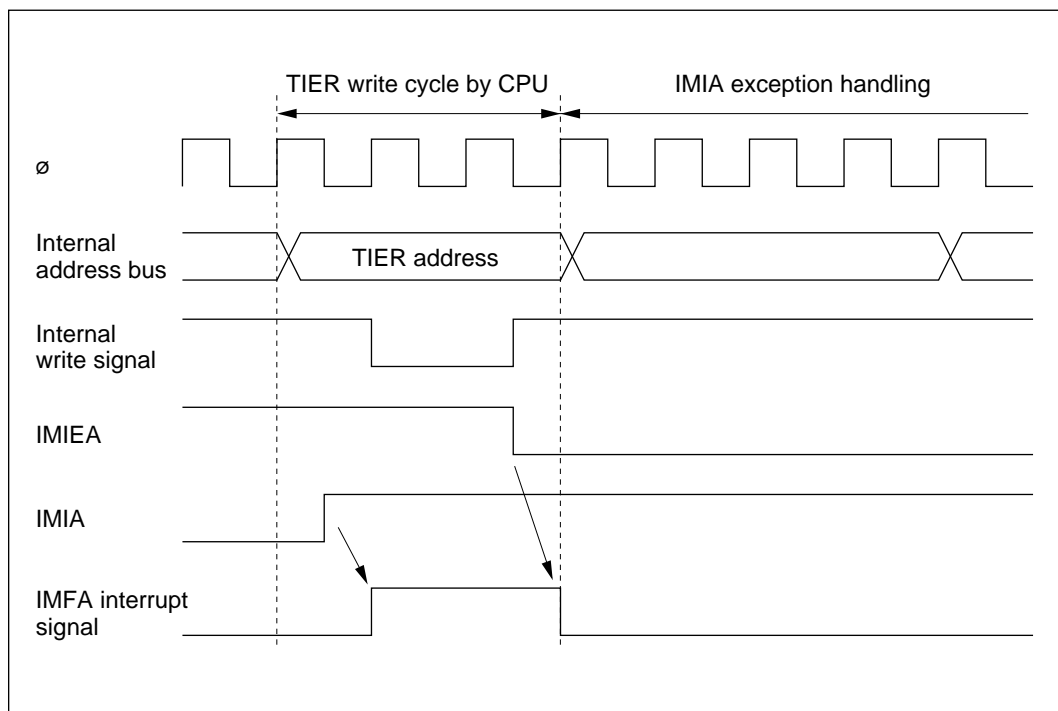

Figure 5-8   Contention between Interrupt and Interrupt-Disabling Instruction

This type of contention will not occur if the interrupt is masked when the interrupt enable bit or flag is cleared to 0.

5.5.2 Instructions that Inhibit Interrupts

The LDC, ANDC, ORC, and XORC instructions inhibit interrupts. When an interrupt occurs, after determining the interrupt priority, the interrupt controller requests a CPU interrupt. If the CPU is currently executing one of these interrupt-inhibiting instructions, however, when the instruction is completed the CPU always continues by executing the next instruction.

5.5.3 Interrupts during EEPMOV Instruction Execution

The EEPMOV.B and EEPMOV.W instructions differ in their reaction to interrupt requests.

When the EEPMOV.B instruction is executing a transfer, no interrupts are accepted until the transfer is completed, not even NMI.

When the EEPMOV.W instruction is executing a transfer, interrupt requests other than NMI are not accepted until the transfer is completed. If NMI is requested, NMI exception handling starts at a transfer cycle boundary. The PC value saved on the stack is the address of the next instruction. Programs should be coded as follows to allow for NMI interrupts during EEPMOV.W execution:

```
L1:  EEPMOV.W
     MOV.W R4,R4
     BNE   L1
```

Section 6   Bus Controller

6.1 Overview

The H8/3032 Series has an on-chip bus controller that divides the external address space into eight areas and can assign different bus specifications to each. This enables different types of memory to be connected easily.

A bus arbitration function of the bus controller controls the operation of the DMA controller (DMAC) and refresh controller. The bus controller can also release the bus to an external device.

6.1.1 Features

Features of the bus controller are listed below.

*   Independent settings for address areas 0 to 7

    — 128-kbyte areas in 1-Mbyte mode.
    — Areas can be designated for two-state or three-state access.

*   Four wait modes

    — Programmable wait mode, pin auto-wait mode, and pin wait modes 0 and 1 can be selected.
    — Zero to three wait states can be inserted automatically.

6.1.2 Block Diagram

Figure 6-1 shows a block diagram of the bus controller.
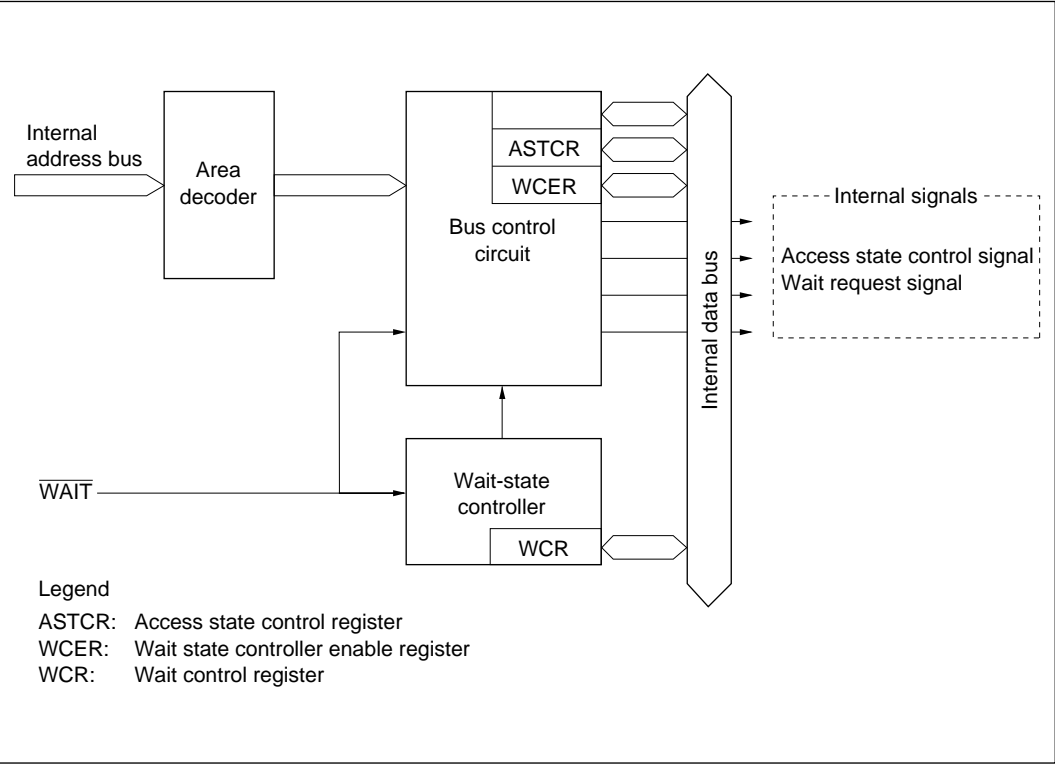

Figure 6-1   Block Diagram of Bus Controller

6.1.3 Input/Output Pins

Table 6-1 summarizes the bus controller's input/output pins.

Table 6-1   Bus Controller Pins

Name	Abbreviation	I/O	Function
Address strobe	$\overline{\text{AS}}$	Output	Strobe signal indicating valid address output on the address bus
Read	$\overline{\text{RD}}$	Output	Strobe signal indicating reading from the external address space
Write	$\overline{\text{WR}}$	Output	Strobe signal indicating writing to the external address space, with valid data on the data bus
Wait	$\overline{\text{WAIT}}$	Input	Wait request signal for access to external three-state-access areas

6.1.4 Register Configuration

Table 6-2 summarizes the bus controller's registers.

Table 6-2   Bus Controller Registers

Address*	Name	Abbreviation	R/W	Initial Value
H'FFED	Access state control register	ASTCR	R/W	H'FF
H'FFEE	Wait control register	WCR	R/W	H'F3
H'FFEF	Wait state controller enable register	WCER	R/W	H'FF

Note: * Lower 16 bits of the address.

6.2 Register Descriptions

6.2.1 Access State Control Register (ASTCR)

ASTCR is an 8-bit readable/writable register that selects whether each area is accessed in two states or three states.

Bit	7	6	5	4	3	2	1	0
	AST7	AST6	AST5	AST4	AST3	AST2	AST1	AST0
Initial value	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bits selecting number of states for access to each area

ASTCR is initialized to H'FF by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bits 7 to 0—Area 7 to 0 Access State Control (AST7 to AST0): These bits select whether the corresponding area is accessed in two or three states.

Bits 7 to 0 AST7 to AST0	Description	
0	Areas 7 to 0 are accessed in two states	
1	Areas 7 to 0 are accessed in three states	(Initial value)

ASTCR specifies the number of states in which external areas are accessed. On-chip memory and registers are accessed in a fixed number of states that does not depend on ASTCR settings.

6.2.2 Wait Control Register (WCR)

WCR is an 8-bit readable/writable register that selects the wait mode for the wait-state controller (WSC) and specifies the number of wait states.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	WMS1	WMS2	WC1	WC0
Initial value	1	1	1	1	0	0	1	1
Read/Write	—	—	—	—	R/W	R/W	R/W	R/W

Reserved bits

Wait count 1/0
These bits select the number of wait states inserted

Wait mode select 1/0
These bits select the wait mode

WCR is initialized to H'F3 by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bits 7 to 4—Reserved: Read-only bits, always read as 1.

Bits 3 and 2—Wait Mode Select 1 and 0 (WMS1/0): These bits select the wait mode.

Bit 3 WMS1	Bit 2 WMS0	Description	
0	0	Programmable wait mode	(Initial value)
	1	No wait states inserted by wait-state controller	
1	0	Pin wait mode 1	
	1	Pin auto-wait mode	

Bits 1 and 0—Wait Count 1 and 0 (WC1/0): These bits select the number of wait states inserted in access to external three-state-access areas.

Bit 1 WC1	Bit 0 WC0	Description	
0	0	No wait states inserted by wait-state controller	
	1	1 state inserted	
1	0	2 states inserted	
	1	3 states inserted	(Initial value)

6.2.3 Wait State Controller Enable Register (WCER)

WCER is an 8-bit readable/writable register that enables or disables wait-state control of external three-state-access areas by the wait-state controller.

Bit	7	6	5	4	3	2	1	0
	WCE7	WCE6	WCE5	WCE4	WCE3	WCE2	WCE1	WCE0
Initial value	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Wait state controller enable 7 to 0
These bits enable or disable wait-state control

WCER is initialized to H'FF by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bits 7 to 0—Wait-State Controller Enable 7 to 0 (WCE7 to WCE0): These bits enable or disable wait-state control of external three-state-access areas.

Bits 7 to 0 WCE7 to WCE0	Description	
0	Wait-state control disabled (pin wait mode 0)	
1	Wait-state control enabled	(Initial value)

6.3 Operation

6.3.1 Area Division

The external address space is divided into areas 0 to 7. Each area has a size of 128 kbytes in the 1-Mbyte mode. Figure 6-2 shows a general view of the memory map.

Address	Region
H'00000	On-chip ROM[1]
H'1FFFF	Area 0 (128 kbytes)
H'20000	Area 1 (128 kbytes)
H'3FFFF	
H'40000	Area 2 (128 kbytes)
H'5FFFF	
H'60000	Area 3 (128 kbytes)
H'7FFFF	
H'80000	Area 4 (128 kbytes)
H'9FFFF	
H'A0000	Area 5 (128 kbytes)
H'BFFFF	
H'C0000	Area 6 (128 kbytes)
H'DFFFF	
H'E0000	Area 7 (128 kbytes)
	On-chip RAM[1, 2]
	External address space[3]
H'FFFFF	On-chip I/O registers[1]

1-Mbyte mode (mode 1)

Notes: There is no area division in modes 2 and 3.

1. The number of access states to on-chip ROM, on-chip RAM, and on-chip I/O registers is fixed.
2. This area follows area 7 specifications when the RAME bit in SYSCR is 0.
3. This area follows area 7 specifications.

Figure 6-2 Access Area Map

The bus specifications for each area can be selected in ASTCR, WCER, and WCR as shown in table 6-3.

Table 6-3   Bus Specifications

ASTCR	WCER	WCR		Bus Specifications		
ASTn	WCEn	WMS1	WMS0	Bus Width	Access States	Wait Mode
0	—	—	—	8	2	Disabled
1	0	—	—	8	3	Pin wait mode 0
	1	0	0	8	3	Programmable wait mode
			1	8	3	Disabled
		1	0	8	3	Pin wait mode 1
			1	8	3	Pin auto-wait mode

Note: n = 0 to 7

6.3.2 Bus Control Signal Timing

8-Bit, Three-State-Access Areas: Figure 6-3 shows the timing of bus control signals for an 8-bit, three-state-access area. Wait states can be inserted.
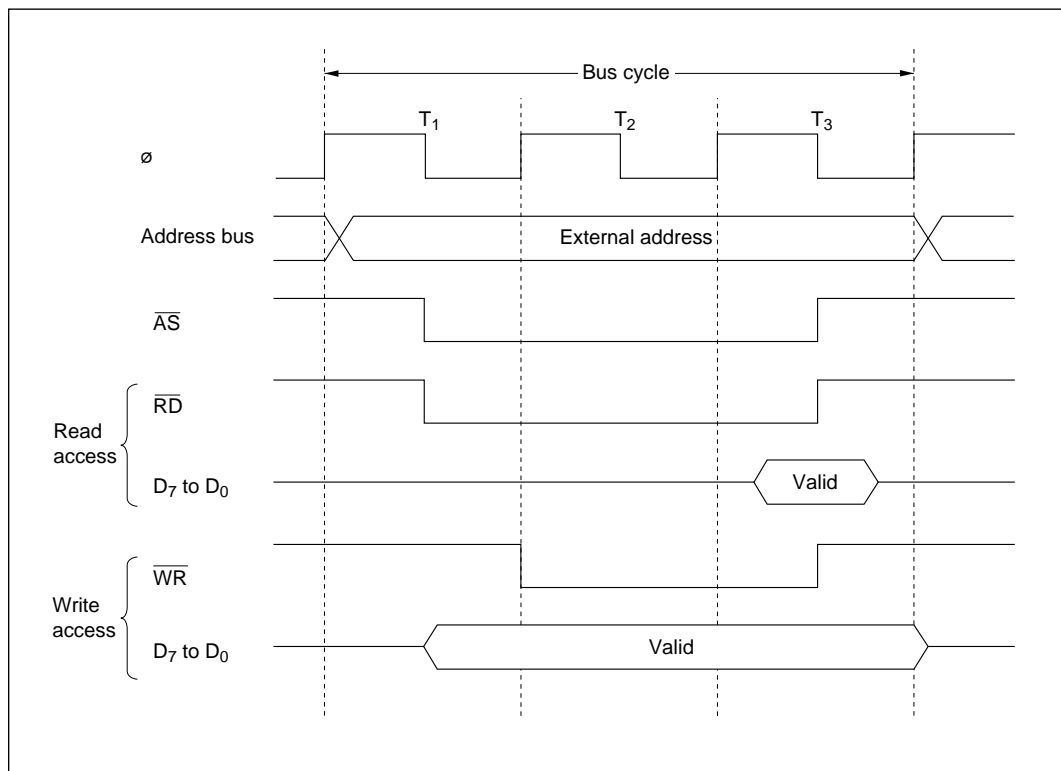

Figure 6-3 Bus Control Signal Timing for 8-Bit, Three-State-Access Area

8-Bit, Two-State-Access Areas: Figure 6-4 shows the timing of bus control signals for an 8-bit, two-state-access area. Wait status cannot be inserted.
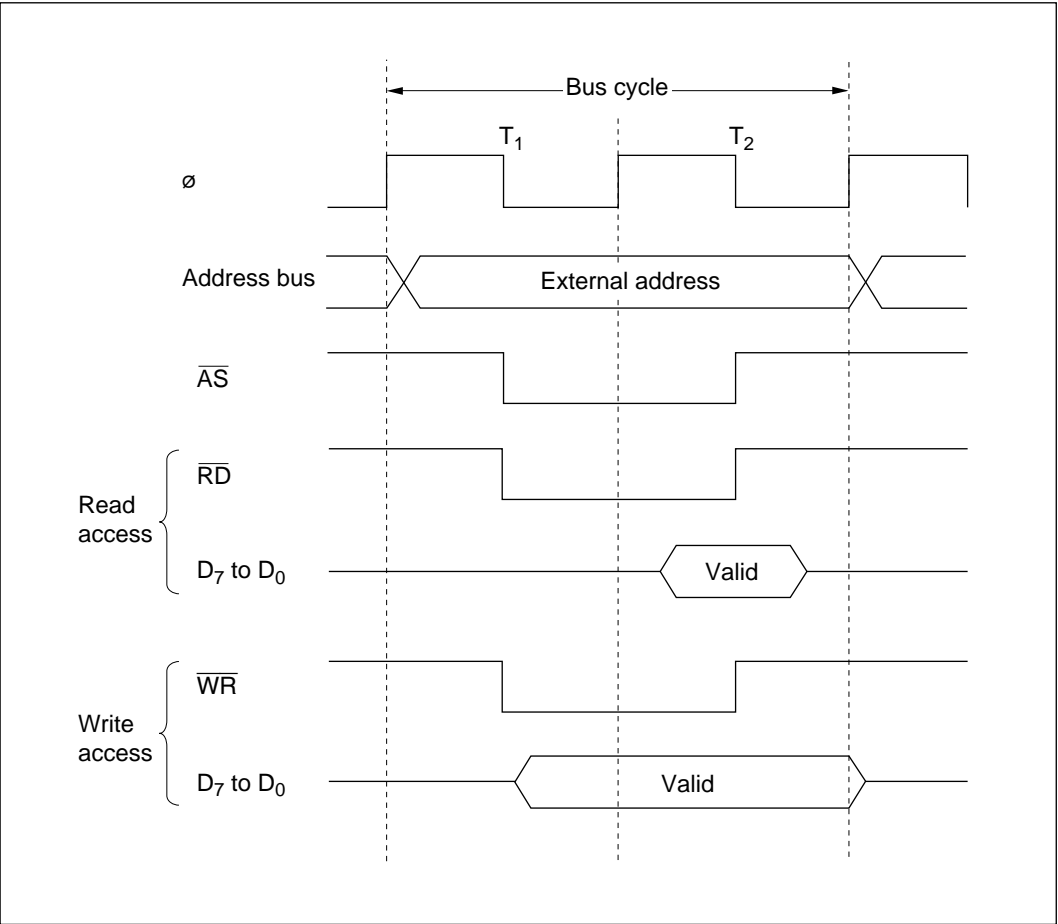

Figure 6-4   Bus Control Signal Timing for 8-Bit, Two-State-Access Area

6.3.3 Wait Modes

Four wait modes can be selected for each area as shown in table 6-4.

Table 6-4 Wait Mode Selection

ASTCR	WCER	WCR			
ASTn Bit	WCEn Bit	WMS1 Bit	WMS0 Bit	WSC Control	Wait Mode
0	—	—	—	Disabled	No wait states
1	0	—	—	Disabled	Pin wait mode 0
	1	0	0	Enabled	Programmable wait mode
			1	Enabled	No wait states
		1	0	Enabled	Pin wait mode 1
			1	Enabled	Pin auto-wait mode

Note: n = 7 to 0

The ASTn and WCEn bits can be set independently for each area. Bits WMS1 and WMS0 apply to all areas. All areas for which WSC control is enabled operate in the same wait mode.

Pin Wait Mode 0: The wait state controller is disabled. Wait states can only be inserted by $\overline{\text{WAIT}}$ pin control. During access to an external three-state-access area, if the $\overline{\text{WAIT}}$ pin is low at the fall of the system clock (ø) in the T_2 state, a wait state (T_W) is inserted. If the $\overline{\text{WAIT}}$ pin remains low, wait states continue to be inserted until the $\overline{\text{WAIT}}$ signal goes high. Figure 6-5 shows the timing.
Figure 6-5   Pin Wait Mode 0

Pin Wait Mode 1: In all accesses to external three-state-access areas, the number of wait states (T_W) selected by bits WC1 and WC0 are inserted. If the $\overline{\text{WAIT}}$ pin is low at the fall of the system clock (ø) in the last of these wait states, an additional wait state is inserted. If the $\overline{\text{WAIT}}$ pin remains low, wait states continue to be inserted until the $\overline{\text{WAIT}}$ signal goes high.

Pin wait mode 1 is useful for inserting four or more wait states, or for inserting different numbers of wait states for different external devices.

If the wait count is 0, this mode operates in the same way as pin wait mode 0.

Figure 6-6 shows the timing when the wait count is 1 (WC1 = 0, WC0 = 1) and one additional wait state is inserted by $\overline{\text{WAIT}}$ input.
Figure 6-6   Pin Wait Mode 1

Pin Auto-Wait Mode: If the $\overline{\text{WAIT}}$ pin is low, the number of wait states (T_W) selected by bits WC1 and WC0 are inserted.

In pin auto-wait mode, if the $\overline{\text{WAIT}}$ pin is low at the fall of the system clock ($\emptyset$) in the T_2 state, the number of wait states (T_W) selected by bits WC1 and WC0 are inserted. No additional wait states are inserted even if the $\overline{\text{WAIT}}$ pin remains low.

Figure 6-7 shows the timing when the wait count is 1.
Figure 6-7   Pin Auto-Wait Mode

Programmable Wait Mode: The number of wait states (T_W) selected by bits WC1 and WC0 are inserted in all accesses to external three-state-access areas. Figure 6-8 shows the timing when the wait count is 1 (WC1 = 0, WC0 = 1).
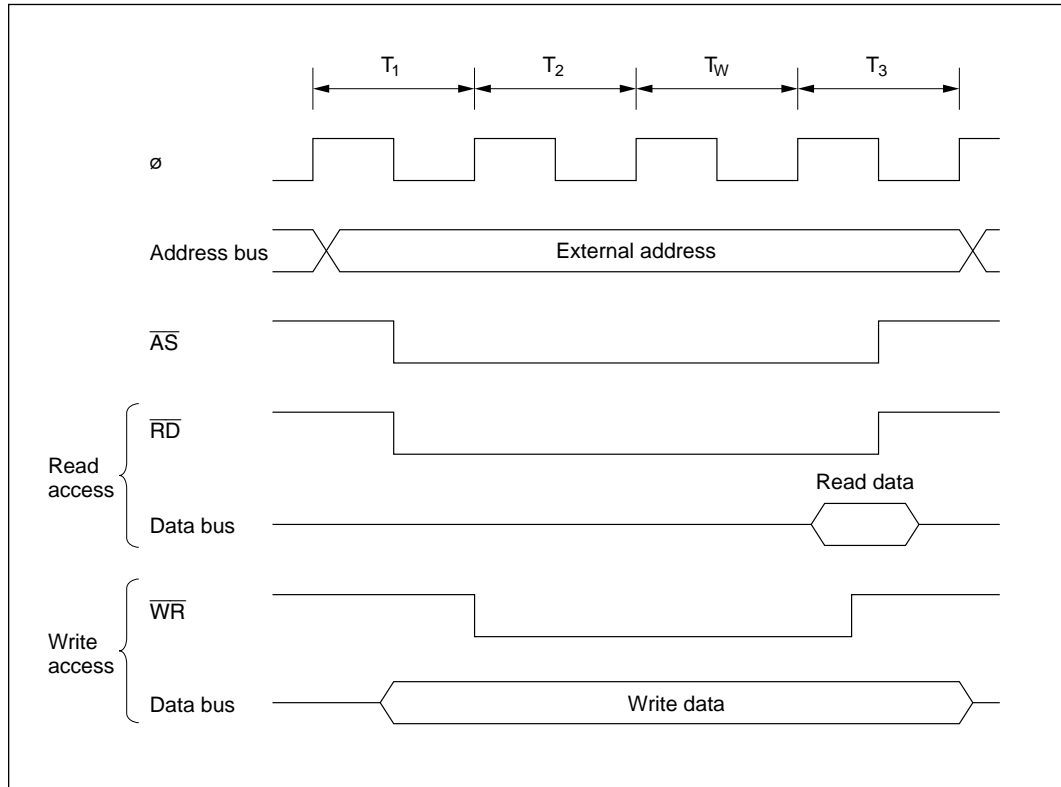

Figure 6-8   Programmable Wait Mode

Example of Wait State Control Settings: A reset initializes ASTCR and WCER to H'FF and WCR to H'F3, selecting programmable wait mode and three wait states for all areas. Software can select other wait modes for individual areas by modifying the ASTCR, WCER, and WCR settings. Figure 6-9 shows an example of wait mode settings.

Area 0	3-state-access area, programmable wait mode
Area 1	3-state-access area, programmable wait mode
Area 2	3-state-access area, pin wait mode 0
Area 3	3-state-access area, pin wait mode 0
Area 4	2-state-access area, no wait states inserted
Area 5	2-state-access area, no wait states inserted
Area 6	2-state-access area, no wait states inserted
Area 7	2-state-access area, no wait states inserted

Bit:	7	6	5	4	3	2	1	0
ASTCR H'0F:	0	0	0	0	1	1	1	1
WCER H'33:	0	0	1	1	0	0	1	1
WCR H'F3:	—	—	—	—	0	0	1	1

Note: Wait states cannot be inserted in areas designated for two-state access by ASTCR.

Figure 6-9 Wait Mode Settings (Example)

6.3.4 Interconnections with Memory (Example)

For each area, the bus controller can select two- or three-state access. In three-state-access areas, wait states can be inserted in a variety of modes, simplifying the connection of both high-speed and low-speed devices.

Figure 6-10 shows an example of interconnections between the H8/3032 Series and memory. Figure 6-10 shows a memory map for this example.

A 32-kword × 8-bit EPROM is connected to area 0. This device is accessed in three states via a 8-bit bus.

Two 32-kword × 8-bit SRAM devices (SRAM1 and SRAM2) are connected to area 1. These devices are accessed in two states via a 8-bit bus.

One 32-kword × 8-bit SRAM (SRAM3) is connected to area 7. This device is accessed via an 8-bit bus, using three-state access with an additional wait state inserted in pin auto-wait mode.
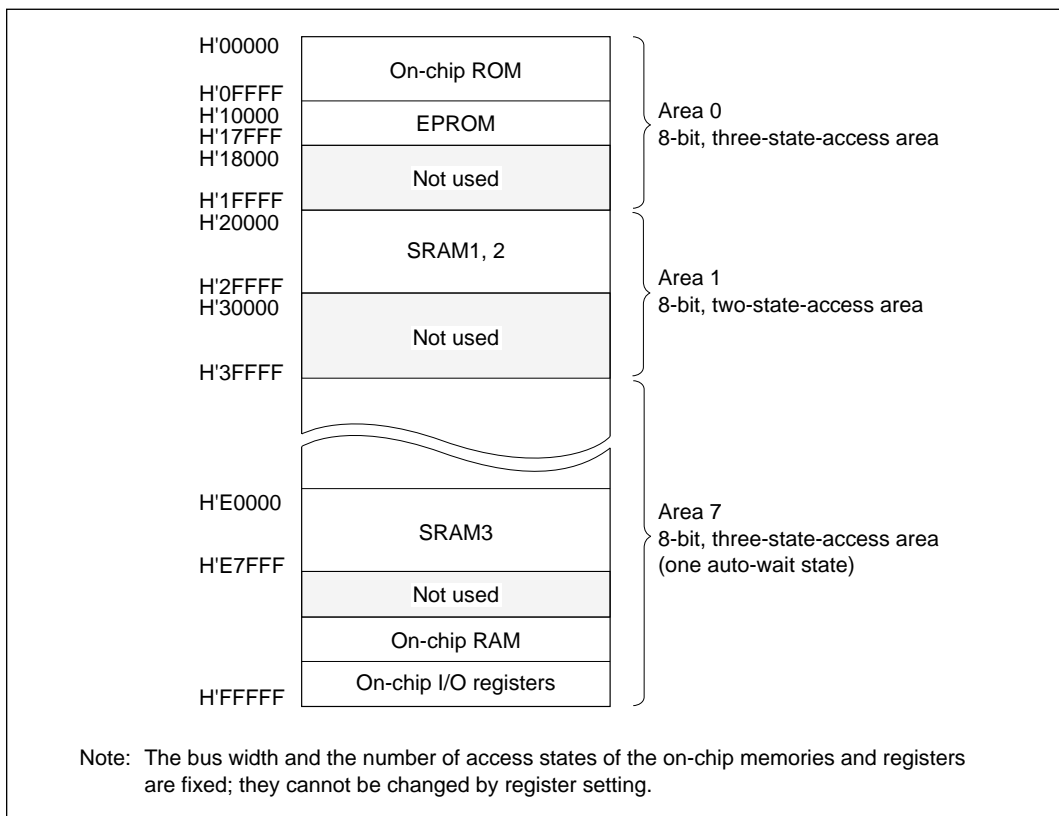

Figure 6-10   Memory Map (Example)

6.4 Usage Notes

6.4.1 Register Write Timing

ASTCR and WCER Write Timing: Data written to ASTCR or WCER takes effect starting from the next bus cycle. Figure 6-11 shows the timing when an instruction fetched from area 0 changes area 0 from three-state access to two-state access.
Figure 6-11   ASTCR Write Timing

Section 7   I/O Ports

7.1 Overview

The H8/3032 Series has nine input/output ports (ports 1, 2, 3, 5, 6, 8, 9, A, and B) and one input port (port 7). Table 7-1 summarizes the port functions. The pins in each port are multiplexed as shown in table 7-1.

Each port has a data direction register (DDR) for selecting input or output, and a data register (DR) for storing output data. In addition to these registers, ports 2, and 5 have an input pull-up control register (PCR) for switching input pull-up transistors on and off.

Ports 1 to 3 and ports 5, 6, and 8 can drive one TTL load and a 90-pF capacitive load. Ports 9, A, and B can drive one TTL load and a 30-pF capacitive load. Ports 1 to 3 and ports 5, 6, 8, 9, A, and B can drive a darlington pair. Ports 1, 2, 5, and B can drive LEDs (with 10-mA current sink). Pins $P8_2$ to $P8_0$, PA_7 to PA_0, and PB_3 to PB_0 have Schmitt-trigger input circuits.

For block diagrams of the ports see appendix C, I/O Port Block Diagrams.

Table 7-1 Port Functions (1)

Port	Description	Pins	Mode 1	Mode 2	Mode 3
Port 1	• 8-bit I/O port • Can drive LEDs	$P1_7$ to $P1_0$/ A_7 to A_0	Address output (A_7 to A_0) and generic input DDR = 0: generic input DDR = 1: address output	Generic input/output	
Port 2	• 8-bit I/O port • Input pull-up • Can drive LEDs	$P2_7$ to $P2_0$/ A_{15} to A_8	Address output (A_{15} to A_8) and generic input DDR = 0: generic input DDR = 1: address output	Generic input/output	
Port 3	• 8-bit I/O port	$P3_7$ to $P3_0$/ D_7 to D_0	Data input/output (D_{15} to D_8)	Generic input/output	
Port 5	• 4-bit I/O port • Input pull-up • Can drive LEDs	$P5_3$ to $P5_0$/ A_{19} to A_{16}	Address output (A_{19} to A_{16}) and generic input DDR = 0: generic input DDR = 1: address output	Generic input/output	
Port 6	• 4-bit I/O port	$P6_5/\overline{WR}$, $P6_4/\overline{RD}$, $P6_3/\overline{AS}$	Bus control signal output ($\overline{WR}$, $\overline{RD}$, $\overline{AS}$)	Generic input/output	
		$P6_0/\overline{WAIT}$	Bus control signal output ($\overline{WAIT}$) and 1-bit generic input/output		
Port 7	• 8-bit input port	$P7_7$ to $P7_0$/ AN_7 to AN_0	Analog input (AN_7 to AN_0) to A/D converter, and generic input		
Port 8	• 4-bit I/O port • $P8_2$ to $P8_0$ have Schmitt inputs	$P8_3/\overline{IRQ_3}$, $P8_2/\overline{IRQ_2}$, $P8_1/\overline{IRQ_1}$, $P8_0/\overline{IRQ_0}$	IRQ_3 to $\overline{IRQ_0}$ input and 4-bit generic input/output		
Port 9	• 3-bit I/O port	$P9_4/SCK/IRQ_4$	Input and output (SCK) for serial communication interface (SCI), IRQ_4 input, and 1-bit generic input/output		
		$P9_2/RxD$, $P9_0/TxD$	Input and output (RxD and Txd) for SCI and 2-bit generic input/output		

Table 7-1 Port Functions (1)

Port	Description	Pins	Mode 1	Mode 2	Mode 3
Port A	• 8-bit I/O port • Schmitt inputs	$PA_7/TP_7/TIOCB_2/$, $PA_6/TP_6/TIOCA_2$, $PA_5/TP_5/TIOCB_1$, $PA_4/TP_4//TIOCA_1$, $PA_3/TP_3/TIOCB_0/$ TCLKD, $PA_2/TP_2/TIOCA_0/$ TCLKC, $PA_1/TP_1/TCLKB$, $PA_0/TP_0/TCLKA$	TPC output (TP_8 to TP_0), ITU input and output (TCLKD, TCLKC, TCLKB, TCLKA, $TIOCB_2$, $TIOCA_2$, $TIOCB_1$, $TIOCA_1$), and generic input/output		
Port B	• 8-bit I/O port • Can drive LEDs • PB_3 to PB_0 have Schmitt inputs	$PB_7/TP_{15}/\overline{ADTRG}$,	TPC output (TP_{15}), trigger input ($\overline{ADTRG}$) to A/D converter, and 1-bit generic input/output		
		PB_6/TP_{14}	TPC output (TP_{14}) and 1-bit generic input/output		
		$PB_5/TP_{13}/TOCXB_4$, $PB_4/TP_{12}/TOCXA_4$, $PB_3/TP_{11}/TIOCB_4$, $PB_2/TP_{10}/TIOCA_4$, $PB_1/TP_9/TIOCB_3$, $PB_0/TP_8/TIOCA_3$	TPC output (TP_{13} to TP_8), ITU input and output ($TOCXB_4$, $TOCXA_4$, $TIOCB_4$, $TIOCA_4$, $TIOCB_3$, $TIOCA_3$), and $TOCXA_4$, $TIOCB_4$, $TIOCA_4$, $TIOCB_3$, $TIOCA_3$), and 6-bit generic input/output		

7.2 Port 1

7.2.1 Overview

Port 1 is an 8-bit input/output port with the pin configuration shown in figure 7-1. The pin functions differ depending on the operating mode. In mode 1, they are address bus output pins (A_7 to A_0).

In modes 2 and 3, port 1 is a generic input/output port.

Pins in port 1 can drive one TTL load and a 90-pF capacitive load. They can also drive a darlington transistor pair.

Port 1 pins	Modes 1	Modes 2 and 3
$P1_7/A_7$	$P1_7$ (input)/A_7 (output)	$P1_7$ (input/output)
$P1_6/A_6$	$P1_6$ (input)/A_6 (output)	$P1_6$ (input/output)
$P1_5/A_5$	$P1_5$ (input)/A_5 (output)	$P1_5$ (input/output)
$P1_4/A_4$	$P1_4$ (input)/A_4 (output)	$P1_4$ (input/output)
$P1_3/A_3$	$P1_3$ (input)/A_3 (output)	$P1_3$ (input/output)
$P1_2/A_2$	$P1_2$ (input)/A_2 (output)	$P1_2$ (input/output)
$P1_1/A_1$	$P1_1$ (input)/A_1 (output)	$P1_1$ (input/output)
$P1_0/A_0$	$P1_0$ (input)/A_0 (output)	$P1_0$ (input/output)

Port 1

7.2.2 Register Descriptions

Table 7-2 summarizes the registers of port 1.

Table 7-2 Port 1 Registers

Address*	Name	Abbreviation	R/W	Initial Value
H'FFC0	Port 1 data direction register	P1DDR	W	H'00
H'FFC2	Port 1 data register	P1DR	R/W	H'00

Note: * Lower 16 bits of the address.

Port 1 Data Direction Register (P1DDR): P1DDR is an 8-bit write-only register that can select input or output for each pin in port 1.

Bit	7	6	5	4	3	2	1	0
	$P1_7DDR$	$P1_6DDR$	$P1_5DDR$	$P1_4DDR$	$P1_3DDR$	$P1_2DDR$	$P1_1DDR$	$P1_0DDR$
Initial value	0	0	0	0	0	0	0	0
Read/Write	W	W	W	W	W	W	W	W

Port 1 data direction 7 to 0
These bits select input or
output for port 1 pins

Mode 1: A pin in port 1 becomes an address output pin if the corresponding P1DDR bit is set to 1, and a generic input pin if this bit is cleared to 0.

Modes 2 and 3 (Single-Chip Modes): Port 1 functions as an input/output port. A pin in port 1 becomes an output pin if the corresponding P1DDR bit is set to 1, and an input pin if this bit is cleared to 0.

P1DDR is a write-only register. Its value cannot be read. All bits return 1 when read.

P1DDR is initialized to H'00 by a reset and in hardware standby mode. In software standby mode it retains its previous setting. If a P1DDR bit is set to 1, the corresponding pin maintains its output state in software standby mode.

Port 1 Data Register (P1DR): P1DR is an 8-bit readable/writable register that stores data for pins $P1_7$ to $P1_0$.

Bit	7	6	5	4	3	2	1	0
	$P1_7$	$P1_6$	$P1_5$	$P1_4$	$P1_3$	$P1_2$	$P1_1$	$P1_0$
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Port 1 data 7 to 0
These bits store data for port 1 pins

When a bit in P1DDR is set to 1, if port 1 is read the value of the corresponding P1DR bit is returned directly, regardless of the actual state of the pin. When a bit in P1DDR is cleared to 0, if port 1 is read the corresponding pin level is read.

P1DR is initialized to H'00 by a reset and in hardware standby mode. In software standby mode it retains its previous setting.

7.2.3 Pin Functions in Each Mode

The pin functions of port 1 differ between mode 1 and modes 2 and 3 (single-chip modes). The pin functions in each mode are described below.

Mode 1: Address output or generic input can be selected for each pin in port 1. A pin becomes an address output pin if the corresponding P1DDR bit is set to 1, and a generic input pin if this bit is cleared to 0. Following a reset, all pins are input pins. To use a pin for address output, its P1DDR bit must be set to 1. Figure 7-2 shows the pin functions in mode 1.

	When P1DDR = 1	When P1DDR = 0
	A_7 (output)	$P1_7$ (input)
	A_6 (output)	$P1_6$ (input)
	A_5 (output)	$P1_5$ (input)
	A_4 (output)	$P1_4$ (input)
Port 1	A_3 (output)	$P1_3$ (input)
	A_2 (output)	$P1_2$ (input)
	A_1 (output)	$P1_1$ (input)
	A_0 (output)	$P1_0$ (input)
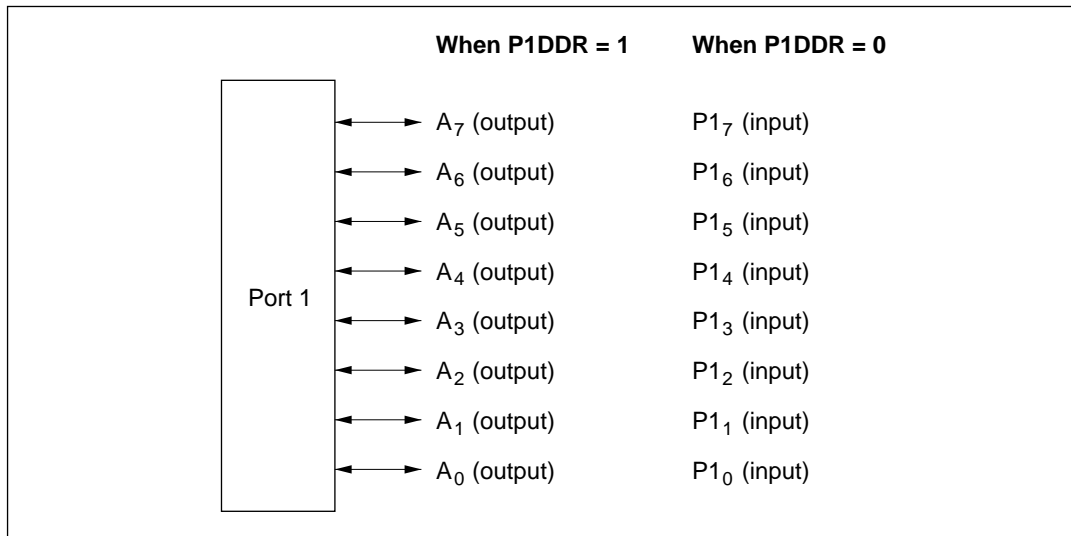

Figure 7-2   Pin Functions in Mode 1 (Port 1)

Modes 2 and 3 (Single-Chip Modes): Input or output can be selected separately for each pin in port 1. A pin becomes an output pin if the corresponding P1DDR bit is set to 1, and an input pin if this bit is cleared to 0. Figure 7-3 shows the pin functions in modes 2 and 3.

	$P1_7$ (input/output)
	$P1_6$ (input/output)
	$P1_5$ (input/output)
	$P1_4$ (input/output)
Port 1	$P1_3$ (input/output)
	$P1_2$ (input/output)
	$P1_1$ (input/output)
	$P1_0$ (input/output)

Figure 7-3   Pin Functions in Modes 2 and 3 (Port 1)

7.3 Port 2

7.3.1 Overview

Port 2 is an 8-bit input/output port with the pin configuration shown in figure 7-4.

The pin functions differ depending on the operating mode. In mode 1, settings in the port 1 data direction register (P1DDR) can designate pins for address bus output (A_{15} to A_8) or generic input. In modes 2 and 3, port 2 is a generic input/output port.

Port 2 has software-programmable built-in pull-up transistors. Pins in port 2 can drive one TTL load and a 90-pF capacitive load. They can also drive a darlington transistor pair.

	Port 2 pins	Mode 1	Modes 2 and 3
	$P2_7/A_{15}$	$P2_7$ (input)/A_{15} (output)	$P2_7$ (input/output)
	$P2_6/A_{14}$	$P2_6$ (input)/A_{14} (output)	$P2_6$ (input/output)
	$P2_5/A_{13}$	$P2_5$ (input)/A_{13} (output)	$P2_5$ (input/output)
Port 2	$P2_4/A_{12}$	$P2_4$ (input)/A_{12} (output)	$P2_4$ (input/output)
	$P2_3/A_{11}$	$P2_3$ (input)/A_{11} (output)	$P2_3$ (input/output)
	$P2_2/A_{10}$	$P2_2$ (input)/A_{10} (output)	$P2_2$ (input/output)
	$P2_1/A_9$	$P2_1$ (input)/A_9 (output)	$P2_1$ (input/output)
	$P2_0/A_8$	$P2_0$ (input)/A_8 (output)	$P2_0$ (input/output)
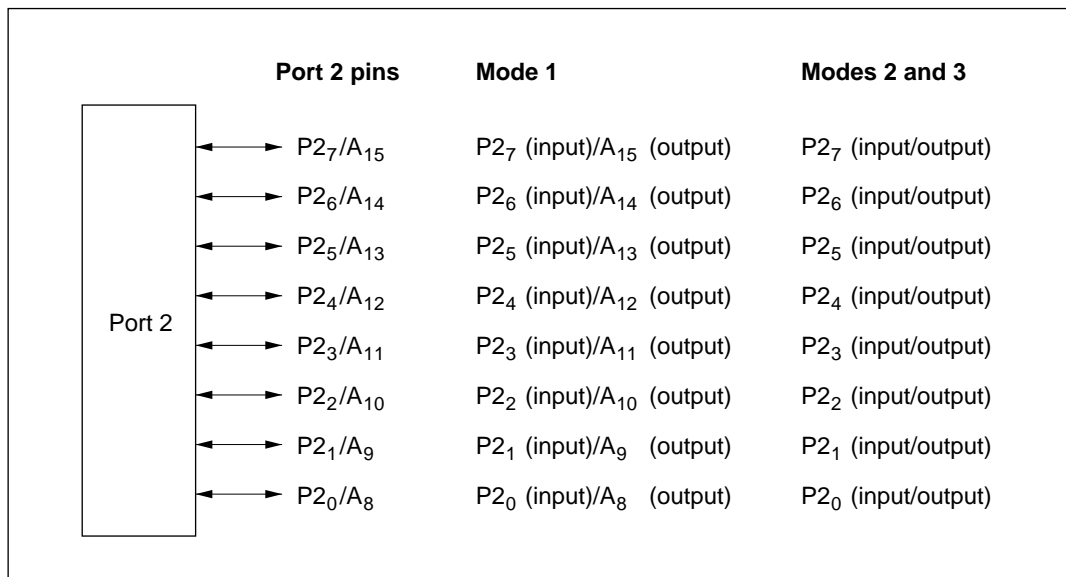

Figure 7-4   Port 2 Pin Configuration

7.3.2 Register Descriptions

Table 7-3 summarizes the registers of port 2.

Table 7-3   Port 2 Registers

Address*	Name	Abbreviation	R/W	Initial Value
H'FFC1	Port 2 data direction register	P2DDR	W	H'00
H'FFC3	Port 2 data register	P2DR	R/W	H'00
H'FFD8	Port 2 input pull-up control register	P2PCR	R/W	H'00

Note: * Lower 16 bits of the address.

Port 2 Data Direction Register (P2DDR): P2DDR is an 8-bit write-only register that can select input or output for each pin in port 2.

Bit	7	6	5	4	3	2	1	0
	$P2_7DDR$	$P2_6DDR$	$P2_5DDR$	$P2_4DDR$	$P2_3DDR$	$P2_2DDR$	$P2_1DDR$	$P2_0DDR$
Initial value	0	0	0	0	0	0	0	0
Read/Write	W	W	W	W	W	W	W	W

Port 2 data direction 7 to 0
These bits select input or
output for port 2 pins

Mode 1: A pin in port 2 becomes an address output pin if the corresponding P2DDR bit is set to 1, and a generic input pin if this bit is cleared to 0.

Modes 2 and 3: Port 2 functions as an input/output port. A pin in port 2 becomes an output pin if the corresponding P2DDR bit is set to 1, and an input pin if this bit is cleared to 0.

P2DDR is a write-only register. Its value cannot be read. All bits return 1 when read.

P2DDR is initialized to H'00 by a reset and in hardware standby mode. In software standby mode it retains its previous setting. If a P2DDR bit is set to 1, the corresponding pin maintains its output state in software standby mode.

Port 2 Data Register (P2DR): P2DR is an 8-bit readable/writable register that stores data for pins $P2_7$ to $P2_0$.

Bit	7	6	5	4	3	2	1	0
	$P2_7$	$P2_6$	$P2_5$	$P2_4$	$P2_3$	$P2_2$	$P2_1$	$P2_0$
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Port 2 data 7 to 0
These bits store data for port 2 pins

When a bit in P2DDR is set to 1, if port 2 is read the value of the corresponding P2DR bit is returned directly, regardless of the actual state of the pin. When a bit in P2DDR is cleared to 0, if port 2 is read the corresponding pin level is read.

P2DR is initialized to H'00 by a reset and in hardware standby mode. In software standby mode it retains its previous setting.

Port 2 Input Pull-Up Control Register (P2PCR): P2PCR is an 8-bit readable/writable register that controls the MOS input pull-up transistors in port 2.

Bit	7	6	5	4	3	2	1	0
	$P2_7PCR$	$P2_6PCR$	$P2_5PCR$	$P2_4PCR$	$P2_3PCR$	$P2_2PCR$	$P2_1PCR$	$P2_0PCR$
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Port 2 input pull-up control 7 to 0
These bits control input pull-up transistors built into port 2

When a P2DDR bit is cleared to 0 (selecting generic input), if the corresponding bit from $P2_7PCR$ to $P2_0PCR$ is set to 1, the input pull-up transistor is turned on.

P2PCR is initialized to H'00 by a reset and in hardware standby mode. In software standby mode it retains its previous setting.

7.3.3 Pin Functions in Each Mode

The pin functions of port 2 differ between mode 1 and modes 2 and 3. The pin functions in each mode are described below.

Mode 1: Address output or generic input can be selected for each pin in port 2. A pin becomes an address output pin if the corresponding P2DDR bit is set to 1, and a generic input pin if this bit is cleared to 0. Following a reset, all pins are input pins. To use a pin for address output, its P2DDR bit must be set to 1. Figure 7-5 shows the pin functions in mode 1.

	When P2DDR = 1	When P2DDR = 0
	A_{15} (output)	$P2_7$ (input)
	A_{14} (output)	$P2_6$ (input)
	A_{13} (output)	$P2_5$ (input)
	A_{12} (output)	$P2_4$ (input)
Port 2	A_{11} (output)	$P2_3$ (input)
	A_{10} (output)	$P2_2$ (input)
	A_9 (output)	$P2_1$ (input)
	A_8 (output)	$P2_0$ (input)
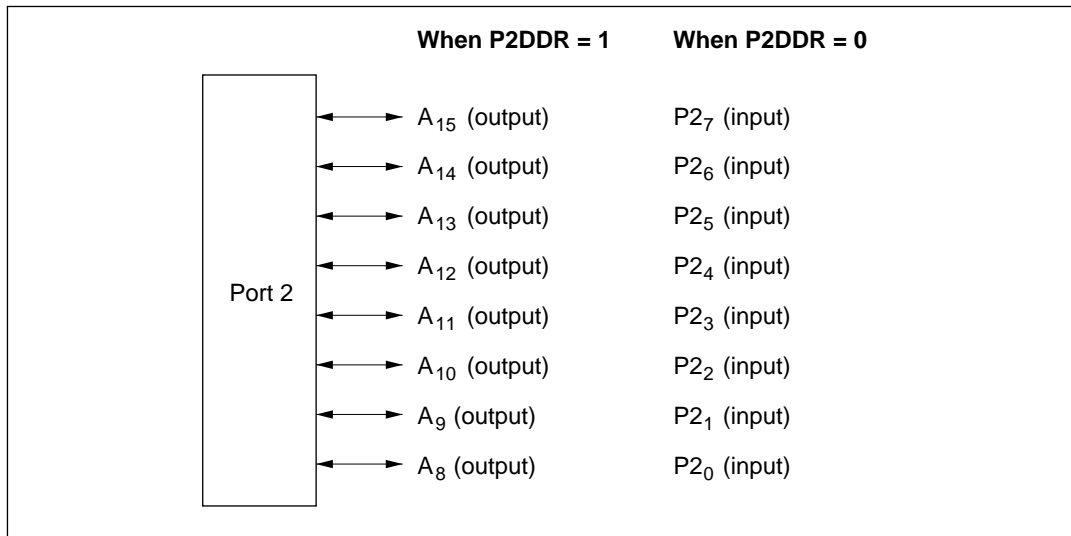

Figure 7-5   Pin Functions in Mode 1 (Port 2)

Modes 2 and 3: Input or output can be selected separately for each pin in port 2. A pin becomes an output pin if the corresponding P2DDR bit is set to 1, and an input pin if this bit is cleared to 0. Figure 7-6 shows the pin functions in modes 2 and 3.

	$P2_7$ (input/output)
	$P2_6$ (input/output)
	$P2_5$ (input/output)
	$P2_4$ (input/output)

	$P2_2$ (input/output)
	$P2_1$ (input/output)
	$P2_0$ (input/output)
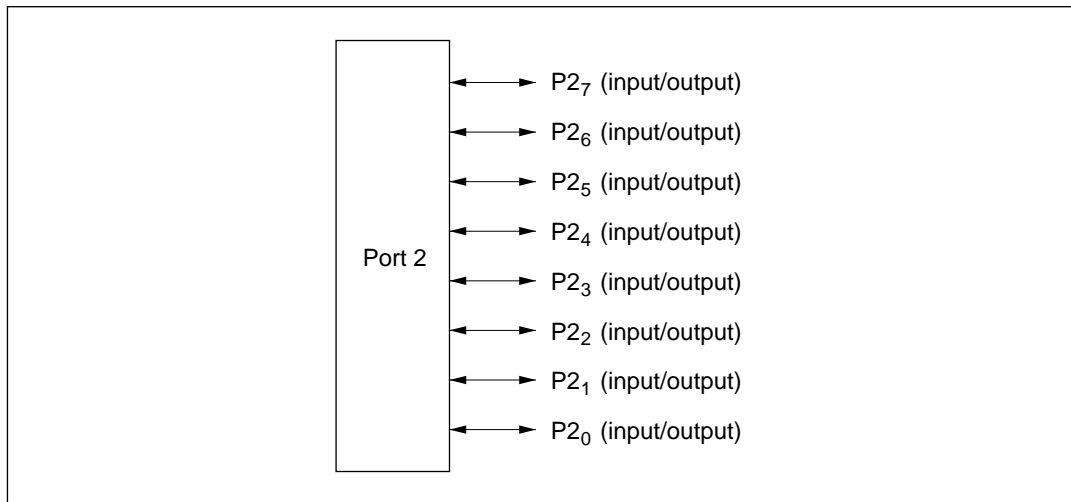

Figure 7-6   Pin Functions in Modes 2 and 3 (Port 2)

7.3.4 Input Pull-Up Transistors

Port 2 has built-in MOS input pull-up transistors that can be controlled by software. These input pull-up transistors can be turned on and off individually.

When a P2PCR bit is set to 1 and the corresponding P2DDR bit is cleared to 0, the input pull-up transistor is turned on.

The input pull-up transistors are turned off by a reset and in hardware standby mode. In software standby mode they retain their previous state.

Table 7-4 summarizes the states of the input pull-up transistors in each mode.

Table 7-4 Input Pull-Up Transistor States (Port 2)

Mode	Reset	Hardware Standby Mode	Software Standby Mode	Other Modes
1 2 3	Off	Off	On/off	On/off

Legend
Off: The input pull-up transistor is always off.
On/off: The input pull-up transistor is on if P2PCR = 1 and P2DDR = 0. Otherwise, it is off.

7.4 Port 3

7.4.1 Overview

Port 3 is an 8-bit input/output port with the pin configuration shown in figure 7-7. Port 3 is a data bus in mode 1 and a generic input/output port in modes 2 and 3.

Pins in port 3 can drive one TTL load and a 90-pF capacitive load. They can also drive a darlington transistor pair.

	Port 3 pins	Mode 1	Modes 2 and 3
	$P3_7/D_7$	D_7 (input/output)	$P3_7$ (input/output)
	$P3_6/D_6$	D_6 (input/output)	$P3_6$ (input/output)
	$P3_5/D_5$	D_5 (input/output)	$P3_5$ (input/output)
	$P3_4/D_4$	D_4 (input/output)	$P3_4$ (input/output)
Port 3	$P3_3/D_3$	D_3 (input/output)	$P3_3$ (input/output)
	$P3_2/D_2$	D_2 (input/output)	$P3_2$ (input/output)
	$P3_1/D_1$	D_1 (input/output)	$P3_1$ (input/output)
	$P3_0/D_0$	D_0 (input/output)	$P3_0$ (input/output)

7.4.2 Register Descriptions

Table 7-5 summarizes the registers of port 3.

Table 7-5   Port 3 Registers

Address*	Name	Abbreviation	R/W	Initial Value
H'FFC4	Port 3 data direction register	P3DDR	W	H'00
H'FFC6	Port 3 data register	P3DR	R/W	H'00

Note: * Lower 16 bits of the address.

Port 3 Data Direction Register (P3DDR): P3DDR is an 8-bit write-only register that can select input or output for each pin in port 3.

Bit	7	6	5	4	3	2	1	0
	$P3_7DDR$	$P3_6DDR$	$P3_5DDR$	$P3_4DDR$	$P3_3DDR$	$P3_2DDR$	$P3_1DDR$	$P3_0DDR$
Initial value	0	0	0	0	0	0	0	0
Read/Write	W	W	W	W	W	W	W	W

Port 3 data direction 7 to 0
These bits select input or output for port 3 pins

Mode 1: Port 3 functions as a data bus. P3DDR is ignored.

Modes 2 and 3: Port 3 functions as an input/output port. A pin in port 3 becomes an output pin if the corresponding P3DDR bit is set to 1, and an input pin if this bit is cleared to 0.

P3DDR is a write-only register. Its value cannot be read. All bits return 1 when read.

P3DDR is initialized to H'00 by a reset and in hardware standby mode. In software standby mode it retains its previous setting. If a P3DDR bit is set to 1, the corresponding pin maintains its output state in software standby mode.

Port 3 Data Register (P3DR): P3DR is an 8-bit readable/writable register that stores data for pins $P3_7$ to $P3_0$.

Bit	7	6	5	4	3	2	1	0
	$P3_7$	$P3_6$	$P3_5$	$P3_4$	$P3_3$	$P3_2$	$P3_1$	$P3_0$
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Port 3 data 7 to 0
These bits store data for port 3 pins

When a bit in P3DDR is set to 1, if port 3 is read the value of the corresponding P3DR bit is returned directly, regardless of the actual state of the pin. When a bit in P3DDR is cleared to 0, if port 3 is read the corresponding pin level is read.

P3DR is initialized to H'00 by a reset and in hardware standby mode. In software standby mode it retains its previous setting.

7.4.3 Pin Functions in Each Mode

The pin functions of port 3 differ between modes 1 and modes 2 and 3. The pin functions in each mode are described below.

Mode 1: All pins of port 3 automatically become data input/output pins. Figure 7-8 shows the pin functions in mode 1.

Port 3

D_7 (input/output)
D_6 (input/output)

7.5 Port 5

7.5.1 Overview

Port 5 is a 4-bit input/output port with the pin configuration shown in figure 7-10. The pin functions differ depending on the operating mode.

In mode 1, settings in the port 5 data direction register (P5DDR) designate pins for address bus output (A_{19} to A_{16}) or generic input. In modes 2 and 3, port 5 is a generic input/output port.

Port 5 has software-programmable built-in pull-up transistors.

Pins in port 5 can drive one TTL load and a 90-pF capacitive load. They can also drive a LED or a darlington transistor pair.

	Port 5 pins	Mode 1	Modes 2 and 3
	$P5_3/A_{19}$	$P5_3$ (input)/A_{19} (output)	$P5_3$ (input/output)
Port 5	$P5_2/A_{18}$	$P5_2$ (input)/A_{18} (output)	$P5_2$ (input/output)
	$P5_1/A_{17}$	$P5_1$ (input)/A_{17} (output)	$P5_1$ (input/output)
	$P5_0/A_{16}$	$P5_0$ (input)/A_{16} (output)	$P5_0$ (input/output)

7.5.2 Register Descriptions

Table 7-6 summarizes the registers of port 5.

Table 7-6   Port 5 Registers

Address*	Name	Abbreviation	R/W	Initial Value
H'FFC8	Port 5 data direction register	P5DDR	W	H'F0
H'FFCA	Port 5 data register	P5DR	R/W	H'F0
H'FFDB	Port 5 input pull-up control register	P5PCR	R/W	H'F0

Note: * Lower 16 bits of the address.

Port 5 Data Direction Register (P5DDR): P5DDR is an 8-bit write-only register that can select input or output for each pin in port 5.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	$P5_3DDR$	$P5_2DDR$	$P5_1DDR$	$P5_0DDR$
Initial value	1	1	1	1	0	0	0	0
Read/Write	—	—	—	—	W	W	W	W

Reserved bits (bits 7 to 4)

Port 5 data direction 3 to 0
These bits select input or output for port 5 pins

Mode 1: A pin in port 5 becomes an address output pin if the corresponding P5DDR bit is set to 1, and a generic input pin if this bit is cleared to 0.

Modes 2 and 3: Port 5 functions as an input/output port. A pin in port 5 becomes an output pin if the corresponding P5DDR bit is set to 1, and an input pin if this bit is cleared to 0.

P5DDR is a write-only register. Its value cannot be read. All bits return 1 when read.

P5DDR is initialized to H'F0 by a reset and in hardware standby mode. In software standby mode it retains its previous setting. If a P5DDR bit is set to 1, the corresponding pin maintains its output state in software standby mode.

Port 5 Data Register (P5DR): P5DR is an 8-bit readable/writable register that stores data for pins $P5_3$ to $P5_0$.

When a bit in P5DDR is set to 1, if port 5 is read the value of the corresponding P5DR bit is

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	$P5_3$	$P5_2$	$P5_1$	$P5_0$
Initial value	1	1	1	1	0	0	0	0
Read/Write	—	—	—	—	R/W	R/W	R/W	R/W

Reserved bits (bits 7 to 4)

Port 5 data 3 to 0
These bits store data for port 5 pins

returned directly, regardless of the actual state of the pin. When a bit in P5DDR is cleared to 0, if port 5 is read the corresponding pin level is read.

Bits $P5_7$ to $P5_4$ are reserved. They can be written and read, but they cannot be used for port input or output.

P5DR is initialized to H'F0 by a reset and in hardware standby mode. In software standby mode it retains its previous setting.

Port 5 Input Pull-Up Control Register (P5PCR): P5PCR is an 8-bit readable/writable register that controls the MOS input pull-up transistors in port 5.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	$P5_3PCR$	$P5_2PCR$	$P5_1PCR$	$P5_0PCR$
Initial value	1	1	1	1	0	0	0	0
Read/Write	—	—	—	—	R/W	R/W	R/W	R/W

Reserved bits

Port 5 input pull-up control 3 to 0
These bits control input pull-up transistors built into port 5

When a P5DDR bit is cleared to 0 (selecting generic input), if the corresponding bit from $P5_3PCR$ to $P5_0PCR$ is set to 1, the input pull-up transistor is turned on.

P5PCR is initialized to H'F0 by a reset and in hardware standby mode. In software standby mode it retains its previous setting.

7.5.3 Pin Functions in Each Mode

The functions of port 5 differ depending on the operating mode. The pin functions in each mode are described below.

Mode 1: Address output or generic input can be selected for each pin in port 5. A pin becomes an address output pin if the corresponding P5DDR bit is set to 1, and a generic input pin if this bit is cleared to 0. Following a reset, all pins are input pins. To use a pin for address output, its P5DDR must be set to 1. Figure 7-11 shows the pin functions in mode 1.

	When P5DDR = 1	When P5DDR = 0
Port 5	A_{19} (output)	$P5_3$ (input)
	A_{18} (output)	$P5_2$ (input)
	A_{17} (output)	$P5_1$ (input)
	A_{16} (output)	$P5_0$ (input)
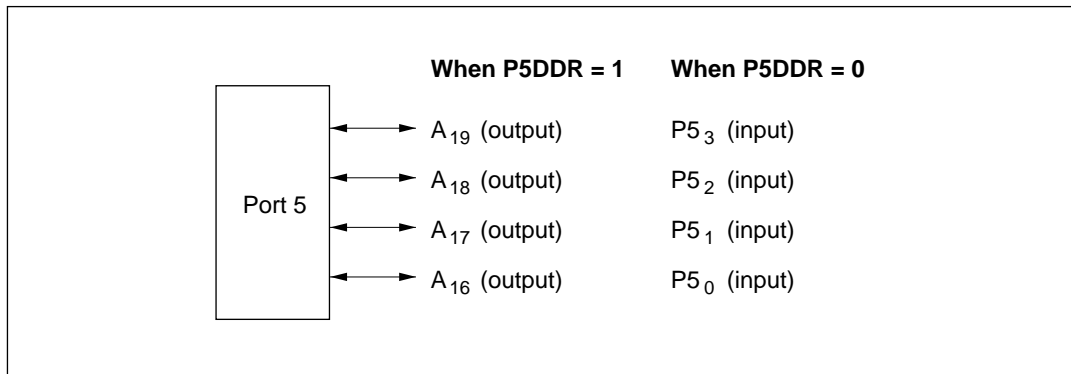

Figure 7-11 Pin Functions in Mode 1 (Port 5)

Modes 2 and 3: Input or output can be selected separately for each pin in port 5. A pin becomes an output pin if the corresponding P5DDR bit is set to 1, and an input pin if this bit is cleared to 0. Figure 7-12 shows the pin functions in modes 2 and 3.

Port 5	$P5_3$ (input/output)
	$P5_2$ (input/output)
	$P5_1$ (input/output)
	$P5_0$ (input/output)
Figure 7-12 Pin Functions in Modes 2 and 3 (Port 5)

7.5.4 Input Pull-Up Transistors

Port 5 has built-in MOS pull-up transistors that can be controlled by software. These input pull-up transistors can be turned on and off individually.

When a P5PCR bit is set to 1 and the corresponding P5DDR bit is cleared to 0, the input pull-up transistor is turned on.

The input pull-up transistors are turned off by a reset and in hardware standby mode. In software standby mode they retain their previous state.

Table 7-7 summarizes the states of the input pull-up transistors in each mode.

Table 7-7   Input Pull-Up Transistor States (Port 5)

Mode	Reset	Hardware Standby Mode	Software Standby Mode	Other Modes
1 2 3	Off	Off	On/off	On/off

Legend
Off: The input pull-up transistor is always off.
On/off: The input pull-up transistor is on if P5PCR = 1 and P5DDR = 0. Otherwise, it is off.

7.6 Port 6

7.6.1 Overview

Port 6 is a 4-bit input/output port that is also used for input and output of bus control signals ($\overline{WR}$, $\overline{RD}$, $\overline{AS}$, and $\overline{WAIT}$).

Figure 7-13 shows the pin configuration of port 6. In mode 1, the pin functions are $\overline{WR}$, $\overline{RD}$, $\overline{AS}$, and $P6_0/\overline{WAIT}$. In modes 2 and 3, port 6 is a generic input/output port.

Pins in port 6 can drive one TTL load and a 90-pF capacitive load. They can also drive a darlington transistor pair.

	Port 6 pins	Modes 1	Modes 2 and 3
Port 6	$P6_5 / \overline{WR}$	$\overline{WR}$ (output)	$P6_5$ (input/output)
	$P6_4 / \overline{RD}$	$\overline{RD}$ (output)	$P6_4$ (input/output)
	$P6_3 / \overline{AS}$	$\overline{AS}$ (output)	$P6_3$ (input/output)
	$P6_0 / \overline{WAIT}$	P6 (input/output)/$\overline{WAIT}$ (input)	$P6_0$ (input/output)
Figure 7-13   Port 6 Pin Configuration

7.6.2 Register Descriptions

Table 7-8 summarizes the registers of port 6.

Table 7-8   Port 6 Registers

Address*	Name	Abbreviation	R/W	Initial Value
H'FFC9	Port 6 data direction register	P6DDR	W	H'80
H'FFCB	Port 6 data register	P6DR	R/W	H'80
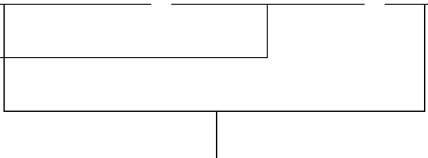

Note: * Lower 16 bits of the address.

Port 6 Data Direction Register (P6DDR): P6DDR is an 8-bit write-only register that can select input or output for each pin in port 6.

Bit	7	6	5	4	3	2	1	0
	—	—	P6$_5$DDR	P6$_4$DDR	P6$_3$DDR	—	—	P6$_0$DDR
Initial value	1	0	0	0	0	0	0	0
Read/Write	—	W	W	W	W	W	W	W

Reserved bit

Port 6 data direction 6 to 0
These bits select input or output for port 6 pins

Mode 1: Pins P6$_5$ to P6$_3$ function as bus control output pins ($\overline{WR}$, $\overline{RD}$, $\overline{AS}$). P6$_0$ functions as an input/output pin. When P6$_0$DDR is set to 1, P6$_0$ is an output pin, and when P6$_0$DDR is 0, P6$_0$ is an input pin. The P6$_5$DDR to P6$_3$DDR bit settings are ignored.
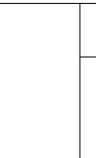

Modes 2 and 3: Port 6 is a generic input/output port. A pin in port 6 becomes an output pin if the corresponding P6DDR bit is set to 1, and an input pin if this bit is cleared to 0. Bits 7, 6, 2, and 1 are reserved.

P6DDR is a write-only register. Its value cannot be read. All bits return 1 when read.
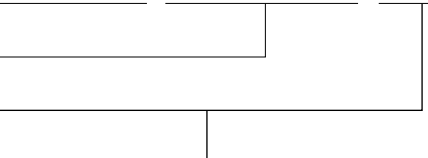

P6DDR is initialized to H'80 by a reset and in hardware standby mode. In software standby mode it retains its previous setting. If a P6DDR bit is set to 1, the corresponding pin maintains its output state in software standby mode.

Port 6 Data Register (P6DR): P6DR is an 8-bit readable/writable register that stores data for pins P6$_5$ to P6$_3$ and P6$_0$.

Bit	7	6	5	4	3	2	1	0
	—	—	P6$_5$	P6$_4$	P6$_3$	—	—	P6$_0$
Initial value	1	0	0	0	0	0	0	0
Read/Write	—	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Reserved bit

Port 6 data 5 to 3, 0
These bits store data for port 6 pins

140

When a bit in P6DDR is set to 1, if port 6 is read the value of the corresponding P6DR bit is returned directly. When a bit in P6DDR is cleared to 0, if port 6 is read the corresponding pin level is read. Bits 7, 6, 2, and 1 are reserved. Bit 7 cannot be modified and always reads 1. Bits 6, 2, and 1 can be written and read, but cannot be used as ports. If bit 6, 2, or 1 in P6DDR is read while its value is 1, the value of the corresponding bit in P6DR will be read. If bit 6, 2, or 1 in P6DDR is read while its value is 0, if will always read 1.

P6DR is initialized to H'80 by a reset and in hardware standby mode. In software standby mode it retains its previous setting.

7.6.3 Pin Functions in Each Mode

Mode 1: $P6_5$ to $P6_3$ function as bus control output pins. $P6_0$ is either a bus control input pin or generic input/output pin, functioning as an output pin when bit $P6_0DDR$ is set to 1 and an input pin when this bit is cleared to 0. Figure 7-14 and table 7-9 indicate the pin functions in mode 1.
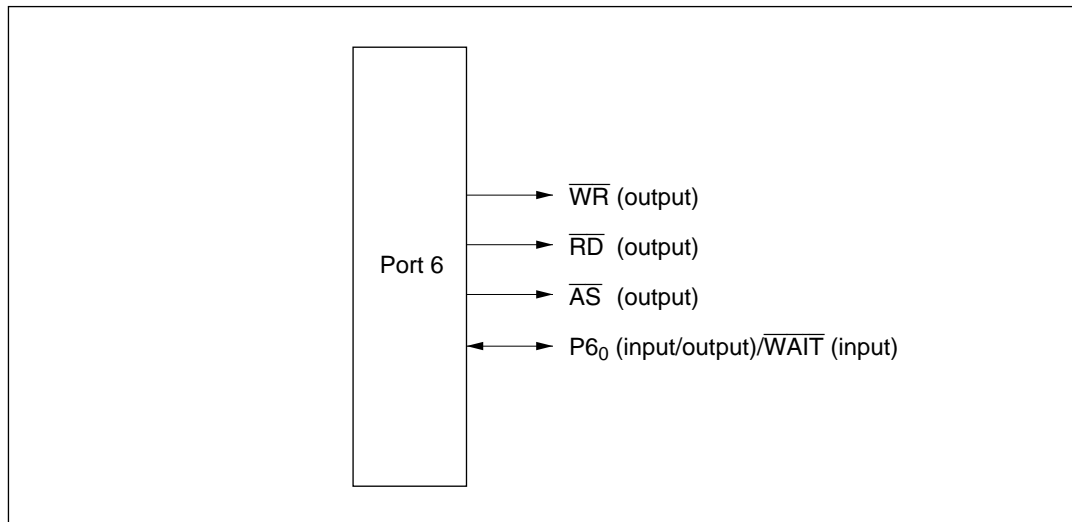

Figure 7-14   Pin Functions in Mode 1 (Port 6)

Table 7-9   Port 6 Pin Functions in Mode 1

Pin	Pin Functions and Selection Method
P6$_5$/$\overline{WR}$	Functions as follows regardless of P6$_5$DDR

P6$_5$DDR	0	1
Pin function	$\overline{WR}$ output	

Pin	Pin Functions and Selection Method
P6$_4$/$\overline{RD}$	Functions as follows regardless of P6$_4$DDR

P6$_4$DDR	0	1
Pin function	$\overline{RD}$ output	

Pin	Pin Functions and Selection Method
P6$_3$/$\overline{AS}$	Functions as follows regardless of P6$_3$DDR

P6$_3$DDR	0	1
Pin function	$\overline{AS}$ output	

Pin	Pin Functions and Selection Method
P6$_0$/$\overline{WAIT}$	Bits WCE7 to WCE0 in WCER, bit WMS1 in WCR, and bit P6$_0$DDR select the pin function as follows

WCER	All 1s			Not all 1s
WMS1	0		1	—
P6$_0$DDR	0	1	0*	0*
Pin function	P6$_0$ input	P6$_0$ output	$\overline{WAIT}$ input	

Note: * Do not set bit P6$_0$DDR to 1.

Modes 2 and 3: Input or output can be selected separately for each pin in port 6. A pin becomes an output pin if the corresponding P6DDR bit is set to 1, and an input pin if this bit is cleared to 0. Figure 7-15 shows the pin functions in modes 2 and 3.

7.7.2 Register Description

Table 7-10 summarizes the port 7 register. Port 7 is an input-only port, so it has no data direction register.

Table 7-10 Port 7 Data Register

Address*	Name	Abbreviation	R/W	Initial Value
H'FFCE	Port 7 data register	P7DR	R	Undetermined

Note: * Lower 16 bits of the address.

Port 7 Data Register (P7DR)

Bit	7	6	5	4	3	2	1	0
	$P7_7$	$P7_6$	$P7_5$	$P7_4$	$P7_3$	$P7_2$	$P7_1$	$P7_0$
Initial value	—*	—*	—*	—*	—*	—*	—*	—*
Read/Write	R	R	R	R	R	R	R	R

Note: * Determined by pins $P7_7$ to $P7_0$.

When port 7 is read, the pin levels are always read.

7.8 Port 8

7.8.1 Overview

Port 8 is a 4-bit input/output port that is also used for $\overline{IRQ_3}$ to $\overline{IRQ_0}$ input. Figure 7-17 shows the pin configuration of port 8.

Pin $P8_0$ functions as input/output pin or as an $\overline{IRQ_0}$ input pin. Pins $P8_3$ to $P8_1$ function as either input pins or $\overline{IRQ_3}$ to $\overline{IRQ_1}$ input pins in mode 1, and as input/output pins or $\overline{IRQ_3}$ to $\overline{IRQ_1}$ input pins in modes 2 and 3.

Pins in port 8 can drive one TTL load and a 90-pF capacitive load. They can also drive a darlington transistor pair. Pins $P8_2$ to $P8_0$ have Schmitt-trigger inputs.

	Port 8 pins	Mode 1	Modes 2 and 3
	$P8_3/\overline{IRQ_3}$	$P8_3$ (input)/IRQ_3 (input)	$P8_3$ (input/output)/IRQ_3 (input)
Port 8	$P8_2/\overline{IRQ_2}$	$P8_2$ (input)/IRQ_2 (input)	$P8_2$ (input/output)/IRQ_2 (input)
	$P8_1/\overline{IRQ_1}$	$P8_1$ (input)/IRQ_1 (input)	$P8_1$ (input/output)/IRQ_1 (input)
	$P8_0/\overline{IRQ_0}$	$P8_0$ (input/output)/IRQ_0 (input)	$P8_0$ (input/output)/IRQ_0 (input)
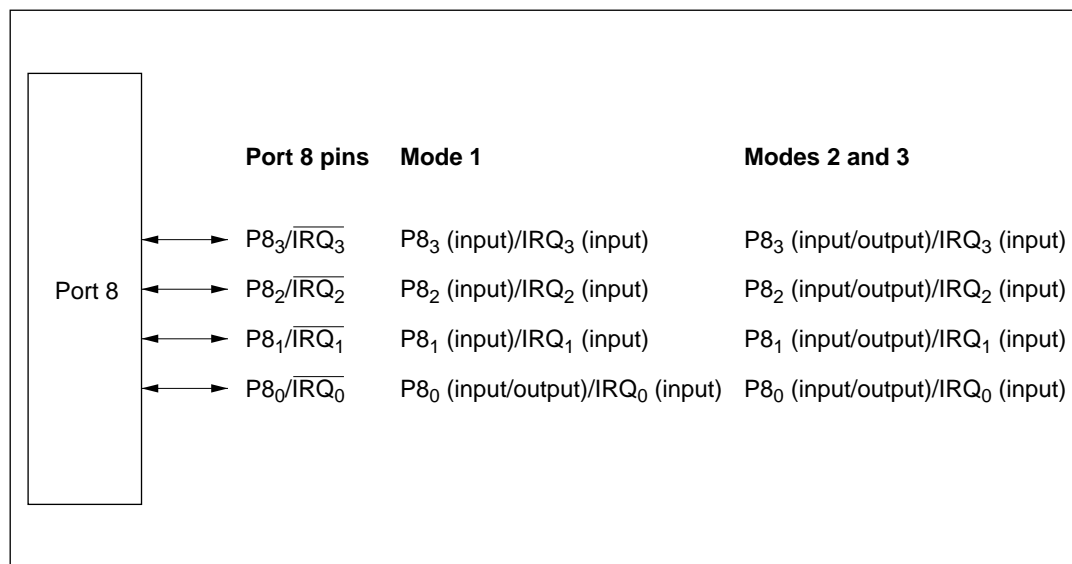

Figure 7-17   Port 8 Pin Configuration

7.8.2 Register Descriptions

Table 7-11 summarizes the registers of port 8.

Table 7-11 Port 8 Registers

Address*	Name	Abbreviation	R/W	Initial Value
H'FFCD	Port 8 data direction register	P8DDR	W	H'E0
H'FFCF	Port 8 data register	P8DR	R/W	H'E0

Note: * Lower 16 bits of the address.

Port 8 Data Direction Register (P8DDR): P8DDR is an 8-bit write-only register that can select input or output for each pin in port 8.

	7	6	5	4	3	2	1	0
Bit	—	—	—	—	$P8_3DDR$	$P8_2DDR$	$P8_1DDR$	$P8_0DDR$
Initial value	1	1	1	0	0	0	0	0
Read/Write	—	—	—	W	W	W	W	W

Reserved bits

Port 8 data direction 3 to 0
These bits select input or output for port 8 pins

- Mode 1

  Pins $P8_3$ to $P8_1$ function as input pins. Do not set $P8_3DDR$ to $P8_1DDR$ to 1. Pin $P8_0$ functions as an output pin when $P8_0DDR$ is set to 1, and as input pin when $P8_0DDR$ is cleared to 0.

- Modes 2 and 3

  Port 8 is a generic input/output port. A pin port 8 becomes an output pin if the corresponding P8DDR bit is set to 1, and an input pin if this bit is cleared to 0.

Bits 7 to 4 are reserved bits. P8DDR is a write-only register. Its value cannot be read. All bits return 1 when read.

P8DDR is initialized to H'E0 by a reset and in hardware standby mode. In software standby mode it retains its previous setting. If a P8DDR bit is set to 1, the corresponding pin maintains its output state in software standby mode.

147

Port 8 Data Register (P8DR): P8DR is an 8-bit readable/writable register that stores data for pins $P8_3$ to $P8_0$.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	$P8_3$	$P8_2$	$P8_1$	$P8_0$
Initial value	1	1	1	0	0	0	0	0
Read/Write	—	—	—	R/W	R/W	R/W	R/W	R/W

Reserved bits (bits 7 to 4)

Port 8 data 4 to 0
These bits store data
for port 8 pins

When a bit in P8DDR is set to 1, if port 8 is read the value of the corresponding P8DR bit is returned directly. When a bit in P8DDR is cleared to 0, if port 8 is read the corresponding pin level is read.

Bits 7 to 4 are reserved. Bits 7 to 5 cannot be modified and always read 1. Bit 4 can be written and read, but it cannot be used for port input or output. If bit 4 of P8DDR is read while its value is 1, bit 4 of P8DR is read directly. If bit 4 of P8DDR is read while its value is 0, it always reads 1.

P8DR is initialized to H'E0 by a reset and in hardware standby mode. In software standby mode it retains its previous setting.

7.8.3 Pin Functions

The port 8 pins are also used for $\overline{IRQ_3}$ to $\overline{IRQ_0}$. Table 7-12 describes the selection of pin functions.

148

Table 7-12 Port 8 Pin Functions

Pin	Pin Functions and Selection Method
P8$_3$/$\overline{\text{IRQ}_3}$	Bit P8$_3$DDR selects the pin function as follows

P8$_3$DDR	0	1	
		Mode 1	Modes 2 and 3
Pin function	P8$_3$ input	Illegal setting	P8$_3$ output
		$\overline{\text{IRQ}_3}$ input	

Pin	
P8$_2$/$\overline{\text{IRQ}_2}$	Bit P8$_2$DDR selects the pin function as follows

P8$_2$DDR	0	1	
		Mode 1	Modes 2 and 3
Pin function	P8$_2$ input	Illegal setting	P8$_2$ output
		$\overline{\text{IRQ}_2}$ input	

Pin	
P8$_1$/$\overline{\text{IRQ}_1}$	Bit P8$_1$DDR selects the pin function as follows

P8$_1$DDR	0	1	
		Mode 1	Modes 2 and 3
Pin function	P8$_1$ input	Illegal setting	P8$_1$ output
		$\overline{\text{IRQ}_1}$ input	

Pin	
P8$_0$/$\overline{\text{IRQ}_0}$	Bit P8$_0$DDR selects the pin function as follows

P8$_0$DDR	0	1
Pin function	P8$_0$ input	P8$_0$ output
	$\overline{\text{IRQ}_0}$ input	

7.9 Port 9

7.9.1 Overview

Port 9 is a 3-bit input/output port that is also used for input and output (TxD, RxD, SCK) by serial communication interface (SCI), and for $\overline{IRQ_4}$ input. Port 9 has the same set of pin functions in all operating modes. Figure 7-18 shows the pin configuration of port 9.

Pins in port 9 can drive one TTL load and a 30-pF capacitive load. They can also drive a darlington transistor pair.

Port 9 pins

	—	—	—	P9$_4$DDR	—	P9$_2$DDR	—	P9$_0$DDR
Initial value	1	1	0	0	0	0	0	0
Read/Write	—	—	W	W	W	W	W	W

Reserved bits

Port 9 data direction 4, 2, 0
These bits select input or output for port 9 pins
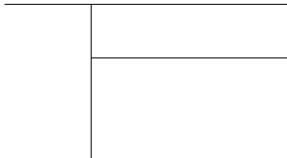

A pin in port 9 becomes an output pin if the corresponding P9DDR bit is set to 1, and an input pin if this bit is cleared to 0.

P9DDR is a write-only register. Its value cannot be read. All bits return 1 when read.
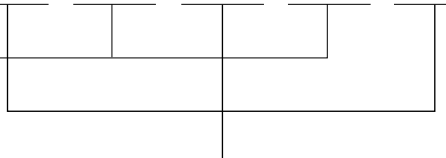

P9DDR is initialized to H'C0 by a reset and in hardware standby mode. In software standby mode it retains its previous setting. If a P9DDR bit is set to 1, the corresponding pin maintains its output state in software standby mode.

Port 9 Data Register (P9DR): P9DR is an 8-bit readable/writable register that stores data for pins P9$_4$, P9$_2$, and P9$_0$.

Bit	7	6	5	4	3	2	1	0
	—	—	—	P9$_4$	—	P9$_2$	—	P9$_0$
Initial value	1	1	0	0	0	0	0	0
Read/Write	—	—	R/W	R/W	R/W	R/W	R/W	R/W

Reserved bits

Port 9 data 4, 2, 0
These bits store data for port 9 pins

When a bit in P9DDR is set to 1, if port 9 is read the value of the corresponding P9DR bit is returned directly. When a bit in P9DDR is cleared to 0, if port 9 is read the corresponding pin level is read.

Bits 7 to 5, 3 and 1 are reserved. Bits 7 and 6 cannot be modified and always read 1. Bits 5, 3, and 1 can be written and read, but they cannot be used for port input or output. If bit 5, 3, or 1 in P9DDR is read while its value is 1, the corresponding bit in P9DR is read directly. If bit 5, 3, or 1 in P9DDR is read while its value is 0, it always reads 1.

P9DR is initialized to H'C0 by a reset and in hardware standby mode. In software standby mode it retains its previous setting.

7.9.3 Pin Functions

The port 9 pins are also used for SCI input and output (TxD, RxD, SCK), and for $\overline{IRQ_4}$ input. Table 7-14 describes the selection of pin functions.

Table 7-14 Port 9 Pin Functions

Pin	Pin Functions and Selection Method

152

7.10 Port A

7.10.1 Overview

Port A is an 8-bit input/output port that is also used for output (TP_7 to TP_0) from the programmable timing pattern controller (TPC) and input and output ($TIOCB_2$, $TIOCA_2$, $TIOCB_1$, $TIOCA_1$, $TIOCB_0$, $TIOCA_0$, TCLKD, TCLKC, TCLKB, TCLKA) by the 16-bit integrated timer unit (ITU), Figure 7-19 shows the pin configuration of port A.

Pins in port A can drive one TTL load and a 30-pF capacitive load. They can also drive a darlington transistor pair. Port A has Schmitt-trigger inputs.
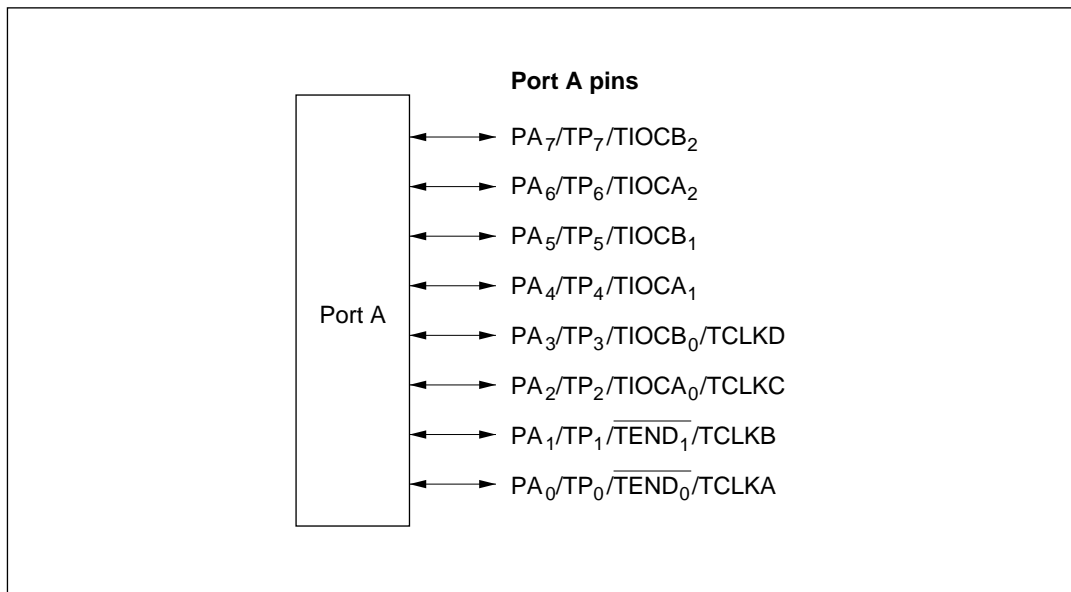

Figure 7-19   Port A Pin Configuration

7.10.2 Register Descriptions

Table 7-15 summarizes the registers of port A.

Table 7-15 Port A Registers

Address*	Name	Abbreviation	R/W	Initial Value
H'FFD1	Port A data direction register	PADDR	W	H'00
H'FFD3	Port A data register	PADR	R/W	H'00

Note: * Lower 16 bits of the address.

Port A Data Direction Register (PADDR): PADDR is an 8-bit write-only register that can select input or output for each pin in port A.

Bit	7	6	5	4	3	2	1	0
	PA_7DDR	PA_6DDR	PA_5DDR	PA_4DDR	PA_3DDR	PA_2DDR	PA_1DDR	PA_0DDR
Initial value	0	0	0	0	0	0	0	0
Read/Write	W	W	W	W	W	W	W	W

Port A data direction 7 to 0
These bits select input or output for port A pins

A pin in port A becomes an output pin if the corresponding PADDR bit is set to 1, and an input pin if this bit is cleared to 0.

PADDR is a write-only register. Its value cannot be read. All bits return 1 when read.

PADDR is initialized to H'00 by a reset and in hardware standby mode. In software standby mode it retains its previous setting. If a PADDR bit is set to 1, the corresponding pin maintains its output state in software standby mode.

Port A Data Register (PADR): PADR is an 8-bit readable/writable register that stores data for pins PA$_7$ to PA$_0$.

Bit	7	6	5	4	3	2	1	0
	PA$_7$	PA$_6$	PA$_5$	PA$_4$	PA$_3$	PA$_2$	PA$_1$	PA$_0$
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Port A data 7 to 0
These bits store data for port A pins

When a bit in PADDR is set to 1, if port A is read the value of the corresponding PADR bit is returned directly. When a bit in PADDR is cleared to 0, if port A is read the corresponding pin level is read.

PADR is initialized to H'00 by a reset and in hardware standby mode. In software standby mode it retains its previous setting.

When port A pins are used for TPC output, PADR stores output data for TPC output groups 0 and 1. If a bit in the next data enable register (NDERA) is set to 1, the corresponding PADR bit cannot be written. In this case, PADR can be updated only when data is transferred from NDRA.

7.10.3 Pin Functions

The port A pins are also used for TPC output (TP$_7$ to TP$_0$), ITU input/output (TIOCB$_2$ to TIOCB$_0$, TIOCA$_2$ to TIOCA$_0$), and input (TCLKD, TCLKC, TCLKB, TCLKA). Table 7-16 describes the selection of pin functions.

Table 7-16 Port A Pin Functions

Pin	Pin Functions and Selection Method
PA$_7$/TP$_7$/ TIOCB$_2$	ITU channel 2 settings (bit PWM2 in TMDR and bits IOB2 to IOB0 in TIOR2), bit NDER7 in NDERA, and bit PA$_7$DDR in PADDR select the pin function as follows

7.11 Port B

7.11.1 Overview

Port B is an 8-bit input/output port that is also used for TPC output (TP_{15} to TP_8), ITU input/output ($TIOCB_4$, $TIOCB_3$, $TIOCA_4$, $TIOCA_3$) and ITU output ($TOCXB_4$, $TOCXA_4$), and $\overline{ADTRG}$ input to the A/D converter. Port B has the same set of pin functions in all operating modes. Figure 7-20 shows the pin configuration of port B.

Pins in port B can drive one TTL load and a 30-pF capacitive load. They can also drive a darlington transistor pair. Pins PB_3 to PB_0 have Schmitt-trigger inputs.

Port B pins

Port B

- PB_7 (input/output)/TP_{15} (output)/$\overline{ADTRG}$ (input)
- PB_6 (input/output)/TP_{14} (output)
- PB_5 (input/output)/TP_{13} (output)/$TOCXB_4$ (output)
- PB_4 (input/output)/TP_{12} (output)/$TOCXA_4$ (output)
- PB_3 (input/output)/TP_{11} (output)/$TIOCB_4$ (input/output)
- PB_2 (input/output)/TP_{10} (output)/$TIOCA_4$ (input/output)
- PB_1 (input/output)/TP_9 (output)/$TIOCB_3$ (input/output)
- PB_0 (input/output)/TP_8 (output)/$TIOCA_3$ (input/output)
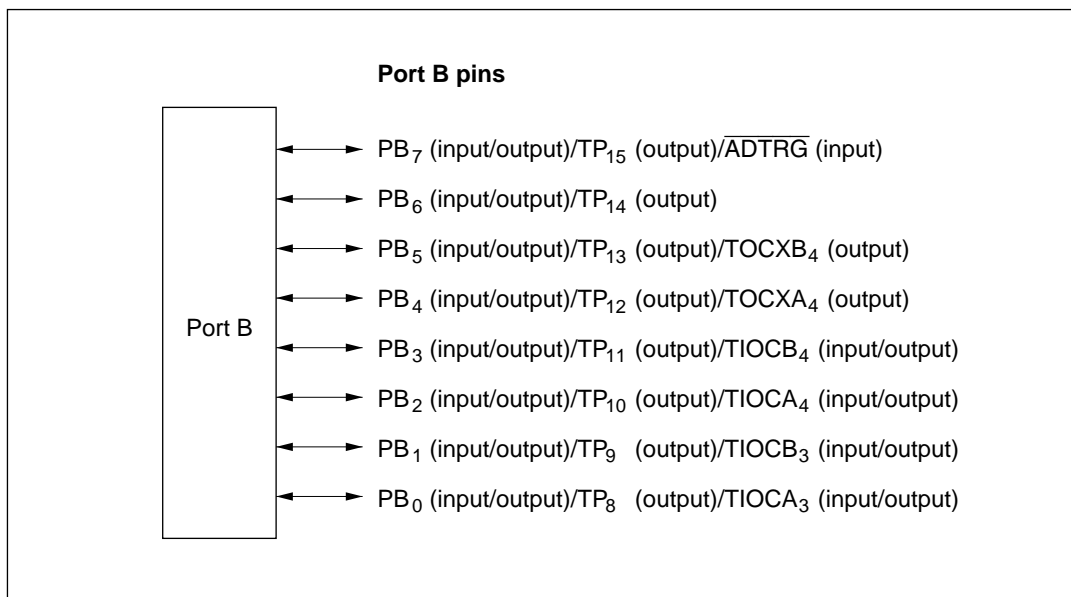

Figure 7-20   Port B Pin Configuration

7.11.2 Register Descriptions

Table 7-17 summarizes the registers of port B.

Table 7-17   Port B Registers

Address*	Name	Abbreviation	R/W	Initial Value
H'FFD4	Port B data direction register	PBDDR	W	H'00
H'FFD6	Port B data register	PBDR	R/W	H'00

Note: * Lower 16 bits of the address.

Port B Data Direction Register (PBDDR): PBDDR is an 8-bit write-only register that can select input or output for each pin in port B.

Bit	7	6	5	4	3	2	1	0
	PB$_7$DDR	PB$_6$DDR	PB$_5$DDR	PB$_4$DDR	PB$_3$DDR	PB$_2$DDR	PB$_1$DDR	PB$_0$DDR
Initial value	0	0	0	0	0	0	0	0
Read/Write	W	W	W	W	W	W	W	W

Port B data direction 7 to 0
These bits select input or output for port B pins

A pin in port B becomes an output pin if the corresponding PBDDR bit is set to 1, and an input pin if this bit is cleared to 0.

PBDDR is a write-only register. Its value cannot be read. All bits return 1 when read.

PBDDR is initialized to H'00 by a reset and in hardware standby mode. In software standby mode it retains its previous setting. If a PBDDR bit is set to 1, the corresponding pin maintains its output state in software standby mode.

Port B Data Register (PBDR): PBDR is an 8-bit readable/writable register that stores data for pins PB7 to PB0.

Bit	7	6	5	4	3	2	1	0
	PB$_7$	PB$_6$	PB$_5$	PB$_4$	PB$_3$	PB$_2$	PB$_1$	PB$_0$
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Port B data 7 to 0
These bits store data for port B pins

When a bit in PBDDR is set to 1, if port B is read the value of the corresponding PBDR bit is returned directly. When a bit in PBDDR is cleared to 0, if port B is read the corresponding pin level is read.

PBDR is initialized to H'00 by a reset and in hardware standby mode. In software standby mode it retains its previous setting.

When port B pins are used for TPC output, PBDR stores output data for TPC output groups 2 and 3. If a bit in the next data enable register (NDERB) is set to 1, the corresponding PBDR bit cannot be written. In this case, PBDR can be updated only when data is transferred from NDRB.

7.11.3 Pin Functions

The port B pins are also used for TPC output (TP$_{15}$ to TP$_8$), ITU input/output (TIOCB$_4$, TIOCB$_3$, TIOCA$_4$, TIOCA$_3$) and output (TOCXB$_4$, TOCXA$_4$), and $\overline{\text{ADTRG}}$ input. Table 7-18 describes the selection of pin functions.

Table 7-18 Port B Pin Functions

Pin	Pin Functions and Selection Method

PB$_7$/ TP$_{15}$/ $\overline{\text{ADTRG}}$	Bit TRGE in ADCR, bit NDER15 in NDERB and bit PB$_7$DDR in PBDDR select the pin function as follows

PB$_7$DDR	0	1	1
NDER15	—	0	1
Pin function	PB$_7$ input	PB$_7$ output	TP$_{15}$ output
	$\overline{\text{ADTRG}}$ input*		

Notes: * $\overline{\text{ADTRG}}$ input when TRGE = 1.

PB$_6$/ TP$_{14}$/	Bit NDER14 in NDERB and bit PB$_6$DDR in PBDDR select the pin function as follows

PB$_6$DDR	0	1	1
NDER14	—	0	1
Pin function	PB$_6$ input	PB$_6$ output	TP$_{14}$ output

PB$_5$/ TP$_{13}$/ TOCXB$_4$	ITU channel 4 settings (bit CMD1 in TFCR and bit EXB4 in TOER), bit NDER13 in NDERB, and bit PB$_5$DDR in PBDDR select the pin function as follows

EXB4, CMD1	Not both 1			Both 1
PB$_5$DDR	0	1	1	—
NDER13	—	0	1	—

Section 8   16-Bit Integrated Timer Unit (ITU)

8.1 Overview

The H8/3032 Series has a built-in 16-bit integrated timer-pulse unit (ITU) with five 16-bit timer channels.

8.1.1 Features

ITU features are listed below.

- Capability to process up to 12 pulse outputs or 10 pulse inputs

- Ten general registers (GRs, two per channel) with independently-assignable output compare or input capture functions

- Selection of eight counter clock sources for each channel:

  Internal clocks: ø, ø/2, ø/4, ø/8
  External clocks: TCLKA, TCLKB, TCLKC, TCLKD

- Five operating modes selectable in all channels:

  — Waveform output by compare match

     Selection of 0 output, 1 output, or toggle output (only 0 or 1 output in channel 2)

  — Input capture function

     Rising edge, falling edge, or both edges (selectable)

  — Counter clearing function

     Counters can be cleared by compare match or input capture

  — Synchronization

     Two or more timer counters (TCNTs) can be preset simultaneously, or cleared simultaneously by compare match or input capture. Counter synchronization enables synchronous register input and output.

— PWM mode

PWM output can be provided with an arbitrary duty cycle. With synchronization, up to five-phase PWM output is possible

- Phase counting mode selectable in channel 2

Two-phase encoder output can be counted automatically.

- Three additional modes selectable in channels 3 and 4

— Reset-synchronized PWM mode

If channels 3 and 4 are combined, three-phase PWM output is possible with three pairs of complementary waveforms.

— Complementary PWM mode

If channels 3 and 4 are combined, three-phase PWM output is possible with three pairs of non-overlapping complementary waveforms.

— Buffering

Input capture registers can be double-buffered. Output compare registers can be updated automatically.

- High-speed access via internal 16-bit bus

The 16-bit timer counters, general registers, and buffer registers can be accessed at high speed via a 16-bit bus.

- Fifteen interrupt sources

Each channel has two compare match/input capture interrupts and an overflow interrupt. All interrupts can be requested independently.

- Output triggering of programmable pattern controller (TPC)

Compare match/input capture signals from channels 0 to 3 can be used as TPC output triggers.

Table 8-1 summarizes the ITU functions.

Table 8-1   ITU Functions

Item		Channel 0	Channel 1	Channel 2	Channel 3	Channel 4
Clock sources		Internal clocks: ø, ø/2, ø/4, ø/8 External clocks: TCLKA, TCLKB, TCLKC, TCLKD, selectable independently

	H'FF9F	Buffer register B4 (low)	BRB4L	R/W	H'FF

Notes: 1. The lower 16 bits of the address are indicated.
2. Only 0 can be written, to clear flags.

8.2 Register Descriptions

8.2.1 Timer Start Register (TSTR)

TSTR is an 8-bit readable/writable register that starts and stops the timer counter (TCNT) in channels 0 to 4.

Bit	7	6	5	4	3	2	1	0
	—	—	—	STR4	STR3	STR2	STR1	STR0
Initial value	1	1	1	0	0	0	0	0
Read/Write	—	—	—	R/W	R/W	R/W	R/W	R/W

Reserved bits

Counter start 4 to 0
These bits start and stop TCNT4 to TCNT0

TSTR is initialized to H'E0 by a reset and in standby mode.

Bits 7 to 5—Reserved: Read-only bits, always read as 1.

Bit 4—Counter Start 4 (STR4): Starts and stops timer counter 4 (TCNT4).

Bit 4 STR4	Description	
0	TCNT4 is halted	(Initial value)
1	TCNT4 is counting	

Bit 3—Counter Start 3 (STR3): Starts and stops timer counter 3 (TCNT3).

Bit 3 STR3	Description	
0	TCNT3 is halted	(Initial value)
1	TCNT3 is counting	

Bit 2—Counter Start 2 (STR2): Starts and stops timer counter 2 (TCNT2).

Bit 2 STR2	Description	
0	TCNT2 is halted	(Initial value)
1	TCNT2 is counting	

Bit 1—Counter Start 1 (STR1): Starts and stops timer counter 1 (TCNT1).

Bit 1 STR1	Description	
0	TCNT1 is halted	(Initial value)
1	TCNT1 is counting	

Bit 0—Counter Start 0 (STR0): Starts and stops timer counter 0 (TCNT0).

Bit 0 STR0	Description	
0	TCNT0 is halted	(Initial value)
1	TCNT0 is counting	

8.2.2 Timer Synchro Register (TSNC)

TSNC is an 8-bit readable/writable register that selects whether channels 0 to 4 operate independently or synchronously. Channels are synchronized by setting the corresponding bits to 1.

Bit	7	6	5	4	3	2	1	0
	—	—	—	SYNC4	SYNC3	SYNC2	SYNC1	SYNC0
Initial value	1	1	1	0	0	0	0	0
Read/Write	—	—	—	R/W	R/W	R/W	R/W	R/W

Reserved bits (bits 7–5)

Timer sync 4 to 0 (bits 4–0)
These bits synchronize channels 4 to 0

TSNC is initialized to H'E0 by a reset and in standby mode.

Bits 7 to 5—Reserved: Read-only bits, always read as 1.

Bit 4—Timer Sync 4 (SYNC4): Selects whether channel 4 operates independently or synchronously.

Bit 4 SYNC4	Description	
0	Channel 4's timer counter (TCNT4) operates independently TCNT4 is preset and cleared independently of other channels	(Initial value)
1	Channel 4 operates synchronously TCNT4 can be synchronously preset and cleared	

Bit 3—Timer Sync 3 (SYNC3): Selects whether channel 3 operates independently or synchronously.

Bit 3

SYNC3	Description	
0	Channel 3's timer counter (TCNT3) operates independently TCNT3 is preset and cleared independently of other channels	(Initial value)
1	Channel 3 operates synchronously TCNT3 can be synchronously preset and cleared	

Bit 2—Timer Sync 2 (SYNC2): Selects whether channel 2 operates independently or synchronously.

Bit 2

SYNC2	Description	
0	Channel 2's timer counter (TCNT2) operates independently TCNT2 is preset and cleared independently of other channels	(Initial value)
1	Channel 2 operates synchronously TCNT2 can be synchronously preset and cleared	

Bit 1—Timer Sync 1 (SYNC1): Selects whether channel 1 operates independently or synchronously.

Bit 1

SYNC1	Description	
0	Channel 1's timer counter (TCNT1) operates independently TCNT1 is preset and cleared independently of other channels	(Initial value)
1	Channel 1 operates synchronously TCNT1 can be synchronously preset and cleared	

Bit 0—Timer Sync 0 (SYNC0): Selects whether channel 0 operates independently or synchronously.

Bit 0

SYNC0	Description	
0	Channel 0's timer counter (TCNT0) operates independently TCNT0 is preset and cleared independently of other channels	(Initial value)
1	Channel 0 operates synchronously TCNT0 can be synchronously preset and cleared	

8.2.3 Timer Mode Register (TMDR)

TMDR is an 8-bit readable/writable register that selects PWM mode for channels 0 to 4. It also selects phase counting mode and the overflow flag (OVF) setting conditions for channel 2.

Bit	7	6	5	4	3	2	1	0
	—	MDF	FDIR	PWM4	PWM3	PWM2	PWM1	PWM0
Initial value	1	0	0	0	0	0	0	0
Read/Write	—	R/W	R/W	R/W	R/W	R/W	R/W	R/W

PWM mode 4 to 0
These bits select PWM
mode for channels 4 to 0

Flag direction
Selects the setting condition for the overflow
flag (OVF) in timer status register 2 (TSR2)

Phase counting mode flag
Selects phase counting mode for channel 2

Reserved bit

TMDR is initialized to H'80 by a reset and in standby mode.

Bit 7—Reserved: Read-only bit, always read as 1.

Bit 6—Phase Counting Mode Flag (MDF): Selects whether channel 2 operates normally or in phase counting mode.

Bit 6 MDF	Description	
0	Channel 2 operates normally	(Initial value)
1	Channel 2 operates in phase counting mode	

When MDF is set to 1 to select phase counting mode, timer counter 2 (TCNT2) operates as an up/down-counter and pins TCLKA and TCLKB become counter clock input pins. TCNT2 counts both rising and falling edges of TCLKA and TCLKB, and counts up or down as follows.

Counting Direction	Down-Counting				Up-Counting			
TCLKA pin	↑	High	↓	Low	↑	Low	↓	High
TCLKB pin	Low	↑	High	↓	High	↑	Low	↓

In phase counting mode channel 2 operates as above regardless of the external clock edges selected by bits CKEG1 and CKEG0 and the clock source selected by bits TPSC2 to TPSC0 in timer control register 2 (TCR2). Phase counting mode takes precedence over these settings.

The counter clearing condition selected by the CCLR1 and CCLR0 bits in TCR2 and the compare match/input capture settings and interrupt functions of timer I/O control register 2 (TIOR2), timer interrupt enable register 2 (TIER2), and timer status register 2 (TSR2) remain effective in phase counting mode.

Bit 5—Flag Direction (FDIR): Designates the setting condition for the overflow flag (OVF) in timer status register 2 (TSR2). The FDIR designation is valid in all modes in channel 2.

Bit 5

FDIR	Description	
0	OVF is set to 1 in TSR2 when TCNT2 overflows or underflows	(Initial value)
1	OVF is set to 1 in TSR2 when TCNT2 overflows	

Bit 4—PWM Mode 4 (PWM4): Selects whether channel 4 operates normally or in PWM mode.

Bit 4

PWM4	Description	
0	Channel 4 operates normally	(Initial value)
1	Channel 4 operates in PWM mode	

When bit PWM4 is set to 1 to select PWM mode, pin TIOCA4 becomes a PWM output pin. The output goes to 1 at compare match with general register A4 (GRA4), and to 0 at compare match with general register B4 (GRB4).

If complementary PWM mode or reset-synchronized PWM mode is selected by bits CMD1 and CMD0 in the timer function control register (TFCR), the CMD1 and CMD0 setting takes precedence and the PWM4 setting is ignored.

Bit 3—PWM Mode 3 (PWM3): Selects whether channel 3 operates normally or in PWM mode.

Bit 3 PWM3	Description	
0	Channel 3 operates normally	(Initial value)
1	Channel 3 operates in PWM mode	

When bit PWM3 is set to 1 to select PWM mode, pin TIOCA3 becomes a PWM output pin. The output goes to 1 at compare match with general register A3 (GRA3), and to 0 at compare match with general register B3 (GRB3).

If complementary PWM mode or reset-synchronized PWM mode is selected by bits CMD1 and CMD0 in the timer function control register (TFCR), the CMD1 and CMD0 setting takes precedence and the PWM3 setting is ignored.

Bit 2—PWM Mode 2 (PWM2): Selects whether channel 2 operates normally or in PWM mode.

Bit 2 PWM2	Description	
0	Channel 2 operates normally	(Initial value)
1	Channel 2 operates in PWM mode	

When bit PWM2 is set to 1 to select PWM mode, pin TIOCA2 becomes a PWM output pin. The output goes to 1 at compare match with general register A2 (GRA2), and to 0 at compare match with general register B2 (GRB2).

Bit 1—PWM Mode 1 (PWM1): Selects whether channel 1 operates normally or in PWM mode.

Bit 1 PWM1	Description	
0	Channel 1 operates normally	(Initial value)
1	Channel 1 operates in PWM mode	

When bit PWM1 is set to 1 to select PWM mode, pin TIOCA1 becomes a PWM output pin. The output goes to 1 at compare match with general register A1 (GRA1), and to 0 at compare match with general register B1 (GRB1).

186

Bit 0—PWM Mode 0 (PWM0): Selects whether channel 0 operates normally or in PWM mode.

Bit 0 PWM0	Description	
0	Channel 0 operates normally	(Initial value)
1	Channel 0 operates in PWM mode	

When bit PWM0 is set to 1 to select PWM mode, pin TIOCA0 becomes a PWM output pin. The output goes to 1 at compare match with general register A0 (GRA0), and to 0 at compare match with general register B0 (GRB0).

8.2.4 Timer Function Control Register (TFCR)

TFCR is an 8-bit readable/writable register that selects complementary PWM mode, reset-synchronized PWM mode, and buffering for channels 3 and 4.

Bit	7	6	5	4	3	2	1	0
	—	—	CMD1	CMD0	BFB4	BFA4	BFB3	BFA3
Initial value	1	1	0	0	0	0	0	0
Read/Write	—	—	R/W	R/W	R/W	R/W	R/W	R/W

Reserved bits

Combination mode 1/0
These bits select complementary PWM mode or reset-synchronized PWM mode for channels 3 and 4

Buffer mode B4 and A4
These bits select buffering of general registers (GRB4 and GRA4) by buffer registers (BRB4 and BRA4) in channel 4

Buffer mode B3 and A3
These bits select buffering of general registers (GRB3 and GRA3) by buffer registers (BRB3 and BRA3) in channel 3

TFCR is initialized to H'C0 by a reset and in standby mode.

Bits 7 and 6—Reserved: Read-only bits, always read as 1.

Bits 5 and 4—Combination Mode 1 and 0 (CMD1, CMD0): These bits select whether channels 3 and 4 operate in normal mode, complementary PWM mode, or reset-synchronized PWM mode.

Bit 5 CMD1	Bit 4 CMD0	Description	
0	0	Channels 3 and 4 operate normally	(Initial value)
	1		
1	0	Channels 3 and 4 operate together in complementary PWM mode	
	1	Channels 3 and 4 operate together in reset-synchronized PWM mode	

Before selecting reset-synchronized PWM mode or complementary PWM mode, halt the timer counter or counters that will be used in these modes.

When these bits select complementary PWM mode or reset-synchronized PWM mode, they take precedence over the setting of the PWM mode bits (PWM4 and PWM3) in TMDR. Settings of timer sync bits SYNC4 and SYNC3 in the timer synchro register (TSNC) are valid in complementary PWM mode and reset-synchronized PWM mode, however. When complementary PWM mode is selected, channels 3 and 4 must not be synchronized (do not set bits SYNC3 and SYNC4 both to 1 in TSNC).

Bit 3—Buffer Mode B4 (BFB4): Selects whether GRB4 operates normally in channel 4, or whether GRB4 is buffered by BRB4.

Bit 3 BFB4	Description	
0	GRB4 operates normally	(Initial value)
1	GRB4 is buffered by BRB4	

Bit 2—Buffer Mode A4 (BFA4): Selects whether GRA4 operates normally in channel 4, or whether GRA4 is buffered by BRA4.

Bit 2 BFA4	Description	
0	GRA4 operates normally	(Initial value)
1	GRA4 is buffered by BRA4	

Bit 1—Buffer Mode B3 (BFB3): Selects whether GRB3 operates normally in channel 3, or whether GRB3 is buffered by BRB3.

Bit 1 BFB3	Description	
0	GRB3 operates normally	(Initial value)
1	GRB3 is buffered by BRB3	

Bit 0—Buffer Mode A3 (BFA3): Selects whether GRA3 operates normally in channel 3, or whether GRA3 is buffered by BRA3.

Bit 0 BFA3	Description	
0	GRA3 operates normally	(Initial value)
1	GRA3 is buffered by BRA3	

8.2.5 Timer Output Master Enable Register (TOER)

TOER is an 8-bit readable/writable register that enables or disables output settings for channels 3 and 4.

Bit	7	6	5	4	3	2	1	0
	—	—	EXB4	EXA4	EB3	EB4	EA4	EA3
Initial value	1	1	1	1	1	1	1	1
Read/Write	—	—	R/W	R/W	R/W	R/W	R/W	R/W

Reserved bits

Master enable TOCXA$_4$, TOCXB$_4$
These bits enable or disable output settings for pins TOCXA4 and TOCXB4

Master enable TIOCA$_3$, TIOCB$_3$, TIOCA$_4$, TIOCB$_4$
These bits enable or disable output settings for pins TIOCA3, TIOCB3 , TIOCA4, and TIOCB4

TOER is initialized to H'FF by a reset and in standby mode.

Bits 7 and 6—Reserved: Read-only bits, always read as 1.

Bit 5—Master Enable TOCXB$_4$ (EXB4): Enables or disables ITU output at pin TOCXB$_4$.

Bit 5 EXB4	Description
0	TOCXB$_4$ output is disabled regardless of TFCR settings (TOCXB$_4$ operates as a generic input/output pin). If XTGD = 0, EXB4 is cleared to 0 when input capture A occurs in channel 1.
1	TOCXB$_4$ is enabled for output according to TFCR settings (Initial value)

Bit 4—Master Enable TOCXA$_4$ (EXA4): Enables or disables ITU output at pin TOCXA$_4$.

Bit 4 EXA4	Description
0	TOCXA$_4$ output is disabled regardless of TFCR settings (TOCXA$_4$ operates as a generic input/output pin). If XTGD = 0, EXA4 is cleared to 0 when input capture A occurs in channel 1.
1	TOCXA$_4$ is enabled for output according to TFCR settings (Initial value)

Bit 3—Master Enable TIOCB$_3$ (EB3): Enables or disables ITU output at pin TIOCB$_3$.

Bit 3 EB3	Description
0	TIOCB$_3$ output is disabled regardless of TIOR3 and TFCR settings (TIOCB$_3$ operates as a generic input/output pin). If XTGD = 0, EB3 is cleared to 0 when input capture A occurs in channel 1.
1	TIOCB$_3$ is enabled for output according to TIOR3 and TFCR settings (Initial value)

Bit 2—Master Enable TIOCB$_4$ (EB4): Enables or disables ITU output at pin TIOCB$_4$.

Bit 2 EB4	Description
0	TIOCB$_4$ output is disabled regardless of TIOR4 and TFCR settings (TIOCB$_4$ operates as a generic input/output pin). If XTGD = 0, EB4 is cleared to 0 when input capture A occurs in channel 1.
1	TIOCB$_4$ is enabled for output according to TIOR4 and TFCR settings (Initial value)

Bit 1—Master Enable TIOCA$_4$ (EA4): Enables or disables ITU output at pin TIOCA$_4$.

Bit 1 EA4	Description
0	TIOCA$_4$ output is disabled regardless of TIOR4, TMDR, and TFCR settings (TIOCA$_4$ operates as a generic input/output pin). If XTGD = 0, EA4 is cleared to 0 when input capture A occurs in channel 1.
1	TIOCA$_4$ is enabled for output according to TIOR4, TMDR, and (Initial value) TFCR settings

Bit 0—Master Enable TIOCA$_3$ (EA3): Enables or disables ITU output at pin TIOCA$_3$.

Bit 0 EA3	Description
0	TIOCA$_3$ output is disabled regardless of TIOR3, TMDR, and TFCR settings (TIOCA$_3$ operates as a generic input/output pin). If XTGD = 0, EA3 is cleared to 0 when input capture A occurs in channel 1.
1	TIOCA$_3$ is enabled for output according to TIOR3, TMDR, and (Initial value) TFCR settings

8.2.6 Timer Output Control Register (TOCR)

TOCR is an 8-bit readable/writable register that selects externally triggered disabling of output in complementary PWM mode and reset-synchronized PWM mode, and inverts the output levels.

Bit	7	6	5	4	3	2	1	0
	—	—	—	XTGD	—	—	OLS4	OLS3
Initial value	1	1	1	1	1	1	1	1
Read/Write	—	—	—	R/W	—	—	R/W	R/W

Reserved bits (bits 7–5)

Output level select 3, 4
These bits select output levels in complementary PWM mode and reset-synchronized PWM mode

Reserved bits (bits 3, 2)

External trigger disable
Selects externally triggered disabling of output in complementary PWM mode and reset-synchronized PWM mode

The settings of the XTGD, OLS4, and OLS3 bits are valid only in complementary PWM mode and reset-synchronized PWM mode. These settings do not affect other modes.

TOCR is initialized to H'FF by a reset and in standby mode.

Bits 7 to 5—Reserved: Read-only bits, always read as 1.

Bit 4—External Trigger Disable (XTGD): Selects externally triggered disabling of ITU output in complementary PWM mode and reset-synchronized PWM mode.

Bit 4 XTGD	Description
0	Input capture A in channel 1 is used as an external trigger signal in complementary PWM mode and reset-synchronized PWM mode. When an external trigger occurs, bits 5 to 0 in the timer output master enable register (TOER) are cleared to 0, disabling ITU output.
1	External triggering is disabled (Initial value)

Bits 3 and 2—Reserved: Read-only bits, always read as 1.

Bit 1—Output Level Select 4 (OLS4): Selects output levels in complementary PWM mode and reset-synchronized PWM mode.

Bit 1 OLS4	Description	
0	TIOCA3, TIOCA4, and TIOCB4 outputs are inverted	
1	TIOCA3, TIOCA4, and TIOCB4 outputs are not inverted	(Initial value)

Bit 0—Output Level Select 3 (OLS3): Selects output levels in complementary PWM mode and reset-synchronized PWM mode.

Bit 0 OLS3	Description	
0	TIOCB3, TOCXA4, and TOCXB4 outputs are inverted	
1	TIOCB3, TOCXA4, and TOCXB4 outputs are not inverted	(Initial value)

8.2.7 Timer Counters (TCNT)

TCNT is a 16-bit counter. The ITU has five TCNTs, one for each channel.

Channel	Abbreviation	Function
0	TCNT0	Up-counter
1	TCNT1	
2	TCNT2	Phase counting mode: up/down-counter Other modes: up-counter
3	TCNT3	Complementary PWM mode: up/down-counter
4	TCNT4	Other modes: up-counter

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Each TCNT is a 16-bit readable/writable register that counts pulse inputs from a clock source. The clock source is selected by bits TPSC2 to TPSC0 in the timer control register (TCR).

TCNT0 and TCNT1 are up-counters. TCNT2 is an up/down-counter in phase counting mode and an up-counter in other modes. TCNT3 and TCNT4 are up/down-counters in complementary PWM mode and up-counters in other modes.

TCNT can be cleared to H'0000 by compare match with general register A or B (GRA or GRB) or by input capture to GRA or GRB (counter clearing function) in the same channel.

When TCNT overflows (changes from H'FFFF to H'0000), the overflow flag (OVF) is set to 1 in the timer status register (TSR) of the corresponding channel.

When TCNT underflows (changes from H'0000 to H'FFFF), the overflow flag (OVF) is set to 1 in TSR of the corresponding channel.

The TCNTs are linked to the CPU by an internal 16-bit bus and can be written or read by either word access or byte access.

Each TCNT is initialized to H'0000 by a reset and in standby mode.

8.2.8 General Registers (GRA, GRB)

The general registers are 16-bit registers. The ITU has 10 general registers, two in each channel.

Channel	Abbreviation	Function
0	GRA0, GRB0	Output compare/input capture register
1	GRA1, GRB1	
2	GRA2, GRB2	
3	GRA3, GRB3	Output compare/input capture register; can be buffered by buffer registers BRA and BRB
4	GRA4, GRB4	

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

A general register is a 16-bit readable/writable register that can function as either an output compare register or an input capture register. The function is selected by settings in the timer I/O control register (TIOR).

When a general register is used as an output compare register, its value is constantly compared with the TCNT value. When the two values match (compare match), the IMFA or IMFB flag is set to 1 in the timer status register (TSR). Compare match output can be selected in TIOR.

When a general register is used as an input capture register, rising edges, falling edges, or both edges of an external input capture signal are detected and the current TCNT value is stored in the general register. The corresponding IMFA or IMFB flag in TSR is set to 1 at the same time. The valid edge or edges of the input capture signal are selected in TIOR.

TIOR settings are ignored in PWM mode, complementary PWM mode, and reset-synchronized PWM mode.

General registers are linked to the CPU by an internal 16-bit bus and can be written or read by either word access or byte access.

General registers are initialized to the output compare function (with no output signal) by a reset and in standby mode. The initial value is H'FFFF.

8.2.9 Buffer Registers (BRA, BRB)

The buffer registers are 16-bit registers. The ITU has four buffer registers, two each in channels 3 and 4.

Channel	Abbreviation	Function
3	BRA3, BRB3	Used for buffering
4	BRA4, BRB4	• When the corresponding GRA or GRB functions as an output compare register, BRA or BRB can function as an output compare buffer register: the BRA or BRB value is automatically transferred to GRA or GRB at compare match
		• When the corresponding GRA or GRB functions as an input capture register, BRA or BRB can function as an input capture buffer register: the GRA or GRB value is automatically transferred to BRA or BRB at input capture

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

A buffer register is a 16-bit readable/writable register that is used when buffering is selected. Buffering can be selected independently by bits BFB4, BFA4, BFB3, and BFA3 in TFCR.

The buffer register and general register operate as a pair. When the general register functions as an output compare register, the buffer register functions as an output compare buffer register. When the general register functions as an input capture register, the buffer register functions as an input capture buffer register.

The buffer registers are linked to the CPU by an internal 16-bit bus and can be written or read by either word or byte access.

Buffer registers are initialized to H'FFFF by a reset and in standby mode.

8.2.10 Timer Control Registers (TCR)

TCR is an 8-bit register. The ITU has five TCRs, one in each channel.

Channel	Abbreviation	Function
0	TCR0	TCR controls the timer counter. The TCRs in all channels are
1	TCR1	functionally identical. When phase counting mode is selected in channel 2, the settings of bits CKEG1 and CKEG0 and TPSC2 to
2	TCR2	TPSC0 in TCR2 are ignored.
3	TCR3	
4	TCR4	

Bit	7	6	5	4	3	2	1	0
	—	CCLR1	CCLR0	CKEG1	CKEG0	TPSC2	TPSC1	TPSC0
Initial value	1	0	0	0	0	0	0	0
Read/Write	—	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Timer prescaler 2 to 0
These bits select the counter clock

Clock edge 1/0
These bits select external clock edges

Counter clear 1/0
These bits select the counter clear source

Reserved bit

Each TCR is an 8-bit readable/writable register that selects the timer counter clock source, selects the edge or edges of external clock sources, and selects how the counter is cleared.

TCR is initialized to H'80 by a reset and in standby mode.

Bit 7—Reserved: Read-only bit, always read as 1.

Bits 6 and 5—Counter Clear 1/0 (CCLR1, CCLR0): These bits select how TCNT is cleared.

Bit 6 CCLR1	Bit 5 CCLR0	Description	
0	0	TCNT is not cleared	(Initial value)
	1	TCNT is cleared by GRA compare match or input capture[*1]	
1	0	TCNT is cleared by GRB compare match or input capture[*1]	
	1	Synchronous clear: TCNT is cleared in synchronization with other synchronized timers[*2]	

Notes: 1. TCNT is cleared by compare match when the general register functions as a compare match register, and by input capture when the general register functions as an input capture register.
2. Selected in the timer synchro register (TSNC).

Bits 4 and 3—Clock Edge 1/0 (CKEG1, CKEG0): These bits select external clock input edges when an external clock source is used.

Bit 4 CKEG1	Bit 3 CKEG0	Description	
0	0	Count rising edges	(Initial value)
	1	Count falling edges	
1	—	Count both edges	

When channel 2 is set to phase counting mode, bits CKEG1 and CKEG0 in TCR2 are ignored. Phase counting takes precedence.

Bits 2 to 0—Timer Prescaler 2 to 0 (TPSC2 to TPSC0): These bits select the counter clock source.

Bit 2 TPSC2	Bit 1 TPSC1	Bit 0 TPSC0	Function	
0	0	0	Internal clock: ø	(Initial value)
		1	Internal clock: ø/2	
	1	0	Internal clock: ø/4	
		1	Internal clock: ø/8	
1	0	0	External clock A: TCLKA input	
		1	External clock B: TCLKB input	
	1	0	External clock C: TCLKC input	
		1	External clock D: TCLKD input	

When bit TPSC2 is cleared to 0 an internal clock source is selected, and the timer counts only falling edges. When bit TPSC2 is set to 1 an external clock source is selected, and the timer counts the edge or edges selected by bits CKEG1 and CKEG0.

When channel 2 is set to phase counting mode (MDF = 1 in TMDR), the settings of bits TPSC2 to TPSC0 in TCR2 are ignored. Phase counting takes precedence.

8.2.11 Timer I/O Control Register (TIOR)

TIOR is an 8-bit register. The ITU has five TIORs, one in each channel.

Channel	Abbreviation	Function
0	TIOR0	TIOR controls the general registers. Some functions differ in PWM mode. TIOR3 and TIOR4 settings are ignored when complementary PWM mode or reset-synchronized PWM mode is selected in channels 3 and 4.
1	TIOR1	
2	TIOR2	
3	TIOR3	
4	TIOR4	

Bit	7	6	5	4	3	2	1	0
	—	IOB2	IOB1	IOB0	—	IOA2	IOA1	IOA0
Initial value	1	0	0	0	1	0	0	0
Read/Write	—	R/W	R/W	R/W	—	R/W	R/W	R/W

I/O control A2 to A0
These bits select GRA functions

Reserved bit

I/O control B2 to B0
These bits select GRB functions

Reserved bit

Each TIOR is an 8-bit readable/writable register that selects the output compare or input capture function for GRA and GRB, and specifies the functions of the TIOCA and TIOCB pins. If the output compare function is selected, TIOR also selects the type of output. If input capture is selected, TIOR also selects the edge or edges of the input capture signal.

TIOR is initialized to H'88 by a reset and in standby mode.

Bit 7—Reserved: Read-only bit, always read as 1.

Bits 6 to 4—I/O Control B2 to B0 (IOB2 to IOB0): These bits select the GRB function.

Bit 6 IOB2	Bit 5 IOB1	Bit 4 IOB0	Function	
0	0	0	GRB is an output compare register	No output at compare match (Initial value)
		1		0 output at GRB compare match[*1]
	1	0		1 output at GRB compare match[*1]
		1		Output toggles at GRB compare match (1 output in channel 2)[*1, *2]
1	0	0	GRB is an input capture register	GRB captures rising edge of input
		1		GRB captures falling edge of input
	1	0		GRB captures both edges of input
		1		

Notes: 1. After a reset, the output is 0 until the first compare match.
2. Channel 2 output cannot be toggled by compare match. This setting selects 1 output instead.

Bit 3—Reserved: Read-only bit, always read as 1.

Bits 2 to 0—I/O Control A2 to A0 (IOA2 to IOA0): These bits select the GRA function.

Bit 2 IOA2	Bit 1 IOA1	Bit 0 IOA0	Function	
0	0	0	GRA is an output compare register	No output at compare match (Initial value)
		1		0 output at GRA compare match[*1]
	1	0		1 output at GRA compare match[*1]
		1		Output toggles at GRA compare match (1 output in channel 2)[*1, *2]
1	0	0	GRA is an input capture register	GRA captures rising edge of input
		1		GRA captures falling edge of input
	1	0		GRA captures both edges of input
		1		

Notes: 1. After a reset, the output is 0 until the first compare match.
2. Channel 2 output cannot be toggled by compare match. This setting selects 1 output instead.

8.2.12 Timer Status Register (TSR)

TSR is an 8-bit register. The ITU has five TSRs, one in each channel.

Channel	Abbreviation	Function
0	TSR0	Indicates input capture, compare match, and overflow status
1	TSR1	
2	TSR2	
3	TSR3	
4	TSR4	

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	OVF	IMFB	IMFA
Initial value	1	1	1	1	1	0	0	0
Read/Write	—	—	—	—	—	R/(W)*	R/(W)*	R/(W)*

Reserved bits

Overflow flag
Status flag indicating
overflow or underflow

Input capture/compare match flag B
Status flag indicating GRB compare
match or input capture

Input capture/compare match flag A
Status flag indicating GRA compare
match or input capture

Note: * Only 0 can be written, to clear the flag.

Each TSR is an 8-bit readable/writable register containing flags that indicate TCNT overflow or underflow and GRA or GRB compare match or input capture. These flags are interrupt sources and generate CPU interrupts if enabled by corresponding bits in the timer interrupt enable register (TIER).

TSR is initialized to H'F8 by a reset and in standby mode.

Bits 7 to 3—Reserved: Read-only bits, always read as 1.

Bit 2—Overflow Flag (OVF): This status flag indicates TCNT overflow or underflow.

Bit 2 OVF	Description	
0	[Clearing condition] Read OVF when OVF = 1, then write 0 in OVF	(Initial value)
1	[Setting condition] TCNT overflowed from H'FFFF to H'0000, or underflowed from H'0000 to H'FFFF*	

Notes: * TCNT underflow occurs when TCNT operates as an up/down-counter. Underflow occurs only under the following conditions:
1. Channel 2 operates in phase counting mode (MDF = 1 in TMDR)
2. Channels 3 and 4 operate in complementary PWM mode (CMD1 = 1 and CMD0 = 0 in TFCR)

Bit 1—Input Capture/Compare Match Flag B (IMFB): This status flag indicates GRB compare match or input capture events.

Bit 1 IMFB	Description	
0	[Clearing condition] Read IMFB when IMFB = 1, then write 0 in IMFB	(Initial value)
1	[Setting conditions] TCNT = GRB when GRB functions as a compare match register. TCNT value is transferred to GRB by an input capture signal, when GRB functions as an input capture register.	

Bit 0—Input Capture/Compare Match Flag A (IMFA): This status flag indicates GRA compare match or input capture events.

Bit 0 IMFA	Description	
0	[Clearing condition] Read IMFA when IMFA = 1, then write 0 in IMFA. DMAC activated by IMIA interrupt (channels 0 to 3 only).	(Initial value)
1	[Setting conditions] TCNT = GRA when GRA functions as a compare match register. TCNT value is transferred to GRA by an input capture signal, when GRA functions as an input capture register.	

8.2.13 Timer Interrupt Enable Register (TIER)

TIER is an 8-bit register. The ITU has five TIERs, one in each channel.

Channel	Abbreviation	Function
0	TIER0	Enables or disables interrupt requests.
1	TIER1	
2	TIER2	
3	TIER3	
4	TIER4	

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	OVIE	IMIEB	IMIEA
Initial value	1	1	1	1	1	0	0	0
Read/Write	—	—	—	—	—	R/W	R/W	R/W

Reserved bits

Overflow interrupt enable
Enables or disables OVF interrupts

Input capture/compare match interrupt enable B
Enables or disables IMFB interrupts

Input capture/compare match interrupt enable A
Enables or disables IMFA interrupts
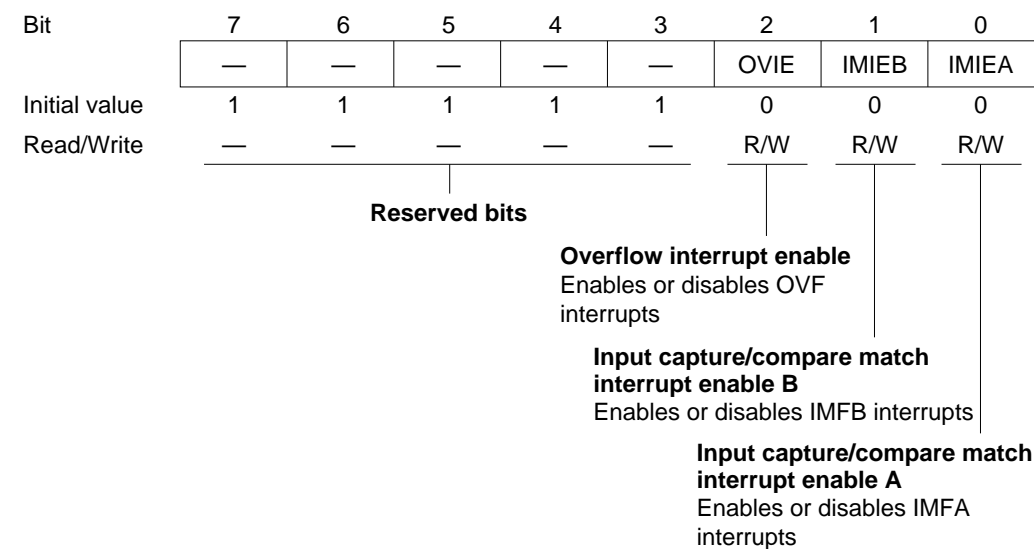

Each TIER is an 8-bit readable/writable register that enables and disables overflow interrupt requests and general register compare match and input capture interrupt requests.

TIER is initialized to H'F8 by a reset and in standby mode.

Bits 7 to 3—Reserved: Read-only bits, always read as 1.

Bit 2—Overflow Interrupt Enable (OVIE): Enables or disables the interrupt requested by the overflow flag (OVF) in TSR when OVF is set to 1.

Bit 2 OVIE	Description	
0	OVI interrupt requested by OVF is disabled	(Initial value)
1	OVI interrupt requested by OVF is enabled	

Bit 1—Input Capture/Compare Match Interrupt Enable B (IMIEB): Enables or disables the interrupt requested by the IMFB flag in TSR when IMFB is set to 1.

Bit 1 IMIEB	Description	
0	IMIB interrupt requested by IMFB is disabled	(Initial value)
1	IMIB interrupt requested by IMFB is enabled	

Bit 0—Input Capture/Compare Match Interrupt Enable A (IMIEA): Enables or disables the interrupt requested by the IMFA flag in TSR when IMFA is set to 1.

Bit 0 IMIEA	Description	
0	IMIA interrupt requested by IMFA is disabled	(Initial value)
1	IMIA interrupt requested by IMFA is enabled	

8.3 CPU Interface

8.3.1 16-Bit Accessible Registers

The timer counters (TCNTs), general registers A and B (GRAs and GRBs), and buffer registers A and B (BRAs and BRBs) are 16-bit registers, and are linked to the CPU by an internal 16-bit data bus. These registers can be written or read a word at a time, or a byte at a time.

Figures 8-6 and 8-7 show examples of word access to a timer counter (TCNT). Figures 8-8, 8-9, 8-10, and 8-11 show examples of byte access to TCNTH and TCNTL.
Figure 8-6   Access to Timer Counter (CPU Writes to TCNT, Word)
Figure 8-7   Access to Timer Counter (CPU Reads TCNT, Word)
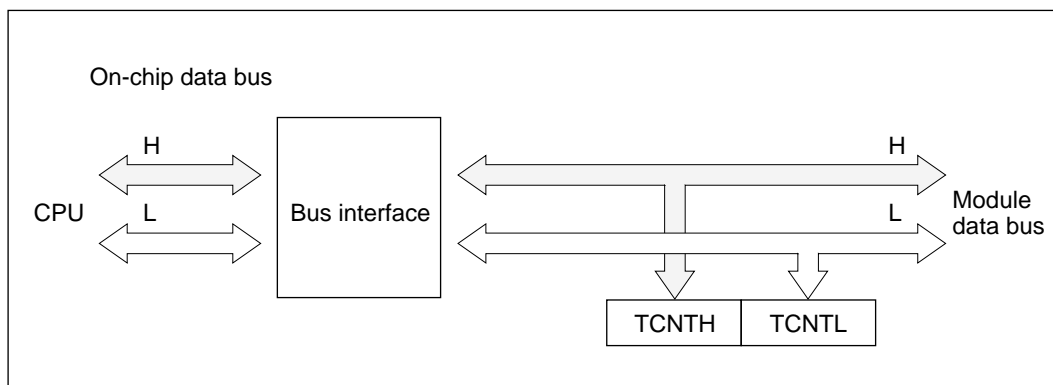

Figure 8-8　Access to Timer Counter (CPU Writes to TCNT, Upper Byte)
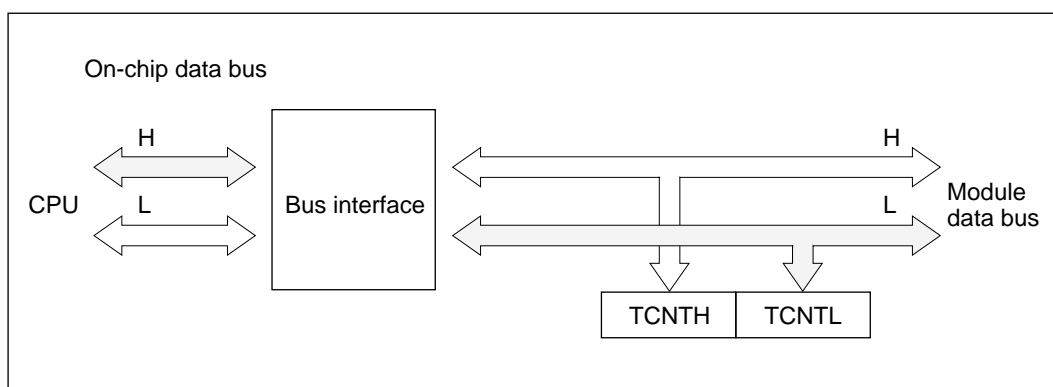

Figure 8-9　Access to Timer Counter (CPU Writes to TCNT, Lower Byte)
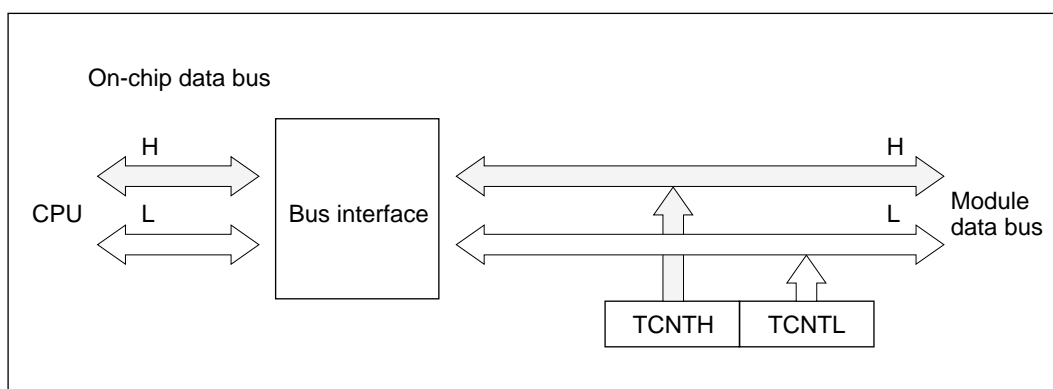

Figure 8-10　Access to Timer Counter (CPU Reads TCNT, Upper Byte)
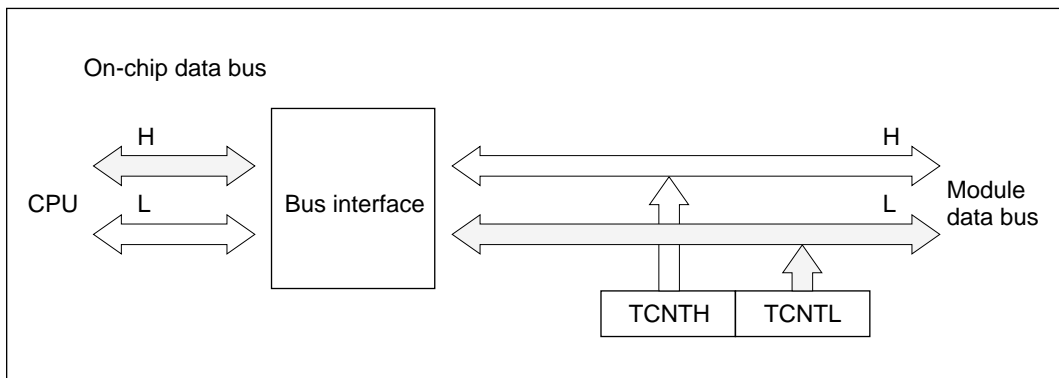

Figure 8-11   Access to Timer Counter (CPU Reads TCNT, Lower Byte)

8.3.2 8-Bit Accessible Registers

The registers other than the timer counters, general registers, and buffer registers are 8-bit registers. These registers are linked to the CPU by an internal 8-bit data bus.

Figures 8-12 and 8-13 show examples of byte read and write access to a TCR.

If a word-size data transfer instruction is executed, two byte transfers are performed.
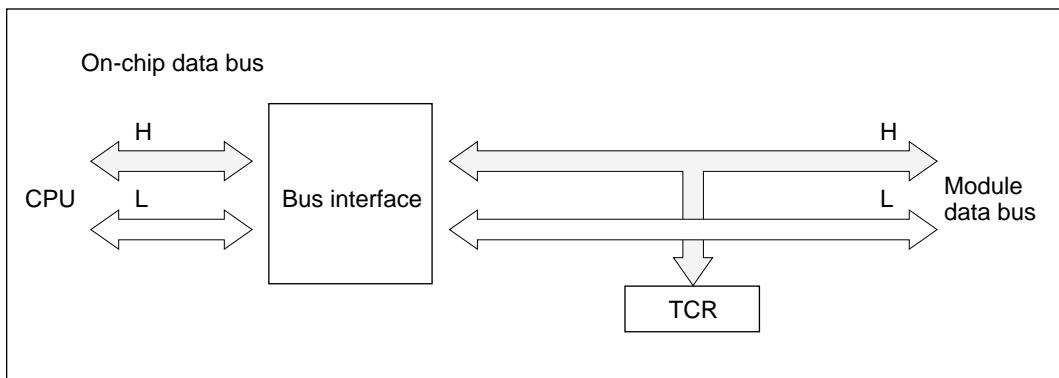

Figure 8-12   TCR Access (CPU Writes to TCR)
Figure 8-13   TCR Access (CPU Reads TCR)

8.4 Operation

8.4.1 Overview

A summary of operations in the various modes is given below.

Normal Operation: Each channel has a timer counter and general registers. The timer counter counts up, and can operate as a free-running counter, periodic counter, or external event counter. General registers A and B can be used for input capture or output compare.

Synchronous Operation: The timer counters in designated channels are preset synchronously. Data written to the timer counter in any one of these channels is simultaneously written to the timer counters in the other channels as well. The timer counters can also be cleared synchronously if so designated by the CCLR1 and CCLR0 bits in the TCRs.

PWM Mode: A PWM waveform is output from the TIOCA pin. The output goes to 1 at compare match A and to 0 at compare match B. The duty cycle can be varied from 0% to 100% depending on the settings of GRA and GRB. When a channel is set to PWM mode, its GRA and GRB automatically become output compare registers.

Reset-Synchronized PWM Mode: Channels 3 and 4 are paired for three-phase PWM output with complementary waveforms. (The three phases are related by having a common transition point.) When reset-synchronized PWM mode is selected GRA3, GRB3, GRA4, and GRB4 automatically function as output compare registers, TIOCA3, TIOCB3, TIOCA4, TOCXA4, TIOCB4, and TOCXB4 function as PWM output pins, and TCNT3 operates as an up-counter. TCNT4 operates independently, and is not compared with GRA4 or GRB4.

Complementary PWM Mode: Channels 3 and 4 are paired for three-phase PWM output with non-overlapping complementary waveforms. When complementary PWM mode is selected GRA3, GRB3, GRA4, and GRB4 automatically function as output compare registers, and TIOCA3, TIOCB3, TIOCA4, TOCXA4, TIOCB4, and TOCXB4 function as PWM output pins. TCNT3 and TCNT4 operate as up/down-counters.

Phase Counting Mode: The phase relationship between two clock signals input at TCLKA and TCLKB is detected and TCNT2 counts up or down accordingly. When phase counting mode is selected TCLKA and TCLKB become clock input pins and TCNT2 operates as an up/down-counter.

Buffering

- If the general register is an output compare register

  When compare match occurs the buffer register value is transferred to the general register.

- If the general register is an input capture register

  When input capture occurs the TCNT value is transferred to the general register, and the previous general register value is transferred to the buffer register.

- Complementary PWM mode

  The buffer register value is transferred to the general register when TCNT3 and TCNT4 change counting direction.

- Reset-synchronized PWM mode

  The buffer register value is transferred to the general register at GRA3 compare match.

8.4.2 Basic Functions

Counter Operation: When one of bits STR0 to STR4 is set to 1 in the timer start register (TSTR), the timer counter (TCNT) in the corresponding channel starts counting. The counting can be free-running or periodic.

- Sample setup procedure for counter

  Figure 8-14 shows a sample procedure for setting up a counter.
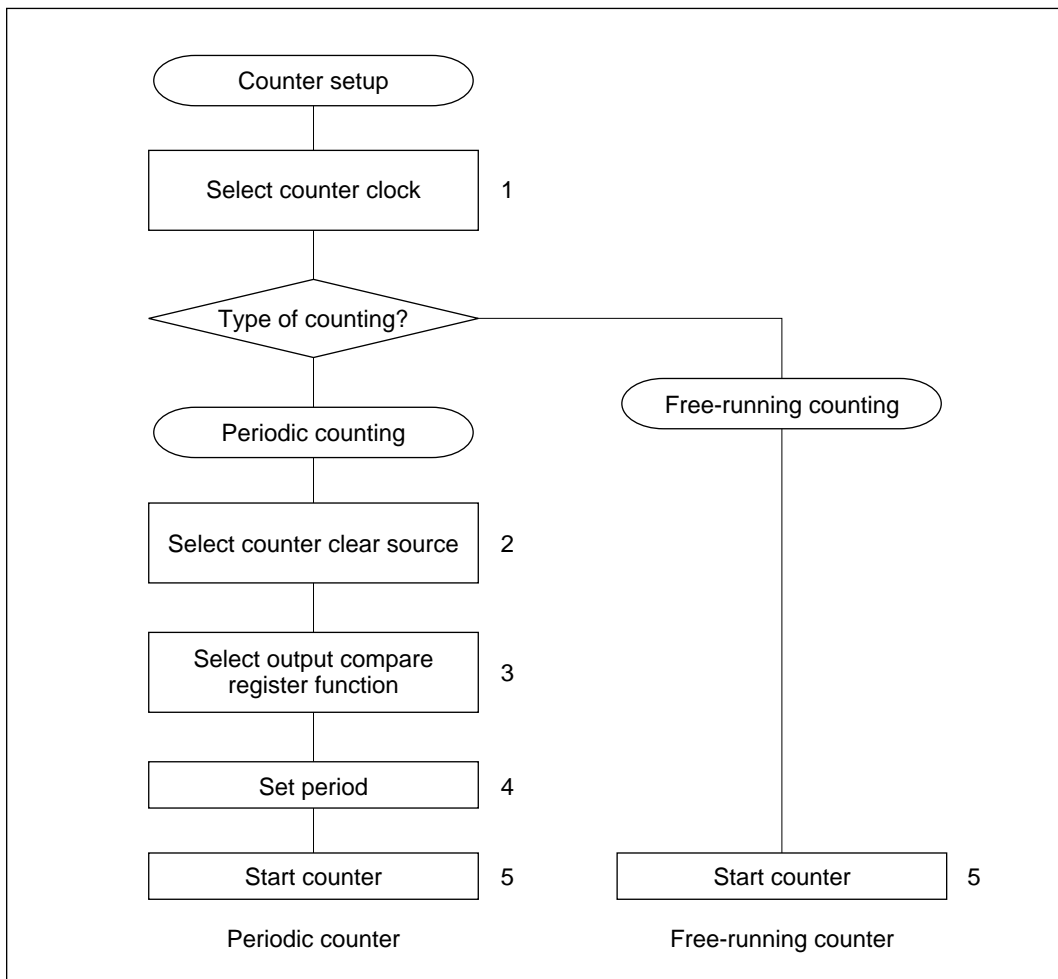

Figure 8-14   Counter Setup Procedure (Example)

1. Set bits TPSC2 to TPSC0 in TCR to select the counter clock source. If an external clock source is selected, set bits CKEG1 and CKEG0 in TCR to select the desired edge(s) of the external clock signal.
2. For periodic counting, set CCLR1 and CCLR0 in TCR to have TCNT cleared at GRA compare match or GRB compare match.
3. Set TIOR to select the output compare function of GRA or GRB, whichever was selected in step 2.
4. Write the count period in GRA or GRB, whichever was selected in step 2.
5. Set the STR bit to 1 in TSTR to start the timer counter.

- Free-running and periodic counter operation

A reset leaves the counters (TCNTs) in ITU channels 0 to 4 all set as free-running counters. A free-running counter starts counting up when the corresponding bit in TSTR is set to 1. When the count overflows from H'FFFF to H'0000, the overflow flag (OVF) is set to 1 in the timer status register (TSR). If the corresponding OVIE bit is set to 1 in the timer interrupt enable register, a CPU interrupt is requested. After the overflow, the counter continues counting up from H'0000. Figure 8-15 illustrates free-running counting.
Figure 8-15 Free-Running Counter Operation

When a channel is set to have its counter cleared by compare match, in that channel TCNT operates as a periodic counter. Select the output compare function of GRA or GRB, set bit CCLR1 or CCLR0 in the timer control register (TCR) to have the counter cleared by compare match, and set the count period in GRA or GRB. After these settings, the counter starts counting up as a periodic counter when the corresponding bit is set to 1 in TSTR. When the count matches GRA or GRB, the IMFA or IMFB flag is set to 1 in TSR and the counter is cleared to H'0000. If the corresponding IMIEA or IMIEB bit is set to 1 in TIER, a CPU interrupt is requested at this time. After the compare match, TCNT continues counting up from H'0000. Figure 8-16 illustrates periodic counting.
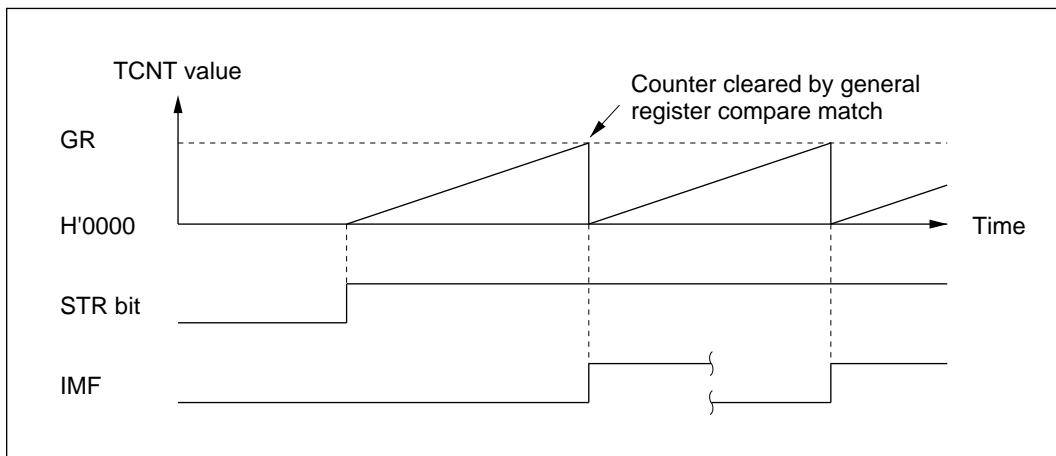

Figure 8-16   Periodic Counter Operation

- Count timing

  — Internal clock source

  Bits TPSC2 to TPSC0 in TCR select the system clock (ø) or one of three internal clock sources obtained by prescaling the system clock (ø/2, ø/4, ø/8). Figure 8-17 shows the timing.
Figure 8-17   Count Timing for Internal Clock Sources

213

— External clock source

Bits TPSC2 to TPSC0 in TCR select an external clock input pin (TCLKA to TCLKD), and its valid edge or edges are selected by bits CKEG1 and CKEG0. The rising edge, falling edge, or both edges can be selected.

The pulse width of the external clock signal must be at least 1.5 system clocks when a single edge is selected, and at least 2.5 system clocks when both edges are selected. Shorter pulses will not be counted correctly.

Figure 8-18 shows the timing when both edges are detected.
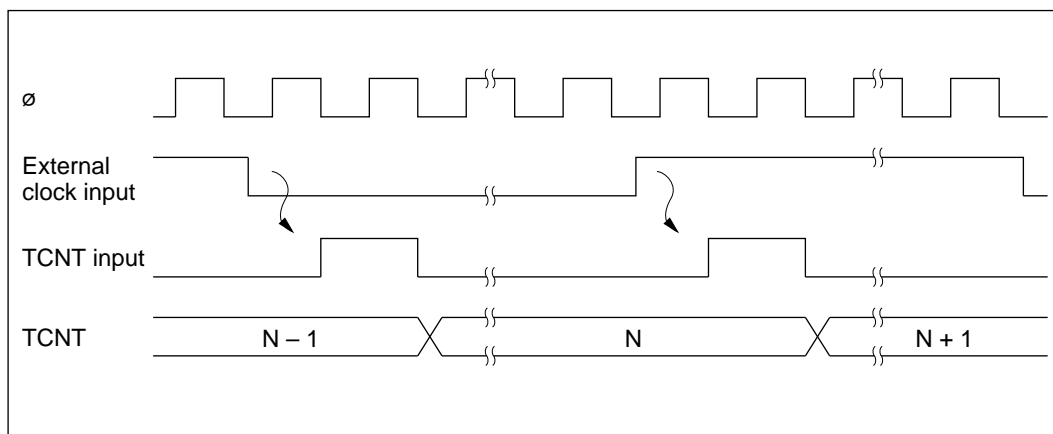

Figure 8-18   Count Timing for External Clock Sources (when Both Edges are Detected)

214

Waveform Output by Compare Match: In ITU channels 0, 1, 3, and 4, compare match A or B can cause the output at the TIOCA or TIOCB pin to go to 0, go to 1, or toggle. In channel 2 the output can only go to 0 or go to 1.

• Sample setup procedure for waveform output by compare match

Figure 8-19 shows a sample procedure for setting up waveform output by compare match.

Output setup		1. Select the compare match output mode (0, 1, or toggle) in TIOR. When a waveform output mode is selected, the pin switches from its generic input/output function to the output compare function (TIOCA or TIOCB). An output compare pin outputs 0 until the first compare match occurs.
Select waveform output mode	1	
Set output timing	2	2. Set a value in GRA or GRB to designate the compare match timing.
Start counter	3	3. Set the STR bit to 1 in TSTR to start the timer counter.
Waveform output		

Figure 8-19   Setup Procedure for Waveform Output by Compare Match (Example)

• Examples of waveform output

Figure 8-20 shows examples of 0 and 1 output. TCNT operates as a free-running counter, 0 output is selected for compare match A, and 1 output is selected for compare match B. When the pin is already at the selected output level, the pin level does not change.
Figure 8-20   0 and 1 Output (Examples)

Figure 8-21 shows examples of toggle output. TCNT operates as a periodic counter, cleared by compare match B. Toggle output is selected for both compare match A and B.
Figure 8-21   Toggle Output (Example)

216

- Output compare timing

  The compare match signal is generated in the last state in which TCNT and the general register match (when TCNT changes from the matching value to the next value). When the compare match signal is generated, the output value selected in TIOR is output at the output compare pin (TIOCA or TIOCB). When TCNT matches a general register, the compare match signal is not generated until the next counter clock pulse.
  Figure 8-22 shows the output compare timing.
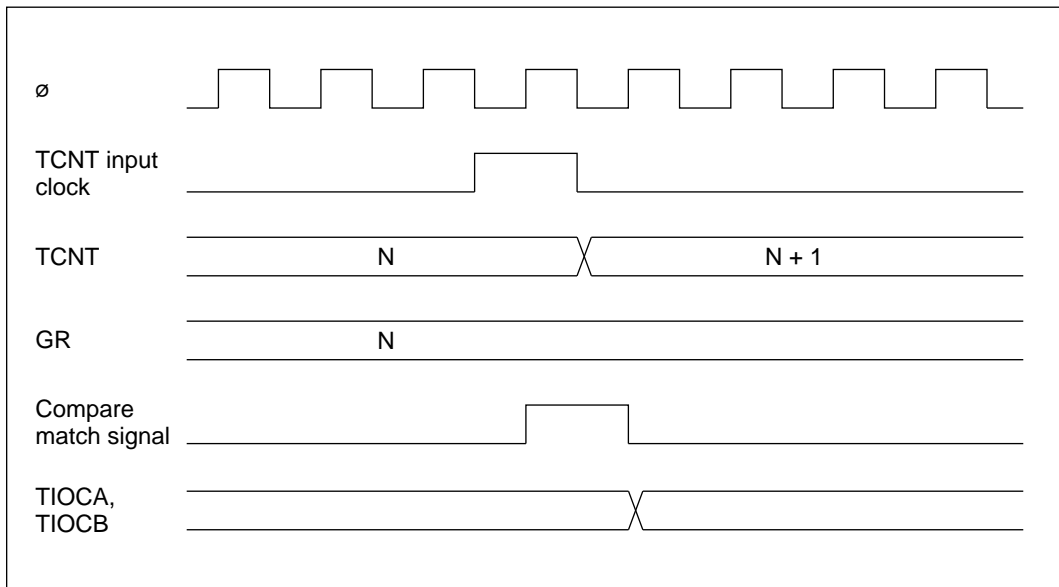

Figure 8-22 Output Compare Timing

Input Capture Function: The TCNT value can be captured into a general register when a transition occurs at an input capture/output compare pin (TIOCA or TIOCB). Capture can take place on the rising edge, falling edge, or both edges. The input capture function can be used to measure pulse width or period.

- Sample setup procedure for input capture

  Figure 8-23 shows a sample procedure for setting up input capture.
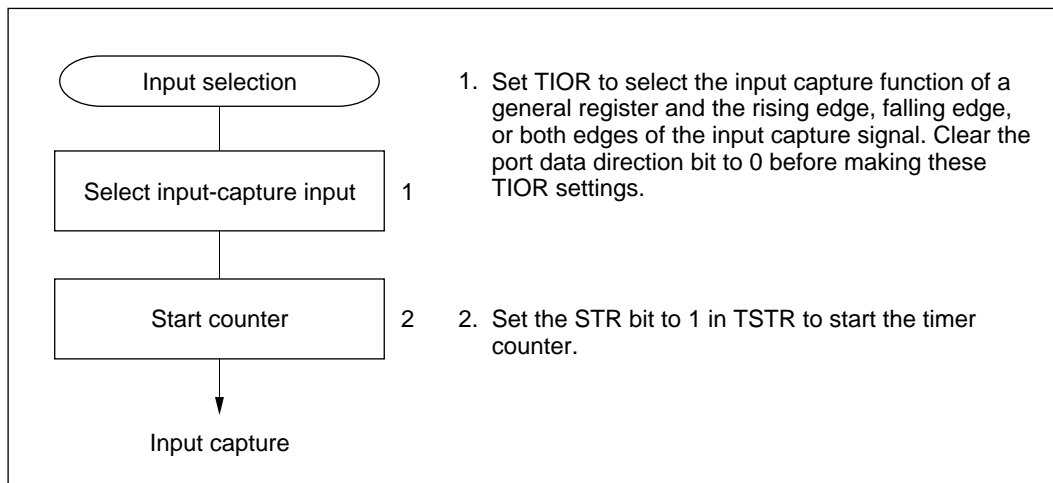

Figure 8-23 Setup Procedure for Input Capture (Example)

- Examples of input capture

  Figure 8-24 illustrates input capture when the falling edge of TIOCB and both edges of TIOCA are selected as capture edges. TCNT is cleared by input capture into GRB.
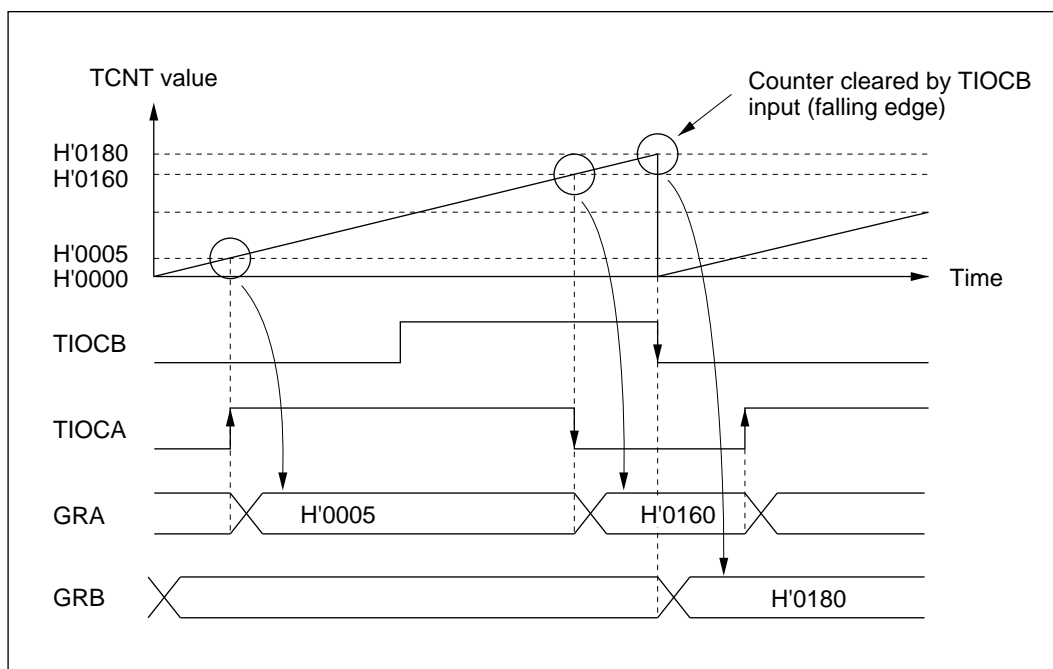

Figure 8-24 Input Capture (Example)

- Input capture signal timing

  Input capture on the rising edge, falling edge, or both edges can be selected by settings in TIOR. Figure 8-25 shows the timing when the rising edge is selected. The pulse width of the input capture signal must be at least 1.5 system clocks for single-edge capture, and 2.5 system clocks for capture of both edges.
Figure 8-25   Input Capture Signal Timing

8.4.3 Synchronization

The synchronization function enables two or more timer counters to be synchronized by writing the same data to them simultaneously (synchronous preset). With appropriate TCR settings, two or more timer counters can also be cleared simultaneously (synchronous clear). Synchronization enables additional general registers to be associated with a single time base. Synchronization can be selected for all channels (0 to 4).

Sample Setup Procedure for Synchronization: Figure 8-26 shows a sample procedure for setting up synchronization.
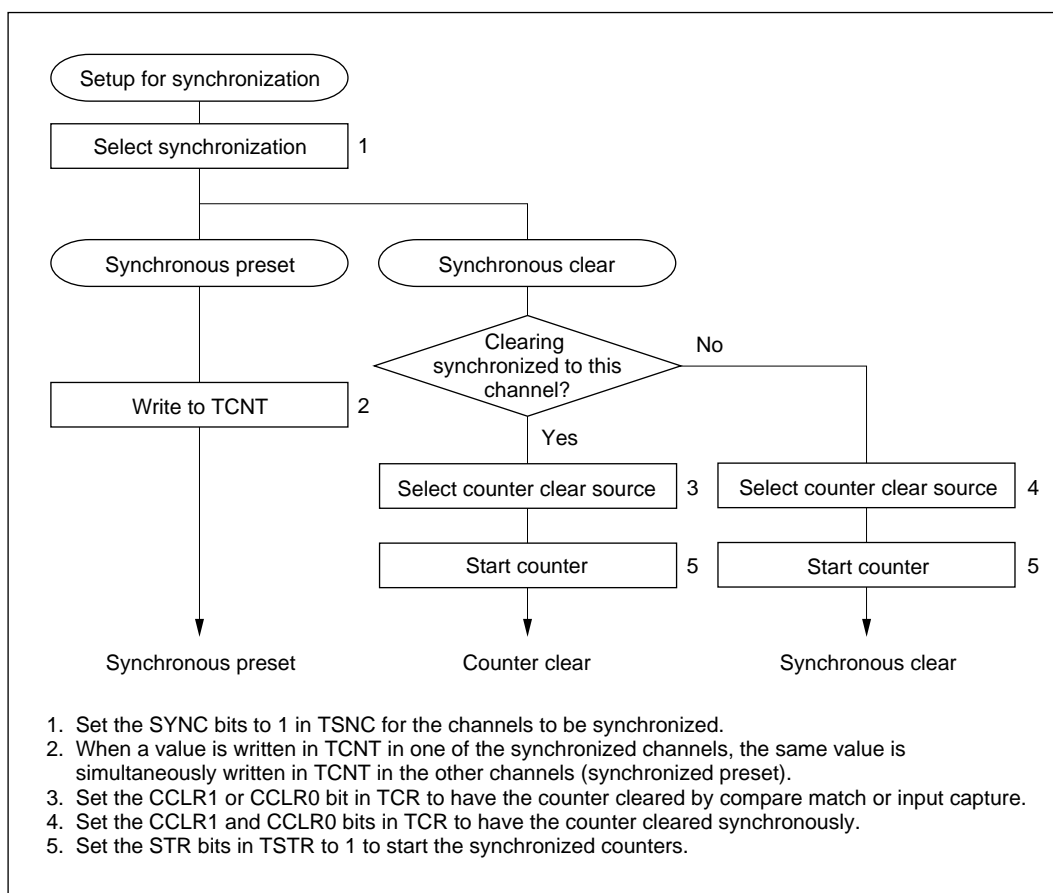

Figure 8-26   Setup Procedure for Synchronization (Example)

Example of Synchronization: Figure 8-27 shows an example of synchronization. Channels 0, 1, and 2 are synchronized, and are set to operate in PWM mode. Channel 0 is set for counter clearing by compare match with GRB0. Channels 1 and 2 are set for synchronous counter clearing. The timer counters in channels 0, 1, and 2 are synchronously preset, and are synchronously cleared by compare match with GRB0. A three-phase PWM waveform is output from pins TIOCA0, TIOCA1, and TIOCA2. For further information on PWM mode, see section 8.4.4, PWM Mode.
Figure 8-27   Synchronization (Example)

8.4.4 PWM Mode

In PWM mode GRA and GRB are paired and a PWM waveform is output from the TIOCA pin. GRA specifies the time at which the PWM output changes to 1. GRB specifies the time at which the PWM output changes to 0. If either GRA or GRB is selected as the counter clear source, a PWM waveform with a duty cycle from 0% to 100% is output at the TIOCA pin. PWM mode can be selected in all channels (0 to 4).

Table 8-4 summarizes the PWM output pins and corresponding registers. If the same value is set in GRA and GRB, the output does not change when compare match occurs.

Table 8-4 PWM Output Pins and Registers

Channel	Output Pin	1 Output	0 Output
0	TIOCA0	GRA0	GRB0
1	TIOCA1	GRA1	GRB1
2	TIOCA2	GRA2	GRB2
3	TIOCA3	GRA3	GRB3
4	TIOCA4	GRA4	GRB4

Sample Setup Procedure for PWM Mode: Figure 8-28 shows a sample procedure for setting up PWM mode.

1. Set bits TPSC2 to TPSC0 in TCR to select the counter clock source. If an external clock source is selected, set bits CKEG1 and CKEG0 in TCR to select the desired edge(s) of the external clock signal.
2. Set bits CCLR1 and CCLR0 in TCR to select the counter clear source.
3. Set the time at which the PWM waveform should go to 1 in GRA.
4. Set the time at which the PWM waveform should go to 0 in GRB.
5. Set the PWM bit in TMDR to select PWM mode. When PWM mode is selected, regardless of the TIOR contents, GRA and GRB become output compare registers specifying the times at which the PWM goes to 1 and 0. The TIOCA pin automatically becomes the PWM output pin. The TIOCB pin conforms to the settings of bits IOB1 and IOB0 in TIOR. If TIOCB output is not desired, clear both IOB1 and IOB0 to 0.
6. Set the STR bit to 1 in TSTR to start the timer counter.

Figure 8-28   Setup Procedure for PWM Mode (Example)

Examples of PWM Mode: Figure 8-29 shows examples of operation in PWM mode. The PWM waveform is output from the TIOCA pin. The output goes to 1 at compare match with GRA, and to 0 at compare match with GRB.

In the examples shown, TCNT is cleared by compare match with GRA or GRB. Synchronized operation and free-running counting are also possible.
Figure 8-29   PWM Mode (Example 1)

Figure 8-30 shows examples of the output of PWM waveforms with duty cycles of 0% and 100%. If the counter is cleared by compare match with GRB, and GRA is set to a higher value than GRB, the duty cycle is 0%. If the counter is cleared by compare match with GRA, and GRB is set to a higher value than GRA, the duty cycle is 100%.
Figure 8-30 PWM Mode (Example 2)

8.4.5 Reset-Synchronized PWM Mode

In reset-synchronized PWM mode channels 3 and 4 are combined to produce three pairs of complementary PWM waveforms, all having one waveform transition point in common.

When reset-synchronized PWM mode is selected TIOCA3, TIOCB3, TIOCA4, TOCXA4, TIOCB4, and TOCXB4 automatically become PWM output pins, and TCNT3 functions as an up-counter.

Table 8-5 lists the PWM output pins. Table 8-6 summarizes the register settings.

Table 8-5   Output Pins in Reset-Synchronized PWM Mode

Channel	Output Pin	Description
3	TIOCA3	PWM output 1
	TIOCB3	PWM output 1´ (complementary waveform to PWM output 1)
4	TIOCA4	PWM output 2
	TOCXA4	PWM output 2´ (complementary waveform to PWM output 2)
	TIOCB4	PWM output 3
	TOCXB4	PWM output 3´ (complementary waveform to PWM output 3)

Table 8-6   Register Settings in Reset-Synchronized PWM Mode

Register	Setting
TCNT3	Initially set to H'0000
TCNT4	Not used (operates independently)
GRA3	Specifies the count period of TCNT3
GRB3	Specifies a transition point of PWM waveforms output from TIOCA3 and TIOCB3
GRA4	Specifies a transition point of PWM waveforms output from TIOCA4 and TOCXA4
GRB4	Specifies a transition point of PWM waveforms output from TIOCB4 and TOCXB4

Sample Setup Procedure for Reset-Synchronized PWM Mode: Figure 8-31 shows a sample procedure for setting up reset-synchronized PWM mode.

         Reset-synchronized PWM mode
```

1. Clear the STR3 bit in TSTR to 0 to halt TCNT3. Reset-synchronized PWM mode must be set up while TCNT3 is halted.
2. Set bits TPSC2 to TPSC0 in TCR to select the counter clock source for channel 3. If an external clock source is selected, select the external clock edge(s) with bits CKEG1 and CKEG0 in TCR.
3. Set bits CCLR1 and CCLR0 in TCR3 to select GRA3 compare match as the counter clear source.
4. Set bits CMD1 and CMD0 in TFCR to select reset-synchronized PWM mode. TIOCA3, TIOCB3, TIOCA4, TIOCB4, TOCXA4, and TOCXB4 automatically become PWM output pins.
5. Preset TCNT3 to H'0000. TCNT4 need not be preset.
6. GRA3 is the waveform period register. Set the waveform period value in GRA3. Set transition times of the PWM output waveforms in GRB3, GRA4, and GRB4. Set times within the compare match range of TCNT3. X ≤ GRA3 (X: setting value)
7. Set the STR3 bit in TSTR to 1 to start TCNT3.

Figure 8-31   Setup Procedure for Reset-Synchronized PWM Mode (Example)

Example of Reset-Synchronized PWM Mode: Figure 8-32 shows an example of operation in reset-synchronized PWM mode. TCNT3 operates as an up-counter in this mode. TCNT4 operates independently, detached from GRA4 and GRB4. When TCNT3 matches GRA3, TCNT3 is cleared and resumes counting from H'0000. The PWM outputs toggle at compare match with GRB3, GRA4, GRB4, and TCNT3 respectively, and all toggle when the counter is cleared.
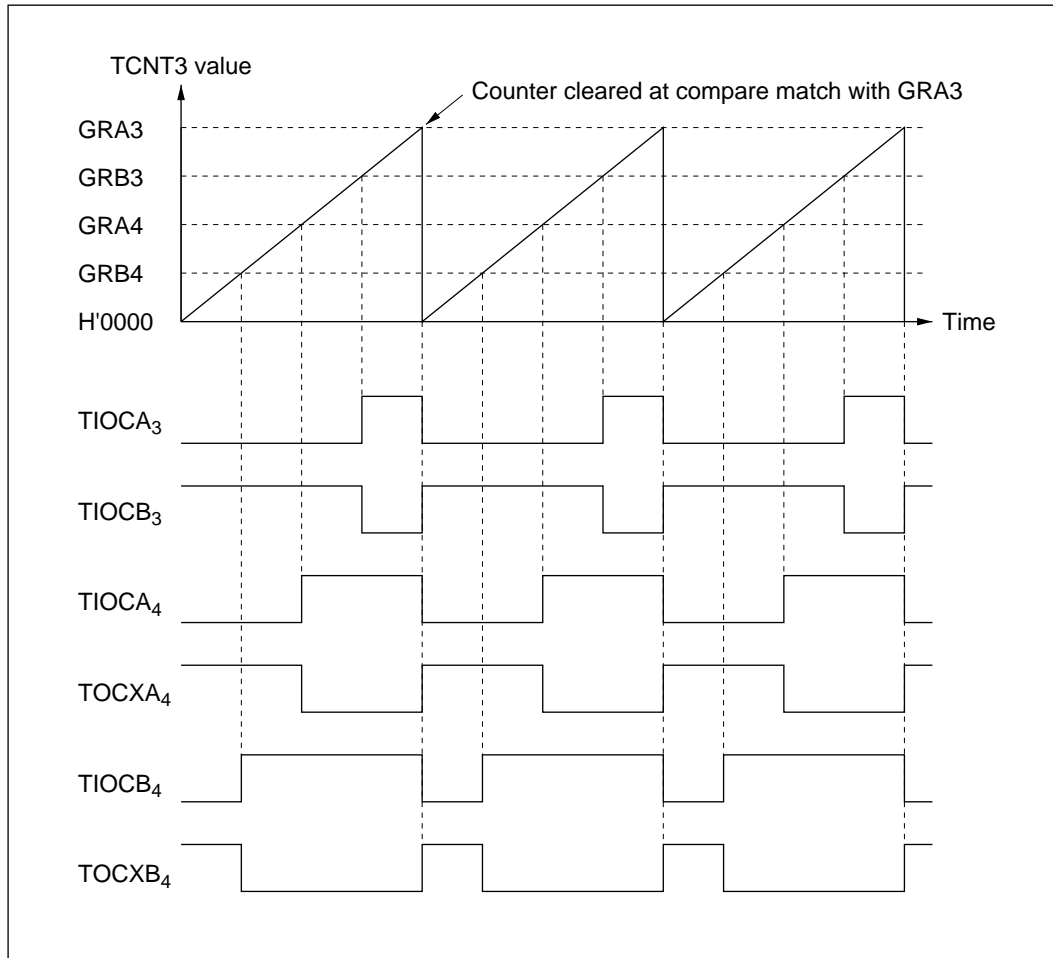

Figure 8-32   Operation in Reset-Synchronized PWM Mode (Example)
(when OLS3 = OLS4 = 1)

For the settings and operation when reset-synchronized PWM mode and buffer mode are both selected, see section 8.4.8, Buffering.

8.4.6 Complementary PWM Mode

In complementary PWM mode channels 3 and 4 are combined to output three pairs of complementary, non-overlapping PWM waveforms.

When complementary PWM mode is selected $TIOCA_3$, $TIOCB_3$, $TIOCA_4$, $TOCXA_4$, $TIOCB_4$, and $TOCXB_4$ automatically become PWM output pins, and TCNT3 and TCNT4 function as up/down-counters.

Table 8-7 lists the PWM output pins. Table 8-8 summarizes the register settings.

Table 8-7 Output Pins in Complementary PWM Mode

Channel	Output Pin	Description
3	$TIOCA_3$	PWM output 1
	$TIOCB_3$	PWM output 1´ (non-overlapping complementary waveform to PWM output 1)
4	$TIOCA_4$	PWM output 2
	$TOCXA_4$	PWM output 2´ (non-overlapping complementary waveform to PWM output 2)
	$TIOCB_4$	PWM output 3
	$TOCXB_4$	PWM output 3´ (non-overlapping complementary waveform to PWM output 3)

Table 8-8 Register Settings in Complementary PWM Mode

Register	Setting
TCNT3	Initially specifies the non-overlap margin (difference to TCNT4)
TCNT4	Initially set to H'0000
GRA3	Specifies the upper limit value of TCNT3 minus 1
GRB3	Specifies a transition point of PWM waveforms output from $TIOCA_3$ and $TIOCB_3$
GRA4	Specifies a transition point of PWM waveforms output from $TIOCA_4$ and $TOCXA_4$
GRB4	Specifies a transition point of PWM waveforms output from $TIOCB_4$ and $TOCXB_4$

Setup Procedure for Complementary PWM Mode: Figure 8-33 shows a sample procedure for setting up complementary PWM mode.

        Complementary PWM mode
```

1. Clear bits STR3 and STR4 to 0 in TSTR to halt the timer counters. Complementary PWM mode must be set up while TCNT3 and TCNT4 are halted.

2. Set bits TPSC2 to TPSC0 in TCR to select the same counter clock source for channels 3 and 4. If an external clock source is selected, select the external clock edge(s) with bits CKEG1 and CKEG0 in TCR. Do not select any counter clear source with bits CCLR1 and CCLR0 in TCR.

3. Set bits CMD1 and CMD0 in TFCR to select complementary PWM mode. $TIOCA_3$, $TIOCB_3$, $TIOCA_4$, $TIOCB_4$, $TOCXA_4$, and $TOCXB_4$ automatically become PWM output pins.

4. Clear TCNT4 to H'0000. Set the non-overlap margin in TCNT3. Do not set TCNT3 and TCNT4 to the same value.

5. GRA3 is the waveform period register. Set the upper limit value of TCNT3 minus 1 in GRA3. Set transition times of the PWM output waveforms in GRB3, GRA4, and GRB4. Set times within the compare match range of TCNT3 and TCNT4. $T \leq X$ (X: initial setting of GRB3, GRA4, or GRB4. T: initial setting of TCNT3)

6. Set bits STR3 and STR4 in TSTR to 1 to start TCNT3 and TCNT4.

Note: After exiting complementary PWM mode, to resume operating in complementary PWM mode, follow the entire setup procedure from step 1 again.

Figure 8-33   Setup Procedure for Complementary PWM Mode (Example)

Clearing Complementary PWM Mode: Figure 8-34 shows a sample procedure for clearing complementary PWM mode.

1. Clear bit CMD1 in TFCR to 0, and set channels 3 and 4 to normal operating mode.

2. After setting channels 3 and 4 to normal operating mode, wait at least one clock count before clearing bits STR3 and STR4 of TSTR to 0 to stop the counter operation of TCNT3 and TCNT4.
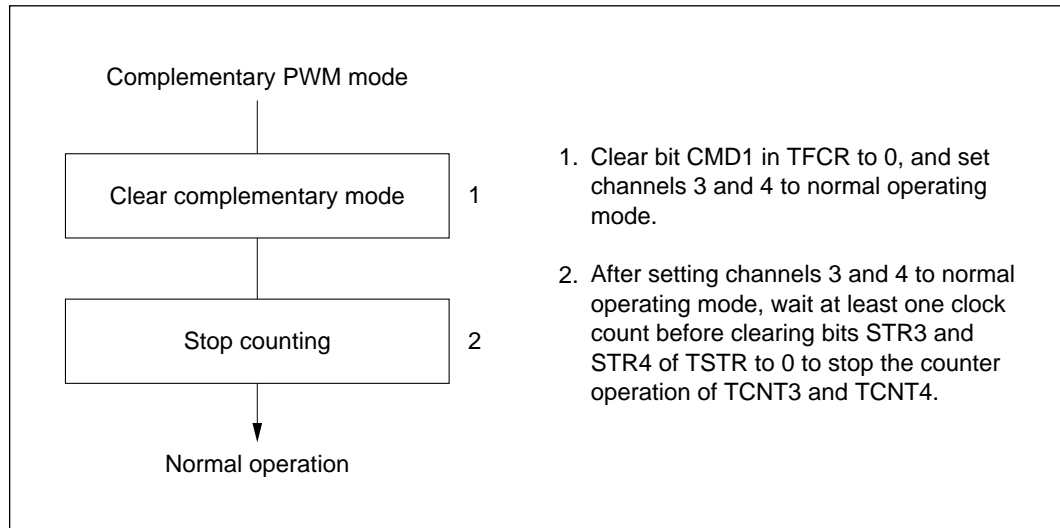

Figure 8-34   Clearing Procedure for Complementary PWM Mode (Example)

Examples of Complementary PWM Mode: Figure 8-35 shows an example of operation in complementary PWM mode. TCNT3 and TCNT4 operate as up/down-counters, counting down from compare match between TCNT3 and GRA3 and counting up from the point at which TCNT4 underflows. During each up-and-down counting cycle, PWM waveforms are generated by compare match with general registers GRB3, GRA4, and GRB4. Since TCNT3 is initially set to a higher value than TCNT4, compare match events occur in the sequence TCNT3, TCNT4, TCNT4, TCNT3.
Figure 8-35 Operation in Complementary PWM Mode (Example 1)
(when OLS3 = OLS4 = 1)

Figure 8-36 shows examples of waveforms with 0% and 100% duty cycles (in one phase) in complementary PWM mode. In this example the outputs change at compare match with GRB3, so waveforms with duty cycles of 0% or 100% can be output by setting GRB3 to a value larger than GRA3. The duty cycle can be changed easily during operation by use of the buffer registers. For further information see section 8.4.8, Buffering.
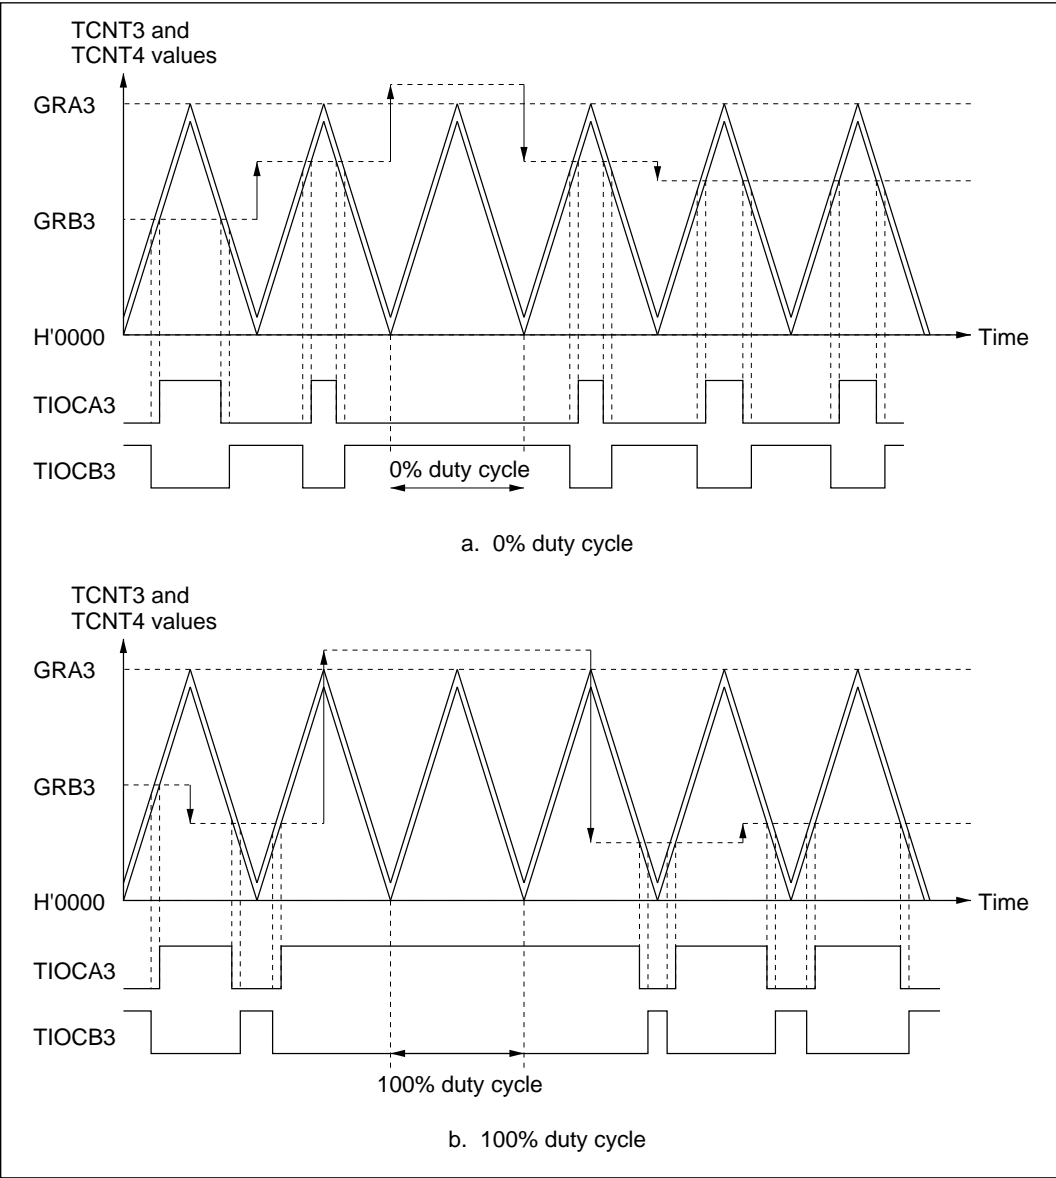

Figure 8-36 Operation in Complementary PWM Mode (Example 2)
(when OLS3 = OLS4 = 1)

233

In complementary PWM mode, TCNT3 and TCNT4 overshoot and undershoot at the transitions between up-counting and down-counting. The setting conditions for the IMFA bit in channel 3 and the OVF bit in channel 4 differ from the usual conditions. In buffered operation the buffer transfer conditions also differ. Timing diagrams are shown in figures 8-37 and 8-38.
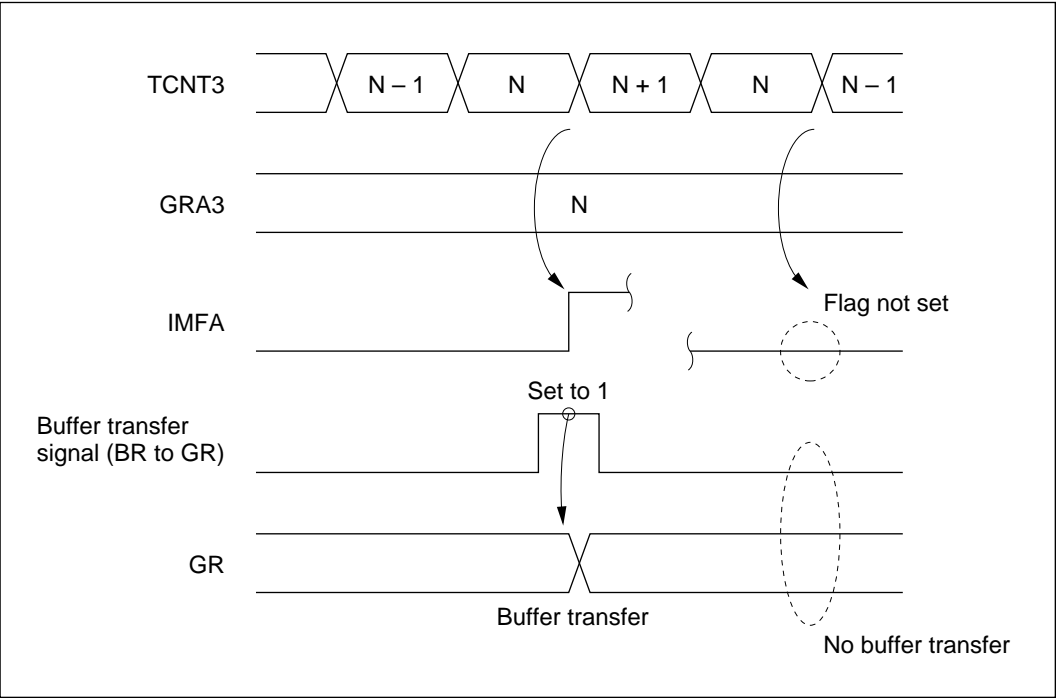

Figure 8-37   Overshoot Timing
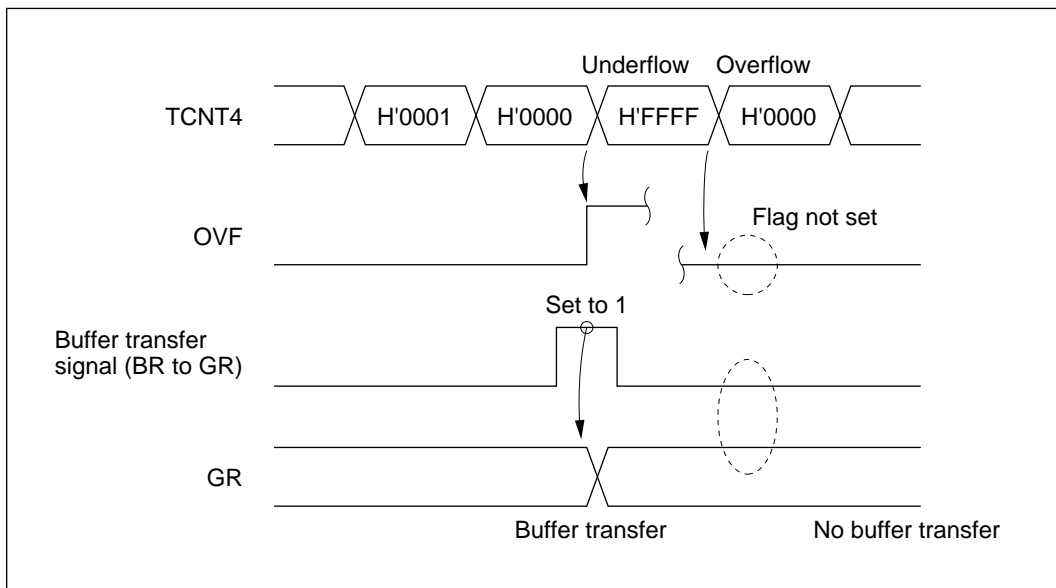

Figure 8-38   Undershoot Timing

In channel 3, IMFA is set to 1 only during up-counting. In channel 4, OVF is set to 1 only when an underflow occurs. When buffering is selected, buffer register contents are transferred to the general register at compare match A3 during up-counting, and when TCNT4 underflows.

General Register Settings in Complementary PWM Mode: When setting up general registers for complementary PWM mode or changing their settings during operation, note the following points.

- Initial settings

  Do not set values from H'0000 to T – 1 (where T is the initial value of TCNT3). After the counters start and the first compare match A3 event has occurred, however, settings in this range also become possible.

- Changing settings

  Use the buffer registers. Correct waveform output may not be obtained if a general register is written to directly.

- Cautions on changes of general register settings

  Figure 8-39 shows six correct examples and one incorrect example.

235
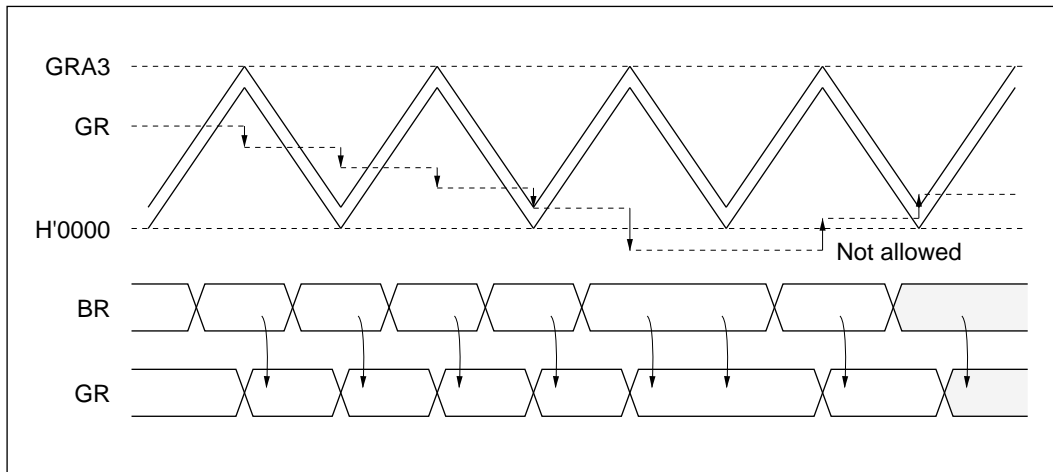

Figure 8-39 Changing a General Register Setting by Buffer Transfer (Example 1)

— Buffer transfer at transition from up-counting to down-counting

If the general register value is in the range from GRA3 – T + 1 to GRA3, do not transfer a buffer register value outside this range. Conversely, if the general register value is outside this range, do not transfer a value within this range. See figure 8-40.
Figure 8-40 Changing a General Register Setting by Buffer Transfer (Caution 1)

— Buffer transfer at transition from down-counting to up-counting

If the general register value is in the range from H'0000 to T – 1, do not transfer a buffer register value outside this range. Conversely, when a general register value is outside this range, do not transfer a value within this range. See figure 8-41.
Figure 8-41   Changing a General Register Setting by Buffer Transfer (Caution 2)

— General register settings outside the counting range (H'0000 to GRA3)

Waveforms with a duty cycle of 0% or 100% can be output by setting a general register to a value outside the counting range. When a buffer register is set to a value outside the counting range, then later restored to a value within the counting range, the counting direction (up or down) must be the same both times. See figure 8-42.
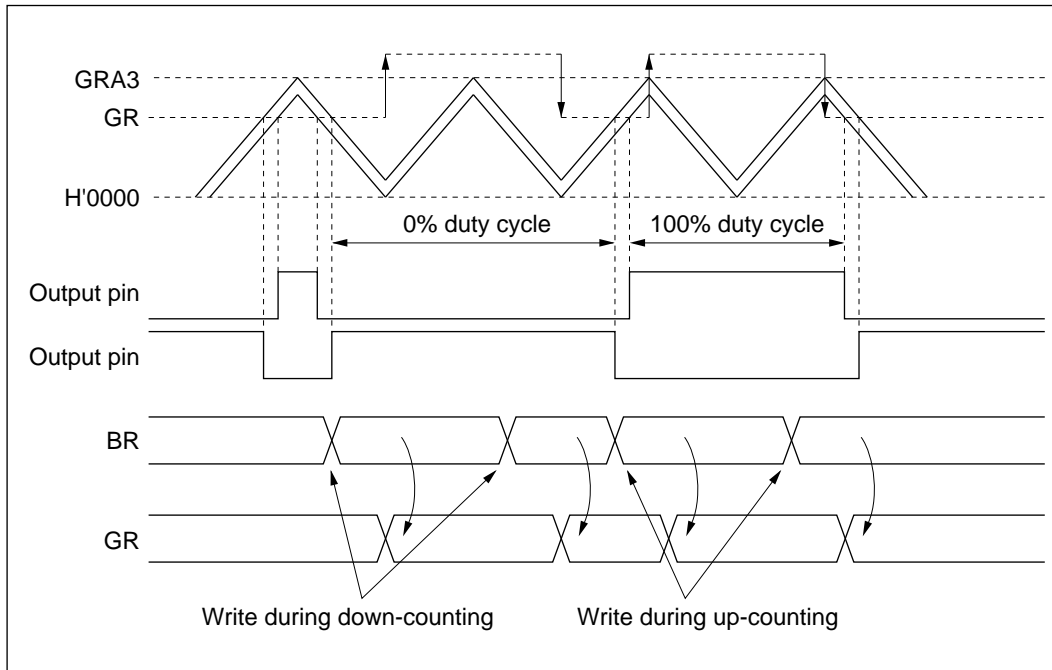

Figure 8-42   Changing a General Register Setting by Buffer Transfer (Example 2)

Settings can be made in this way by detecting GRA3 compare match or TCNT4 underflow before writing to the buffer register.

8.4.7 Phase Counting Mode

In phase counting mode the phase difference between two external clock inputs (at the TCLKA and TCLKB pins) is detected, and TCNT2 counts up or down accordingly.

In phase counting mode, the TCLKA and TCLKB pins automatically function as external clock input pins and TCNT2 becomes an up/down-counter, regardless of the settings of bits TPSC2 to TPSC0, CKEG1, and CKEG0 in TCR2. Settings of bits CCLR1, CCLR0 in TCR2, and settings in TIOR2, TIER2, TSR2, GRA2, and GRB2 are valid. The input capture and output compare functions can be used, and interrupts can be generated.

Phase counting is available only in channel 2.

Sample Setup Procedure for Phase Counting Mode: Figure 8-43 shows a sample procedure for setting up phase counting mode.
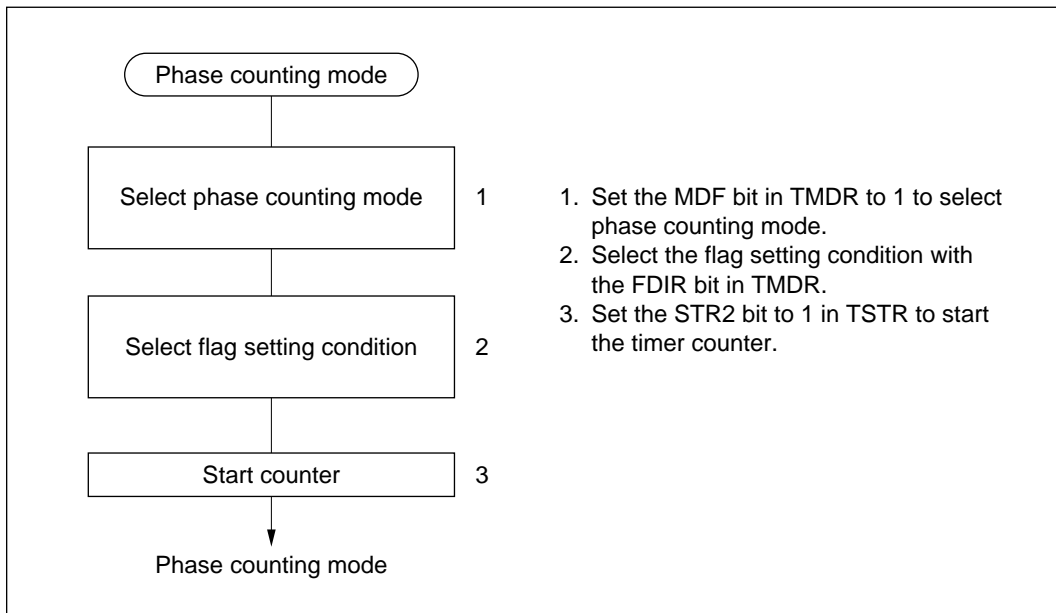

Figure 8-43   Setup Procedure for Phase Counting Mode (Example)

Example of Phase Counting Mode: Figure 8-44 shows an example of operations in phase counting mode. Table 8-9 lists the up-counting and down-counting conditions for TCNT2.

In phase counting mode both the rising and falling edges of TCLKA and TCLKB are counted. The phase difference between TCLKA and TCLKB must be at least 1.5 states, the phase overlap must also be at least 1.5 states, and the pulse width must be at least 2.5 states. See figure 8-45.
Figure 8-44   Operation in Phase Counting Mode (Example)

Table 8-9   Up/Down Counting Conditions

Counting Direction	Up-Counting				Down-Counting			
TCLKB	⤒	High	⤓	Low	High	⤓	Low	⤒
TCLKA	Low	⤒	High	⤓	⤓	Low	⤒	High
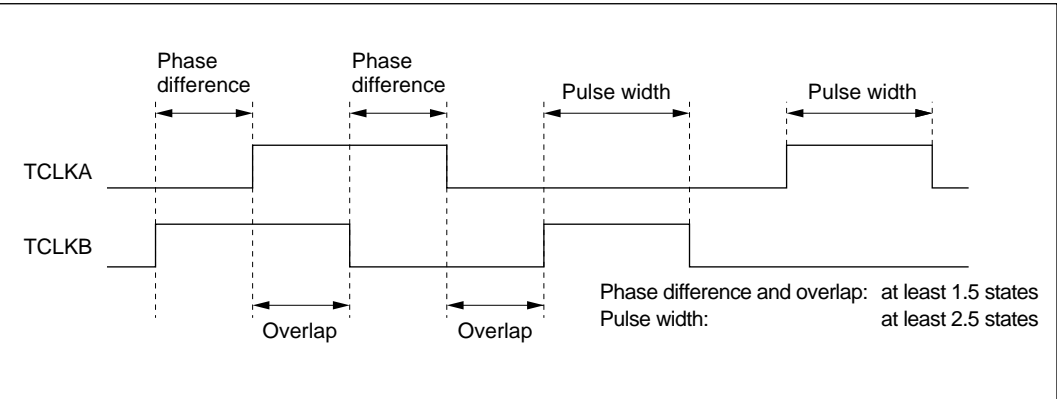

Figure 8-45   Phase Difference, Overlap, and Pulse Width in Phase Counting Mode

8.4.8 Buffering

Buffering operates differently depending on whether a general register is an output compare register or an input capture register, with further differences in reset-synchronized PWM mode and complementary PWM mode. Buffering is available only in channels 3 and 4. Buffering operations under the conditions mentioned above are described next.

- General register used for output compare

  The buffer register value is transferred to the general register at compare match. See figure 8-46.
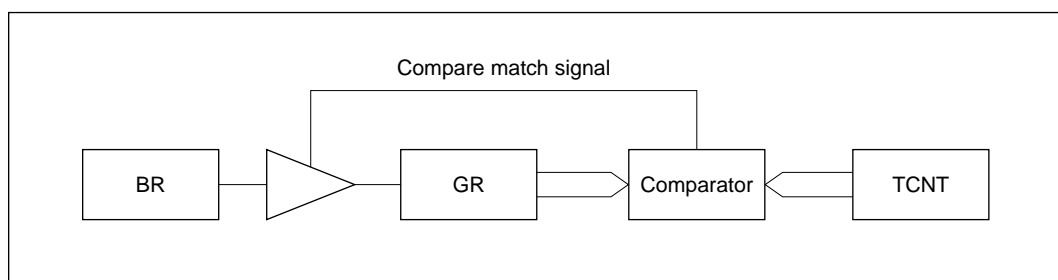

Figure 8-46   Compare Match Buffering

- General register used for input capture

  The TCNT value is transferred to the general register at input capture. The previous general register value is transferred to the buffer register.
  See figure 8-47.
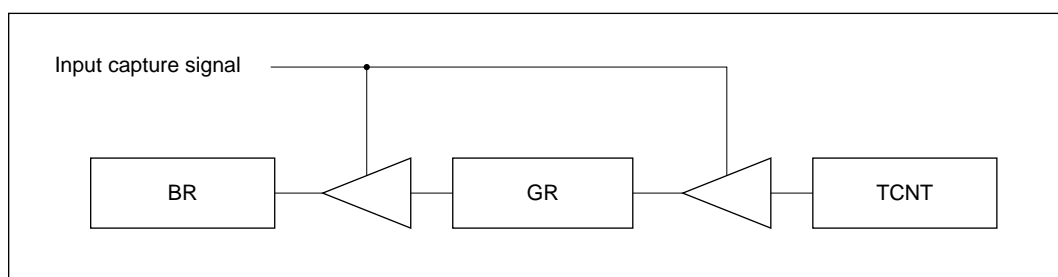

Figure 8-47   Input Capture Buffering

- Complementary PWM mode

  The buffer register value is transferred to the general register when TCNT3 and TCNT4 change counting direction. This occurs at the following two times:

  — When TCNT3 matches GRA3
  — When TCNT4 underflows

- Reset-synchronized PWM mode

  The buffer register value is transferred to the general register at compare match A3.

Sample Buffering Setup Procedure: Figure 8-48 shows a sample buffering setup procedure.
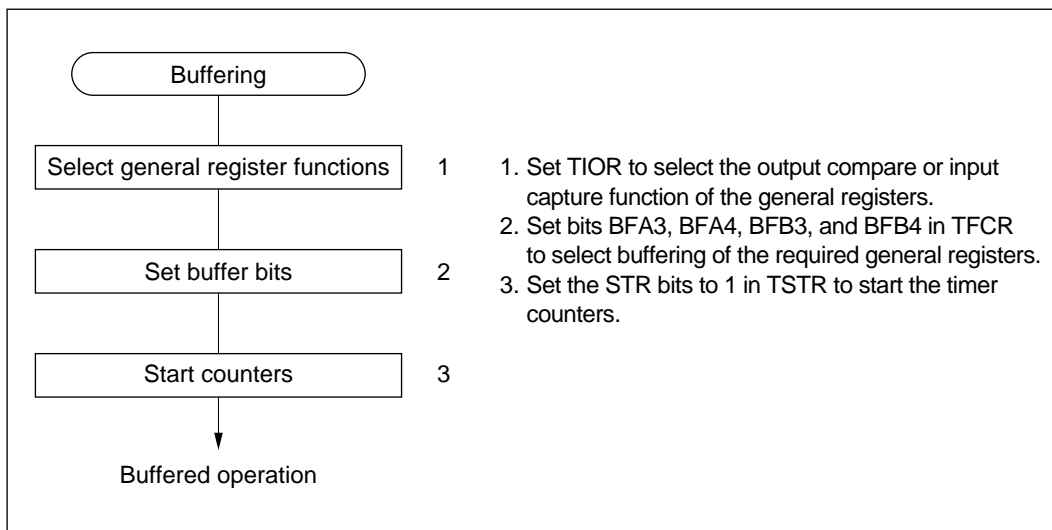

Figure 8-48   Buffering Setup Procedure (Example)

Examples of Buffering: Figure 8-49 shows an example in which GRA is set to function as an output compare register buffered by BRA, TCNT is set to operate as a periodic counter cleared by GRB compare match, and TIOCA and TIOCB are set to toggle at compare match A and B. Because of the buffer setting, when TIOCA toggles at compare match A, the BRA value is simultaneously transferred to GRA. This operation is repeated each time compare match A occurs. Figure 8-50 shows the transfer timing.
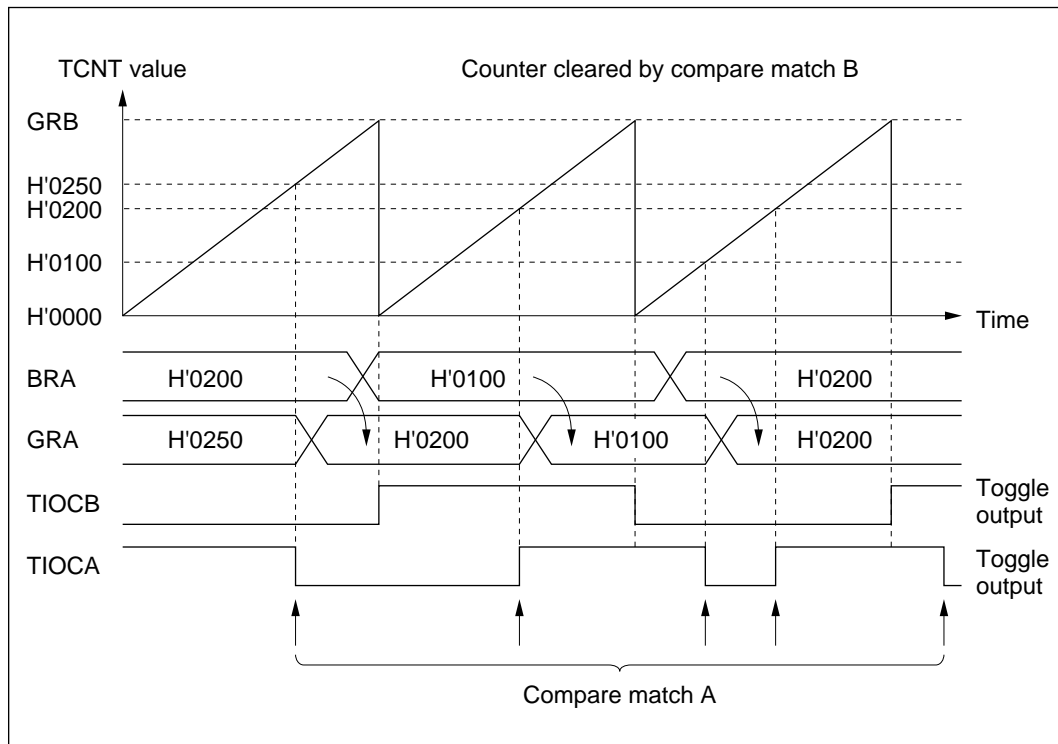

Figure 8-49   Register Buffering (Example 1: Buffering of Output Compare Register)
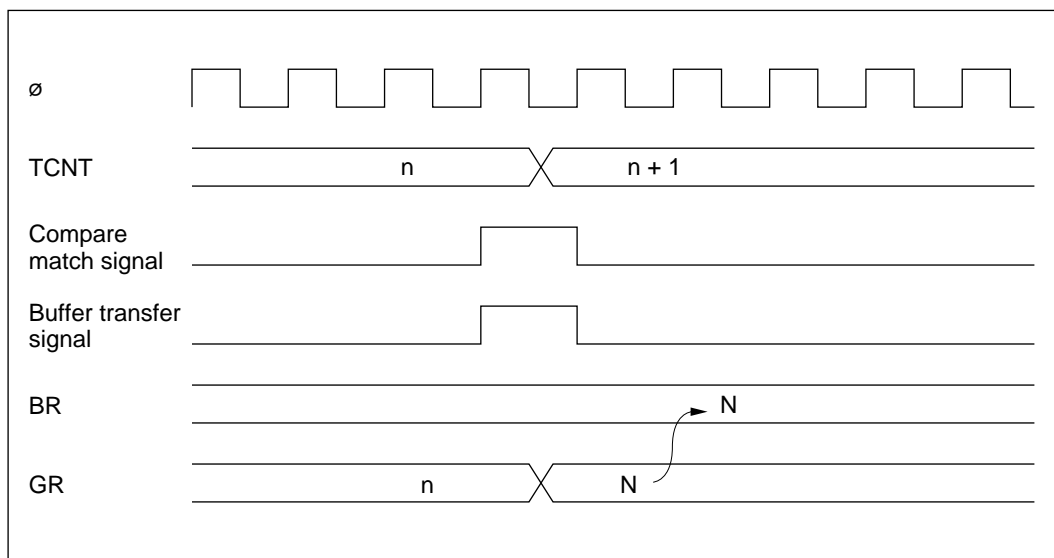

Figure 8-50 Compare Match and Buffer Transfer Timing (Example)

Figure 8-51 shows an example in which GRA is set to function as an input capture register buffered by BRA, and TCNT is cleared by input capture B. The falling edge is selected as the input capture edge at TIOCB. Both edges are selected as input capture edges at TIOCA. Because of the buffer setting, when the TCNT value is captured into GRA at input capture A, the previous GRA value is simultaneously transferred to BRA. Figure 8-52 shows the transfer timing.
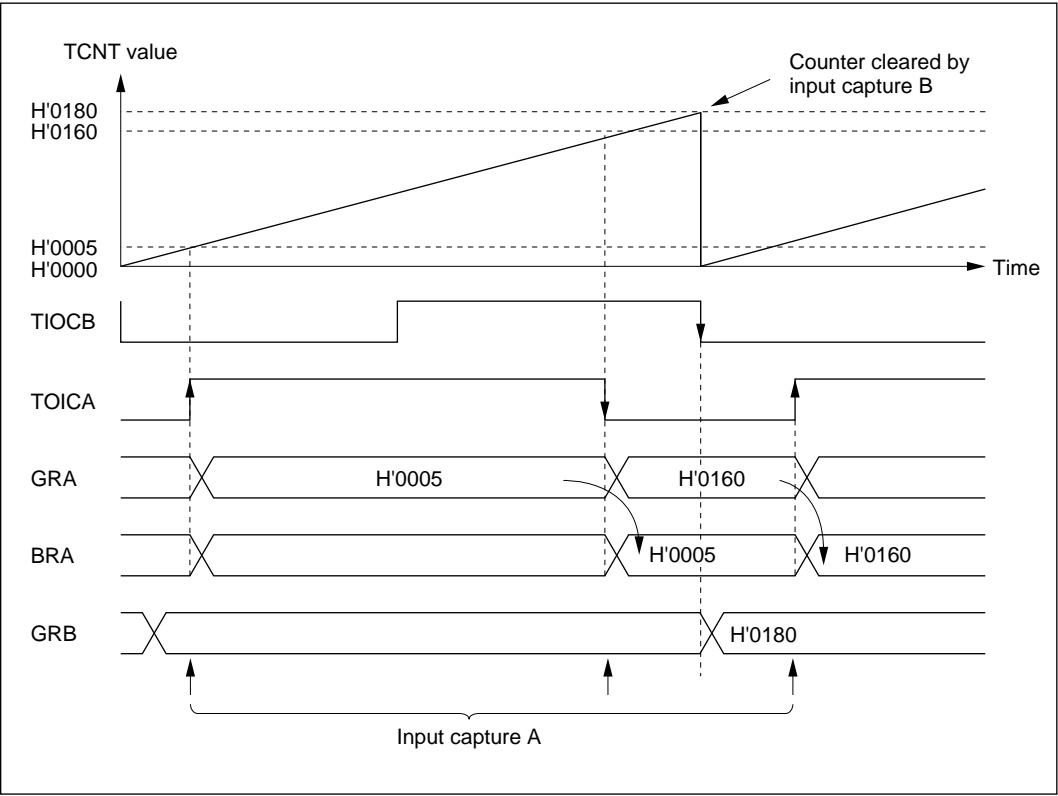

Figure 8-51 Register Buffering (Example 2: Buffering of Input Capture Register)

245
Figure 8-52   Input Capture and Buffer Transfer Timing (Example)

Figure 8-53 shows an example in which GRB3 is buffered by BRB3 in complementary PWM mode. Buffering is used to set GRB3 to a higher value than GRA3, generating a PWM waveform with 0% duty cycle. The BRB3 value is transferred to GRB3 when TCNT3 matches GRA3, and when TCNT4 underflows.
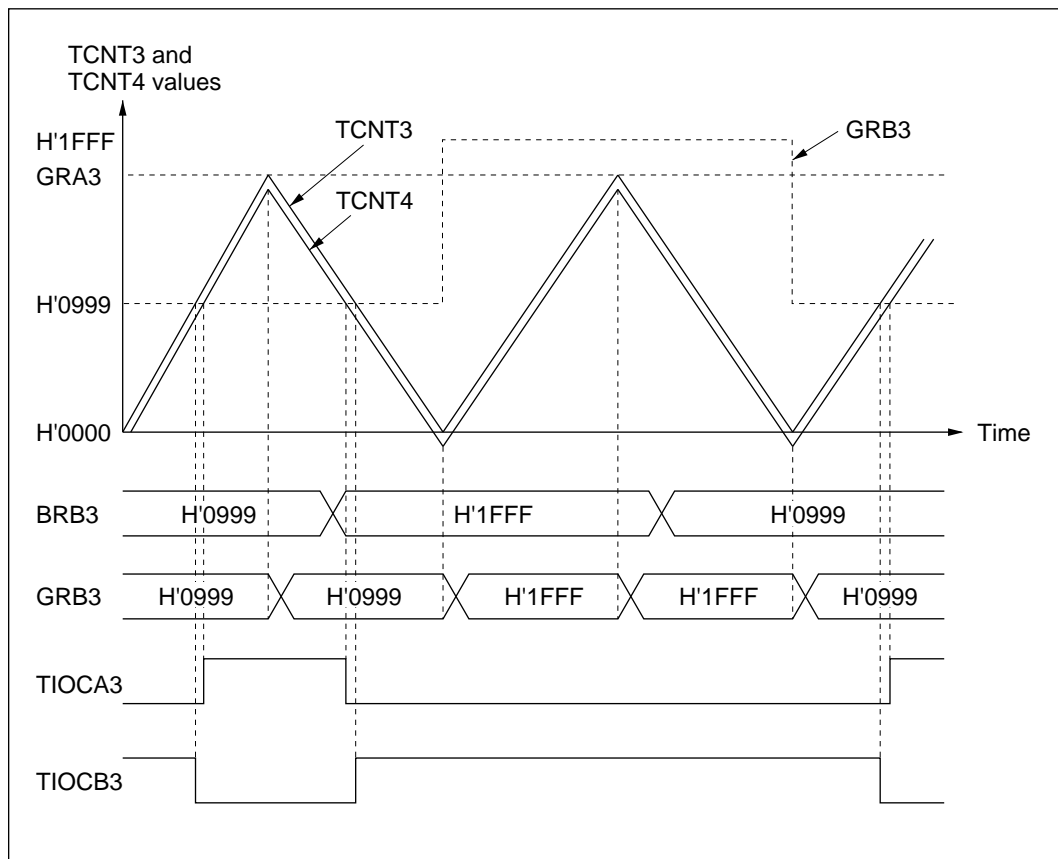

Figure 8-53   Register Buffering (Example 4: Buffering in Complementary PWM Mode)

247

8.4.9 ITU Output Timing

The ITU outputs from channels 3 and 4 can be disabled by bit settings in TOER or by an external trigger, or inverted by bit settings in TOCR.

Timing of Enabling and Disabling of ITU Output by TOER: In this example an ITU output is disabled by clearing a master enable bit to 0 in TOER. An arbitrary value can be output by appropriate settings of the data register (DR) and data direction register (DDR) of the corresponding input/output port. Figure 8-54 illustrates the timing of the enabling and disabling of ITU output by TOER.
Figure 8-54 Timing of Disabling of ITU Output by Writing to TOER (Example)

Timing of Disabling of ITU Output by External Trigger: If the XTGD bit is cleared to 0 in TOCR in reset-synchronized PWM mode or complementary PWM mode, when an input capture A signal occurs in channel 1, the master enable bits are cleared to 0 in TOER, disabling ITU output. Figure 8-55 shows the timing.
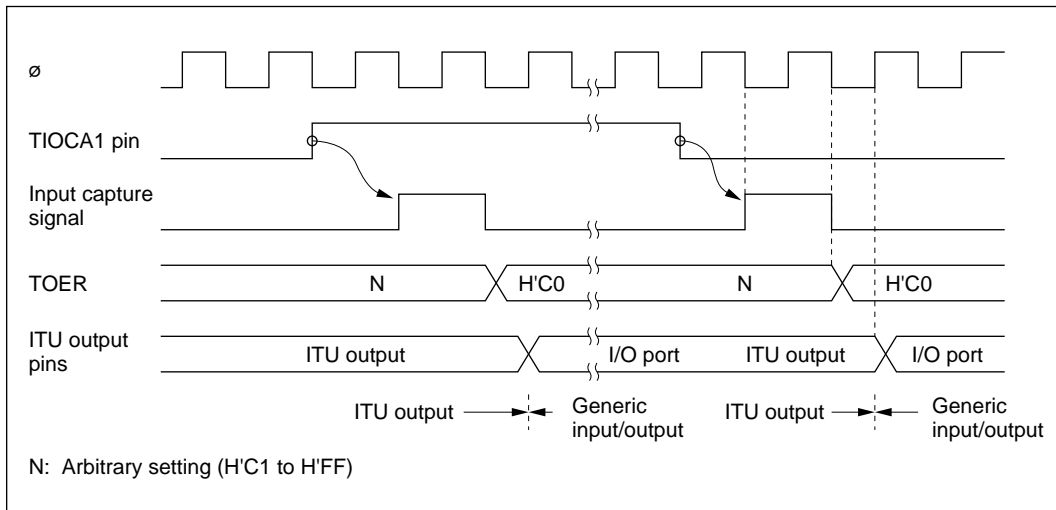

Figure 8-55 Timing of Disabling of ITU Output by External Trigger (Example)

Timing of Output Inversion by TOCR: The output levels in reset-synchronized PWM mode and complementary PWM mode can be inverted by inverting the output level select bits (OLS4 and OLS3) in TOCR. Figure 8-56 shows the timing.
Figure 8-56 Timing of Inverting of ITU Output Level by Writing to TOCR (Example)

249

8.5 Interrupts

The ITU has two types of interrupts: input capture/compare match interrupts, and overflow interrupts.

8.5.1 Setting of Status Flags

Timing of Setting of IMFA and IMFB at Compare Match: IMFA and IMFB are set to 1 by a compare match signal generated when TCNT matches a general register (GR). The compare match signal is generated in the last state in which the values match (when TCNT is updated from the matching count to the next count). Therefore, when TCNT matches a general register, the compare match signal is not generated until the next timer clock input. Figure 8-57 shows the timing of the setting of IMFA and IMFB.
Figure 8-57   Timing of Setting of IMFA and IMFB by Compare Match

Timing of Setting of IMFA and IMFB by Input Capture: IMFA and IMFB are set to 1 by an input capture signal. The TCNT contents are simultaneously transferred to the corresponding general register. Figure 8-58 shows the timing.
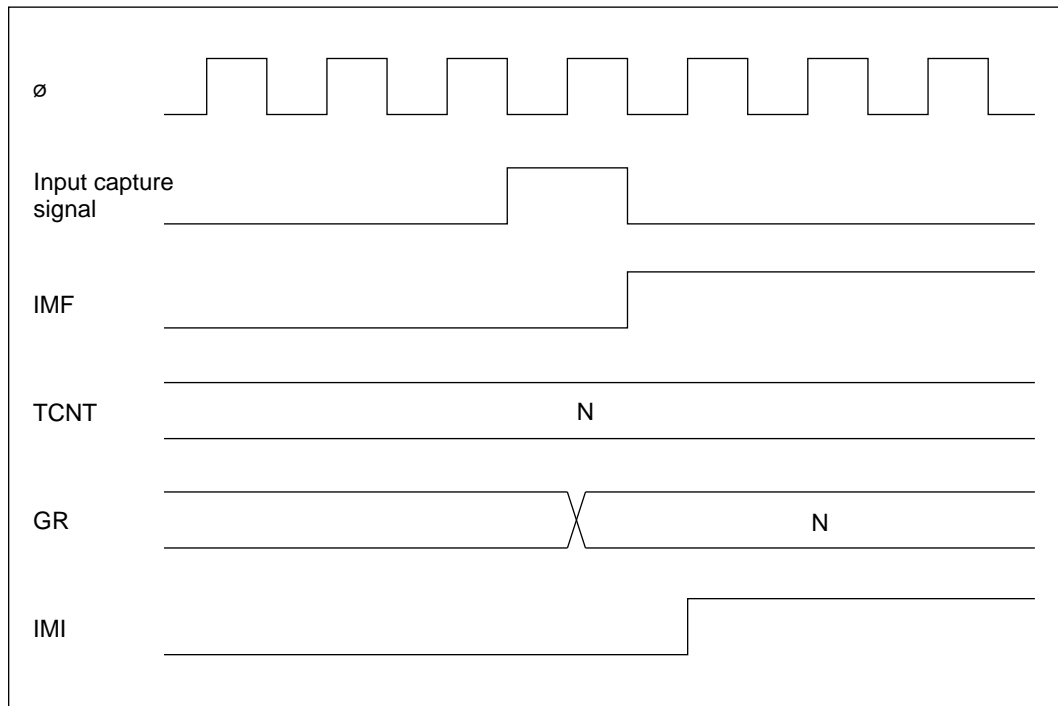

Figure 8-58   Timing of Setting of IMFA and IMFB by Input Capture

Timing of Setting of Overflow Flag (OVF): OVF is set to 1 when TCNT overflows from H'FFFF to H'0000 or underflows from H'0000 to H'FFFF. Figure 8-59 shows the timing.
Figure 8-59   Timing of Setting of OVF

8.5.2 Clearing of Status Flags

If the CPU reads a status flag while it is set to 1, then writes 0 in the status flag, the status flag is cleared. Figure 8-60 shows the timing.
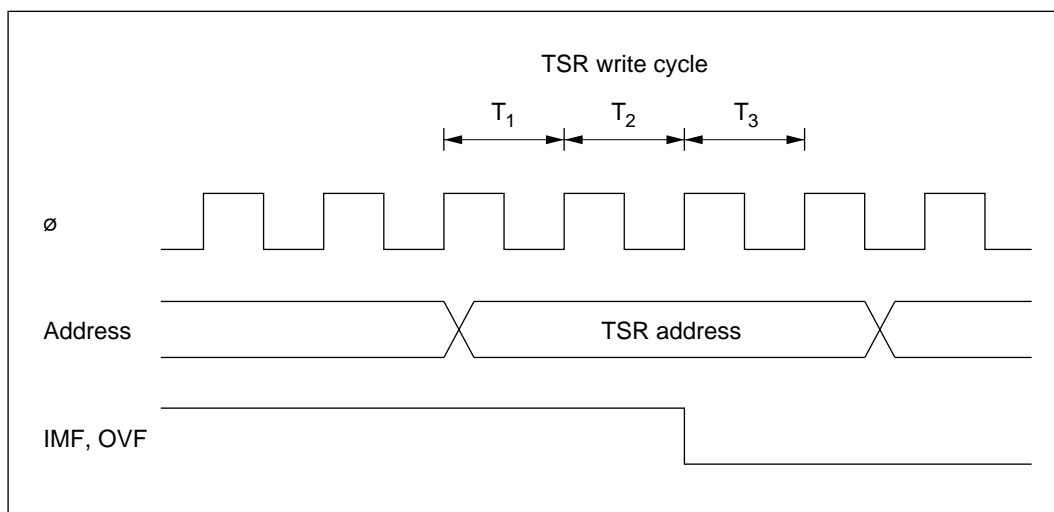

Figure 8-60   Timing of Clearing of Status Flags

8.5.3 Interrupt Sources

Each ITU channel can generate a compare match/input capture A interrupt, a compare match/input capture B interrupt, and an overflow interrupt. In total there are 15 interrupt sources, all independently vectored. An interrupt is requested when the interrupt request flag and interrupt enable bit are both set to 1.

The priority order of the channels can be modified in interrupt priority registers A and B (IPRA and IPRB). For details see section 5, Interrupt Controller.

Table 8-10 lists the interrupt sources.

Table 8-10   ITU Interrupt Sources

Channel	Interrupt Source	Description	Priority*
0	IMIA0	Compare match/input capture A0	High
	IMIB0	Compare match/input capture B0	↑
	OVI0	Overflow 0	
1	IMIA1	Compare match/input capture A1	
	IMIB1	Compare match/input capture B1	
	OVI1	Overflow 1	
2	IMIA2	Compare match/input capture A2	
	IMIB2	Compare match/input capture B2	
	OVI2	Overflow 2	
3	IMIA3	Compare match/input capture A3	
	IMIB3	Compare match/input capture B3	
	OVI3	Overflow 3	
4	IMIA4	Compare match/input capture A4	
	IMIB4	Compare match/input capture B4	
	OVI4	Overflow 4	Low

Note: *The priority immediately after a reset is indicated. Inter-channel priorities can be changed by settings in IPRA and IPRB.

8.6 Usage Notes

This section describes contention and other matters requiring special attention during ITU operations.

Contention between TCNT Write and Clear: If a counter clear signal occurs in the T_3 state of a TCNT write cycle, clearing of the counter takes priority and the write is not performed. See figure 8-61.
Figure 8-61   Contention between TCNT Write and Clear

Contention between TCNT Word Write and Increment: If an increment pulse occurs in the T_3 state of a TCNT word write cycle, writing takes priority and TCNT is not incremented. See figure 8-62.
Figure 8-62 Contention between TCNT Word Write and Increment

Contention between TCNT Byte Write and Increment: If an increment pulse occurs in the T_2 or T_3 state of a TCNT byte write cycle, writing takes priority and TCNT is not incremented. The TCNT byte that was not written retains its previous value. See figure 8-63, which shows an increment pulse occurring in the T_2 state of a byte write to TCNTH.
Figure 8-63   Contention between TCNT Byte Write and Increment

Contention between General Register Write and Compare Match: If a compare match occurs in the T_3 state of a general register write cycle, writing takes priority and the compare match signal is inhibited. See figure 8-64.
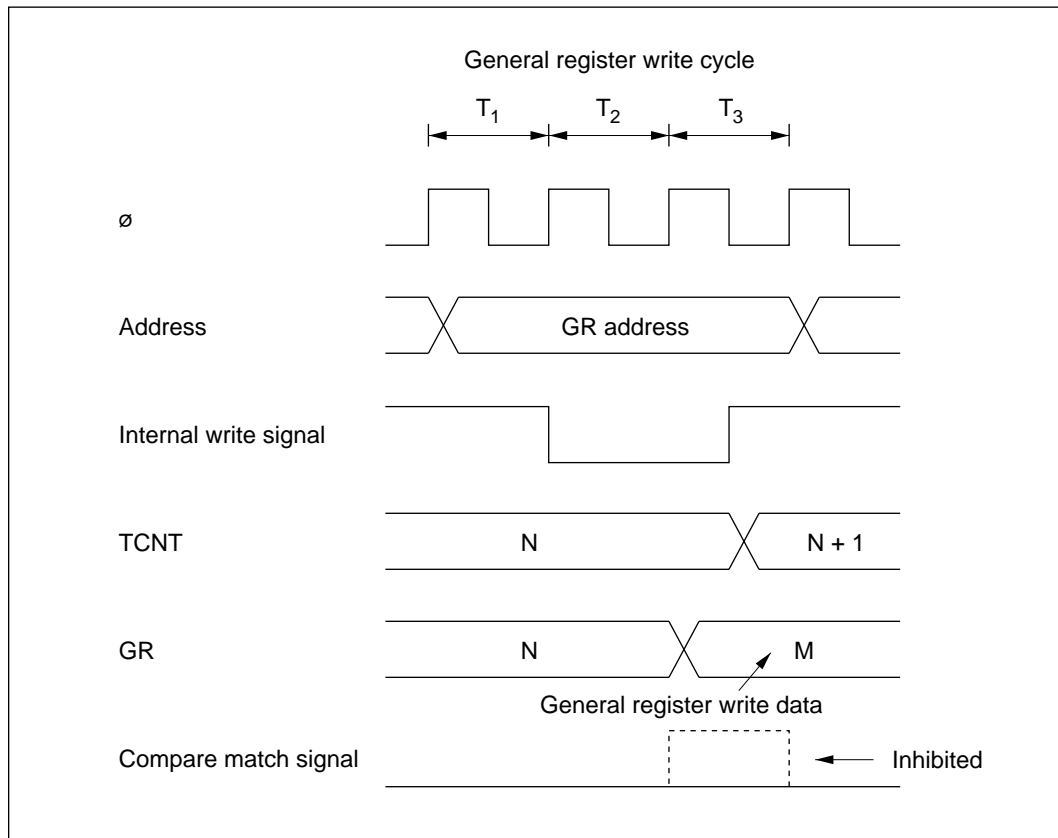

Figure 8-64   Contention between General Register Write and Compare Match

Contention between TCNT Write and Overflow or Underflow: If an overflow occurs in the T_3 state of a TCNT write cycle, writing takes priority and the counter is not incremented. OVF is set to 1.The same holds for underflow. See figure 8-65.
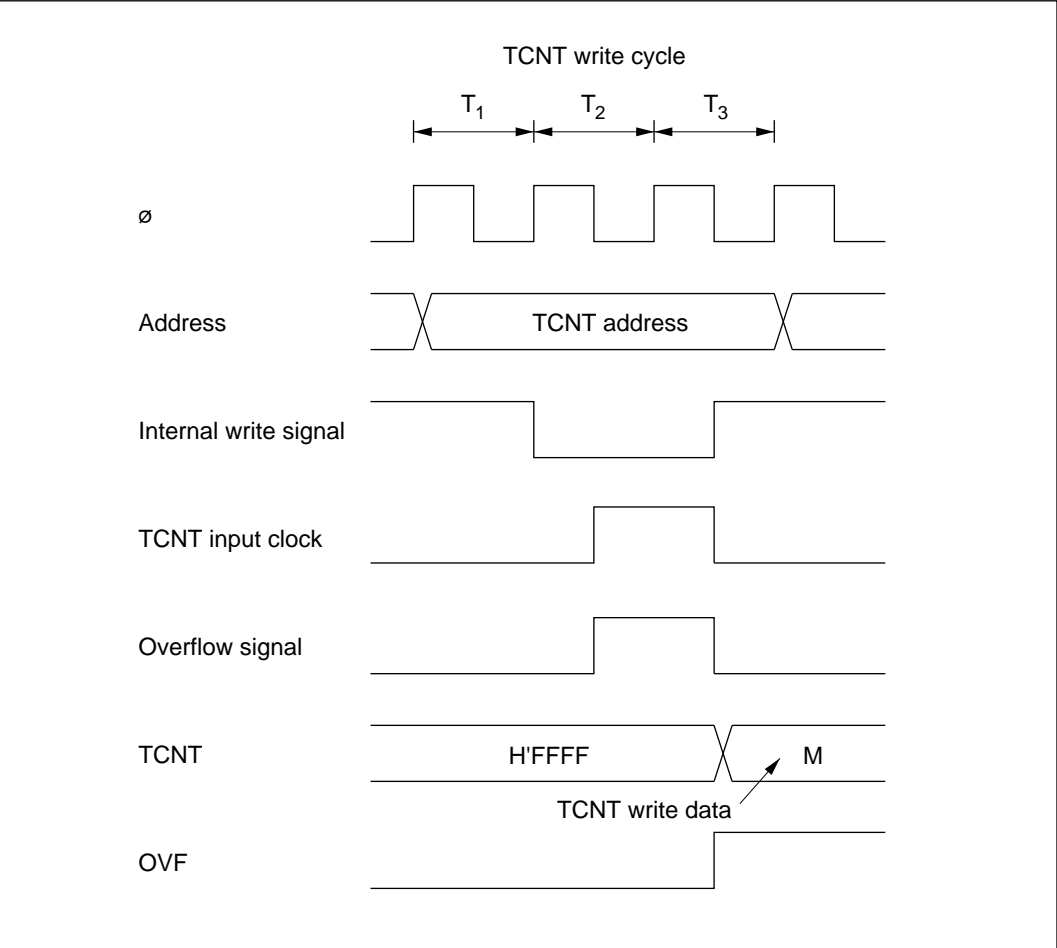

Figure 8-65   Contention between TCNT Write and Overflow

Contention between General Register Read and Input Capture: If an input capture signal occurs during the T_3 state of a general register read cycle, the value before input capture is read. See figure 8-66.

General register read cycle

T_1 T_2 T_3

ø

Address   GR address

Internal read signal

Input capture signal

GR   X   M

Internal data bus   X
Figure 8-66   Contention between General Register Read and Input Capture

Contention between Counter Clearing by Input Capture and Counter Increment: If an input capture signal and counter increment signal occur simultaneously, the counter is cleared according to the input capture signal. The counter is not incremented by the increment signal. The value before the counter is cleared is transferred to the general register. See figure 8-67.
Figure 8-67   Contention between Counter Clearing by Input Capture and Counter Increment

Contention between General Register Write and Input Capture: If an input capture signal occurs in the T_3 state of a general register write cycle, input capture takes priority and the write to the general register is not performed. See figure 8-68.
Figure 8-68   Contention between General Register Write and Input Capture

Note on Waveform Period Setting: When a counter is cleared by compare match, the counter is cleared in the last state at which the TCNT value matches the general register value, at the time when this value would normally be updated to the next count. The actual counter frequency is therefore given by the following formula:

$$f = \frac{\emptyset}{(N + 1)}$$

(f: counter frequency. ø: system clock frequency. N: value set in general register.)

261

Contention between Buffer Register Write and Input Capture: If a buffer register is used for input capture buffering and an input capture signal occurs in the T_3 state of a write cycle, input capture takes priority and the write to the buffer register is not performed.
See figure 8-69.
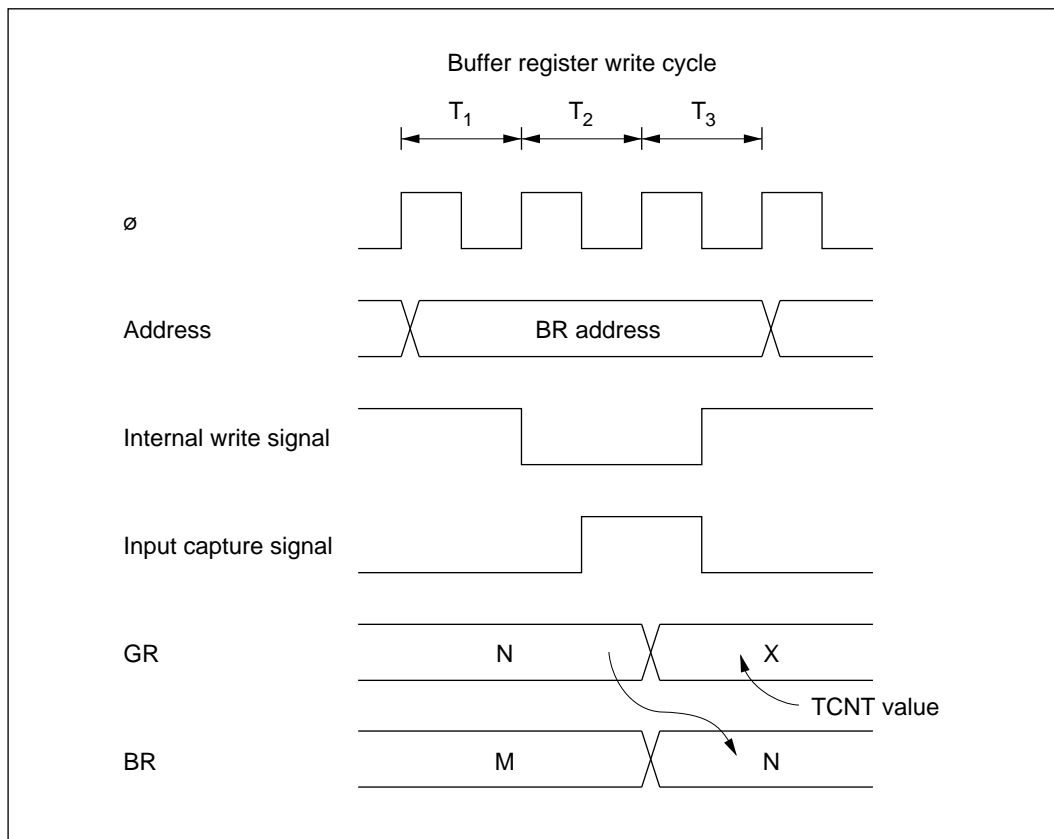

Figure 8-69 Contention between Buffer Register Write and Input Capture

Note on Synchronous Preset: When channels are synchronized, if a TCNT value is modified by byte write access, all 16 bits of all synchronized counters assume the same value as the counter that was addressed.

(Example) When channels 2 and 3 are synchronized

- Byte write to channel 2 or byte write to channel 3

TCNT2	W	X
TCNT3	Y	Z

Upper byte Lower byte

Write A to upper byte of channel 2 →

TCNT2	A	X
TCNT3	A	X

Upper byte Lower byte

Write A to lower byte of channel 3 ↘

TCNT2	Y	A
TCNT3	Y	A

Upper byte Lower byte
- Word write to channel 2 or word write to channel 3

TCNT2	W	X
TCNT3	Y	Z

Upper byte Lower byte

Write AB word to channel 2 or 3 →

TCNT2	A	B
TCNT3	A	B

Upper byte Lower byte
Note on Setup of Reset-Synchronized PWM Mode and Complementary PWM Mode: When setting bits CMD1 and CMD0 in TFCR, take the following precautions:

- Write to bits CMD1 and CMD0 only when TCNT3 and TCNT4 are stopped.

- Do not switch directly between reset-synchronized PWM mode and complementary PWM mode. First switch to normal mode (by clearing bit CMD1 to 0), then select reset-synchronized PWM mode or complementary PWM mode.

ITU Operating Modes

Legend: o Setting available (valid).   — Setting does not affect this mode.
Notes: 1. Master enable bit settings are valid only during waveform output.
2. The input capture function cannot be used in PWM mode. If compare match A and compare match B occur simultaneously, the compare match signal is inhibited.
3. Do not set both channels 3 and 4 for synchronous operation when complementary PWM mode is selected.
4. When reset-synchronized PWM mode is selected, TCNT4 operates independently and the counter clearing function is available. Waveform output is not affected.
5. In complementary PWM mode, select the same clock source for channels 3 and 4.
6. TCR4 settings are valid in reset-synchronized PWM mode, but TCNT4 operates independently, without affecting waveform output.

Section 9   Programmable Timing Pattern Controller

9.1 Overview

The H8/3032 Series has a built-in programmable timing pattern controller (TPC) that provides pulse outputs by using the 16-bit integrated timer-pulse unit (ITU) as a time base. The TPC pulse outputs are divided into 4-bit groups (group 3 to group 0) that can operate simultaneously and independently.

9.1.1 Features

TPC features are listed below.

- 16-bit output data

  Maximum 16-bit data can be output. TPC output can be enabled on a bit-by-bit basis.

- Four output groups

  Output trigger signals can be selected in 4-bit groups to provide up to four different 4-bit outputs.

- Selectable output trigger signals

  Output trigger signals can be selected for each group from the compare-match signals of four ITU channels.

- Non-overlap mode

  A non-overlap margin can be provided between pulse outputs.

9.1.2 Block Diagram

Figure 9-1 shows a block diagram of the TPC.
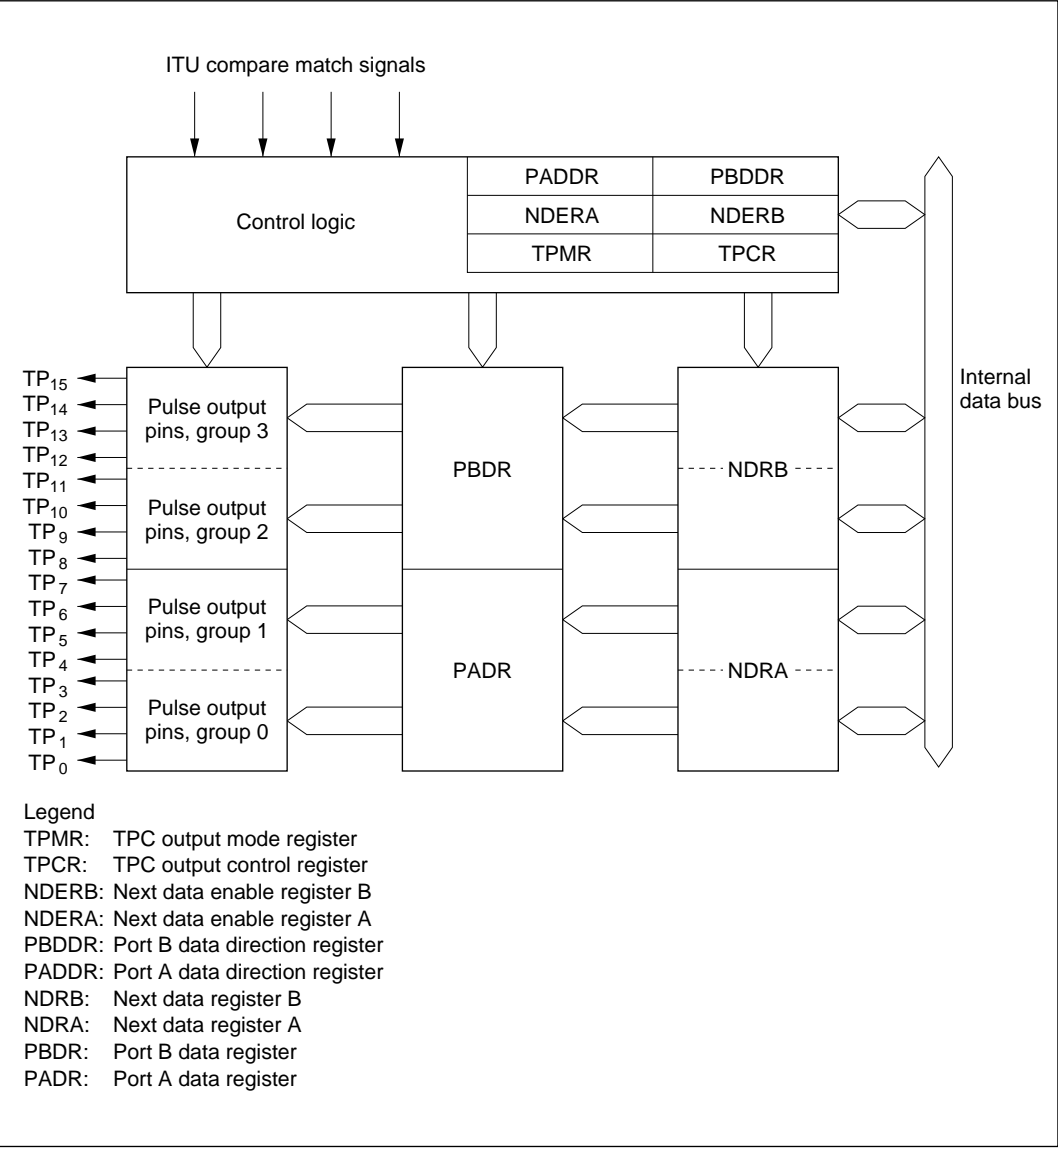

Figure 9-1   TPC Block Diagram

9.1.3 TPC Pins

Table 9-1 summarizes the TPC output pins.

Table 9-1   TPC Pins

Name	Symbol	I/O	Function
TPC output 0	TP_0	Output	Group 0 pulse output
TPC output 1	TP_1	Output	
TPC output 2	TP_2	Output	
TPC output 3	TP_3	Output	
TPC output 4	TP_4	Output	Group 1 pulse output
TPC output 5	TP_5	Output	
TPC output 6	TP_6	Output	
TPC output 7	TP_7	Output	
TPC output 8	TP_8	Output	Group 2 pulse output
TPC output 9	TP_9	Output	
TPC output 10	TP_{10}	Output	
TPC output 11	TP_{11}	Output	
TPC output 12	TP_{12}	Output	Group 3 pulse output
TPC output 13	TP_{13}	Output	
TPC output 14	TP_{14}	Output	
TPC output 15	TP_{15}	Output	

9.1.4 Registers

Table 9-2 summarizes the TPC registers.

Table 9-2 TPC Registers

Address[1]	Name	Abbreviation	R/W	Initial Value
H'FFD1	Port A data direction register	PADDR	W	H'00
H'FFD3	Port A data register	PADR	R/(W)[2]	H'00
H'FFD4	Port B data direction register	PBDDR	W	H'00
H'FFD6	Port B data register	PBDR	R/(W)[2]	H'00
H'FFA0	TPC output mode register	TPMR	R/W	H'F0
H'FFA1	TPC output control register	TPCR	R/W	H'FF
H'FFA2	Next data enable register B	NDERB	R/W	H'00
H'FFA3	Next data enable register A	NDERA	R/W	H'00
H'FFA5/ H'FFA7[3]	Next data register A	NDRA	R/W	H'00
H'FFA4 H'FFA6[3]	Next data register B	NDRB	R/W	H'00

Notes: 1. Lower 16 bits of the address.
2. Bits used for TPC output cannot be written.
3. The NDRA address is H'FFA5 when the same output trigger is selected for TPC output groups 0 and 1 by settings in TPCR. When the output triggers are different, the NDRA address is H'FFA7 for group 0 and H'FFA5 for group 1. Similarly, the address of NDRB is H'FFA4 when the same output trigger is selected for TPC output groups 2 and 3 by settings in TPCR. When the output triggers are different, the NDRB address is H'FFA6 for group 2 and H'FFA4 for group 3.

272

9.2 Register Descriptions

9.2.1 Port A Data Direction Register (PADDR)

PADDR is an 8-bit write-only register that selects input or output for each pin in port A.

Bit	7	6	5	4	3	2	1	0
	PA_7DDR	PA_6DDR	PA_5DDR	PA_4DDR	PA_3DDR	PA_2DDR	PA_1DDR	PA_0DDR
Initial value	0	0	0	0	0	0	0	0
Read/Write	W	W	W	W	W	W	W	W

Port A data direction 7 to 0
These bits select input or
output for port A pins

Port A is multiplexed with pins TP_7 to TP_0. Bits corresponding to pins used for TPC output must be set to 1. For further information about PADDR, see section 7.10, Port A.

9.2.2 Port A Data Register (PADR)

PADR is an 8-bit readable/writable register that stores TPC output data for groups 0 and 1, when these TPC output groups are used.

Bit	7	6	5	4	3	2	1	0
	PA_7	PA_6	PA_5	PA_4	PA_3	PA_2	PA_1	PA_0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*

Port A data 7 to 0
These bits store output data
for TPC output groups 0 and 1

Note: * Bits selected for TPC output by NDERA settings become read-only bits.

For further information about PADR, see section 7.10, Port A.

9.2.3 Port B Data Direction Register (PBDDR)

PBDDR is an 8-bit write-only register that selects input or output for each pin in port B.

Bit	7	6	5	4	3	2	1	0
	PB_7DDR	PB_6DDR	PB_5DDR	PB_4DDR	PB_3DDR	PB_2DDR	PB_1DDR	PB_0DDR
Initial value	0	0	0	0	0	0	0	0
Read/Write	W	W	W	W	W	W	W	W

Port B data direction 7 to 0
These bits select input or
output for port B pins

Port B is multiplexed with pins TP_{15} to TP_8. Bits corresponding to pins used for TPC output must be set to 1. For further information about PBDDR, see section 7.11, Port B.

9.2.4 Port B Data Register (PBDR)

PBDR is an 8-bit readable/writable register that stores TPC output data for groups 2 and 3, when these TPC output groups are used.

Bit	7	6	5	4	3	2	1	0
	PB_7	PB_6	PB_5	PB_4	PB_3	PB_2	PB_1	PB_0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*

Port B data 7 to 0
These bits store output data
for TPC output groups 2 and 3

Note: * Bits selected for TPC output by NDERB settings become read-only bits.

For further information about PBDR, see section 7.11, Port B.

9.2.5 Next Data Register A (NDRA)

NDRA is an 8-bit readable/writable register that stores the next output data for TPC output groups 1 and 0 (pins TP_7 to TP_0). During TPC output, when an ITU compare match event specified in TPCR occurs, NDRA contents are transferred to the corresponding bits in PADR. The address of NDRA differs depending on whether TPC output groups 0 and 1 have the same output trigger or different output triggers.

NDRA is initialized to H'00 by a reset and in hardware standby mode. It is not initialized in software standby mode.

Same Trigger for TPC Output Groups 0 and 1: If TPC output groups 0 and 1 are triggered by the same compare match event, the NDRA address is H'FFA5. The upper 4 bits belong to group 1 and the lower 4 bits to group 0. Address H'FFA7 consists entirely of reserved bits that cannot be modified and always read 1.

Address H'FFA5

Bit	7	6	5	4	3	2	1	0
	NDR7	NDR6	NDR5	NDR4	NDR3	NDR2	NDR1	NDR0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Next data 7 to 4
These bits store the next output data for TPC output group 1

Next data 3 to 0
These bits store the next output data for TPC output group 0

Address H'FFA7

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—
Initial value	1	1	1	1	1	1	1	1
Read/Write	—	—	—	—	—	—	—	—

Reserved bits

Different Triggers for TPC Output Groups 0 and 1: If TPC output groups 0 and 1 are triggered by different compare match events, the address of the upper 4 bits of NDRA (group 1) is H'FFA5 and the address of the lower 4 bits (group 0) is H'FFA7. Bits 3 to 0 of address H'FFA5 and bits 7 to 4 of address H'FFA7 are reserved bits that cannot be modified and always read 1.

Address H'FFA5

Bit	7	6	5	4	3	2	1	0
	NDR7	NDR6	NDR5	NDR4	—	—	—	—
Initial value	0	0	0	0	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	—	—	—	—

Next data 7 to 4
These bits store the next output
data for TPC output group 1

Reserved bits

Address H'FFA7

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	NDR3	NDR2	NDR1	NDR0
Initial value	1	1	1	1	0	0	0	0
Read/Write	—	—	—	—	R/W	R/W	R/W	R/W

Reserved bits

Next data 3 to 0
These bits store the next output
data for TPC output group 0

9.2.6 Next Data Register B (NDRB)

NDRB is an 8-bit readable/writable register that stores the next output data for TPC output groups 3 and 2 (pins TP_{15} to TP_8). During TPC output, when an ITU compare match event specified in TPCR occurs, NDRB contents are transferred to the corresponding bits in PBDR. The address of NDRB differs depending on whether TPC output groups 2 and 3 have the same output trigger or different output triggers.

NDRB is initialized to H'00 by a reset and in hardware standby mode. It is not initialized in software standby mode.

Same Trigger for TPC Output Groups 2 and 3: If TPC output groups 2 and 3 are triggered by the same compare match event, the NDRB address is H'FFA4. The upper 4 bits belong to group 3 and the lower 4 bits to group 2. Address H'FFA6 consists entirely of reserved bits that cannot be modified and always read 1.

Address H'FFA4

Bit	7	6	5	4	3	2	1	0
	NDR15	NDR14	NDR13	NDR12	NDR11	NDR10	NDR9	NDR8
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Next data 15 to 12
These bits store the next output data for TPC output group 3

Next data 11 to 8
These bits store the next output data for TPC output group 2

Address H'FFA6

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—
Initial value	1	1	1	1	1	1	1	1
Read/Write	—	—	—	—	—	—	—	—

Reserved bits

Different Triggers for TPC Output Groups 2 and 3: If TPC output groups 2 and 3 are triggered by different compare match events, the address of the upper 4 bits of NDRB (group 3) is H'FFA4 and the address of the lower 4 bits (group 2) is H'FFA6. Bits 3 to 0 of address H'FFA4 and bits 7 to 4 of address H'FFA6 are reserved bits that cannot be modified and always read 1.

Address H'FFA4

Bit	7	6	5	4	3	2	1	0
	NDR15	NDR14	NDR13	NDR12	—	—	—	—
Initial value	0	0	0	0	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	—	—	—	—

Next data 15 to 12
These bits store the next output
data for TPC output group 3

Reserved bits

Address H'FFA6

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	NDR11	NDR10	NDR9	NDR8
Initial value	1	1	1	1	0	0	0	0
Read/Write	—	—	—	—	R/W	R/W	R/W	R/W

Reserved bits

Next data 11 to 8
These bits store the next output
data for TPC output group 2

9.2.7 Next Data Enable Register A (NDERA)

NDERA is an 8-bit readable/writable register that enables or disables TPC output groups 1 and 0 (TP_7 to TP_0) on a bit-by-bit basis.

Bit	7	6	5	4	3	2	1	0
	NDER7	NDER6	NDER5	NDER4	NDER3	NDER2	NDER1	NDER0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Next data enable 7 to 0
These bits enable or disable
TPC output groups 1 and 0

If a bit is enabled for TPC output by NDERA, then when the ITU compare match event selected in the TPC output control register (TPCR) occurs, the NDRA value is automatically transferred to the corresponding PADR bit, updating the output value. If TPC output is disabled, the bit value is not transferred from NDRA to PADR and the output value does not change.

NDERA is initialized to H'00 by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bits 7 to 0—Next Data Enable 7 to 0 (NDER7 to NDER0): These bits enable or disable TPC output groups 1 and 0 (TP_7 to TP_0) on a bit-by-bit basis.

Bits 7 to 0 NDER7 to NDER0	Description	
0	TPC outputs TP_7 to TP_0 are disabled (NDR7 to NDR0 are not transferred to PA_7 to PA_0)	(Initial value)
1	TPC outputs TP_7 to TP_0 are enabled (NDR7 to NDR0 are transferred to PA_7 to PA_0)	

9.2.8 Next Data Enable Register B (NDERB)

NDERB is an 8-bit readable/writable register that enables or disables TPC output groups 3 and 2 (TP_{15} to TP_8) on a bit-by-bit basis.

Bit	7	6	5	4	3	2	1	0
	NDER15	NDER14	NDER13	NDER12	NDER11	NDER10	NDER9	NDER8
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Next data enable 15 to 8
These bits enable or disable
TPC output groups 3 and 2

If a bit is enabled for TPC output by NDERB, then when the ITU compare match event selected in the TPC output control register (TPCR) occurs, the NDRB value is automatically transferred to the corresponding PBDR bit, updating the output value. If TPC output is disabled, the bit value is not transferred from NDRB to PBDR and the output value does not change.

NDERB is initialized to H'00 by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bits 7 to 0—Next Data Enable 15 to 8 (NDER15 to NDER8): These bits enable or disable TPC output groups 3 and 2 (TP_{15} to TP_8) on a bit-by-bit basis.

Bits 7 to 0 NDER15 to NDER8	Description	
0	TPC outputs TP_{15} to TP_8 are disabled (NDR15 to NDR8 are not transferred to PB_7 to PB_0)	(Initial value)
1	TPC outputs TP_{15} to TP_8 are enabled (NDR15 to NDR8 are transferred to PB_7 to PB_0)	

9.2.9 TPC Output Control Register (TPCR)

TPCR is an 8-bit readable/writable register that selects output trigger signals for TPC outputs on a group-by-group basis.

Bit	7	6	5	4	3	2	1	0
	G3CMS1	G3CMS0	G2CMS1	G2CMS0	G1CMS1	G1CMS0	G0CMS1	G0CMS0
Initial value	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Group 3 compare match select 1 and 0
These bits select the compare match event that triggers TPC output group 3 (TP_{15} to TP_{12})

Group 2 compare match select 1 and 0
These bits select the compare match event that triggers TPC output group 2 (TP_{11} to TP_8)

Group 1 compare match select 1 and 0
These bits select the compare match event that triggers TPC output group 1 (TP_7 to TP_4)

Group 0 compare match select 1 and 0
These bits select the compare match event that triggers TPC output group 0 (TP_3 to TP_0)

TPCR is initialized to H'FF by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bits 7 and 6—Group 3 Compare Match Select 1 and 0 (G3CMS1, G3CMS0): These bits select the compare match event that triggers TPC output group 3 (TP_{15} to TP_{12}).

Bit 7 G3CMS1	Bit 6 G3CMS0	Description
0	0	TPC output group 3 (TP_{15} to TP_{12}) is triggered by compare match in ITU channel 0
	1	TPC output group 3 (TP_{15} to TP_{12}) is triggered by compare match in ITU channel 1
1	0	TPC output group 3 (TP_{15} to TP_{12}) is triggered by compare match in ITU channel 2
	1	TPC output group 3 (TP_{15} to TP_{12}) is triggered by compare match in ITU channel 3 (Initial value)

Bits 5 and 4—Group 2 Compare Match Select 1 and 0 (G2CMS1, G2CMS0): These bits select the compare match event that triggers TPC output group 2 (TP_{11} to TP_8).

Bit 5 G2CMS1	Bit 4 G2CMS0	Description
0	0	TPC output group 2 (TP_{11} to TP_8) is triggered by compare match in ITU channel 0
	1	TPC output group 2 (TP_{11} to TP_8) is triggered by compare match in ITU channel 1
1	0	TPC output group 2 (TP_{11} to TP_8) is triggered by compare match in ITU channel 2
	1	TPC output group 2 (TP_{11} to TP_8) is triggered by compare match in ITU channel 3 (Initial value)

Bits 3 and 2—Group 1 Compare Match Select 1 and 0 (G1CMS1, G1CMS0): These bits select the compare match event that triggers TPC output group 1 (TP_7 to TP_4).

Bit 3 G1CMS1	Bit 2 G1CMS0	Description	
0	0	TPC output group 1 (TP_7 to TP_4) is triggered by compare match in ITU channel 0	
	1	TPC output group 1 (TP_7 to TP_4) is triggered by compare match in ITU channel 1	
1	0	TPC output group 1 (TP_7 to TP_4) is triggered by compare match in ITU channel 2	
	1	TPC output group 1 (TP_7 to TP_4) is triggered by compare match in ITU channel 3	(Initial value)

Bits 1 and 0—Group 0 Compare Match Select 1 and 0 (G0CMS1, G0CMS0): These bits select the compare match event that triggers TPC output group 0 (TP_3 to TP_0).

Bit 1 G0CMS1	Bit 0 G0CMS0	Description	
0	0	TPC output group 0 (TP_3 to TP_0) is triggered by compare match in ITU channel 0	
	1	TPC output group 0 (TP_3 to TP_0) is triggered by compare match in ITU channel 1	
1	0	TPC output group 0 (TP_3 to TP_0) is triggered by compare match in ITU channel 2	
	1	TPC output group 0 (TP_3 to TP_0) is triggered by compare match in ITU channel 3	(Initial value)

9.2.10 TPC Output Mode Register (TPMR)

TPMR is an 8-bit readable/writable register that selects normal or non-overlapping TPC output for each group.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	G3NOV	G2NOV	G1NOV	G0NOV
Initial value	1	1	1	1	0	0	0	0
Read/Write	—	—	—	—	R/W	R/W	R/W	R/W

Reserved bits

Group 3 non-overlap
Selects non-overlapping TPC output for group 3 (TP_{15} to TP_{12})

Group 2 non-overlap
Selects non-overlapping TPC output for group 2 (TP_{11} to TP_8)

Group 1 non-overlap
Selects non-overlapping TPC output for group 1 (TP_7 to TP_4)

Group 0 non-overlap
Selects non-overlapping TPC output for group 0 (TP_3 to TP_0)

The output trigger period of a non-overlapping TPC output waveform is set in general register B (GRB) in the ITU channel selected for output triggering. The non-overlap margin is set in general register A (GRA). The output values change at compare match A and B. For details see section 9.3.4, Non-Overlapping TPC Output.

TPMR is initialized to H'F0 by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bits 7 to 4—Reserved: Read-only bits, always read as 1.

Bit 3—Group 3 Non-Overlap (G3NOV): Selects normal or non-overlapping TPC output for group 3 (TP_{15} to TP_{12}).

Bit 3

G3NOV	Description	
0	Normal TPC output in group 3 (output values change at compare match A in the selected ITU channel)	(Initial value)
1	Non-overlapping TPC output in group 3 (independent 1 and 0 output at compare match A and B in the selected ITU channel)	

Bit 2—Group 2 Non-Overlap (G2NOV): Selects normal or non-overlapping TPC output for group 2 (TP_{11} to TP_8).

Bit 2

G2NOV	Description	
0	Normal TPC output in group 2 (output values change at compare match A in the selected ITU channel)	(Initial value)
1	Non-overlapping TPC output in group 2 (independent 1 and 0 output at compare match A and B in the selected ITU channel)	

Bit 1—Group 1 Non-Overlap (G1NOV): Selects normal or non-overlapping TPC output for group 1 (TP_7 to TP_4).

Bit 1

G1NOV	Description	
0	Normal TPC output in group 1 (output values change at compare match A in the selected ITU channel)	(Initial value)
1	Non-overlapping TPC output in group 1 (independent 1 and 0 output at compare match A and B in the selected ITU channel)	

Bit 0—Group 0 Non-Overlap (G0NOV): Selects normal or non-overlapping TPC output for group 0 (TP_3 to TP_0).

Bit 0

G0NOV	Description	
0	Normal TPC output in group 0 (output values change at compare match A in the selected ITU channel)	(Initial value)
1	Non-overlapping TPC output in group 0 (independent 1 and 0 output at compare match A and B in the selected ITU channel)	

9.3 Operation

9.3.1 Overview

When corresponding bits in PADDR or PBDDR and NDERA or NDERB are set to 1, TPC output is enabled. The TPC output initially consists of the corresponding PADR or PBDR contents. When a compare-match event selected in TPCR occurs, the corresponding NDRA or NDRB bit contents are transferred to PADR or PBDR to update the output values.

Figure 9-2 illustrates the TPC output operation. Table 9-3 summarizes the TPC operating conditions.
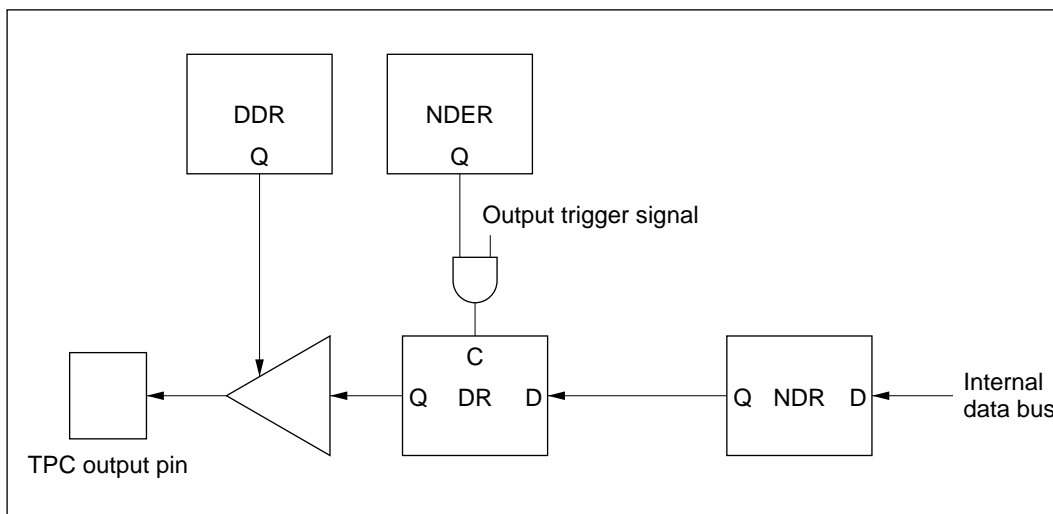

Figure 9-2   TPC Output Operation

Table 9-3   TPC Operating Conditions

NDER	DDR	Pin Function
0	0	Generic input port
	1	Generic output port
1	0	Generic input port (but the DR bit is a read-only bit, and when compare match occurs, the NDR bit value is transferred to the DR bit)
	1	TPC pulse output

Sequential output of up to 16-bit patterns is possible by writing new output data to NDRA and NDRB before the next compare match. For information on non-overlapping operation, see section 9.3.4, Non-Overlapping TPC Output.

9.3.2 Output Timing

If TPC output is enabled, NDRA/NDRB contents are transferred to PADR/PBDR and output when the selected compare match event occurs. Figure 9-3 shows the timing of these operations for the case of normal output in groups 2 and 3, triggered by compare match A.
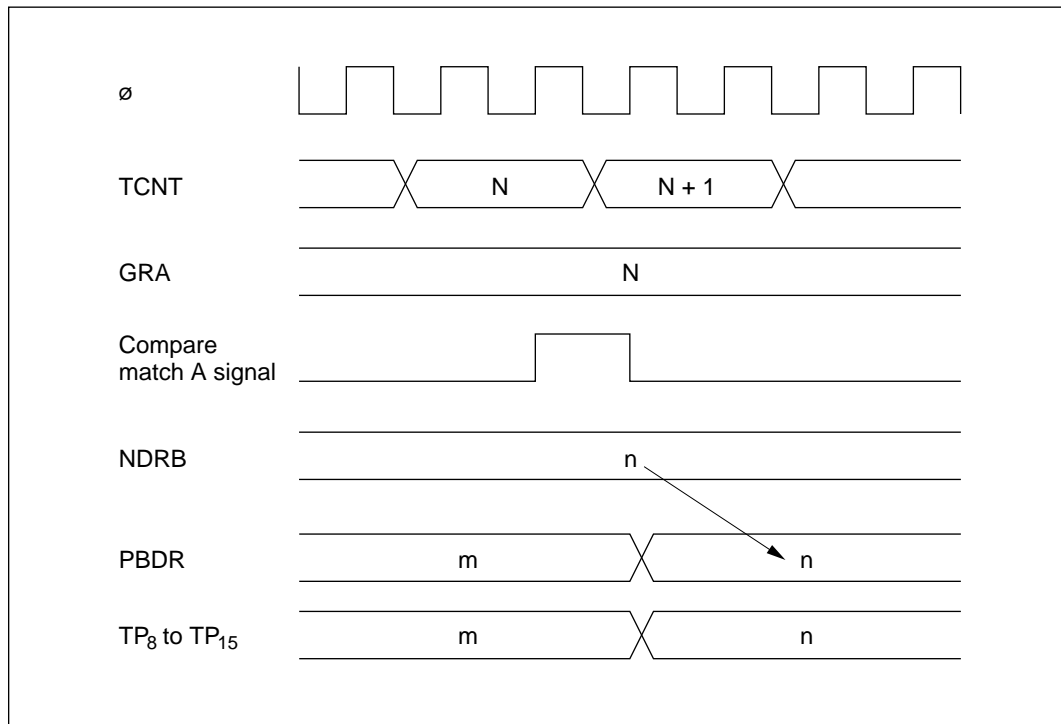

Figure 9-3   Timing of Transfer of Next Data Register Contents and Output (Example)

9.3.3 Normal TPC Output

Sample Setup Procedure for Normal TPC Output: Figure 9-4 shows a sample procedure for setting up normal TPC output.
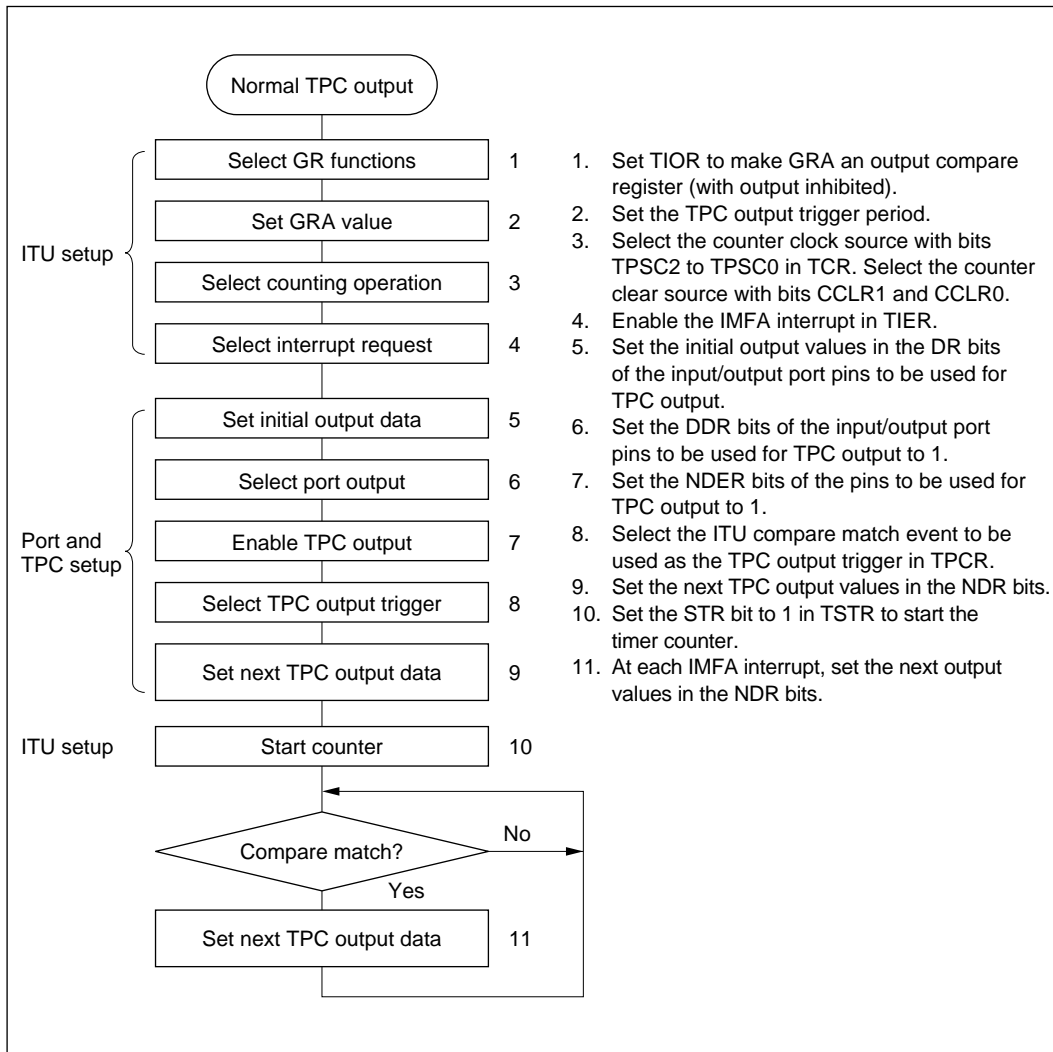

Figure 9-4   Setup Procedure for Normal TPC Output (Example)

The procedure steps:

1. Set TIOR to make GRA an output compare register (with output inhibited).
2. Set the TPC output trigger period.
3. Select the counter clock source with bits TPSC2 to TPSC0 in TCR. Select the counter clear source with bits CCLR1 and CCLR0.
4. Enable the IMFA interrupt in TIER.
5. Set the initial output values in the DR bits of the input/output port pins to be used for TPC output.
6. Set the DDR bits of the input/output port pins to be used for TPC output to 1.
7. Set the NDER bits of the pins to be used for TPC output to 1.
8. Select the ITU compare match event to be used as the TPC output trigger in TPCR.
9. Set the next TPC output values in the NDR bits.
10. Set the STR bit to 1 in TSTR to start the timer counter.
11. At each IMFA interrupt, set the next output values in the NDR bits.

Example of Normal TPC Output (Example of Five-Phase Pulse Output): Figure 9-5 shows an example in which the TPC is used for cyclic five-phase pulse output.

- The ITU channel to be used as the output trigger channel is set up so that GRA is an output compare register and the counter will be cleared by compare match A. The trigger period is set in GRA. The IMIEA bit is set to 1 in TIER to enable the compare match A interrupt.
- H'F8 is written in PBDDR and NDERB, and bits G3CMS1, G3CMS0, G2CMS1, and G2CMS0 are set in TPCR to select compare match in the ITU channel set up in step 1 as the output trigger. Output data H'80 is written in NDRB.
- The timer counter in this ITU channel is started. When compare match A occurs, the NDRB contents are transferred to PBDR and output. The compare match/input capture A (IMFA) interrupt service routine writes the next output data (H'C0) in NDRB.
- Five-phase overlapping pulse output (one or two phases active at a time) can be obtained by writing H'40, H'60, H'20, H'30, H'10, H'18, H'08, H'88… at successive IMFA interrupts.

Figure 9-5   Normal TPC Output Example (Five-Phase Pulse Output)

9.3.4 Non-Overlapping TPC Output

Sample Setup Procedure for Non-Overlapping TPC Output: Figure 9-6 shows a sample procedure for setting up non-overlapping TPC output.

The flowchart on the left:

Non-overlapping TPC output

ITU setup:
1. Select GR functions
2. Set GR values
3. Select counting operation
4. Select interrupt requests

Port and TPC setup:
5. Set initial output data
6. Set up TPC output
7. Enable TPC transfer
8. Select TPC transfer trigger
9. Select non-overlapping groups
10. Set next TPC output data

ITU setup:
11. Start counter

Compare match A? — No (loop back) / Yes

12. Set next TPC output data

The descriptions on the right:

1. Set TIOR to make GRA and GRB output compare registers (with output inhibited).
2. Set the TPC output trigger period in GRB and the non-overlap margin in GRA.
3. Select the counter clock source with bits TPSC2 to TPSC0 in TCR. Select the counter clear source with bits CCLR1 and CCLR0.
4. Enable the IMFA interrupt in TIER.
5. Set the initial output values in the DR bits of the input/output port pins to be used for TPC output.
6. Set the DDR bits of the input/output port pins to be used for TPC output to 1.
7. Set the NDER bits of the pins to be used for TPC output to 1.
8. In TPCR, select the ITU compare match event to be used as the TPC output trigger.
9. In TPMR, select the groups that will operate in non-overlap mode.
10. Set the next TPC output values in the NDR bits.
11. Set the STR bit to 1 in TSTR to start the timer counter.
12. At each IMFA interrupt, write the next output value in the NDR bits.

Figure 9-6   Setup Procedure for Non-Overlapping TPC Output (Example)

Example of Non-Overlapping TPC Output (Example of Four-Phase Complementary Non-Overlapping Output): Figure 9-7 shows an example of the use of TPC output for four-phase complementary non-overlapping pulse output.

- The ITU channel to be used as the output trigger channel is set up so that GRA and GRB are output compare registers and the counter will be cleared by compare match B. The TPC output trigger period is set in GRB. The non-overlap margin is set in GRA. The IMIEA bit is set to 1 in TIER to enable IMFA interrupts.
- H'FF is written in PBDDR and NDERB, and bits G3CMS1, G3CMS0, G2CMS1, and G2CMS0 are set Bits G3NOV and G2NOV are set to 1 in TPMR to select non-overlapping output. Output data H'95 is written in NDRB.
- The timer counter in this ITU channel is started. When compare match B occurs, outputs change from 1 to 0. When compare match A occurs, outputs change from 0 to 1 (the change from 0 to 1 is delayed by the value of GRA). The IMFA interrupt service routine writes the next output data (H'65) in NDRB.
- Four-phase complementary non-overlapping pulse output can be obtained by writing H'59, H'56, H'95… at successive IMFA interrupts.

Figure 9-7   Non-Overlapping TPC Output Example (Four-Phase Complementary Non-Overlapping Pulse Output)

9.3.5 TPC Output Triggering by Input Capture

TPC output can be triggered by ITU input capture as well as by compare match. If GRA functions as an input capture register in the ITU channel selected in TPCR, TPC output will be triggered by the input capture signal. Figure 9-8 shows the timing.
Figure 9-8   TPC Output Triggering by Input Capture (Example)

9.4 Usage Notes

9.4.1 Operation of TPC Output Pins

TP_0 to TP_{15} are multiplexed with ITU pin functions. When ITU output is enabled, the corresponding pins cannot be used for TPC output. The data transfer from NDR bits to DR bits takes place, however, regardless of the usage of the pin.

Pin functions should be changed only under conditions in which the output trigger event will not occur.

9.4.2 Note on Non-Overlapping Output

During non-overlapping operation, the transfer of NDR bit values to DR bits takes place as follows.

1. NDR bits are always transferred to DR bits at compare match A.

2. At compare match B, NDR bits are transferred only if their value is 0. Bits are not transferred if their value is 1.

Figure 9-9 illustrates the non-overlapping TPC output operation.
Figure 9-9 Non-Overlapping TPC Output

Therefore, 0 data can be transferred ahead of 1 data by making compare match B occur before compare match A. NDR contents should not be altered during the interval from compare match B to compare match A (the non-overlap margin).

This can be accomplished by having the IMFA interrupt service routine write the next data in NDR, or by having the IMFA interrupt activate the DMAC. The next data must be written before the next compare match B occurs.

Figure 9-10 shows the timing relationships.
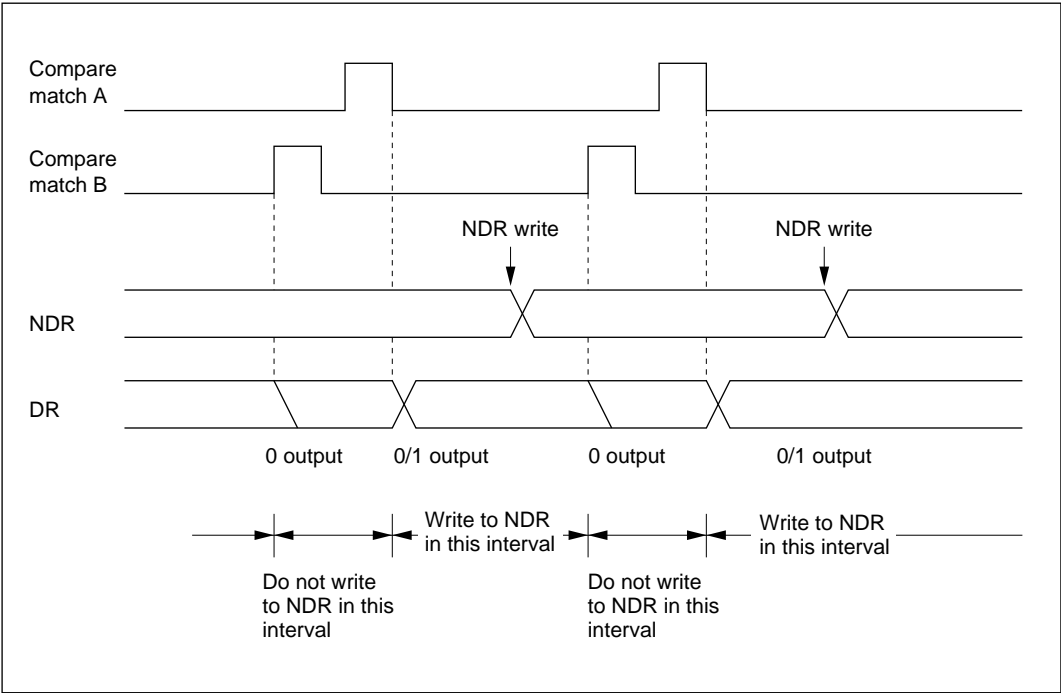

Figure 9-10 Non-Overlapping Operation and NDR Write Timing

Section 10   Watchdog Timer

10.1 Overview

The H8/3032 Series has an on-chip watchdog timer (WDT). The WDT has two selectable functions: it can operate as a watchdog timer to supervise system operation, or it can operate as an interval timer. As a watchdog timer, it generates a reset signal for the H8/3032 Series chip if a system crash allows the timer counter (TCNT) to overflow before being rewritten. In interval timer operation, an interval timer interrupt is requested at each TCNT overflow.

10.1.1 Features

WDT features are listed below.

- Selection of eight counter clock sources

  ø/2, ø/32, ø/64, ø/128, ø/256, ø/512, ø/2048, or ø/4096

- Interval timer option

- Timer counter overflow generates a reset signal or interrupt.

  The reset signal is generated in watchdog timer operation. An interval timer interrupt is generated in interval timer operation.

- Watchdog timer reset signal resets the entire H8/3032 Series internally, and can also be output externally.

  The reset signal generated by timer counter overflow during watchdog timer operation resets the entire H8/3032 Series internally. An external reset signal can be output from the $\overline{\text{RESO}}$ pin to reset other system devices simultaneously.

10.1.2 Block Diagram

Figure 10-1 shows a block diagram of the WDT.
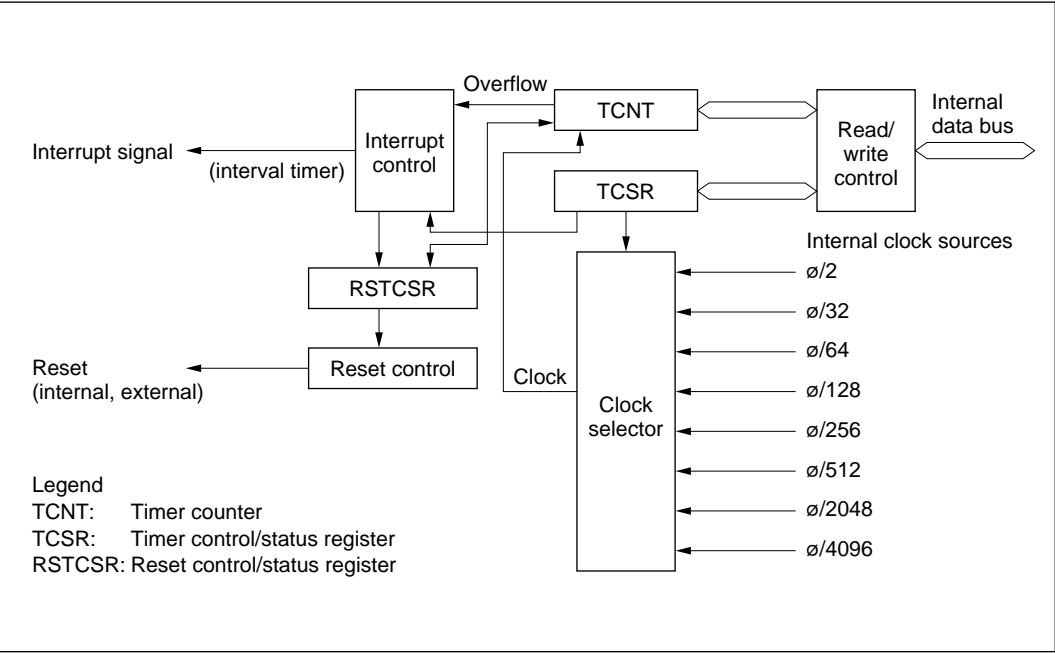

Figure 10-1   WDT Block Diagram

10.1.3 Pin Configuration

Table 10-1 describes the WDT output pin.

Table 10-1   WDT Pin

Name	Abbreviation	I/O	Function
Reset output	$\overline{\text{RESO}}$	Output*	External output of the watchdog timer reset signal

Note: * Open-drain output.

10.1.4 Register Configuration

Table 10-2 summarizes the WDT registers.

Table 10-2 WDT Registers

Address[1]					
Write[2]	Read	Name	Abbreviation	R/W	Initial Value
H'FFA8	H'FFA8	Timer control/status register	TCSR	R/(W)[3]	H'18
	H'FFA9	Timer counter	TCNT	R/W	H'00
H'FFAA	H'FFAB	Reset control/status register	RSTCSR	R/(W)[3]	H'3F

Notes: 1. Lower 16 bits of the address.
      2. Write word data starting at this address.
      3. Only 0 can be written in bit 7, to clear the flag.

10.2 Register Descriptions

10.2.1 Timer Counter (TCNT)

TCNT is an 8-bit readable and writable* up-counter.

Bit	7	6	5	4	3	2	1	0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

When the TME bit is set to 1 in TCSR, TCNT starts counting pulses generated from an internal clock source selected by bits CKS2 to CKS0 in TCSR. When the count overflows (changes from H'FF to H'00), the OVF bit is set to 1 in TCSR. TCNT is initialized to H'00 by a reset and when the TME bit is cleared to 0.

Note: * TCNT is write-protected by a password. For details see section 10.2.4, Notes on Register Access.

10.2.2 Timer Control/Status Register (TCSR)

TCSR is an 8-bit readable and writable[*1] register. Its functions include selecting the timer mode and clock source.

Bit	7	6	5	4	3	2	1	0
	OVF	WT/$\overline{\text{IT}}$	TME	—	—	CKS2	CKS1	CKS0
Initial value	0	0	0	1	1	0	0	0
Read/Write	R/(W)[*2]	R/W	R/W	—	—	R/W	R/W	R/W

Clock select
These bits select the
TCNT clock source

Reserved bits

Timer enable
Selects whether TCNT runs or halts

Timer mode select
Selects the mode

Overflow flag
Status flag indicating overflow

Bits 7 to 5 are initialized to 0 by a reset and in standby mode. Bits 2 to 0 are initialized to 0 by a reset. In software standby mode bits 2 to 0 are not initialized, but retain their previous values.

Notes: 1. TCSR is write-protected by a password. For details see section 10.2.4, Notes on Register Access.
2. Only 0 can be written, to clear the flag.

Bit 7—Overflow Flag (OVF): This status flag indicates that the timer counter has overflowed from H'FF to H'00.

Bit 7 OVF	Description	
0	[Clearing condition] Cleared by reading OVF when OVF = 1, then writing 0 in OVF	(Initial value)
1	[Setting condition] Set when TCNT changes from H'FF to H'00	

Bit 6—Timer Mode Select (WT/$\overline{\text{IT}}$): Selects whether to use the WDT as a watchdog timer or interval timer. If used as an interval timer, the WDT generates an interval timer interrupt request when TCNT overflows. If used as a watchdog timer, the WDT generates a reset signal when TCNT overflows.

Bit 6 WT/$\overline{\text{IT}}$	Description	
0	Interval timer: requests interval timer interrupts	(Initial value)
1	Watchdog timer: generates a reset signal	

Bit 5—Timer Enable (TME): Selects whether TCNT runs or is halted.

Bit 5 TME	Description	
0	TCNT is initialized to H'00 and halted	(Initial value)
1	TCNT is counting	

Bits 4 and 3—Reserved: Read-only bits, always read as 1.

Bits 2 to 0—Clock Select 2 to 0 (CKS2/1/0): These bits select one of eight internal clock sources, obtained by prescaling the system clock (ø), for input to TCNT.

Bit 2 CKS2	Bit 1 CKS1	Bit 0 CKS0	Description	
0	0	0	ø/2	(Initial value)
		1	ø/32	
	1	0	ø/64	
		1	ø/128	
1	0	0	ø/256	
		1	ø/512	
	1	0	ø/2048	
		1	ø/4096	

10.2.3 Reset Control/Status Register (RSTCSR)

RSTCSR is an 8-bit readable and writable[1] register that indicates when a reset signal has been generated by watchdog timer overflow, and controls external output of the reset signal.

Bit	7	6	5	4	3	2	1	0
	WRST	RSTOE	—	—	—	—	—	—
Initial value	0	0	1	1	1	1	1	1
Read/Write	R/(W)[2]	R/W	—	—	—	—	—	—

Reserved bits

Reset output enable
Enables or disables external output of the reset signal

Watchdog timer reset
Indicates that a reset signal has been generated

Bits 7 and 6 are initialized by input of a reset signal at the $\overline{\text{RES}}$ pin. They are not initialized by reset signals generated by watchdog timer overflow.

Notes: 1. RSTCSR is write-protected by a password. For details see section 10.2.4, Notes on Register Access.
2. Only 0 can be written in bit 7, to clear the flag.

Bit 7—Watchdog Timer Reset (WRST): During watchdog timer operation, this bit indicates that TCNT has overflowed and generated a reset signal. This reset signal resets the entire H8/3003 chip internally. If bit RSTOE is set to 1, this reset signal is also output (low) at the $\overline{\text{RESO}}$ pin to initialize external system devices.

Bit 7

WRST	Description	
0	[Clearing condition] Cleared to 0 by reset signal input at $\overline{\text{RES}}$ pin, or by writing 0	(Initial value)
1	[Setting condition] Set when TCNT overflow generates a reset signal during watchdog timer operation	

Bit 6—Reset Output Enable (RSTOE): Enables or disables external output at the $\overline{\text{RESO}}$ pin of the reset signal generated if TCNT overflows during watchdog timer operation.

Bit 6

RSTOE	Description	
0	Reset signal is not output externally	(Initial value)
1	Reset signal is output externally	

Bits 5 to 0—Reserved: Read-only bits, always read as 1.

10.2.4 Notes on Register Access

The watchdog timer's TCNT, TCSR, and RSTCSR registers differ from other registers in being more difficult to write. The procedures for writing and reading these registers are given below.

Writing to TCNT and TCSR: These registers must be written by a word transfer instruction. They cannot be written by byte instructions. Figure 10-2 shows the format of data written to TCNT and TCSR. TCNT and TCSR both have the same write address. The write data must be contained in the lower byte of the written word. The upper byte must contain H'5A (password for TCNT) or H'A5 (password for TCSR). This transfers the write data from the lower byte to TCNT or TCSR.
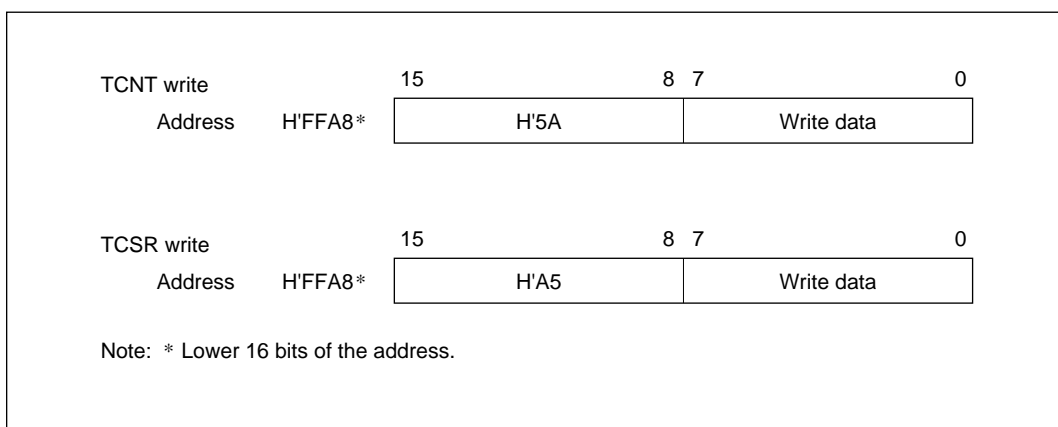

Figure 10-2 Format of Data Written to TCNT and TCSR

Writing to RSTCSR: RSTCSR must be written by a word transfer instruction. It cannot be written by byte transfer instructions. Figure 10-3 shows the format of data written to RSTCSR. To write 0 in the WRST bit, the write data must have H'A5 in the upper byte and H'00 in the lower byte. The H'00 in the lower byte clears the WRST bit in RSTCSR to 0. To write to the RSTOE bit, the upper byte must contain H'5A and the lower byte must contain the write data. Writing this word transfers a write data value into the RSTOE bit.
Figure 10-3   Format of Data Written to RSTCSR

Reading TCNT, TCSR, and RSTCSR: These registers are read like other registers. Byte access instructions can be used. The read addresses are H'FFA8 for TCSR, H'FFA9 for TCNT, and H'FFAB for RSTCSR, as listed in table 10-3.

Table 10-3   Read Addresses of TCNT, TCSR, and RSTCSR

Address*	Register
H'FFA8	TCSR
H'FFA9	TCNT
H'FFAB	RSTCSR

Note: * Lower 16 bits of the address.

10.3 Operation

Operations when the WDT is used as a watchdog timer and as an interval timer are described below.

10.3.1 Watchdog Timer Operation

Figure 10-4 illustrates watchdog timer operation. To use the WDT as a watchdog timer, set the WT/$\overline{\text{IT}}$ and TME bits to 1 in TCSR. Software must prevent TCNT overflow by rewriting the TCNT value (normally by writing H'00) before overflow occurs. If TCNT fails to be rewritten and overflows due to a system crash etc., the H8/3032 Series is internally reset for a duration of 518 states.

The watchdog reset signal can be externally output from the $\overline{\text{RESO}}$ pin to reset external system devices. The reset signal is output externally for 132 states. External output can be enabled or disabled by the RSTOE bit in RSTCSR.

A watchdog reset has the same vector as a reset generated by input at the $\overline{\text{RES}}$ pin. Software can distinguish a $\overline{\text{RES}}$ reset from a watchdog reset by checking the WRST bit in RSTCSR.

If a $\overline{\text{RES}}$ reset and a watchdog reset occur simultaneously, the $\overline{\text{RES}}$ reset takes priority.
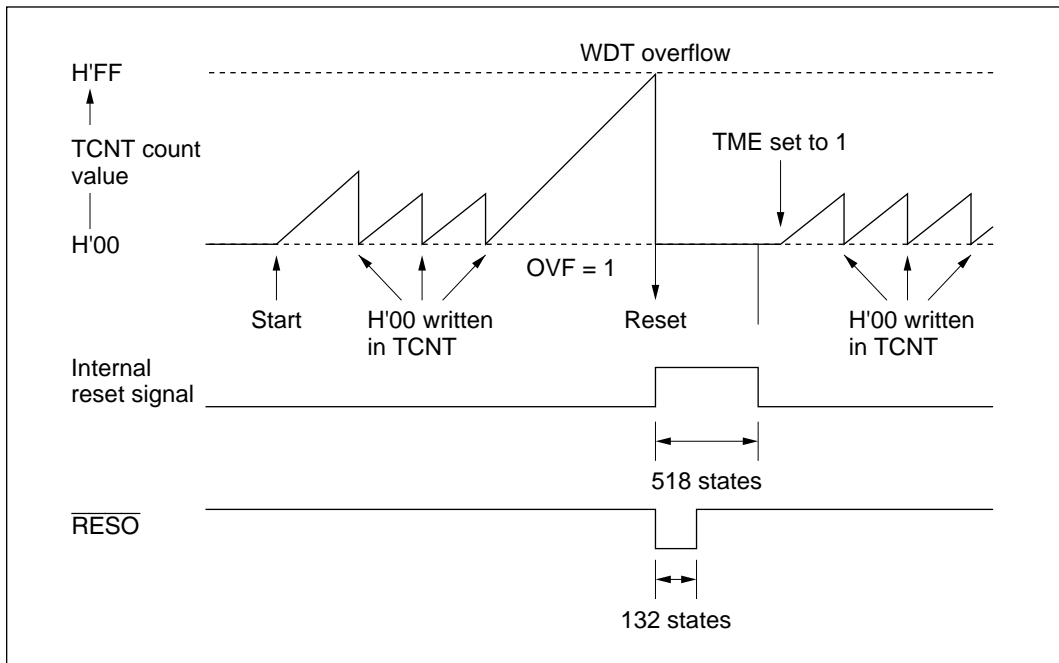

Figure 10-4 Watchdog Timer Operation

305

10.3.2 Interval Timer Operation

Figure 10-5 illustrates interval timer operation. To use the WDT as an interval timer, clear bit WT/$\overline{\text{IT}}$ to 0 and set bit TME to 1 in TCSR. An interval timer interrupt request is generated at each TCNT overflow. This function can be used to generate interval timer interrupts at regular intervals.
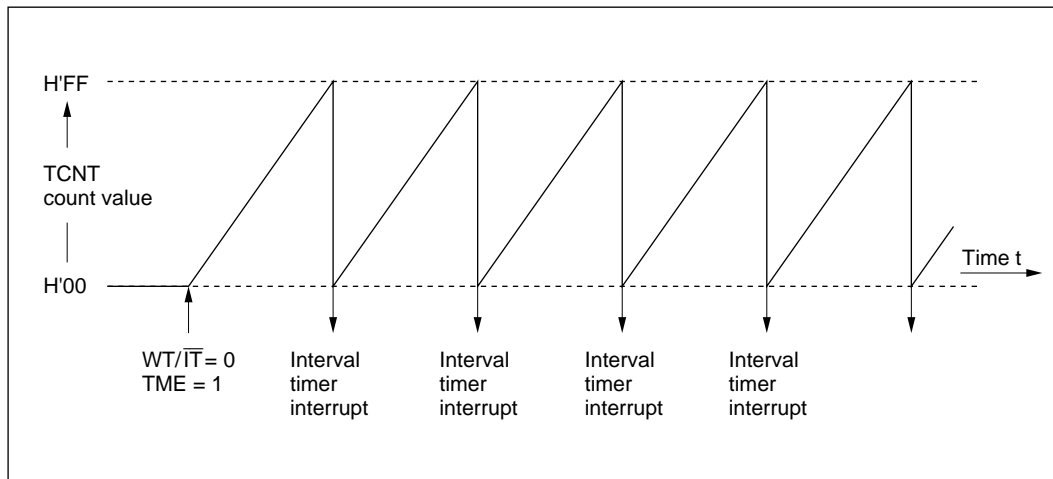

Figure 10-5   Interval Timer Operation

10.3.3 Timing of Setting of Overflow Flag (OVF)

Figure 10-6 shows the timing of setting of the OVF flag in TCSR. The OVF flag is set to 1 when TCNT overflows. At the same time, a reset signal is generated in watchdog timer operation, or an interval timer interrupt is generated in interval timer operation.
Figure 10-6   Timing of Setting of OVF

10.3.4 Timing of Setting of Watchdog Timer Reset Bit (WRST)

The WRST bit in RSTCSR is valid when bits WT/$\overline{\text{IT}}$ and TME are both set to 1 in TCSR.
Figure 10-7 shows the timing of setting of WRST and the internal reset timing. The WRST bit is
set to 1 when TCNT overflows and OVF is set to 1. At the same time an internal reset signal is
generated for the entire H8/3032 Series chip. This internal reset signal clears OVF to 0, but the
WRST bit remains set to 1. The reset routine must therefore clear the WRST bit.
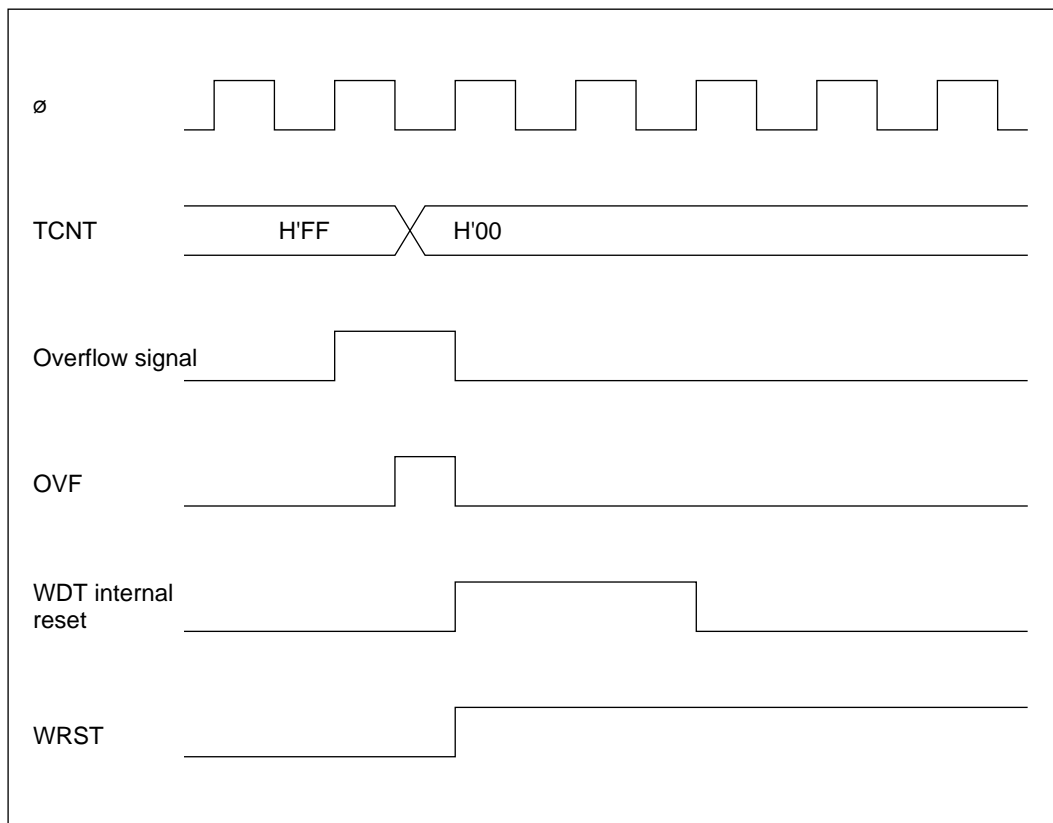

Figure 10-7   Timing of Setting of WRST Bit and Internal Reset

10.4 Interrupts

During interval timer operation, an overflow generates an interval timer interrupt (WOVI). The interval timer interrupt is requested whenever the OVF bit is set to 1 in TCSR.

10.5 Usage Notes

Contention between TCNT Write and Increment: If a timer counter clock pulse is generated during the T_3 state of a write cycle to TCNT, the write takes priority and the timer count is not incremented. See figure 10-8.
Figure 10-8   Contention between TCNT Write and Increment

Changing CKS2 to CKS0 Values: Halt TCNT by clearing the TME bit to 0 in TCSR before changing the values of bits CKS2 to CKS0.

Section 11   Serial Communication Interface

11.1 Overview

The H8/3032 Series has a serial communication interface (SCI). The SCI can communicate in asynchronous mode or synchronous mode, and has a multiprocessor communication function for serial communication among two or more processors.

11.1.1 Features

SCI features are listed below.

• Selection of asynchronous or synchronous mode for serial communication

a. Asynchronous mode

Serial data communication is synchronized one character at a time. The SCI can communicate with a universal asynchronous receiver/transmitter (UART), asynchronous communication interface adapter (ACIA), or other chip that employs standard asynchronous serial communication. It can also communicate with two or more other processors using the multiprocessor communication function. There are twelve selectable serial data communication formats.

— Data length:	7 or 8 bits
— Stop bit length:	1 or 2 bits
— Parity bit:	even, odd, or none
— Multiprocessor bit:	1 or 0
— Receive error detection:	parity, overrun, and framing errors
— Break detection:	by reading the RxD level directly when a framing error occurs

b. Synchronous mode

Serial data communication is synchronized with a clock signal. The SCI can communicate with other chips having a synchronous communication function. There is one serial data communication format.

— Data length:	8 bits
— Receive error detection:	overrun errors

- Full duplex communication

  The transmitting and receiving sections are independent, so the SCI can transmit and receive simultaneously. The transmitting and receiving sections are both double-buffered, so serial data can be transmitted and received continuously.

- Built-in baud rate generator with selectable bit rates

- Selectable transmit/receive clock sources: internal clock from baud rate generator, or external clock from the SCK pin.

- Four types of interrupts

  Transmit-data-empty, transmit-end, receive-data-full, and receive-error interrupts are requested independently.

11.1.2 Block Diagram

Figure 11-1 shows a block diagram of the SCI.
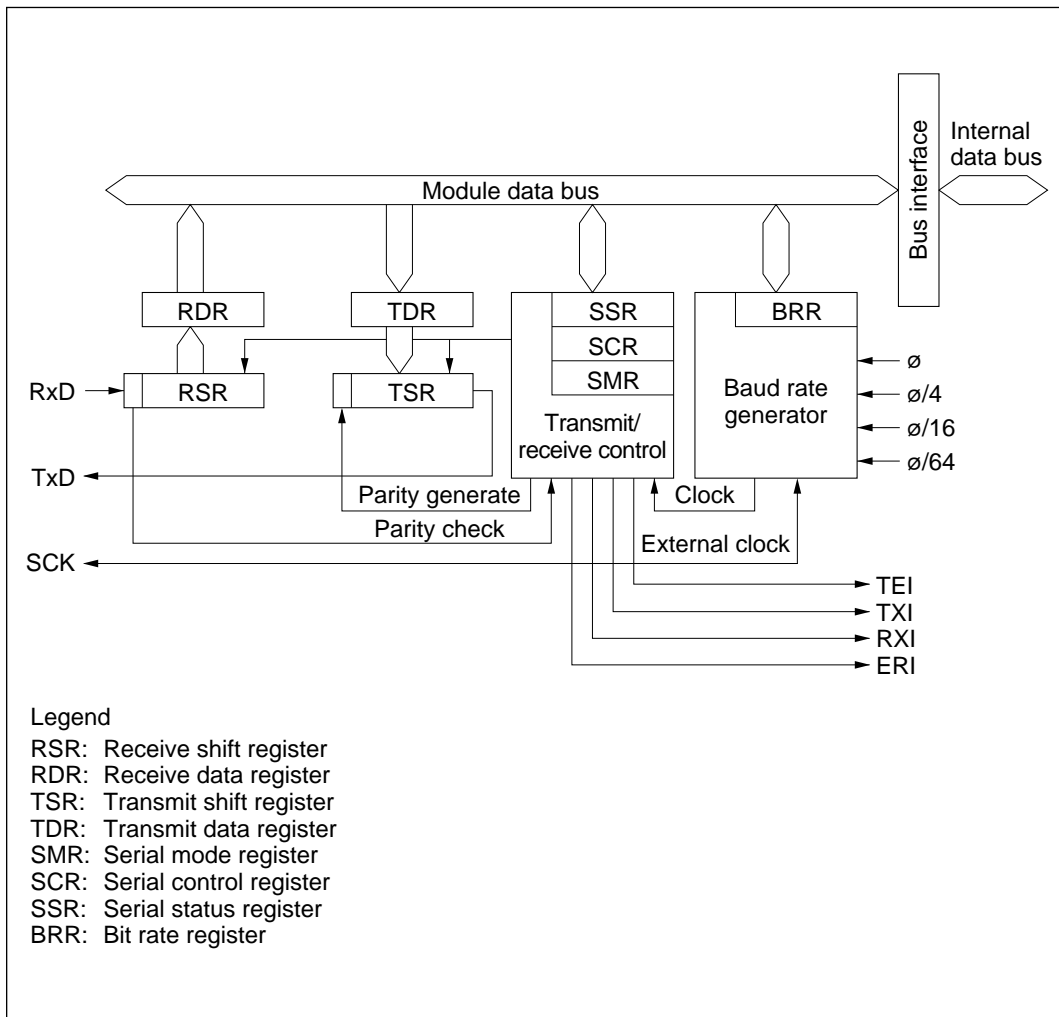

Figure 11-1   SCI Block Diagram

11.1.3 Input/Output Pins

The SCI has serial pins for each channel as listed in table 11-1.

Table 11-1 SCI Pins

Name	Abbreviation	I/O	Function
Serial clock pin	SCK	Input/output	SCI clock input/output
Receive data pin	RxD	Input	SCI receive data input
Transmit data pin	TxD	Output	SCI transmit data output

11.1.4 Register Configuration

The SCI has internal registers as listed in table 11-2. These registers select asynchronous or synchronous mode, specify the data format and bit rate, and control the transmitter and receiver sections.

Table 11-2 Registers

Channel	Address[1]	Name	Abbreviation	R/W	Initial Value
0	H'FFB0	Serial mode register	SMR	R/W	H'00
	H'FFB1	Bit rate register	BRR	R/W	H'FF
	H'FFB2	Serial control register	SCR	R/W	H'00
	H'FFB3	Transmit data register	TDR	R/W	H'FF
	H'FFB4	Serial status register	SSR	R/(W)[2]	H'84
	H'FFB5	Receive data register	RDR	R	H'00
1	H'FFB8	Serial mode register	SMR	R/W	H'00
	H'FFB9	Bit rate register	BRR	R/W	H'FF
	H'FFBA	Serial control register	SCR	R/W	H'00
	H'FFBB	Transmit data register	TDR	R/W	H'FF
	H'FFBC	Serial status register	SSR	R/(W)[2]	H'84
	H'FFBD	Receive data register	RDR	R	H'00

Notes: 1. Lower 16 bits of the address.
2. Only 0 can be written, to clear flags.

314

11.2 Register Descriptions

11.2.1 Receive Shift Register (RSR)

RSR is the register that receives serial data.

Bit	7	6	5	4	3	2	1	0
Initial value								
Read/Write	—	—	—	—	—	—	—	—

The SCI loads serial data input at the RxD pin into RSR in the order received, LSB (bit 0) first, thereby converting the data to parallel data. When 1 byte has been received, it is automatically transferred to RDR. The CPU cannot read or write RSR directly.

11.2.2 Receive Data Register (RDR)

RDR is the register that stores received serial data.

Bit	7	6	5	4	3	2	1	0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R	R	R	R	R	R	R	R

When the SCI finishes receiving 1 byte of serial data, it transfers the received data from RSR into RDR for storage. RSR is then ready to receive the next data. This double buffering allows data to be received continuously.

RDR is a read-only register. Its contents cannot be modified by the CPU. RDR is initialized to H'00 by a reset and in standby mode.

11.2.3 Transmit Shift Register (TSR)

TSR is the register that transmits serial data.

Bit	7	6	5	4	3	2	1	0
Initial value								
Read/Write	—	—	—	—	—	—	—	—

The SCI loads transmit data from TDR into TSR, then transmits the data serially from the TxD pin, LSB (bit 0) first. After transmitting one data byte, the SCI automatically loads the next transmit data from TDR into TSR and starts transmitting it. If the TDRE flag is set to 1 in SSR, however, the SCI does not load the TDR contents into TSR. The CPU cannot read or write TSR directly.

11.2.4 Transmit Data Register (TDR)

TDR is an 8-bit register that stores data for serial transmission.

Bit	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

When the SCI detects that TSR is empty, it moves transmit data written in TDR from TDR into TSR and starts serial transmission. Continuous serial transmission is possible by writing the next transmit data in TDR during serial transmission from TSR.

The CPU can always read and write TDR. TDR is initialized to H'FF by a reset and in standby mode.

11.2.5 Serial Mode Register (SMR)

SMR is an 8-bit register that specifies the SCI serial communication format and selects the clock source for the baud rate generator.

Bit	7	6	5	4	3	2	1	0
	$C/\overline{A}$	CHR	PE	$O/\overline{E}$	STOP	MP	CKS1	CKS0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Clock select 1/0
These bits select the baud rate generator's clock source

Multiprocessor mode
Selects the multiprocessor function

Stop bit length
Selects the stop bit length

Parity mode
Selects even or odd parity

Parity enable
Selects whether a parity bit is added

Character length
Selects character length in asynchronous mode

Communication mode
Selects asynchronous or synchronous mode

The CPU can always read and write SMR. SMR is initialized to H'00 by a reset and in standby mode.

Bit 7—Communication Mode (C/$\overline{\text{A}}$): Selects whether the SCI operates in asynchronous or synchronous mode.

Bit 7 C/$\overline{\text{A}}$	Description	
0	Asynchronous mode	(Initial value)
1	Synchronous mode	

Bit 6—Character Length (CHR): Selects 7-bit or 8-bit data length in asynchronous mode. In synchronous mode the data length is 8 bits regardless of the CHR setting.

Bit 6 CHR	Description	
0	8-bit data	(Initial value)
1	7-bit data*	

Note: * When 7-bit data is selected, the MSB (bit 7) in TDR is not transmitted.

Bit 5—Parity Enable (PE): In asynchronous mode, this bit enables or disables the addition of a parity bit to transmit data, and the checking of the parity bit in receive data. In synchronous mode the parity bit is neither added nor checked, regardless of the PE setting.

Bit 5 PE	Description	
0	Parity bit not added or checked	(Initial value)
1	Parity bit added and checked*	

Note: * When PE is set to 1, an even or odd parity bit is added to transmit data according to the even or odd parity mode selected by the O/$\overline{\text{E}}$ bit, and the parity bit in receive data is checked to see that it matches the even or odd mode selected by the O/$\overline{\text{E}}$ bit.

Bit 4—Parity Mode (O/$\overline{\text{E}}$): Selects even or odd parity. The O/$\overline{\text{E}}$ bit setting is valid in asynchronous mode when the PE bit is set to 1 to enable the adding and checking of a parity bit. The O/$\overline{\text{E}}$ setting is ignored in synchronous mode, or when parity adding and checking is disabled in asynchronous mode.

Bit 4 O/$\overline{\text{E}}$	Description	
0	Even parity[1]	(Initial value)
1	Odd parity[2]	

Notes: 1. When even parity is selected, the parity bit added to transmit data makes an even number of 1s in the transmitted character and parity bit combined. Receive data must have an even number of 1s in the received character and parity bit combined.
2. When odd parity is selected, the parity bit added to transmit data makes an odd number of 1s in the transmitted character and parity bit combined. Receive data must have an odd number of 1s in the received character and parity bit combined.

Bit 3—Stop Bit Length (STOP): Selects one or two stop bits in asynchronous mode. This setting is used only in asynchronous mode. In synchronous mode no stop bit is added, so the STOP bit setting is ignored.

Bit 3 STOP	Description	
0	One stop bit[1]	(Initial value)
1	Two stop bits[2]	

Notes: 1. One stop bit (with value 1) is added at the end of each transmitted character.
2. Two stop bits (with value 1) are added at the end of each transmitted character.

In receiving, only the first stop bit is checked, regardless of the STOP bit setting. If the second stop bit is 1 it is treated as a stop bit. If the second stop bit is 0 it is treated as the start bit of the next incoming character.

Bit 2—Multiprocessor Mode (MP): Selects a multiprocessor format. When a multiprocessor format is selected, parity settings made by the PE and O/$\overline{E}$ bits are ignored. The MP bit setting is valid only in asynchronous mode. It is ignored in synchronous mode.

For further information on the multiprocessor communication function, see section 11.3.3, Multiprocessor Communication Function.

Bit 2 MP	Description	
0	Multiprocessor function disabled	(Initial value)
1	Multiprocessor format selected	

Bits 1 and 0—Clock Select 1 and 0 (CKS1/0): These bits select the clock source of the on-chip baud rate generator. Four clock sources are available: ø, ø/4, ø/16, and ø/64.

For the relationship between the clock source, bit rate register setting, and baud rate, see section 11.2.8, Bit Rate Register.

Bit 1 CKS1	Bit 0 CKS0	Description	
0	0	ø	(Initial value)
0	1	ø/4	
1	0	ø/16	
1	1	ø/64	

11.2.6 Serial Control Register (SCR)

SCR enables the SCI transmitter and receiver, enables or disables serial clock output in asynchronous mode, enables or disables interrupts, and selects the transmit/receive clock source.

Bit	7	6	5	4	3	2	1	0
	TIE	RIE	TE	RE	MPIE	TEIE	CKE1	CKE0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Clock enable 1/0
These bits select the SCI clock source

Transmit end interrupt enable
Enables or disables transmit-end interrupts (TEI)

Multiprocessor interrupt enable
Enables or disables multiprocessor interrupts

Receive enable
Enables or disables the receiver

Transmit enable
Enables or disables the transmitter

Receive interrupt enable
Enables or disables receive-data-full interrupts (RXI) and receive-error interrupts (ERI)

Transmit interrupt enable
Enables or disables transmit-data-empty interrupts (TXI)

The CPU can always read and write SCR. SCR is initialized to H'00 by a reset and in standby mode.

Bit 7—Transmit Interrupt Enable (TIE): Enables or disables the transmit-data-empty interrupt (TXI) requested when the TDRE flag in SSR is set to 1 due to transfer of serial transmit data from TDR to TSR.

Bit 7 TIE	Description	
0	Transmit-data-empty interrupt request (TXI) is disabled*	(Initial value)
1	Transmit-data-empty interrupt request (TXI) is enabled	

Note: * TXI interrupt requests can be cleared by reading the value 1 from the TDRE flag, then clearing it to 0; or by clearing the TIE bit to 0.

Bit 6—Receive Interrupt Enable (RIE): Enables or disables the receive-data-full interrupt (RXI) requested when the RDRF flag is set to 1 in SSR due to transfer of serial receive data from RSR to RDR; also enables or disables the receive-error interrupt (ERI).

Bit 6 RIE	Description
0	Receive-end (RXI) and receive-error (ERI) interrupt requests are disabled (Initial value)
1	Receive-end (RXI) and receive-error (ERI) interrupt requests are enabled

Note: * RXI and ERI interrupt requests can be cleared by reading the value 1 from the RDRF, FER, PER, or ORER flag, then clearing it to 0; or by clearing the RIE bit to 0.

Bit 5—Transmit Enable (TE): Enables or disables the start of SCI serial transmitting operations.

Bit 5 TE	Description	
0	Transmitting disabled[1]	(Initial value)
1	Transmitting enabled[2]	

Notes: 1. The TDRE bit is locked at 1 in SSR.
      2. In the enabled state, serial transmitting starts when the TDRE bit in SSR is cleared to 0 after writing of transmit data into TDR. Select the transmit format in SMR before setting the TE bit to 1.

Bit 4—Receive Enable (RE): Enables or disables the start of SCI serial receiving operations.

Bit 4 RE	Description	
0	Receiving disabled*1	(Initial value)
1	Receiving enabled*2	

Notes: 1. Clearing the RE bit to 0 does not affect the RDRF, FER, PER, and ORER flags. These flags retain their previous values.
2. In the enabled state, serial receiving starts when a start bit is detected in asynchronous mode, or serial clock input is detected in synchronous mode. Select the receive format in SMR before setting the RE bit to 1.

Bit 3—Multiprocessor Interrupt Enable (MPIE): Enables or disables multiprocessor interrupts. The MPIE setting is valid only in asynchronous mode, and only if the MP bit is set to 1 in SMR. The MPIE setting is ignored in synchronous mode or when the MP bit is cleared to 0.

Bit 3 MPIE	Description	
0	Multiprocessor interrupts are disabled (normal receive operation) [Clearing conditions] The MPIE bit is cleared to 0. MPB = 1 in received data.	(Initial value)
1	Multiprocessor interrupts are enabled* Receive-data-full interrupts (RXI), receive-error interrupts (ERI), and setting of the RDRF, FER, and ORER status flags in SSR are disabled until data with the multiprocessor bit set to 1 is received.	

Note: * The SCI does not transfer receive data from RSR to RDR, does not detect receive errors, and does not set the RDRF, FER, and ORER flags in SSR. When it receives data in which MPB = 1, the SCI sets the MPB bit to 1 in SSR, automatically clears the MPIE bit to 0, enables RXI and ERI interrupts (if the RIE bit is set to 1 in SCR), and allows the FER and ORER flags to be set.

Bit 2—Transmit-End Interrupt Enable (TEIE): Enables or disables the transmit-end interrupt (TEI) requested if TDR does not contain new transmit data when the MSB is transmitted.

Bit 2 TEIE	Description	
0	Transmit-end interrupt requests (TEI) are disabled*	(Initial value)
1	Transmit-end interrupt requests (TEI) are enabled*	

Note: * TEI interrupt requests can be cleared by reading the value 1 from the TDRE flag in SSR, then clearing the TDRE flag to 0, thereby also clearing the TEND flag to 0; or by clearing the TEIE bit to 0.

Bits 1 and 0—Clock Enable 1 and 0 (CKE1/0): These bits select the SCI clock source and enable or disable clock output from the SCK pin. Depending on the settings of CKE1 and CKE0, the SCK pin can be used for generic input/output, serial clock output, or serial clock input.

The CKE0 setting is valid only in asynchronous mode, and only when the SCI is internally clocked (CKE1 = 0). The CKE0 setting is ignored in synchronous mode, or when an external clock source is selected (CKE1 = 1). Select the SCI operating mode in SMR before setting the CKE1 and CKE0 bits. For further details on selection of the SCI clock source, see table 11-9 in section 11.3, Operation.

Bit 1 CKE1	Bit 0 CKE0	Description	
0	0	Asynchronous mode	Internal clock, SCK pin available for generic input/output [1]
		Synchronous mode	Internal clock, SCK pin used for serial clock output [1]
0	1	Asynchronous mode	Internal clock, SCK pin used for clock output [2]
		Synchronous mode	Internal clock, SCK pin used for serial clock output
1	0	Asynchronous mode	External clock, SCK pin used for clock input [3]
		Synchronous mode	External clock, SCK pin used for serial clock input
1	1	Asynchronous mode	External clock, SCK pin used for clock input [3]
		Synchronous mode	External clock, SCK pin used for serial clock input

Notes: 1. Initial value
2. The output clock frequency is the same as the bit rate.
3. The input clock frequency is 16 times the bit rate.

11.2.7 Serial Status Register (SSR)

SSR is an 8-bit register containing multiprocessor bit values, and status flags that indicate SCI operating status.

Bit	7	6	5	4	3	2	1	0
	TDRE	RDRF	ORER	FER	PER	TEND	MPB	MPBT
Initial value	1	0	0	0	0	1	0	0
Read/Write	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R	R	R/W

Multiprocessor bit transfer
Value of multi-processor bit to be transmitted

Multiprocessor bit
Stores the received multiprocessor bit value

Transmit end
Status flag indicating end of transmission

Parity error
Status flag indicating detection of a receive parity error

Framing error
Status flag indicating detection of a receive framing error

Overrun error
Status flag indicating detection of a receive overrun error

Receive data register full
Status flag indicating that data has been received and stored in RDR

Transmit data register empty
Status flag indicating that transmit data has been transferred from TDR into TSR and new data can be written in TDR

Note: * Only 0 can be written, to clear the flag.

The CPU can always read and write SSR, but cannot write 1 in the TDRE, RDRF, ORER, PER, and FER flags. These flags can be cleared to 0 only if they have first been read while set to 1. The TEND and MPB flags are read-only bits that cannot be written.

SSR is initialized to H'84 by a reset and in standby mode.

Bit 7—Transmit Data Register Empty (TDRE): Indicates that the SCI has loaded transmit data from TDR into TSR and the next serial transmit data can be written in TDR.

Bit 7 TDRE	Description	
0	TDR contains valid transmit data [Clearing conditions] Software reads TDRE while it is set to 1, then writes 0.	
1	TDR does not contain valid transmit data [Setting conditions] The chip is reset or enters standby mode. The TE bit in SCR is cleared to 0. TDR contents are loaded into TSR, so new data can be written in TDR.	(Initial value)

Bit 6—Receive Data Register Full (RDRF): Indicates that RDR contains new receive data.

Bit 6 RDRF	Description	
0	RDR does not contain new receive data [Clearing conditions] The chip is reset or enters standby mode. Software reads RDRF while it is set to 1, then writes 0. The DMAC reads data from RDR.	(Initial value)
1	RDR contains new receive data [Setting condition] When serial data is received normally and transferred from RSR to RDR.	

Note: The RDR contents and RDRF flag are not affected by detection of receive errors or by clearing of the RE bit to 0 in SCR. They retain their previous values. If the RDRF flag is still set to 1 when reception of the next data ends, an overrun error occurs and receive data is lost.

Bit 5—Overrun Error (ORER): Indicates that data reception ended abnormally due to an overrun error.

Bit 5 ORER	Description	
0	Receiving is in progress or has ended normally [Clearing conditions] The chip is reset or enters standby mode. Software reads ORER while it is set to 1, then writes 0.	(Initial value)[1]
1	A receive overrun error occurred[2] [Setting condition] Reception of the next serial data ends when RDRF = 1.	

Notes: 1. Clearing the RE bit to 0 in SCR does not affect the ORER flag, which retains its previous value.
2. RDR continues to hold the receive data before the overrun error, so subsequent receive data is lost. Serial receiving cannot continue while the ORER flag is set to 1. In synchronous mode, serial transmitting is also disabled.

Bit 4—Framing Error (FER): Indicates that data reception ended abnormally due to a framing error in asynchronous mode.

Bit 4 FER	Description	
0	Receiving is in progress or has ended normally [Clearing conditions] The chip is reset or enters standby mode. Software reads FER while it is set to 1, then writes 0.	(Initial value)[1]
1	A receive framing error occurred[2] [Setting condition] The stop bit at the end of receive data is checked and found to be 0.	

Notes: 1. Clearing the RE bit to 0 in SCR does not affect the FER flag, which retains its previous value.
2. When the stop bit length is 2 bits, only the first bit is checked. The second stop bit is not checked. When a framing error occurs the SCI transfers the receive data into RDR but does not set the RDRF flag. Serial receiving cannot continue while the FER flag is set to 1. In synchronous mode, serial transmitting is also disabled.

Bit 3—Parity Error (PER): Indicates that data reception ended abnormally due to a parity error in asynchronous mode.

Bit 3 PER	Description	
0	Receiving is in progress or has ended normally[*1] [Clearing conditions] The chip is reset or enters standby mode. Software reads PER while it is set to 1, then writes 0.	(Initial value)
1	A receive parity error occurred[*2] [Setting condition] The number of 1s in receive data, including the parity bit, does not match the even or odd parity setting of O/$\overline{E}$ in SMR.	

Notes: 1. Clearing the RE bit to 0 in SCR does not affect the PER flag, which retains its previous value.
2. When a parity error occurs the SCI transfers the receive data into RDR but does not set the RDRF flag. Serial receiving cannot continue while the PER flag is set to 1. In synchronous mode, serial transmitting is also disabled.

Bit 2—Transmit End (TEND): Indicates that when the last bit of a serial character was transmitted TDR did not contain new transmit data, so transmission has ended. The TEND flag is a read-only bit and cannot be written.

Bit 2 TEND	Description	
0	Transmission is in progress [Clearing conditions] Software reads TDRE while it is set to 1, then writes 0 in the TDRE flag.	
1	End of transmission [Setting conditions] The chip is reset or enters standby mode. The TE bit is cleared to 0 in SCR. TDRE is 1 when the last bit of a serial character is transmitted.	(Initial value)

Bit 1—Multiprocessor Bit (MPB): Stores the value of the multiprocessor bit in receive data when a multiprocessor format is used in asynchronous mode. MPB is a read-only bit and cannot be written.

Bit 1 MPB	Description	
0	Multiprocessor bit value in receive data is 0*	(Initial value)
1	Multiprocessor bit value in receive data is 1	

Note: * If the RE bit is cleared to 0 when a multiprocessor format is selected, MPB retains its previous value.

Bit 0—Multiprocessor Bit Transfer (MPBT): Stores the value of the multiprocessor bit added to transmit data when a multiprocessor format is selected for transmitting in asynchronous mode. The MPBT setting is ignored in synchronous mode, when a multiprocessor format is not selected, or when the SCI is not transmitting.

Bit 0 MPBT	Description	
0	Multiprocessor bit value in transmit data is 0	(Initial value)
1	Multiprocessor bit value in transmit data is 1	

11.2.8 Bit Rate Register (BRR)

BRR is an 8-bit register that, together with the CKS1 and CKS0 bits in SMR that select the baud rate generator clock source, determines the serial communication bit rate.

Bit	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The CPU can always read and write BRR. BRR is initialized to H'FF by a reset and in standby mode. The two SCI channels have independent baud rate generator control, so different values can be set in the two channels.

Table 11-3 shows examples of BRR settings in asynchronous mode. Table 11-4 shows examples of BRR settings in synchronous mode.

Table 11-3   Examples of Bit Rates and BRR Settings in Asynchronous Mode

Bit Rate (bits/s)	ø (MHz)

Table 11-4   Examples of Bit Rates and BRR Settings in Synchronous Mode

Bit Rate (bits/s)	ø (MHz)									
	2		4		8		10		16	
	n	N	n	N	n	N	n	N	n	N
110	3	70	—	—	—	—	—	—	—	—
250	2	124	2	249	3	124	—	—	3	249
500	1	249	2	124	2	249	—	—	3	124
1 k	1	124	1	249	2	124	—	—	2	249
2.5 k	0	199	1	99	1	199	1	249	2	99
5 k	0	99	0	199	1	99	1	124	1	199
10 k	0	49	0	99	0	199	0	249	1	99
25 k	0	19	0	39	0	79	0	99	0	159
50 k	0	9	0	19	0	39	0	49	0	79
100 k	0	4	0	9	0	19	0	24	0	39
250 k	0	1	0	3	0	7	0	9	0	15
500 k	0	0*	0	1	0	3	0	4	0	7
1 M			0	0*	0	1	—	—	0	3
2 M					0	0*	—	—	0	1
2.5 M					—	—	0	0*	—	—
4 M									0	0*

Note: Settings with an error of 1% or less are recommended.
Legend
Blank: No setting available
—:   Setting possible, but error occurs
*:   Continuous transmit/receive not possible

The BRR setting is calculated as follows:

Asynchronous mode:

$$N = \frac{ø}{64 \times 2^{2n-1} \times B} \times 10^6 - 1$$

Synchronous mode:

$$N = \frac{ø}{8 \times 2^{2n-1} \times B} \times 10^6 - 1$$

B: Bit rate (bits/s)
N: BRR setting for baud rate generator ($0 \leq N \leq 255$)
ø: System clock frequency (MHz)
n: Baud rate generator clock source (n = 0, 1, 2, 3)
    (For the clock sources and values of n, see the table below.)

333

| n | Clock Source | SMR Settings | |
		CKS1	CKS0
0	ø	0	0
1	ø/4	0	1
2	ø/16	1	0
3	ø/64	1	1

The bit rate error in asynchronous mode is calculated as follows.

$$\text{Error (\%)} = \left\{ \frac{\text{ø} \times 10^6}{(N + 1) \times B \times 64 \times 2^{2n-1}} - 1 \right\} \times 100$$

Table 11-5 indicates the maximum bit rates in asynchronous mode for various system clock frequencies. Tables 11-6 and 11-7 indicate the maximum bit rates with external clock input.

11.3 Operation

11.3.1 Overview

The SCI has an asynchronous mode in which characters are synchronized individually, and a synchronous mode in which communication is synchronized with clock pulses. Serial communication is possible in either mode. Asynchronous or synchronous mode and the communication format are selected in SMR, as shown in table 11-8. The SCI clock source is selected by the $C/\overline{A}$ bit in SMR and the CKE1 and CKE0 bits in SCR, as shown in table 11-9.

Asynchronous Mode

- Data length is selectable: 7 or 8 bits.

- Parity and multiprocessor bits are selectable. So is the stop bit length (1 or 2 bits). These selections determine the communication format and character length.

- In receiving, it is possible to detect framing errors, parity errors, overrun errors, and the break state.

- An internal or external clock can be selected as the SCI clock source.

    — When an internal clock is selected, the SCI operates using the on-chip baud rate generator, and can output a serial clock signal with a frequency matching the bit rate.

    — When an external clock is selected, the external clock input must have a frequency 16 times the bit rate. (The on-chip baud rate generator is not used.)

Synchronous Mode

- The communication format has a fixed 8-bit data length.

- In receiving, it is possible to detect overrun errors.

- An internal or external clock can be selected as the SCI clock source.

    — When an internal clock is selected, the SCI operates using the on-chip baud rate generator, and outputs a serial clock signal to external devices.

    — When an external clock is selected, the SCI operates on the input serial clock. The on-chip baud rate generator is not used.

338

Table 11-8 SMR Settings and Serial Communication Formats

SMR Settings						SCI Communication Format			
Bit 7 C/$\overline{\text{A}}$	Bit 6 CHR	Bit 2 MP	Bit 5 PE	Bit 3 STOP	Mode	Data Length	Multi-processor Bit	Parity Bit	Stop Bit Length
0	0	0	0	0	Asynchronous mode	8-bit data	Absent	Absent	1 bit
0	0	0	0	1					2 bits
0	0	0	1	0				Present	1 bit
0	0	0	1	1					2 bits
0	1	0	0	0		7-bit data		Absent	1 bit
0	1	0	0	1					2 bits
0	1	0	1	0				Present	1 bit
0	1	0	1	1					2 bits
0	0	1	—	0	Asynchronous mode (multi-processor format)	8-bit data	Present	Absent	1 bit
0	0	1	—	1					2 bits
0	1	1	—	0		7-bit data			1 bit
0	1	1	—	1					2 bits
1	—	—	—	—	Synchronous mode	8-bit data	Absent		None

Table 11-9 SMR and SCR Settings and SCI Clock Source Selection

SMR	SCR Settings			SCI Transmit/Receive Clock	
Bit 7 C/$\overline{\text{A}}$	Bit 1 CKE1	Bit 0 CKE0	Mode	Clock Source	SCK Pin Function
0	0	0	Asynchronous mode	Internal	SCI does not use the SCK pin
0	0	1			Outputs a clock with frequency matching the bit rate
0	1	0		External	Inputs a clock with frequency 16 times the bit rate
0	1	1			
1	0	0	Synchronous mode	Internal	Outputs the serial clock
1	0	1			
1	1	0		External	Inputs the serial clock
1	1	1			

11.3.2 Operation in Asynchronous Mode

In asynchronous mode each transmitted or received character begins with a start bit and ends with a stop bit. Serial communication is synchronized one character at a time.

The transmitting and receiving sections of the SCI are independent, so full duplex communication is possible. The transmitter and receiver are both double buffered, so data can be written and read while transmitting and receiving are in progress, enabling continuous transmitting and receiving.

Figure 11-2 shows the general format of asynchronous serial communication. In asynchronous serial communication the communication line is normally held in the mark (high) state. The SCI monitors the line and starts serial communication when the line goes to the space (low) state, indicating a start bit. One serial character consists of a start bit (low), data (LSB first), parity bit (high or low), and stop bit (high), in that order.

When receiving in asynchronous mode, the SCI synchronizes at the falling edge of the start bit. The SCI samples each data bit on the eighth pulse of a clock with a frequency 16 times the bit rate. Receive data is latched at the center of each bit.
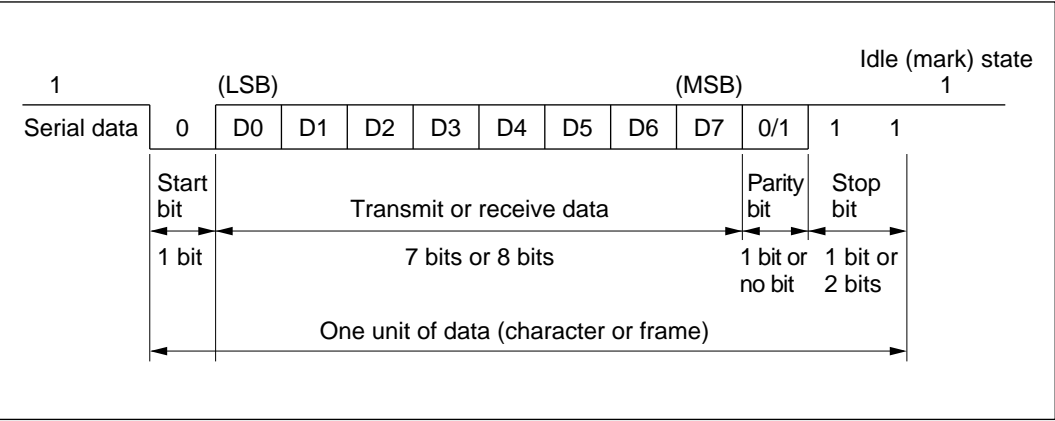

Figure 11-2 Data Format in Asynchronous Communication (Example: 8-Bit Data with Parity and 2 Stop Bits)

Communication Formats: Table 11-10 shows the 12 communication formats that can be selected in asynchronous mode. The format is selected by settings in SMR.

Table 11-10   Serial Communication Formats (Asynchronous Mode)

CHR	PE	MP	STOP	Serial Communication Format and Frame Length
0	0	0	0	S / 8-bit data / STOP
0	0	0	1	S / 8-bit data / STOP / STOP
0	1	0	0	S / 8-bit data / P / STOP
0	1	0	1	S / 8-bit data / P / STOP / STOP
1	0	0	0	S / 7-bit data / STOP
1	0	0	1	S / 7-bit data / STOP / STOP
1	1	0	0	S / 7-bit data / P / STOP
1	1	0	1	S / 7-bit data / P / STOP / STOP
0	—	1	0	S / 8 bit data / MPB / STOP
0	—	1	1	S / 8 bit data / MPB / STOP / STOP
1	—	1	0	S / 7-bit data / MPB / STOP
1	—	1	1	S / 7-bit data / MPB / STOP / STOP

(SMR Settings columns: CHR, PE, MP, STOP. Frame length positions 1–12.)

Legend
S: Start bit
STOP: Stop bit
P: Parity bit
MPB: Multiprocessor bit

Clock: An internal clock generated by the on-chip baud rate generator or an external clock input from the SCK pin can be selected as the SCI transmit/receive clock. The clock source is selected by the C/$\overline{A}$ bit in SMR and bits CKE1 and CKE0 in SCR. See table 11-9.

When an external clock is input at the SCK pin, it must have a frequency equal to 16 times the desired bit rate.

When the SCI operates on an internal clock, it can output a clock signal at the SCK pin. The frequency of this output clock is equal to the bit rate. The phase is aligned as in figure 11-3 so that the rising edge of the clock occurs at the center of each transmit data bit.
Figure 11-3   Phase Relationship between Output Clock and Serial Data (Asynchronous Mode)

Transmitting and Receiving Data

SCI Initialization (Asynchronous Mode): Before transmitting or receiving, clear the TE and RE bits to 0 in SCR, then initialize the SCI as follows.

When changing the communication mode or format, always clear the TE and RE bits to 0 before following the procedure given below. Clearing TE to 0 sets the TDRE flag to 1 and initializes TSR. Clearing RE to 0, however, does not initialize the RDRF, PER, FER, and ORER flags and RDR, which retain their previous contents.

When an external clock is used, the clock should not be stopped during initialization or subsequent operation. SCI operation becomes unreliable if the clock is stopped.

Figure 11-4 is a sample flowchart for initializing the SCI.
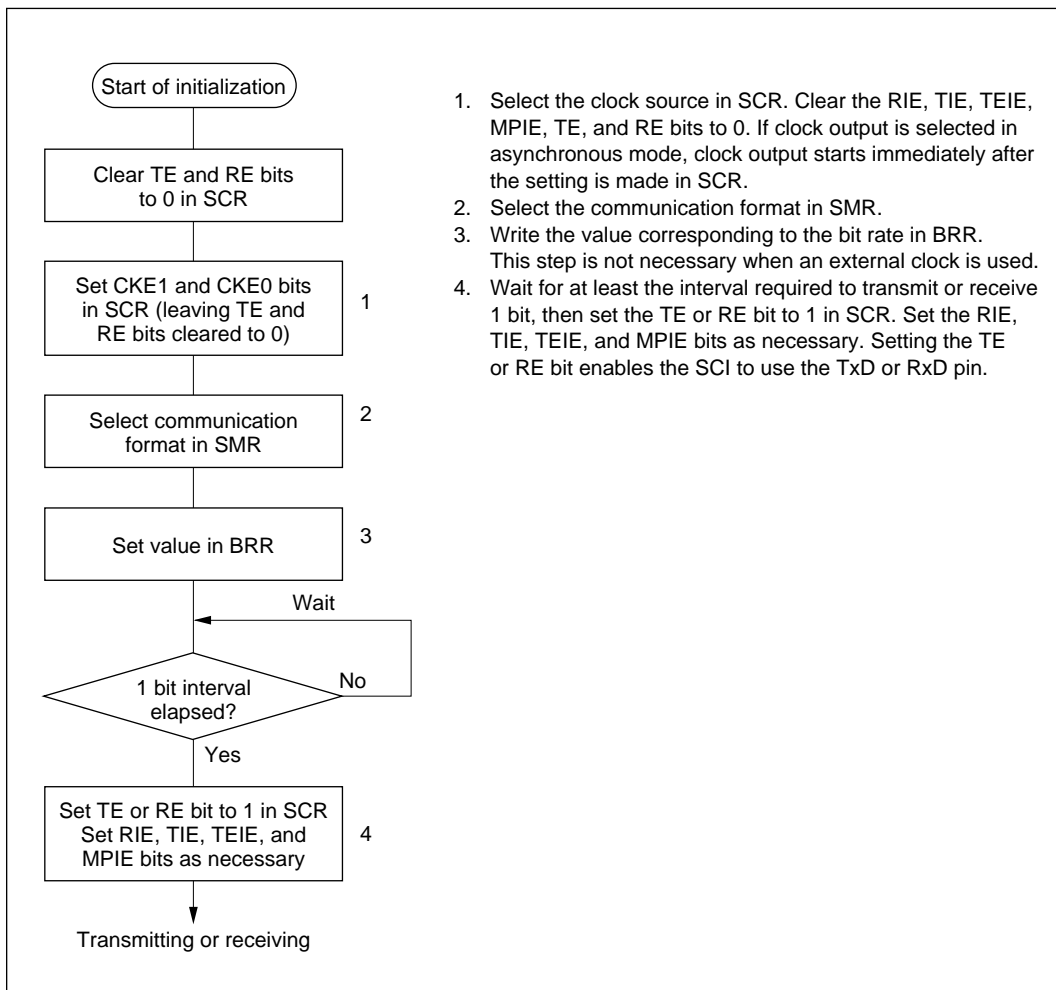

Figure 11-4   Sample Flowchart for SCI Initialization

The flowchart shows the following steps:

- Start of initialization
- Clear TE and RE bits to 0 in SCR
- Set CKE1 and CKE0 bits in SCR (leaving TE and RE bits cleared to 0) — 1
- Select communication format in SMR — 2
- Set value in BRR — 3
- Wait
- 1 bit interval elapsed? — No (loop back to Wait) / Yes
- Set TE or RE bit to 1 in SCR, Set RIE, TIE, TEIE, and MPIE bits as necessary — 4
- Transmitting or receiving

1. Select the clock source in SCR. Clear the RIE, TIE, TEIE, MPIE, TE, and RE bits to 0. If clock output is selected in asynchronous mode, clock output starts immediately after the setting is made in SCR.
2. Select the communication format in SMR.
3. Write the value corresponding to the bit rate in BRR. This step is not necessary when an external clock is used.
4. Wait for at least the interval required to transmit or receive 1 bit, then set the TE or RE bit to 1 in SCR. Set the RIE, TIE, TEIE, and MPIE bits as necessary. Setting the TE or RE bit enables the SCI to use the TxD or RxD pin.

343

Transmitting Serial Data (Asynchronous Mode): Figure 11-5 shows a sample flowchart for transmitting serial data and indicates the procedure to follow.

Figure 11-5 flowchart contents:

1 — Initialize → Start transmitting

2 — Read TDRE flag in SSR → TDRE = 1? (No loops back, Yes continues) → Write transmit data in TDR and clear TDRE flag to 0 in SSR

3 — All data transmitted? (No loops back, Yes continues) → Read TEND flag in SSR → TEND = 1? (No loops back, Yes continues)

4 — Output break signal? (No → End, Yes continues) → Clear DR bit to 0, set DDR bit to 1 → Clear TE bit to 0 in SCR → End

1. SCI initialization: the transmit data output function of the TxD pin is selected automatically.
2. SCI status check and transmit data write: read SSR, check that the TDRE flag is 1, then write transmit data in TDR and clear the TDRE flag to 0.
3. To continue transmitting serial data: after checking that the TDRE flag is 1, indicating that data can be written, write data in TDR, then clear the TDRE flag to 0.
4. To output a break signal at the end of serial transmission: set the DDR bit to 1 and clear the DR bit to 0 (DDR and DR are I/O port registers), then clear the TE bit to 0 in SCR.

Figure 11-5   Sample Flowchart for Transmitting Serial Data

344

In transmitting serial data, the SCI operates as follows.

- The SCI monitors the TDRE flag in SSR. When the TDRE flag is cleared to 0 the SCI recognizes that TDR contains new data, and loads this data from TDR into TSR.

- After loading the data from TDR into TSR, the SCI sets the TDRE flag to 1 and starts transmitting. If the TIE bit is set to 1 in SCR, the SCI requests a transmit-data-empty interrupt (TXI) at this time.

  Serial transmit data is transmitted in the following order from the TxD pin:

— Start bit:	One 0 bit is output.
— Transmit data:	7 or 8 bits are output, LSB first.
— Parity bit or multiprocessor bit:	One parity bit (even or odd parity) or one multiprocessor bit is output. Formats in which neither a parity bit nor a multiprocessor bit is output can also be selected.
— Stop bit:	One or two 1 bits (stop bits) are output.
— Mark state:	Output of 1 bits continues until the start bit of the next transmit data.

- The SCI checks the TDRE flag when it outputs the stop bit. If the TDRE flag is 0, the SCI loads new data from TDR into TSR, outputs the stop bit, then begins serial transmission of the next frame. If the TDRE flag is 1, the SCI sets the TEND flag to 1 in SSR, outputs the stop bit, then continues output of 1 bits in the mark state. If the TEIE bit is set to 1 in SCR, a transmit-end interrupt (TEI) is requested at this time.

Figure 11-6 shows an example of SCI transmit operation in asynchronous mode.
Figure 11-6   Example of SCI Transmit Operation in Asynchronous Mode
(8-Bit Data with Parity and 1 Stop Bit)

345

Receiving Serial Data (Asynchronous Mode): Figure 11-7 shows a sample flowchart for receiving serial data and indicates the procedure to follow.

The flowchart steps:

1. Initialize
2. Start receiving
3. Read ORER, PER, and FER flags in SSR (2)
4. PER ∨ RER ∨ ORER = 1? — Yes → Error handling (3) (continued on next page); No →
5. Read RDRF flag in SSR (4)
6. RDRF = 1? — No → loop back; Yes →
7. Read receive data from RDR, and clear RDRF flag to 0 in SSR
8. Finished receiving? (5) — No → loop back; Yes →
9. Clear RE bit to 0 in SCR
10. End

1. SCI initialization: the receive data function of the RxD pin is selected automatically.
2., 3. Receive error handling and break detection: if a receive error occurs, read the ORER, PER, and FER flags in SSR to identify the error. After executing the necessary error handling, clear the ORER, PER, and FER flags all to 0. Receiving cannot resume if any of the ORER, PER, and FER flags remains set to 1. When a framing error occurs, the RxD pin can be read to detect the break state.
4. SCI status check and receive data read: read SSR, check that RDRF is set to 1, then read receive data from RDR and clear the RDRF flag to 0. Notification that the RDRF flag has changed from 0 to 1 can also be given by the RXI interrupt.
5. To continue receiving serial data: check the RDRF flag, read RDR, and clear the RDRF flag to 0 before the stop bit of the current frame is received.

Figure 11-7   Sample Flowchart for Receiving Serial Data (1)

Figure 11-7   Sample Flowchart for Receiving Serial Data (2)

347

In receiving, the SCI operates as follows.

- The SCI monitors the receive data line. When it detects a start bit, the SCI synchronizes internally and starts receiving.

- Receive data is stored in RSR in order from LSB to MSB.

- The parity bit and stop bit are received.

After receiving, the SCI makes the following checks:

- — Parity check: The number of 1s in the receive data must match the even or odd parity setting of the O/$\overline{\text{E}}$ bit in SMR.
- — Stop bit check: The stop bit value must be 1. If there are two stop bits, only the first stop bit is checked.
- — Status check: The RDRF flag must be 0 so that receive data can be transferred from RSR into RDR.

If these checks all pass, the RDRF flag is set to 1 and the received data is stored in RDR. If one of the checks fails (receive error), the SCI operates as indicated in table 11-11.

Note: When a receive error occurs, further receiving is disabled. In receiving, the RDRF flag is not set to 1. Be sure to clear the error flags.

- When the RDRF flag is set to 1, if the RIE bit is set to 1 in SCR, a receive-data-full interrupt (RXI) is requested. If the ORER, PER, or FER flag is set to 1 and the RIE bit in SCR is also set to 1, a receive-error interrupt (ERI) is requested.

Table 11-11   Receive Error Conditions

Receive Error	Abbreviation	Condition	Data Transfer
Overrun error	ORER	Receiving of next data ends while RDRF flag is still set to 1 in SSR	Receive data not transferred from RSR to RDR
Framing error	FER	Stop bit is 0	Receive data transferred from RSR to RDR
Parity error	PER	Parity of receive data differs from even/odd parity setting in SMR	Receive data transferred from RSR to RDR

Figure 11-8 shows an example of SCI receive operation in asynchronous mode.
Figure 11-8 Example of SCI Receive Operation (8-Bit Data with Parity and One Stop Bit)

11.3.3 Multiprocessor Communication

The multiprocessor communication function enables several processors to share a single serial communication line. The processors communicate in asynchronous mode using a format with an additional multiprocessor bit (multiprocessor format).

In multiprocessor communication, each receiving processor is addressed by an ID. A serial communication cycle consists of an ID-sending cycle that identifies the receiving processor, and a data-sending cycle. The multiprocessor bit distinguishes ID-sending cycles from data-sending cycles.

The transmitting processor starts by sending the ID of the receiving processor with which it wants to communicate as data with the multiprocessor bit set to 1. Next the transmitting processor sends transmit data with the multiprocessor bit cleared to 0.

Receiving processors skip incoming data until they receive data with the multiprocessor bit set to 1. When they receive data with the multiprocessor bit set to 1, receiving processors compare the data with their IDs. The receiving processor with a matching ID continues to receive further incoming data. Processors with IDs not matching the received data skip further incoming data until they again receive data with the multiprocessor bit set to 1. Multiple processors can send and receive data in this way.

Figure 11-9 shows an example of communication among different processors using a multiprocessor format.

349

Communication Formats: Four formats are available. Parity-bit settings are ignored when a multiprocessor format is selected. For details see table 11-8.

Clock: See the description of asynchronous mode.
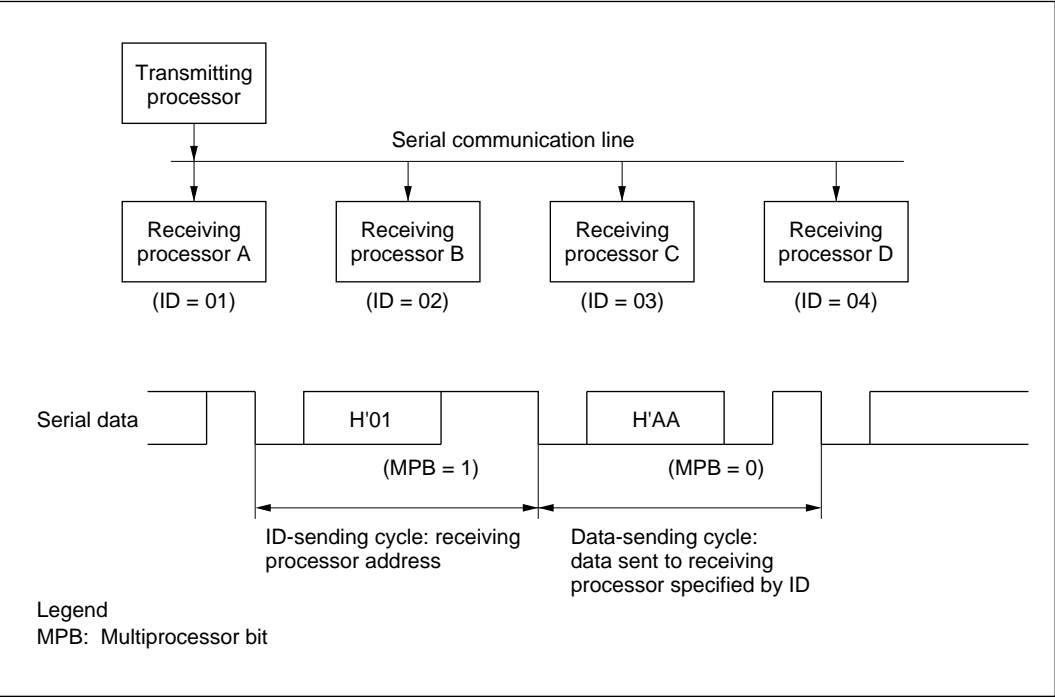

Figure 11-9   Example of Communication among Processors using Multiprocessor Format (Sending Data H'AA to Receiving Processor A)

Transmitting and Receiving Data

Transmitting Multiprocessor Serial Data: Figure 11-10 shows a sample flowchart for transmitting multiprocessor serial data and indicates the procedure to follow.

The following describes the numbered steps shown in the flowchart:

1. SCI initialization: the transmit data output function of the TxD pin is selected automatically.
2. SCI status check and transmit data write: read SSR, check that the TDRE flag is 1, then write transmit data in TDR. Also set the MPBT flag to 0 or 1 in SSR. Finally, clear the TDRE flag to 0.
3. To continue transmitting serial data: after checking that the TDRE flag is 1, indicating that data can be written, write data in TDR, then clear the TDRE flag to 0.
4. To output a break signal at the end of serial transmission: set the DDR bit to 1 and clear the DR bit to 0 (DDR and DR are I/O port registers), then clear the TE bit to 0 in SCR.

Flowchart boxes:
- Initialize (1)
- Start transmitting
- Read TDRE flag in SSR (2)
- TDRE = 1? — No / Yes
- Write transmit data in TDR and set MPBT bit in SSR
- Clear TDRE flag to 0
- All data transmitted? — No / Yes (3)
- Read TEND flag in SSR
- TEND = 1? — No / Yes
- Output break signal? — No / Yes (4)
- Clear DR bit to 0, set DDR bit to 1
- Clear TE bit to 0 in SCR
- End

Figure 11-10   Sample Flowchart for Transmitting Multiprocessor Serial Data

351

In transmitting serial data, the SCI operates as follows.

- The SCI monitors the TDRE flag in SSR. When the TDRE flag is cleared to 0 the SCI recognizes that TDR contains new data, and loads this data from TDR into TSR.

- After loading the data from TDR into TSR, the SCI sets the TDRE flag to 1 and starts transmitting. If the TIE bit in SCR is set to 1, the SCI requests a transmit-data-empty interrupt (TXI) at this time.

Serial transmit data is transmitted in the following order from the TxD pin:

— Start bit:	One 0 bit is output.
— Transmit data:	7 or 8 bits are output, LSB first.
— Multiprocessor bit:	One multiprocessor bit (MPBT value) is output.
— Stop bit:	One or two 1 bits (stop bits) are output.
— Mark state:	Output of 1 bits continues until the start bit of the next transmit data.

- The SCI checks the TDRE flag when it outputs the stop bit. If the TDRE flag is 0, the SCI loads data from TDR into TSR, outputs the stop bit, then begins serial transmission of the next frame. If the TDRE flag is 1, the SCI sets the TEND flag in SSR to 1, outputs the stop bit, then continues output of 1 bits in the mark state. If the TEIE bit is set to 1 in SCR, a transmit-end interrupt (TEI) is requested at this time.

Figure 11-11 shows an example of SCI transmit operation using a multiprocessor format.
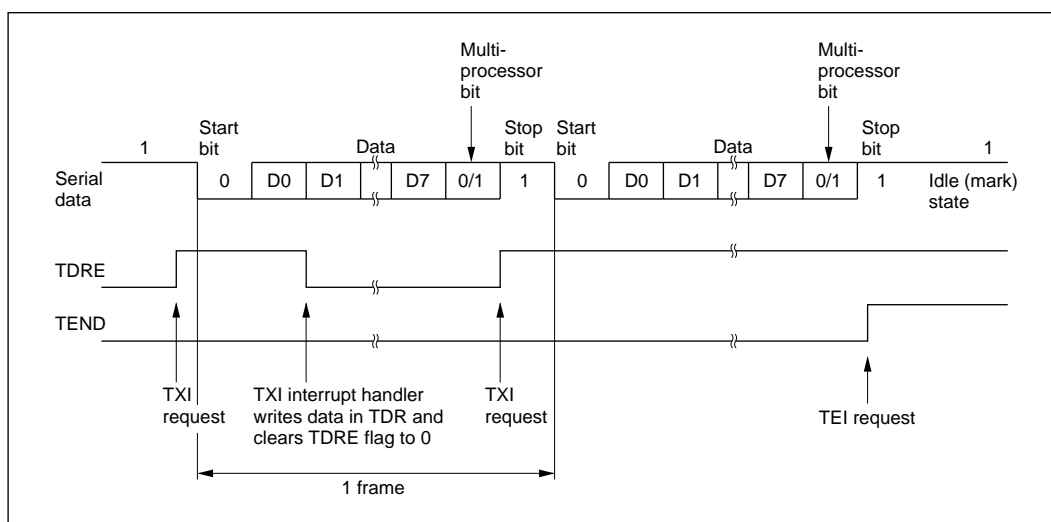

Figure 11-11   Example of SCI Transmit Operation (8-Bit Data with Multiprocessor Bit and One Stop Bit)

Receiving Multiprocessor Serial Data: Figure 11-12 shows a sample flowchart for receiving multiprocessor serial data and indicates the procedure to follow.

354

Figure 11-13 shows an example of SCI receive operation using a multiprocessor format.

a. Own ID does not match data

b. Own ID matches data
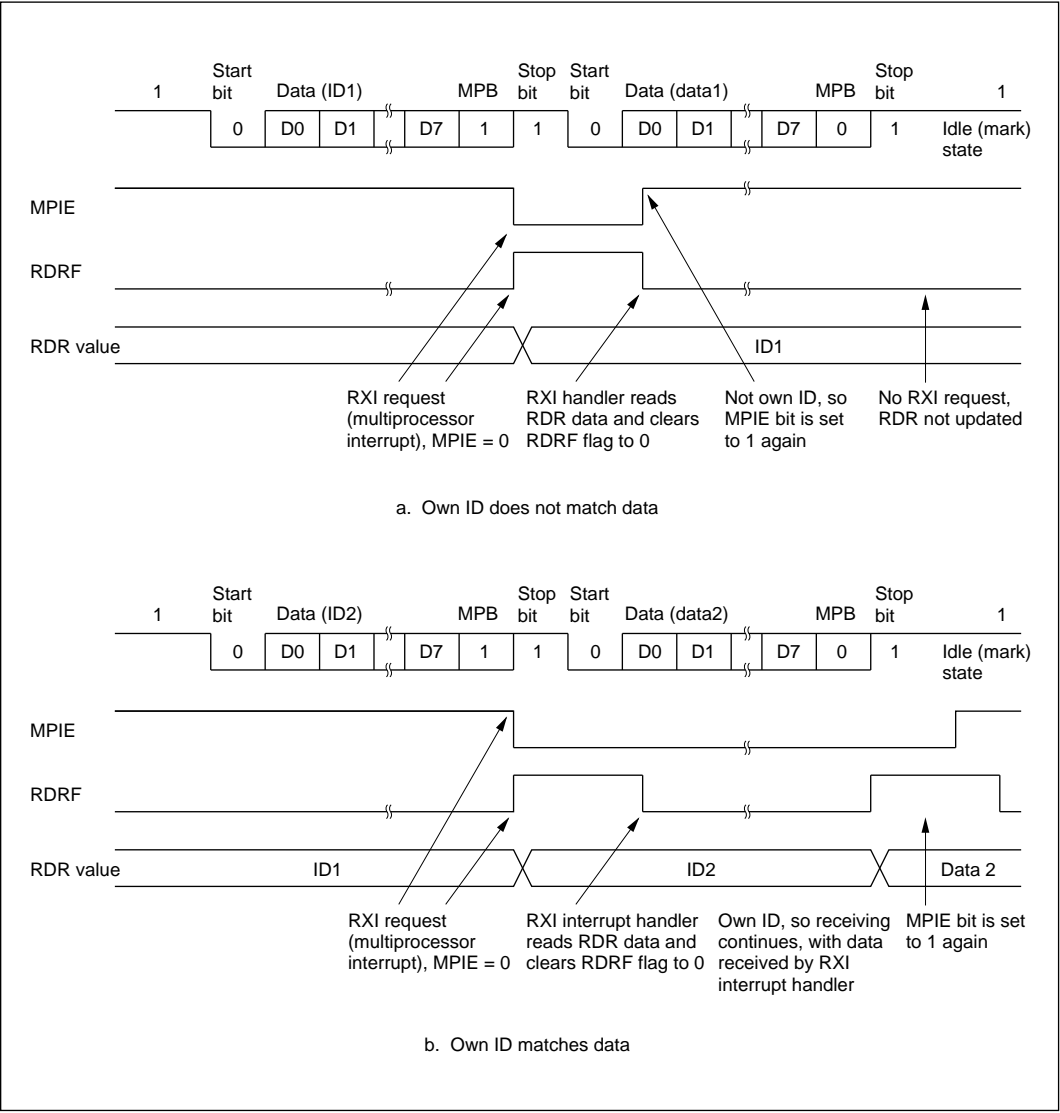

Figure 11-13   Example of SCI Receive Operation (8-Bit Data with Multiprocessor Bit and One Stop Bit)

11.3.4 Synchronous Operation

In synchronous mode, the SCI transmits and receives data in synchronization with clock pulses. This mode is suitable for high-speed serial communication.

The SCI transmitter and receiver share the same clock but are otherwise independent, so full duplex communication is possible. The transmitter and receiver are also double buffered, so continuous transmitting or receiving is possible by reading or writing data while transmitting or receiving is in progress.

Figure 11-14 shows the general format in synchronous serial communication.
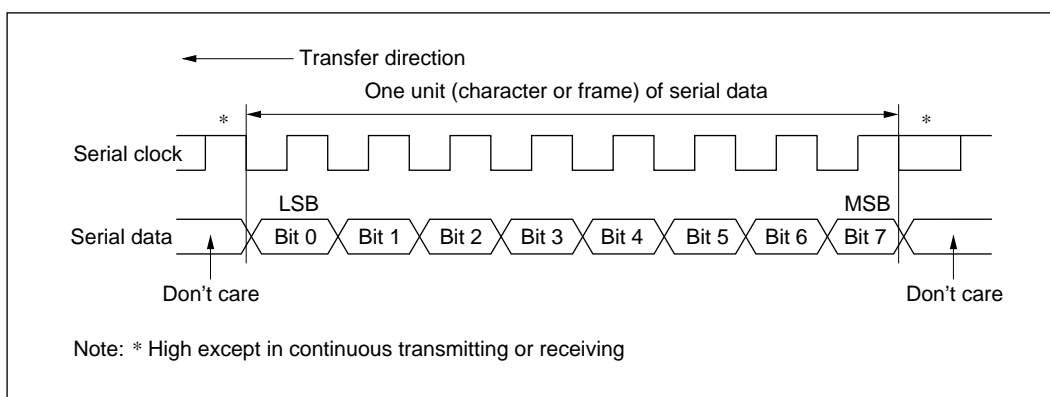

Figure 11-14   Data Format in Synchronous Communication

In synchronous serial communication, each data bit is placed on the communication line from one falling edge of the serial clock to the next. Data is guaranteed valid at the rise of the serial clock. In each character, the serial data bits are transmitted in order from LSB (first) to MSB (last). After output of the MSB, the communication line remains in the state of the MSB. In synchronous mode the SCI receives data by synchronizing with the rise of the serial clock.

Communication Format: The data length is fixed at 8 bits. No parity bit or multiprocessor bit can be added.

Clock: An internal clock generated by the on-chip baud rate generator or an external clock input from the SCK pin can be selected by clearing or setting the CKE1 bit in SCR. See table 11-9. When the SCI operates on an internal clock, it outputs the clock signal at the SCK pin. Eight clock pulses are output per transmitted or received character. When the SCI is not transmitting or receiving, the clock signal remains in the high state. When the SCI is only receiving, it receives in units of two characters, so it outputs 16 clock pulses. To receive in units of one character, an external clock source must be selected.

Transmitting and Receiving Data

SCI Initialization (Synchronous Mode): Before transmitting or receiving, clear the TE and RE bits to 0 in SCR, then initialize the SCI as follows.

When changing the communication mode or format, always clear the TE and RE bits to 0 before following the procedure given below. Clearing the TE bit to 0 sets the TDRE flag to 1 and initializes TSR. Clearing the RE bit to 0, however, does not initialize the RDRF, PER, FER, and ORE flags and RDR, which retain their previous contents.

Figure 11-15 is a sample flowchart for initializing the SCI.
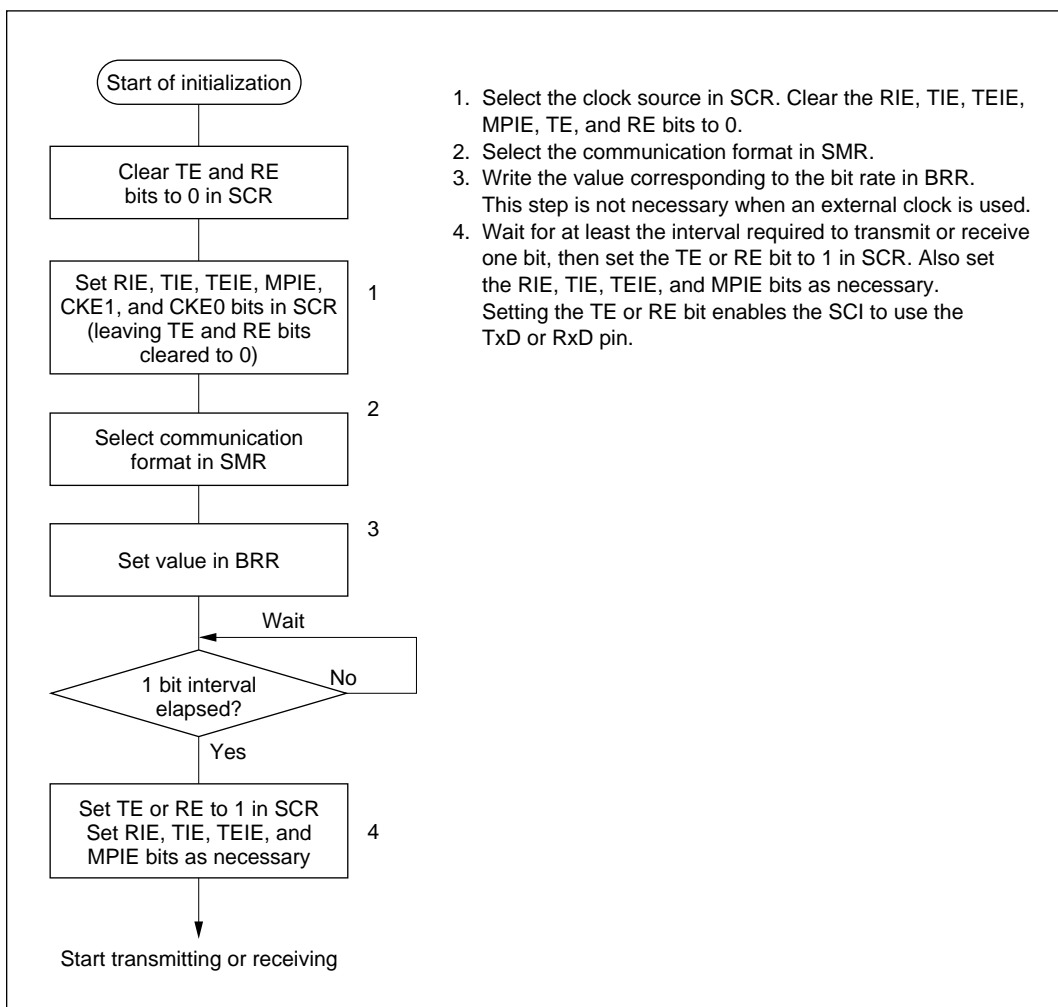

Figure 11-15 Sample Flowchart for SCI Initialization

357

Transmitting Serial Data (Synchronous Mode): Figure 11-16 shows a sample flowchart for transmitting serial data and indicates the procedure to follow.

Figure 11-16 flowchart content:

- Initialize — 1
- Start transmitting
- Read TDRE flag in SSR — 2
- TDRE = 1? — No (loop back) / Yes
- Write transmit data in TDR and clear TDRE flag to 0 in SSR
- All data transmitted? — No (loop back) — 3 / Yes
- Read TEND flag in SSR
- TEND = 1? — No (loop back) / Yes
- Clear TE bit to 0 in SCR
- End

1. SCI initialization: the transmit data output function of the TxD pin is selected automatically.
2. SCI status check and transmit data write: read SSR, check that the TDRE flag is 1, then write transmit data in TDR and clear the TDRE flag to 0.
3. To continue transmitting serial data: after checking that the TDRE flag is 1, indicating that data can be written, write data in TDR, then clear the TDRE flag to 0.

Figure 11-16   Sample Flowchart for Serial Transmitting

In transmitting serial data, the SCI operates as follows.

- The SCI monitors the TDRE flag in SSR. When the TDRE flag is cleared to 0 the SCI recognizes that TDR contains new data, and loads this data from TDR into TSR.

- After loading the data from TDR into TSR, the SCI sets the TDRE flag to 1 and starts transmitting. If the TIE bit is set to 1 in SCR, the SCI requests a transmit-data-empty interrupt (TXI) at this time.

  If clock output is selected, the SCI outputs eight serial clock pulses. If an external clock source is selected, the SCI outputs data in synchronization with the input clock. Data is output from the TxD pin in order from LSB (bit 0) to MSB (bit 7).

- The SCI checks the TDRE flag when it outputs the MSB (bit 7). If the TDRE flag is 0, the SCI loads data from TDR into TSR and begins serial transmission of the next frame. If the TDRE flag is 1, the SCI sets the TEND flag to 1 in SSR, and after transmitting the MSB, holds the TxD pin in the MSB state. If the TEIE bit in SCR is set to 1, a transmit-end interrupt (TEI) is requested at this time.

- After the end of serial transmission, the SCK pin is held in a constant state.

Figure 11-17 shows an example of SCI transmit operation.
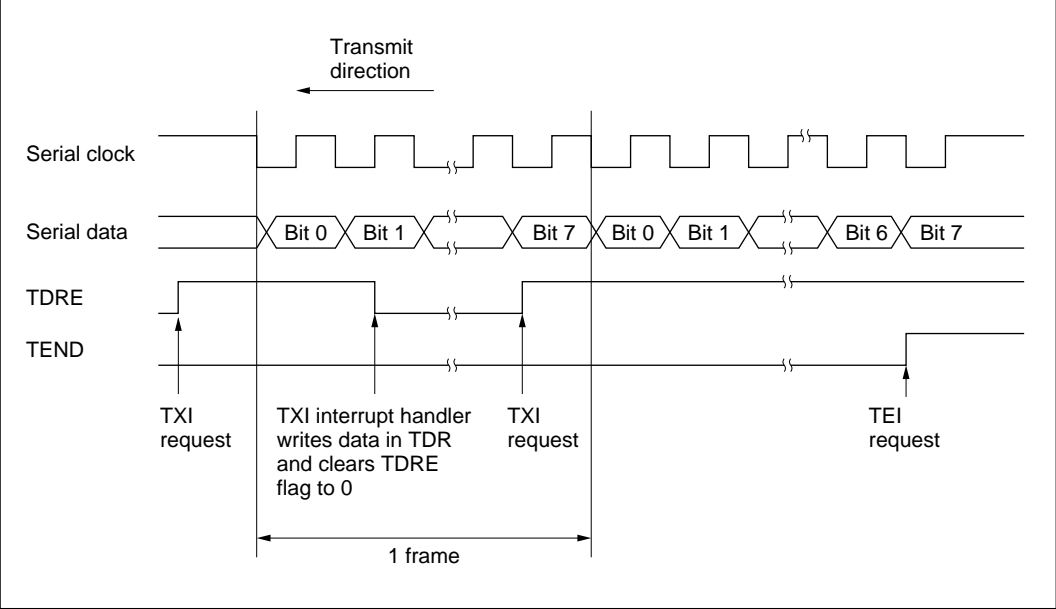

Figure 11-17   Example of SCI Transmit Operation

Receiving Serial Data: Figure 11-18 shows a sample flowchart for receiving serial data and indicates the procedure to follow. When switching from asynchronous mode to synchronous mode, make sure that the ORER, PER, and FER flags are cleared to 0. If the FER or PER flag is set to 1 the RDRF flag will not be set and both transmitting and receiving will be disabled.

1. SCI initialization: the receive data function of the RxD pin is selected automatically.
2., 3. Receive error handling: if a receive error occurs, read the ORER flag in SSR, then after executing the necessary error handling, clear the ORER flag to 0. Neither transmitting nor receiving can resume while the ORER flag remains set to 1.
4. SCI status check and receive data read: read SSR, check that the RDRF flag is set to 1, then read receive data from RDR and clear the RDRF flag to 0. Notification that the RDRF flag has changed from 0 to 1 can also be given by the RXI interrupt.
5. To continue receiving serial data: check the RDRF flag, read RDR, and clear the RDRF flag to 0 before the MSB (bit 7) of the current frame is received.

Figure 11-18   Sample Flowchart for Serial Receiving (1)

Figure 11-18   Sample Flowchart for Serial Receiving (2)

In receiving, the SCI operates as follows.

*   The SCI synchronizes with serial clock input or output and initializes internally.

*   Receive data is stored in RSR in order from LSB to MSB.

    After receiving the data, the SCI checks that the RDRF flag is 0 so that receive data can be transferred from RSR to RDR. If this check passes, the RDRF flag is set to 1 and the received data is stored in RDR. If the check does not pass (receive error), the SCI operates as indicated in table 11-11.

*   After setting the RDRF flag to 1, if the RIE bit is set to 1 in SCR, the SCI requests a receive-data-full interrupt (RXI). If the ORER flag is set to 1 and the RIE bit in SCR is also set to 1, the SCI requests a receive-error interrupt (ERI).

Figure 11-19 shows an example of SCI receive operation.
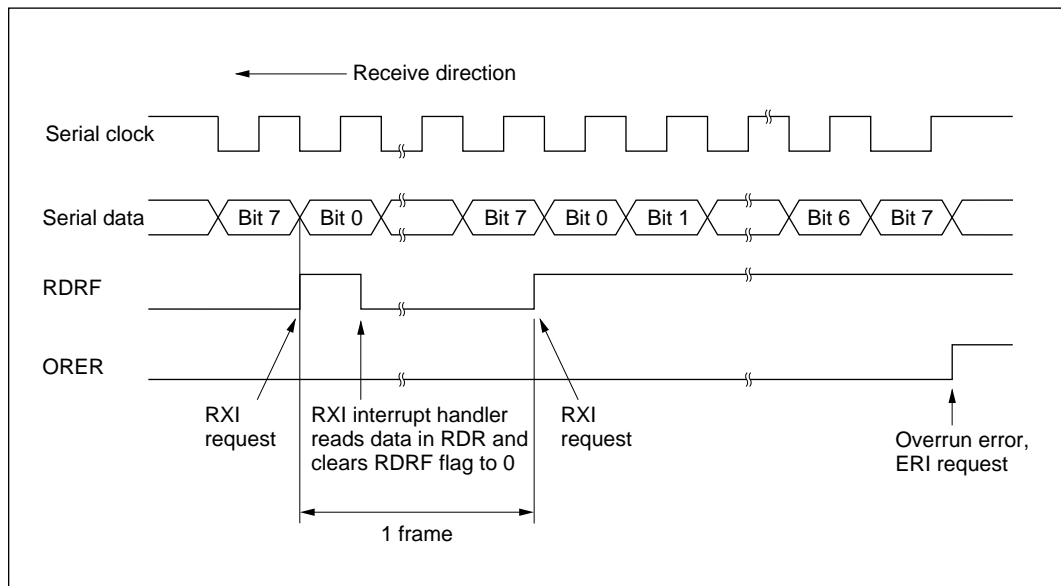

Figure 11-19   Example of SCI Receive Operation

Transmitting and Receiving Serial Data Simultaneously (Synchronous Mode): Figure 11-20 shows a sample flowchart for transmitting and receiving serial data simultaneously and indicates the procedure to follow.
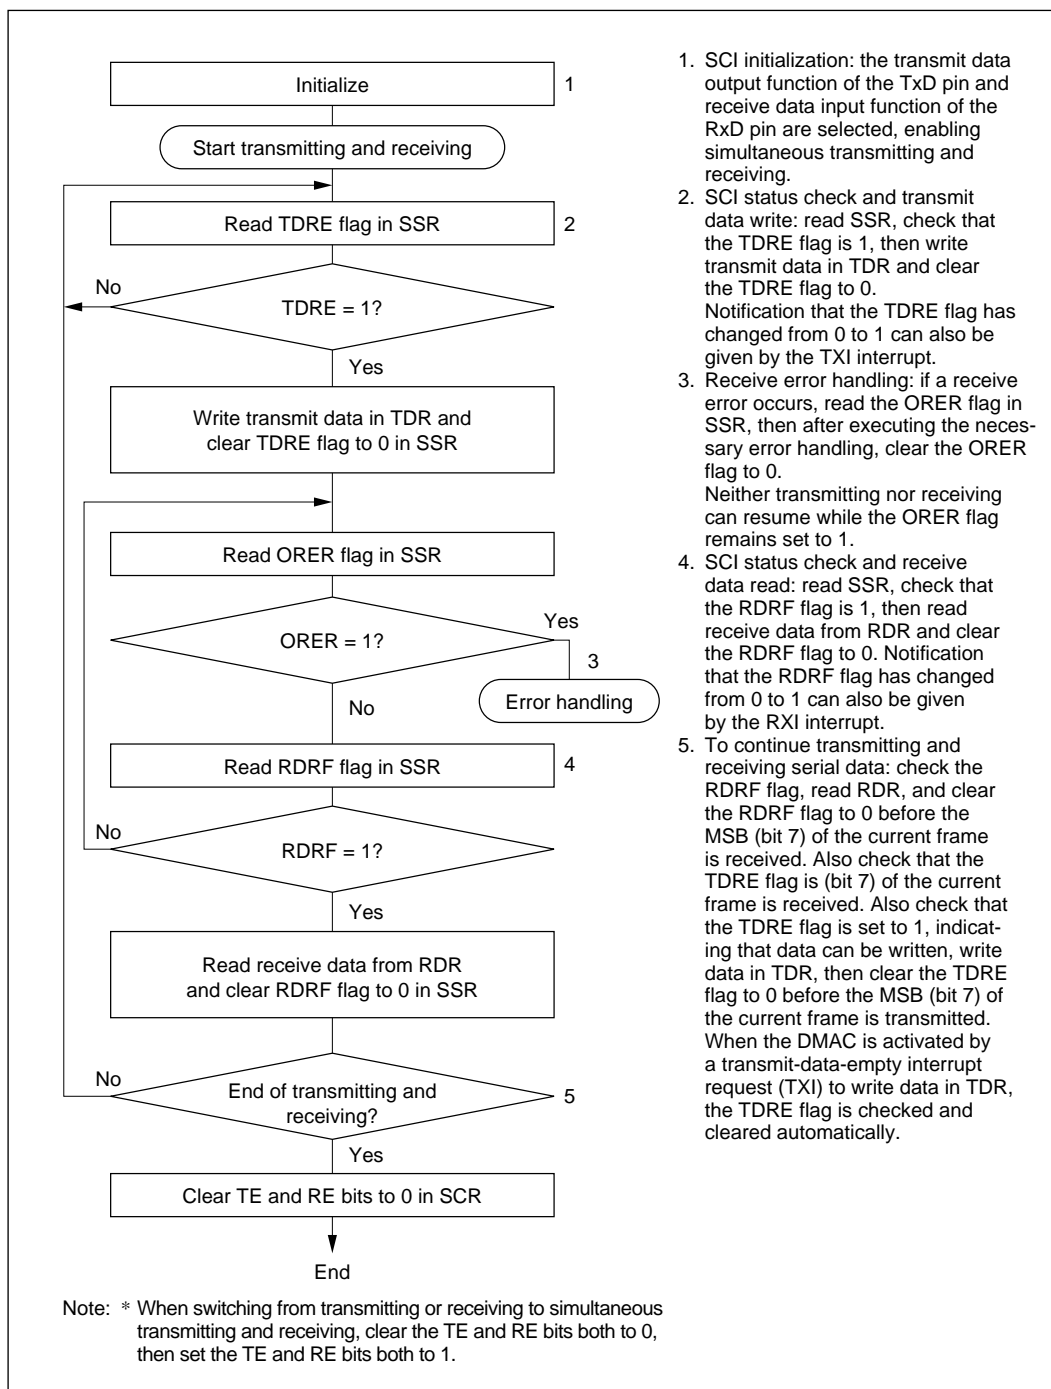

1. SCI initialization: the transmit data output function of the TxD pin and receive data input function of the RxD pin are selected, enabling simultaneous transmitting and receiving.
2. SCI status check and transmit data write: read SSR, check that the TDRE flag is 1, then write transmit data in TDR and clear the TDRE flag to 0.
   Notification that the TDRE flag has changed from 0 to 1 can also be given by the TXI interrupt.
3. Receive error handling: if a receive error occurs, read the ORER flag in SSR, then after executing the necessary error handling, clear the ORER flag to 0.
   Neither transmitting nor receiving can resume while the ORER flag remains set to 1.
4. SCI status check and receive data read: read SSR, check that the RDRF flag is 1, then read receive data from RDR and clear the RDRF flag to 0. Notification that the RDRF flag has changed from 0 to 1 can also be given by the RXI interrupt.
5. To continue transmitting and receiving serial data: check the RDRF flag, read RDR, and clear the RDRF flag to 0 before the MSB (bit 7) of the current frame is received. Also check that the TDRE flag is (bit 7) of the current frame is received. Also check that the TDRE flag is set to 1, indicating that data can be written, write data in TDR, then clear the TDRE flag to 0 before the MSB (bit 7) of the current frame is transmitted. When the DMAC is activated by a transmit-data-empty interrupt request (TXI) to write data in TDR, the TDRE flag is checked and cleared automatically.

Note: * When switching from transmitting or receiving to simultaneous transmitting and receiving, clear the TE and RE bits both to 0, then set the TE and RE bits both to 1.

Figure 11-20   Sample Flowchart for Serial Transmitting
11.4 SCI Interrupts

The SCI has four interrupt request sources: TEI (transmit-end interrupt), ERI (receive-error interrupt), RXI (receive-data-full interrupt), and TXI (transmit-data-empty interrupt). Table 11-12 lists the interrupt sources and indicates their priority. These interrupts can be enabled and disabled by the TIE, TEIE, and RIE bits in SCR. Each interrupt request is sent separately to the interrupt controller.

The TXI interrupt is requested when the TDRE flag is set to 1 in SSR. The TEI interrupt is requested when the TEND flag is set to 1 in SSR.

The RXI interrupt is requested when the RDRF flag is set to 1 in SSR. The ERI interrupt is requested when the ORER, PER, or FER flag is set to 1 in SSR.

Table 11-12 SCI Interrupt Sources

Interrupt	Description	Priority
ERI	Receive error (ORER, FER, or PER)	High
RXI	Receive data register full (RDRF)	↑
TXI	Transmit data register empty (TDRE)	
TEI	Transmit end (TEND)	Low

11.5 Usage Notes

Note the following points when using the SCI.

TDR Write and TDRE Flag: The TDRE flag in SSR is a status flag indicating the loading of transmit data from TDR into TSR. The SCI sets the TDRE flag to 1 when it transfers data from TDR to TSR.

Data can be written into TDR regardless of the state of the TDRE flag. If new data is written in TDR when the TDRE flag is 0, the old data stored in TDR will be lost because this data has not yet been transferred to TSR. Before writing transmit data in TDR, be sure to check that the TDRE flag is set to 1.

Simultaneous Multiple Receive Errors: Table 11-13 indicates the state of SSR status flags when multiple receive errors occur simultaneously. When an overrun error occurs the RSR contents are not transferred to RDR, so receive data is lost.

Table 11-13 SSR Status Flags and Transfer of Receive Data

SSR Status Flags				Receive Data Transfer	
RDRF	**ORER**	**FER**	**PER**	**RSR → RDR**	**Receive Errors**
1	1	0	0	×	Overrun error
0	0	1	0	○	Framing error
0	0	0	1	○	Parity error
1	1	1	0	×	Overrun error + framing error
1	1	0	1	×	Overrun error + parity error
0	0	1	1	○	Framing error + parity error
1	1	1	1	×	Overrun error + framing error + parity error

Notes: ○: Receive data is transferred from RSR to RDR.
  × Receive data is not transferred from RSR to RDR.

Break Detection and Processing: Break signals can be detected by reading the RxD pin directly when a framing error (FER) is detected. In the break state the input from the RxD pin consists of all 0s, so the FER flag is set and the parity error flag (PER) may also be set. In the break state the SCI receiver continues to operate, so if the FER flag is cleared to 0 it will be set to 1 again.

Sending a Break Signal: When the TE bit is cleared to 0 the TxD pin becomes an I/O port, the level and direction (input or output) of which are determined by DR and DDR bits. This feature can be used to send a break signal.

After the serial transmitter is initialized, the DR value substitutes for the mark state until the TE bit is set to 1 (the TxD pin function is not selected until the TE bit is set to 1). The DDR and DR bits should therefore both be set to 1 beforehand.

To send a break signal during serial transmission, clear the DR bit to 0, then clear the TE bit to 0. When the TE bit is cleared to 0 the transmitter is initialized, regardless of its current state, so the TxD pin becomes an output port outputting the value 0.

Receive Error Flags and Transmitter Operation (Synchronous Mode Only): When a receive error flag (ORER, PER, or FER) is set to 1 the SCI will not start transmitting, even if the TDRE flag is cleared to 0. Be sure to clear the receive error flags to 0 when starting to transmit. Note that clearing the RE bit to 0 does not clear the receive error flags to 0.

Receive Data Sampling Timing in Asynchronous Mode and Receive Margin: In asynchronous mode the SCI operates on a base clock with 16 times the bit rate frequency. In receiving, the SCI synchronizes internally with the fall of the start bit, which it samples on the base clock. Receive data is latched at the rising edge of the eighth base clock pulse. See figure 11-21.
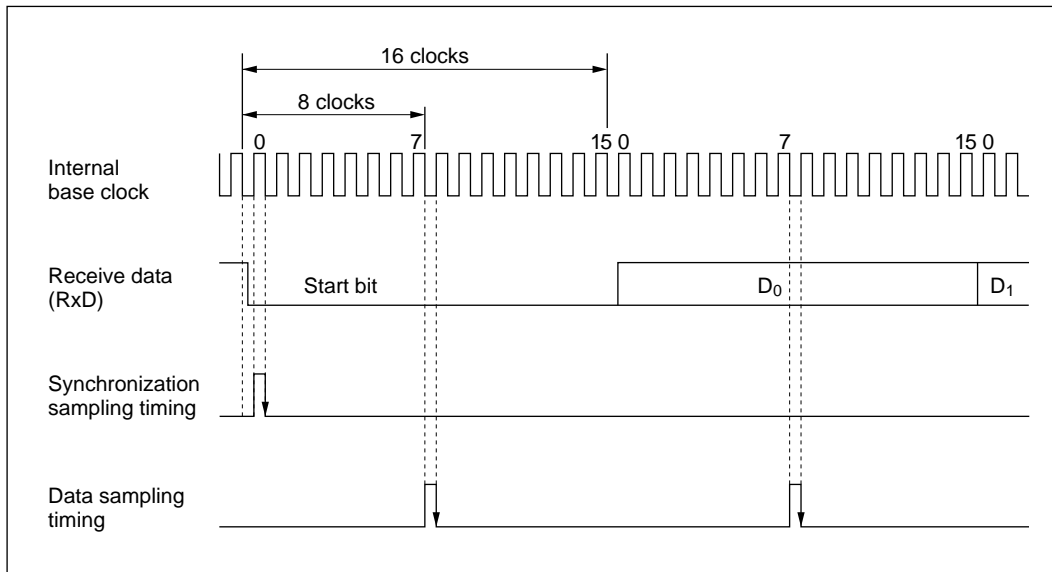

Figure 11-21   Receive Data Sampling Timing in Asynchronous Mode

The receive margin in asynchronous mode can therefore be expressed as in equation (1).

$$M = | (0.5 - \frac{1}{2N}) - (L - 0.5)\, F - \frac{|D - 0.5|}{N} (1 + F) | \times 100\% \dots\dots\dots\dots(1)$$

M: Receive margin (%)
N: Ratio of clock frequency to bit rate (N = 16)
D: Clock duty cycle (D = 0 to 1.0)
L: Frame length (L = 9 to 12)
F: Absolute deviation of clock frequency

From equation (1), if F = 0 and D = 0.5 the receive margin is 46.875%, as given by equation (2).

D = 0.5, F = 0
M = [0.5 – 1/(2 × 16)] × 100%
 = 46.875% ....(2)

This is a theoretical value. A reasonable margin to allow in system designs is 20% to 30%.

Restrictions in Synchronous Mode: When an external clock source is used in synchronous mode, after TDR is reset, wait at least 5 clock counts (5ø) before inputting the transmit clock. If the clock is input four states after the reset of TDR or earlier, an operation error may occur (figure 11-22).

Note: When using an external clock, make sure t is 5 clock cycles or greater.
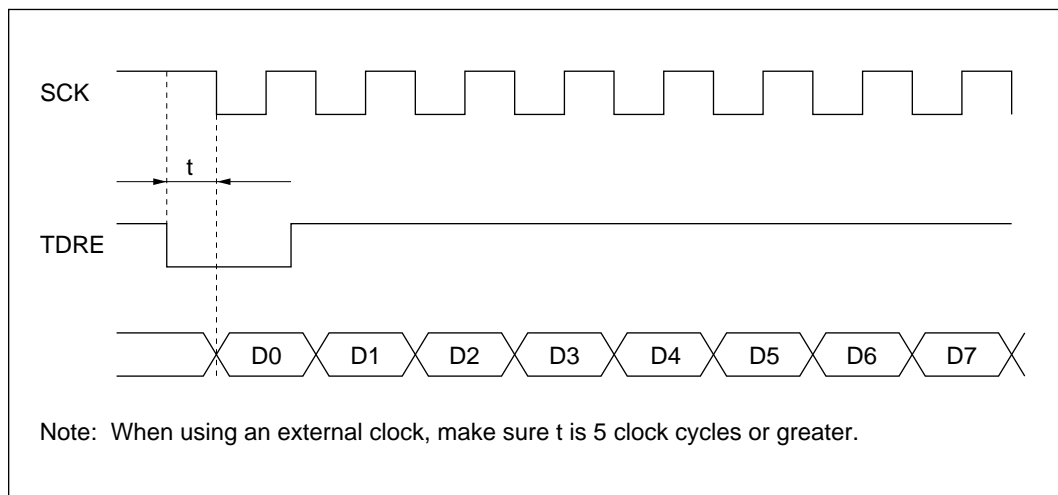

Figure 11-22 Transmission in Synchronous Mode (Example)

Section 12   A/D Converter

12.1 Overview

The H8/3032 Series includes a 10-bit successive-approximations A/D converter with a selection of up to eight analog input channels.

12.1.1 Features

A/D converter features are listed below.

- 10-bit resolution

- Eight input channels

- Selectable analog conversion voltage range

  The analog voltage conversion range can be programmed by input of an analog reference voltage at the V_{REF} pin.

- High-speed conversion

  Conversion time: maximum 8.4 µs per channel (with 16 MHz system clock)

- Two conversion modes

  Single mode: A/D conversion of one channel
  Scan mode: continuous conversion on one to four channels

- Four 16-bit data registers

  A/D conversion results are transferred for storage into data registers corresponding to the channels.

- Sample-and-hold function

- A/D conversion can be externally triggered

- A/D interrupt requested at end of conversion

  At the end of A/D conversion, an A/D end interrupt (ADI) can be requested.

12.1.2 Block Diagram

Figure 12-1 shows a block diagram of the A/D converter.
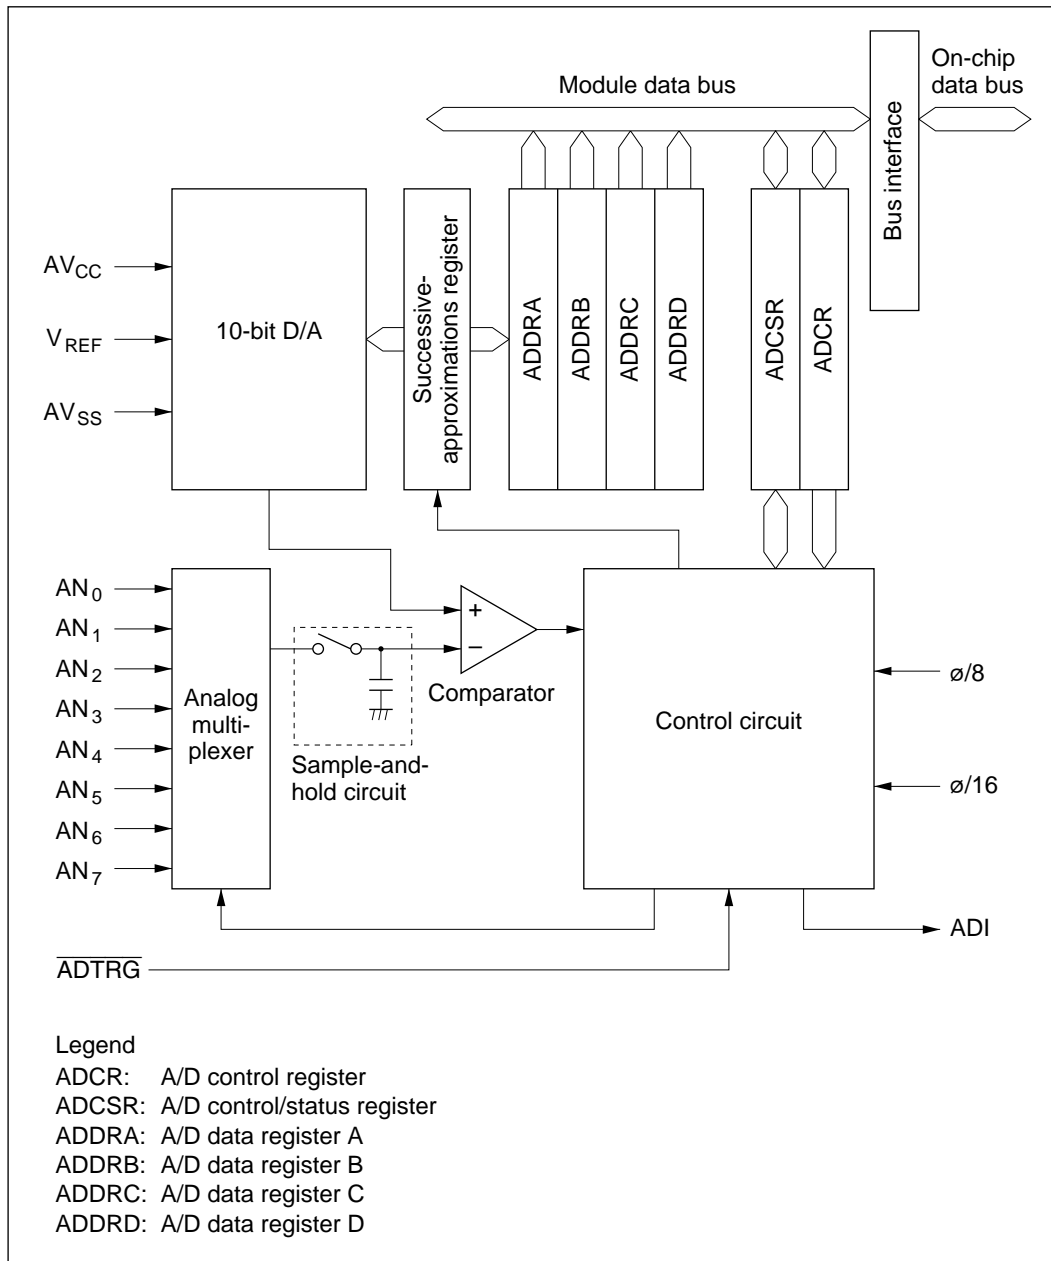

Figure 12-1   A/D Converter Block Diagram

12.1.3 Input Pins

Table 12-1 summarizes the A/D converter's input pins. The eight analog input pins are divided into two groups: group 0 (AN_0 to AN_3), and group 1 (AN_4 to AN_7). AV_{CC} and AV_{SS} are the power supply for the analog circuits in the A/D converter. V_{REF} is the A/D conversion reference voltage.

Table 12-1   A/D Converter Pins

Pin Name	Abbreviation	I/O	Function
Analog power supply pin	AV_{CC}	Input	Analog power supply
Analog ground pin	AV_{SS}	Input	Analog ground and reference voltage
Reference voltage pin	V_{REF}	Input	Analog reference voltage
Analog input pin 0	AN_0	Input	Group 0 analog inputs
Analog input pin 1	AN_1	Input	
Analog input pin 2	AN_2	Input	
Analog input pin 3	AN_3	Input	
Analog input pin 4	AN_4	Input	Group 1 analog inputs
Analog input pin 5	AN_5	Input	
Analog input pin 6	AN_6	Input	
Analog input pin 7	AN_7	Input	
A/D external trigger input pin	$\overline{ADTRG}$	Input	External trigger input for starting A/D conversion

12.1.4 Register Configuration

Table 12-2 summarizes the A/D converter's registers.

Table 12-2 A/D Converter Registers

Address[1]	Name	Abbreviation	R/W	Initial Value
H'FFE0	A/D data register A (high)	ADDRAH	R	H'00
H'FFE1	A/D data register A (low)	ADDRAL	R	H'00
H'FFE2	A/D data register B (high)	ADDRBH	R	H'00
H'FFE3	A/D data register B (low)	ADDRBL	R	H'00
H'FFE4	A/D data register C (high)	ADDRCH	R	H'00
H'FFE5	A/D data register C (low)	ADDRCL	R	H'00
H'FFE6	A/D data register D (high)	ADDRDH	R	H'00
H'FFE7	A/D data register D (low)	ADDRDL	R	H'00
H'FFE8	A/D control/status register	ADCSR	R/(W)[2]	H'00
H'FFE9	A/D control register	ADCR	R/W	H'7E

Notes: 1. Lower 16 bits of the address
2. Only 0 can be written in bit 7, to clear the flag.

12.2 Register Descriptions

12.2.1 A/D Data Registers A to D (ADDRA to ADDRD)

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ADDRn	AD9	AD8	AD7	AD6	AD5	AD4	AD3	AD2	AD1	AD0	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Read/Write (n = A to D)	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

A/D conversion data
10-bit data giving an
A/D conversion result

Reserved bits

The four A/D data registers (ADDRA to ADDRD) are 16-bit read-only registers that store the results of A/D conversion.

An A/D conversion produces 10-bit data, which is transferred for storage into the A/D data register corresponding to the selected channel. The upper 8 bits of the result are stored in the upper byte of the A/D data register. The lower 2 bits are stored in the lower byte. Bits 5 to 0 of an A/D data register are reserved bits that always read 0. Table 12-3 indicates the pairings of analog input channels and A/D data registers.

The CPU can always read and write the A/D data registers. The upper byte can be read directly, but the lower byte is read through a temporary register (TEMP). For details see section 12.3, CPU Interface.

The A/D data registers are initialized to H'0000 by a reset and in standby mode.

Table 12-3   Analog Input Channels and A/D Data Registers

Analog Input Channel		A/D Data Register
Group 0	Group 1	
AN_0	AN_4	ADDRA
AN_1	AN_5	ADDRB
AN_2	AN_6	ADDRC
AN_3	AN_7	ADDRD

12.2.2 A/D Control/Status Register (ADCSR)

Bit	7	6	5	4	3	2	1	0
	ADF	ADIE	ADST	SCAN	CKS	CH2	CH1	CH0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/(W)*	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Channel select 2 to 0
These bits select analog input channels

Clock select
Selects the A/D conversion time

Scan mode
Selects single mode or scan mode

A/D start
Starts or stops A/D conversion

A/D interrupt enable
Enables and disables A/D end interrupts

A/D end flag
Indicates end of A/D conversion

Note: * Only 0 can be written, to clear the flag.

ADCSR is an 8-bit readable/writable register that selects the mode and controls the A/D converter. ADCSR is initialized to H'00 by a reset and in standby mode.

Bit 7—A/D End Flag (ADF): Indicates the end of A/D conversion.

Bit 7 ADF	Description	
0	[Clearing condition] Cleared by reading ADF while ADF = 1, then writing 0 in ADF	(Initial value)
1	[Setting conditions] Single mode: A/D conversion ends Scan mode: A/D conversion ends in all selected channels	

Bit 6—A/D Interrupt Enable (ADIE): Enables or disables the interrupt (ADI) requested at the end of A/D conversion.

Bit 6 ADIE	Description	
0	A/D end interrupt request (ADI) is disabled	(Initial value)
1	A/D end interrupt request (ADI) is enabled	

Bit 5—A/D Start (ADST): Starts or stops A/D conversion. The ADST bit remains set to 1 during A/D conversion. It can also be set to 1 by external trigger input at the $\overline{\text{ADTRG}}$ pin.

Bit 5 ADST	Description	
0	A/D conversion is stopped	(Initial value)
1	Single mode: A/D conversion starts; ADST is automatically cleared to 0 when conversion ends. Scan mode: A/D conversion starts and continues, cycling among the selected channels, until ADST is cleared to 0 by software, by a reset, or by a transition to standby mode.	

Bit 4—Scan Mode (SCAN): Selects single mode or scan mode. For further information on operation in these modes, see section 12.4, Operation. Clear the ADST bit to 0 before switching the conversion mode.

Bit 4 SCAN	Description	
0	Single mode	(Initial value)
1	Scan mode	

Bit 3—Clock Select (CKS): Selects the A/D conversion time. Clear the ADST bit to 0 before switching the conversion time.

Bit 3 CKS	Description	
0	Conversion time = 266 states (maximum)	(Initial value)
1	Conversion time = 134 states (maximum)	

Bits 2 to 0—Channel Select 2 to 0 (CH2 to CH0): These bits and the SCAN bit select the analog input channels. Clear the ADST bit to 0 before changing the channel selection.

Group Selection	Channel Selection		Description	
CH2	CH1	CH0	Single Mode	Scan Mode
0	0	0	AN_0 (Initial value)	AN_0
		1	AN_1	AN_0, AN_1
	1	0	AN_2	AN_0 to AN_2
		1	AN_3	AN_0 to AN_3
1	0	0	AN_4	AN_4
		1	AN_5	AN_4, AN_5
	1	0	AN_6	AN_4 to AN_6
		1	AN_7	AN_4 to AN_7

378

12.2.3 A/D Control Register (ADCR)

Bit	7	6	5	4	3	2	1	0
	TRGE	—	—	—	—	—	—	—
Initial value	0	1	1	1	1	1	1	1
Read/Write	R/W	—	—	—	—	—	—	—

Reserved bits

Trigger enable
Enables or disables external triggering of A/D conversion

ADCR is an 8-bit readable/writable register that enables or disables external triggering of A/D conversion. ADCR is initialized to H'7F by a reset and in standby mode.

Bit 7—Trigger Enable (TRGE): Enables or disables external triggering of A/D conversion.

Bit 7

TRGE	Description	
0	A/D conversion cannot be externally triggered	(Initial value)
1	A/D conversion starts at the falling edge of the external trigger signal ($\overline{\text{ADTRG}}$)	

Bits 6 to 0—Reserved: Read-only bits, always read as 1.

12.3 CPU Interface

ADDRA to ADDRD are 16-bit registers, but they are connected to the CPU by an 8-bit data bus. Therefore, although the upper byte can be be accessed directly by the CPU, the lower byte is read through an 8-bit temporary register (TEMP).

An A/D data register is read as follows. When the upper byte is read, the upper-byte value is transferred directly to the CPU and the lower-byte value is transferred into TEMP. Next, when the lower byte is read, the TEMP contents are transferred to the CPU.

When reading an A/D data register, always read the upper byte before the lower byte. It is possible to read only the upper byte, but if only the lower byte is read, incorrect data may be obtained.

Figure 12-2 shows the data flow for access to an A/D data register.
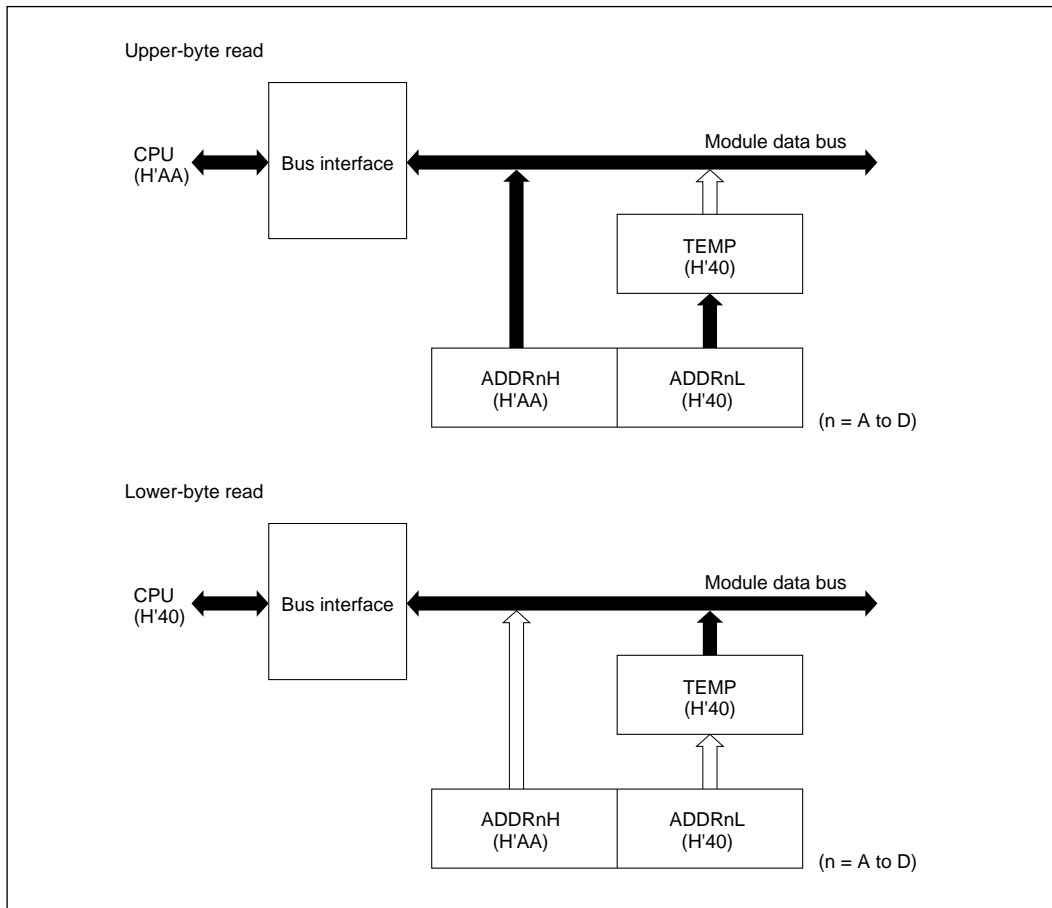

Figure 12-2   A/D Data Register Access Operation (Reading H'AA40)

12.4 Operation

The A/D converter operates by successive approximations with 10-bit resolution. It has two operating modes: single mode and scan mode.

12.4.1 Single Mode (SCAN = 0)

Single mode should be selected when only one A/D conversion on one channel is required. A/D conversion starts when the ADST bit is set to 1 by software, or by external trigger input. The ADST bit remains set to 1 during A/D conversion and is automatically cleared to 0 when conversion ends.

When conversion ends the ADF bit is set to 1. If the ADIE bit is also set to 1, an ADI interrupt is requested at this time. To clear the ADF flag to 0, first read ADCSR, then write 0 in ADF.

When the mode or analog input channel must be switched during analog conversion, to prevent incorrect operation, first clear the ADST bit to 0 in ADCSR to halt A/D conversion. After making the necessary changes, set the ADST bit to 1 to start A/D conversion again. The ADST bit can be set at the same time as the mode or channel is changed.

Typical operations when channel 1 (AN_1) is selected in single mode are described next. Figure 12-3 shows a timing diagram for this example.

1. Single mode is selected (SCAN = 0), input channel AN_1 is selected (CH2 = CH1 = 0, CH0 = 1), the A/D interrupt is enabled (ADIE = 1), and A/D conversion is started (ADST = 1).

2. When A/D conversion is completed, the result is transferred into ADDRB. At the same time the ADF flag is set to 1, the ADST bit is cleared to 0, and the A/D converter becomes idle.

3. Since ADF = 1 and ADIE = 1, an ADI interrupt is requested.

4. The A/D interrupt handling routine starts.

5. The routine reads ADCSR, then writes 0 in the ADF flag.

6. The routine reads and processes the conversion result (ADDRB).

7. Execution of the A/D interrupt handling routine ends. After that, if the ADST bit is set to 1, A/D conversion starts again and steps 2 to 7 are repeated.

Figure 12-3   Example of A/D Converter Operation (Single Mode, Channel 1 Selected)

382
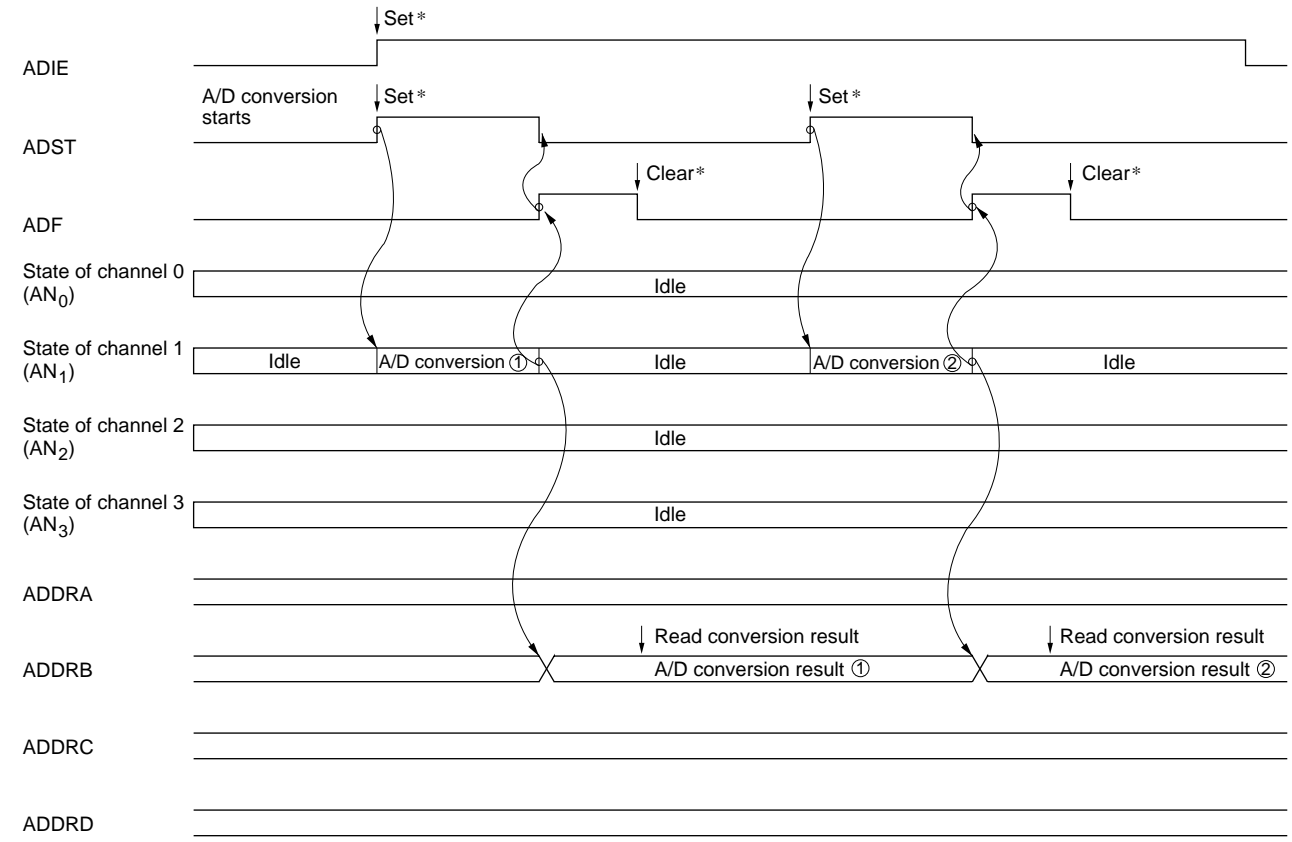

Note: *Vertical arrows (↓) indicate instructions executed by software.

12.4.2 Scan Mode (SCAN = 1)

Scan mode is useful for monitoring analog inputs in a group of one or more channels. When the ADST bit is set to 1 by software or external trigger input, A/D conversion starts on the first channel in the group (AN_0 when CH2 = 0, AN_4 when CH2 = 1). When two or more channels are selected, after conversion of the first channel ends, conversion of the second channel (AN_1 or AN_5) starts immediately. A/D conversion continues cyclically on the selected channels until the ADST bit is cleared to 0. The conversion results are transferred for storage into the A/D data registers corresponding to the channels.

When the mode or analog input channel selection must be changed during analog conversion, to prevent incorrect operation, first clear the ADST bit to 0 in ADCSR to halt A/D conversion. After making the necessary changes, set the ADST bit to 1. A/D conversion will start again from the first channel in the group. The ADST bit can be set at the same time as the mode or channel selection is changed.

Typical operations when three channels in group 0 (AN_0 to AN_2) are selected in scan mode are described next. Figure 12-4 shows a timing diagram for this example.

1. Scan mode is selected (SCAN = 1), scan group 0 is selected (CH2 = 0), analog input channels AN_0 to AN_2 are selected (CH1 = 1, CH0 = 0), and A/D conversion is started (ADST = 1).

2. When A/D conversion of the first channel (AN_0) is completed, the result is transferred into ADDRA. Next, conversion of the second channel (AN_1) starts automatically.

3. Conversion proceeds in the same way through the third channel (AN_2).

4. When conversion of all selected channels (AN_0 to AN_2) is completed, the ADF flag is set to 1 and conversion of the first channel (AN_0) starts again. If the ADIE bit is set to 1, an ADI interrupt is requested at this time.

5. Steps 2 to 4 are repeated as long as the ADST bit remains set to 1. When the ADST bit is cleared to 0, A/D conversion stops. After that, if the ADST bit is set to 1, A/D conversion starts again from the first channel (AN_0).

Figure 12-4　Example of A/D Converter Operation (Scan Mode, Channels AN$_0$ to AN$_2$ Selected)

Notes: 1. Vertical arrows (↓) indicate instructions executed by software.
　　　　2. Data currently being converted is ignored.

384
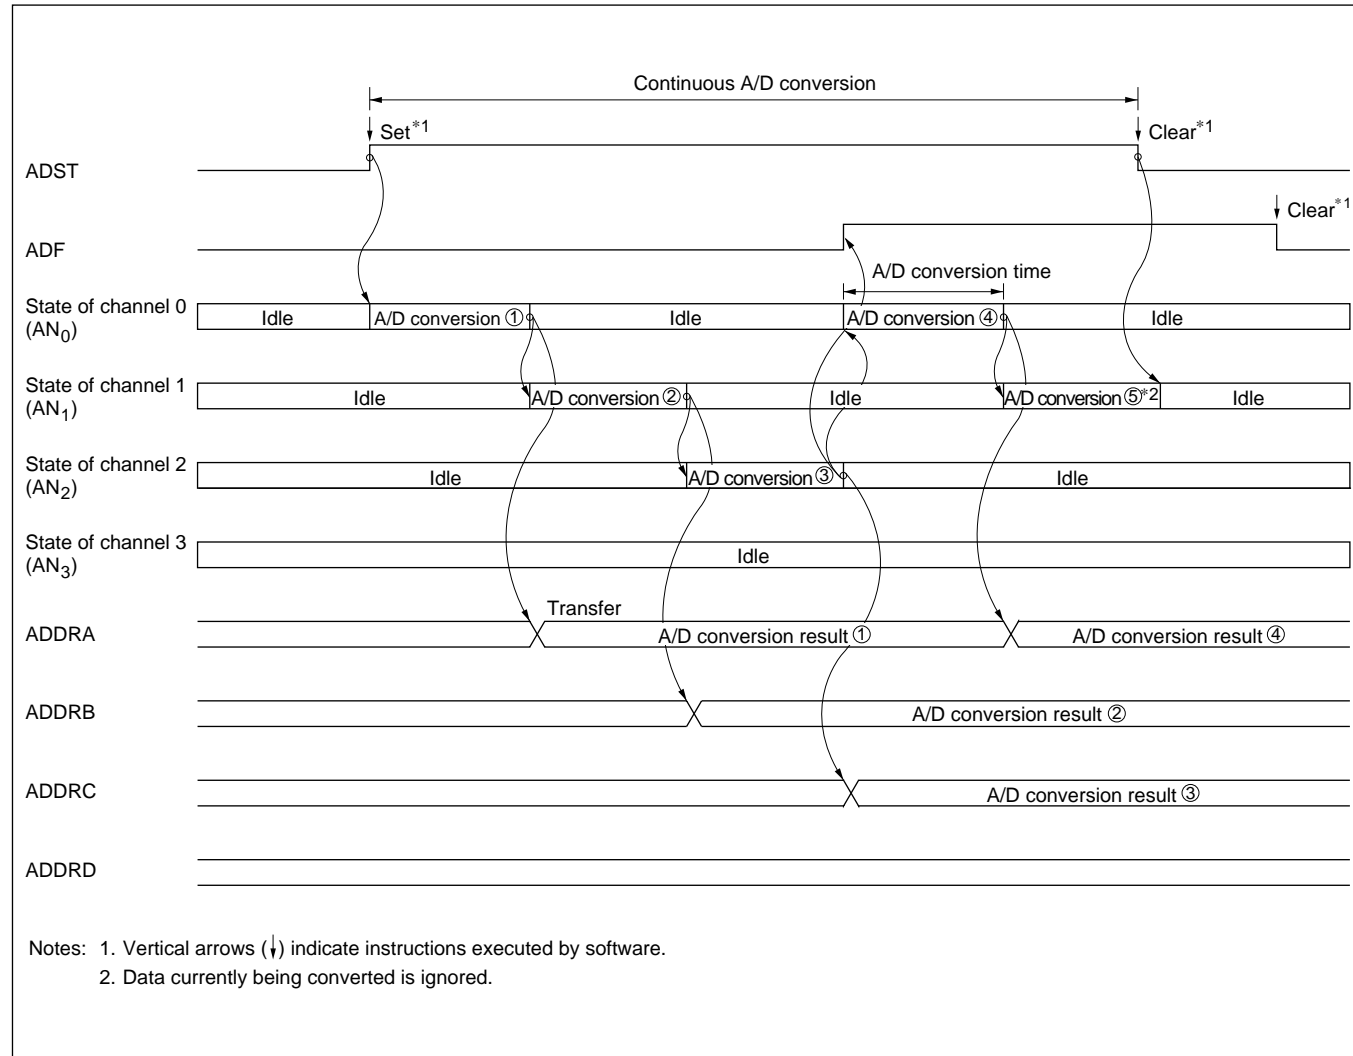

12.4.3 Input Sampling and A/D Conversion Time

The A/D converter has a built-in sample-and-hold circuit. The A/D converter samples the analog input at a time t_D after the ADST bit is set to 1, then starts conversion. Figure 12-5 shows the A/D conversion timing. Table 12-4 indicates the A/D conversion time.

As indicated in figure 12-5, the A/D conversion time includes t_D and the input sampling time. The length of t_D varies depending on the timing of the write access to ADCSR. The total conversion time therefore varies within the ranges indicated in table 12-4.

In scan mode, the values given in table 12-4 apply to the first conversion. In the second and subsequent conversions the conversion time is fixed at 256 states when CKS = 0 or 128 states when CKS = 1.
Figure 12-5 A/D Conversion Timing

385

Table 12-4 A/D Conversion Time (Single Mode)

	Symbol	CKS = 0			CKS = 1		
		Min	Typ	Max	Min	Typ	Max
Synchronization delay	t_D	10	—	17	6	—	9
Input sampling time	t_{SPL}	—	80	—	—	40	—
A/D conversion time	t_{CONV}	259	—	266	131	—	134

Note: Values in the table are numbers of states.

12.4.4 External Trigger Input Timing

A/D conversion can be externally triggered. When the TRGE bit is set to 1 in ADCR, external trigger input is enabled at the $\overline{\text{ADTRG}}$ pin. A high-to-low transition at the $\overline{\text{ADTRG}}$ pin sets the ADST bit to 1 in ADCSR, starting A/D conversion. Other operations, in both single and scan modes, are the same as if the ADST bit had been set to 1 by software. Figure 12-6 shows the timing.
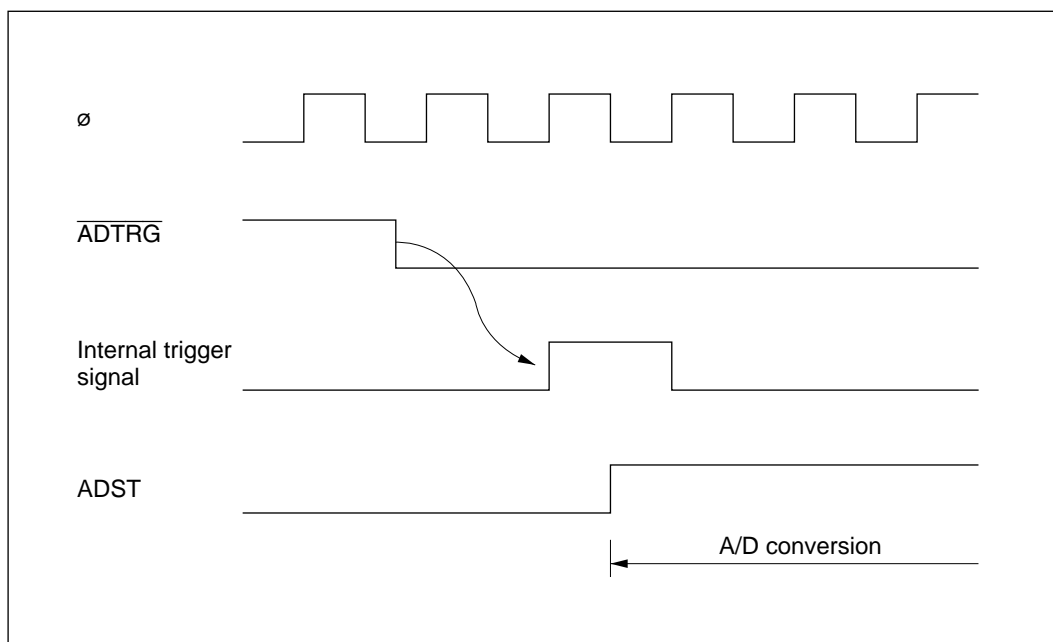

Figure 12-6 External Trigger Input Timing

12.5 Interrupts

The A/D converter generates an interrupt (ADI) at the end of A/D conversion. The ADI interrupt request can be enabled or disabled by the ADIE bit in ADCSR.

12.6 Usage Notes

When using the A/D converter, note the following points:

Analog Input Voltage Range: During A/D conversion, the voltages input to the analog input pins AN_n should be in the range $AV_{SS} \leq AN_n \leq V_{REF}$. (n = 0 to 7)

AV_{CC} and AV_{SS} Input Voltages: AV_{SS} should have the following values: $AV_{SS} = V_{SS}$. If the A/D converter is not used, the values should be $AV_{CC} = V_{CC}$ and $AV_{SS} = V_{SS}$.

V_{REF} Input Range: The analog reference voltage input at the V_{REF} pin should be in the range $V_{REF} \leq AV_{CC}$. If the A/D converter is not used, the value should be $V_{REF} = V_{CC}$.

Section 13 RAM

13.1 Overview

The H8/3032 has 2 kbytes of on-chip static RAM, the H8/3031 has 1 kbyte, and the H8/3030 has 512 bytes. The RAM is connected to the CPU by a 16-bit data bus. The CPU accesses both byte data and word data in two states, making the RAM suitable for rapid data transfer.

The H8/3032 on-chip RAM is assigned to addresses H'FF710 to H'FFF0F in modes 1 and 3, and addresses H'F7 10 to H'FF0F in mode 2. The H8/3031 on-chip RAM is assigned to addresses H'FFB10 to H'FFF0F in modes 1 and 3, and addresses H'FB10 to H'FF0F in mode 2. The H8/3030 on-chip RAM is assigned to addresses H'FFD10 to H'FFF0F in modes 1 and 3, and addresses H'FD10 to H'FF0F in mode 2. The RAM enable bit (RAME) in the system control register (SYSCR) can enable or disable the on-chip RAM.

13.1.1 Block Diagram

Figure 13-1 shows a block diagram of the on-chip RAM.
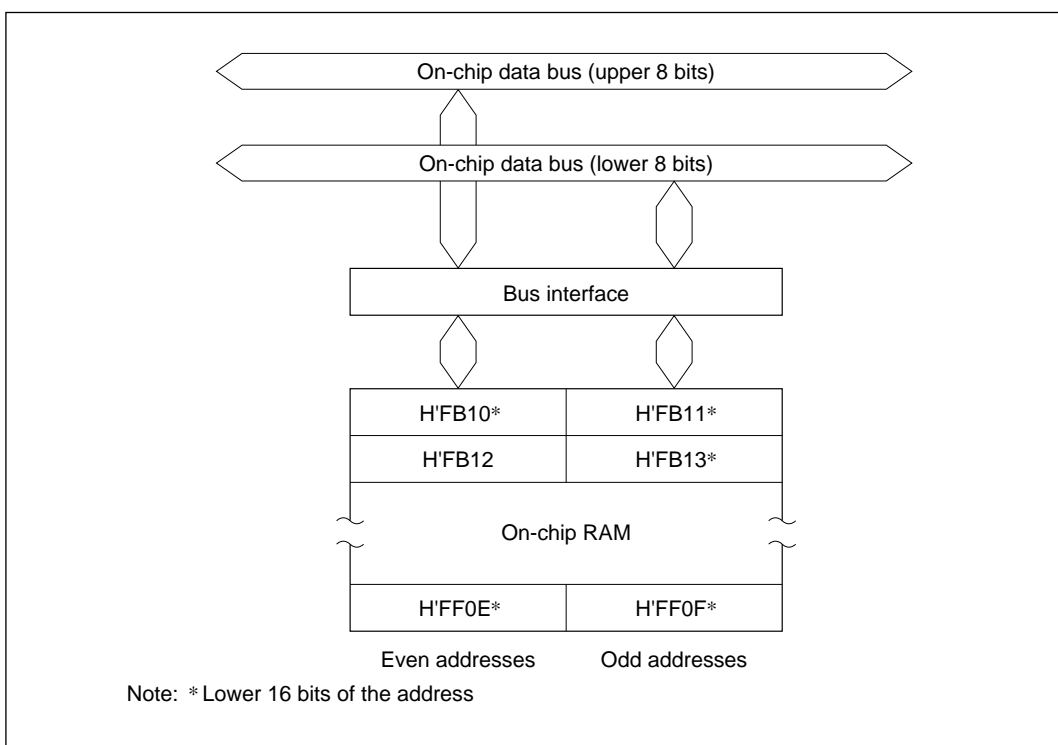

Figure 13-1   RAM Block Diagram (H8/3031 in Mode 2)

389

13.1.2 Register Configuration

The on-chip RAM is controlled by the system control register (SYSCR). Table 13-1 gives the address and initial value of SYSCR.

Table 13-1 RAM Control Register

Address*	Name	Abbreviation	R/W	Initial Value
H'FFF2	System control register	SYSCR	R/W	H'0B

Note: * Lower 16 bits of the address

13.2 System Control Register (SYSCR)

Bit	7	6	5	4	3	2	1	0
	SSBY	STS2	STS1	STS0	UE	NMIEG	—	RAME
Initial value	0	0	0	0	1	0	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	—	R/W

- **RAM enable bit** — Enables or disables on-chip RAM
- **Reserved bit**
- **NMI edge select**
- **User bit enable**
- **Standby timer select 2 to 0**
- **Software standby**

One function of SYSCR is to enable or disable access to the on-chip RAM. The on-chip RAM is enabled or disabled by the RAME bit in SYSCR. For details about the other bits, see section 3.3, System Control Register.

Bit 0—RAM Enable (RAME): Enables or disables the on-chip RAM. The RAME bit is initialized at the rising edge of the input at the $\overline{\text{RES}}$ pin. It is not initialized in software standby mode.

Bit 0 RAME	Description	
0	On-chip RAM is disabled	
1	On-chip RAM is enabled	(Initial value)

13.3 Operation

13.3.1 Mode 1

When the RAME bit is set to 1 in mode 1, accesses to addresses H'FF710 to H'FFF0F of the H8/3032, to addresses H'FFB10 to H'FFF0F of the H8/3031, and to addresses H'FFD10 to H'FFF0F of the H8/3030 are directed to the on-chip RAM space. When the RAME bit is cleared to 0, accesses to such addresses are directed to the off-chip address space.

13.3.2 Modes 2 and 3

When the RAME bit is set to 1 in modes 2 and 3, accesses to addresses H'F710 to H'FF0F of the H8/3032, to addresses H'FB10 to H'FF0F of the H8/3031, and to addresses H'FD10 to H'FF0F of the H8/3030 are directed to the on-chip RAM space. When the RAME bit is cleared to 0, read accesses to such addresses always return H'FF and write accesses are ignored. Note that these addresses represent the lower 16 bits of the address.

Section 14   ROM

14.1 Overview

The H8/3030 has 16 kbytes of on-chip ROM, the H8/3031 has 32 kbytes, and the H8/3032 has 64 kbytes. The ROM is connected to the CPU by a 16-bit data bus. The CPU accesses both byte data and word data in two states, enabling rapid data transfer.

The PROM version of the H8/3032 can be set to PROM mode and programmed with a general-purpose PROM programmer.

14.1.1 Block Diagram

Figure 14-1 shows a block diagram of the ROM.
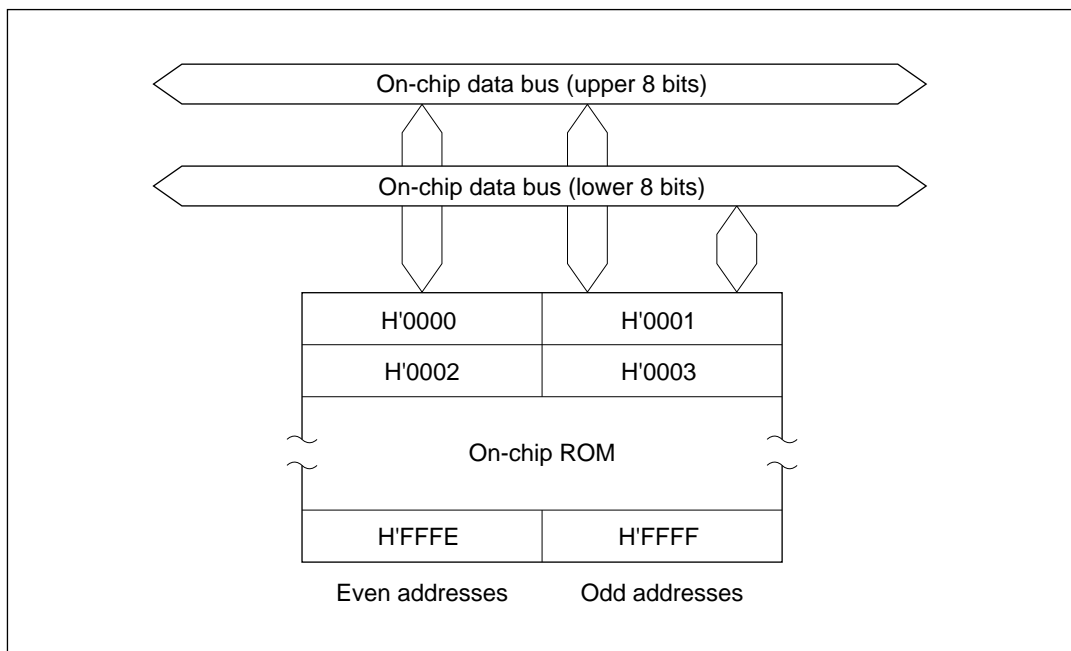

Figure 14-1   ROM Block Diagram (H8/3032)

14.2 PROM Mode

14.2.1 PROM Mode Setting

In PROM mode, the H8/3032 version with on-chip PROM suspends its microcontroller functions, enabling the on-chip PROM to be programmed. The programming method is the same as for the HN27C101, except that page programming is not supported. Table 14-1 indicates how to select PROM mode.

Table 14-1 Selecting PROM Mode

Pins	Setting
Two mode pins (MD_1 and MD_0)	Low
$\overline{STBY}$ pin	
$P5_1$ and $P5_0$	High

14.2.2 Socket Adapter and Memory Map

The PROM is programmed using a general-purpose PROM programmer with a socket adapter to convert to 32 pins. Table 14-2 lists the socket adapter for each package option. Figure 14-2 shows the pin assignments of the socket adapter. Figure 14-3 shows a memory map in PROM mode.

Table 14-2 Socket Adapter

Microcontroller	Package	Socket Adapter
H8/3032	80-pin QFP (FP-80A)	HS3032ESH01H
	80-pin TQFP (TFP-80C)	HS3032ESN01H

The size of the H8/3032 PROM is 64 kbytes. Figure 14-3 shows a memory map in PROM mode. H'FF data should be specified for unused address areas in the on-chip PROM.

When programming the H8/3032 with a PROM programmer, set the address range to H'0000 to H'FFFF and specify H'FF data for addresses H'10000 and up. If H'10000 and higher addresses are programmed by mistake, it may become impossible to program or verify the PROM. Attempts to program in page-programming mode may have the same result.

V_{CC}: V_{CC} voltage level

Read/write specifications are the same as for the standard HN27C101 EPROM, except that page programming is not supported. Do not select page programming mode. A PROM programmer that supports only page-programming mode cannot be used. When selecting a PROM programmer, check that it supports a byte-at-a-time high-speed programming mode. Be sure to set the address range to H'0000 to H'FFFF.

14.3.1 Programming and Verification

An efficient, high-speed programming procedure can be used to program and verify PROM data. This procedure programs the chip quickly without subjecting it to voltage stress and without sacrificing data reliability. Unused address areas contain H'FF data. Figure 14-4 shows the basic high-speed programming flowchart. Tables 14-4 and 14-5 list the electrical characteristics of the chip during programming. Figure 14-5 shows a timing chart.
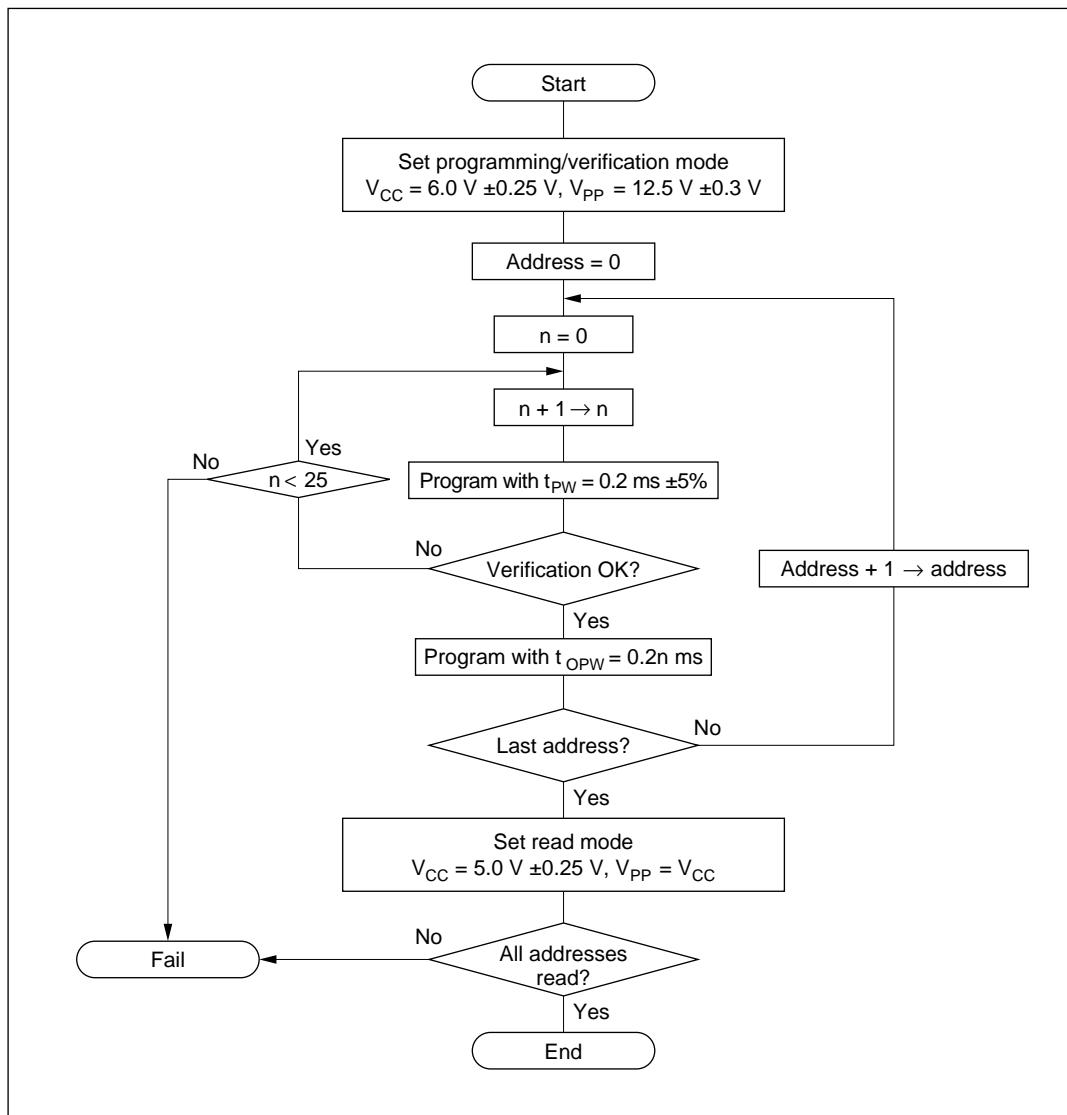

Figure 14-4   High-Speed Programming Flowchart

Table 14-4 DC Characteristics

(Conditions: V_{CC} = 6.0 V ±0.25 V, V_{PP} = 12.5 V ±0.3 V, V_{SS} = 0 V, T_a = 25°C ±5°C)

$\overline{CE}$ setup time	t_{CES}	2	—	—	µs	
Data output delay time	t_{OE}	0	—	150	ns	

Notes: 1. Input pulse level: 0.8 V to 2.2 V
Input rise time and fall time $\leq$ 20 ns
Timing reference levels: 1.0 V and 2.0 V for input; 0.8 V and 2.0 V for output
2. t_{DF} is defined at the point where the output is in the open state and the output level cannot be read.
3. t_{OPW} is defined by the value given in the flowchart.
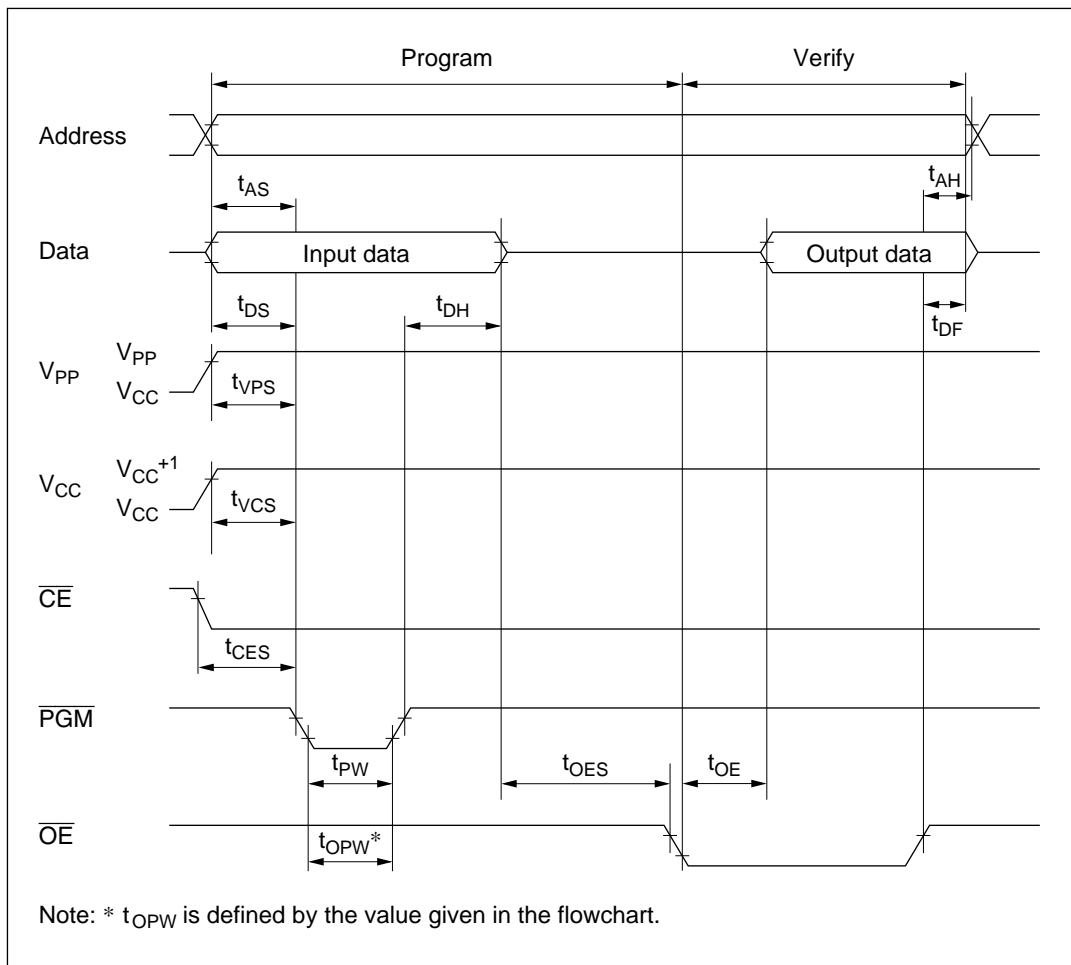

Figure 14-5 PROM Program/Verify Timing

14.3.2 Programming Precautions

- Program with the specified voltages and timing.

  The programming voltage (V_{PP}) in PROM mode is 12.5 V.

  Applied voltages in excess of the rated values can permanently destroy the chip. Be particularly careful about the PROM programmer's overshoot characteristics.

  If the PROM programmer is set to Hitachi HN27C101 specifications, V_{PP} will be 12.5 V.

- Before programming, check that the chip is correctly mounted in the PROM programmer. Overcurrent damage to the chip can result if the index marks on the PROM programmer, socket adapter, and chip are not correctly aligned.

- Don't touch the socket adapter or chip while programming. Touching either of these can cause contact faults and write errors.

- Select the programming mode carefully. The chip cannot be programmed in page programming mode.

- The H8/3032 PROM size is 64 kbytes. Set the address range to H'0000 to H'FFFF. When programming, assign H'FF data to the unused address area (H'10000 to H'1FFFF).

14.4 Reliability of Programmed Data

A highly effective way to improve data retention characteristics is to bake the programmed chips at 150°C, then screen them for data errors. This procedure quickly eliminates chips with PROM memory cells prone to early failure.

Figure 14-6 shows the recommended screening procedure.
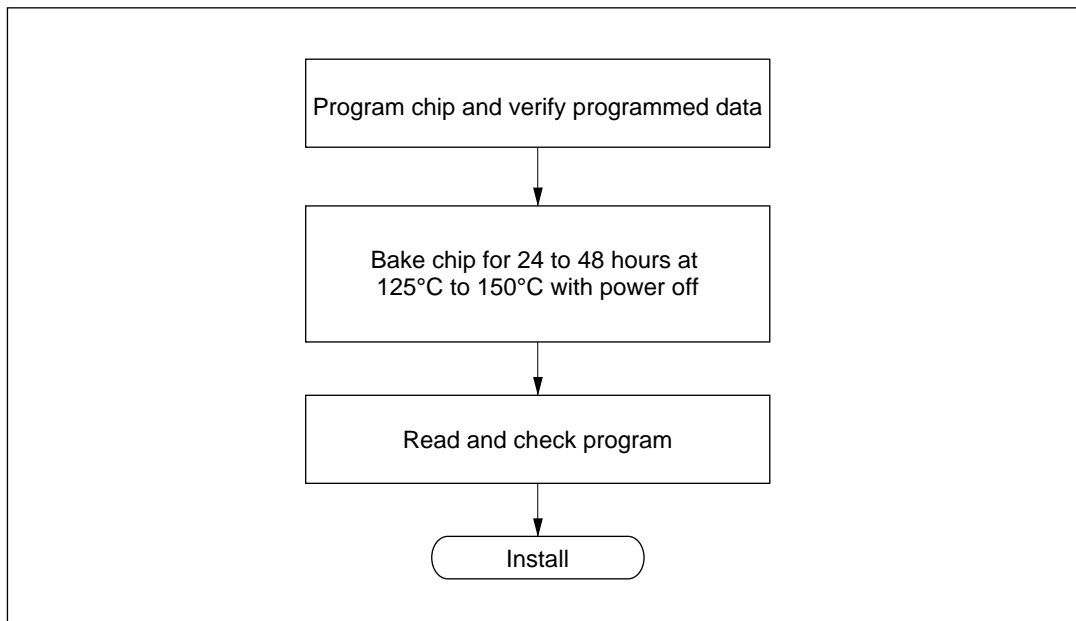

Figure 14-6 Recommended Screening Procedure

If a series of programming errors occurs while the same PROM programmer is in use, stop programming and check the PROM programmer and socket adapter for defects. Please inform Hitachi of any abnormal conditions noted during or after programming or in screening of program data after high-temperature baking.

Section 15   Clock Pulse Generator

15.1 Overview

The H8/3032 Series has a built-in clock pulse generator (CPG) that generates the system clock (ø) and other internal clock signals (ø/2 to ø/4096). The clock pulse generator consists of an oscillator circuit, a duty adjustment circuit, and prescalers.

15.1.1 Block Diagram

Figure 15-1 shows a block diagram of the clock pulse generator.
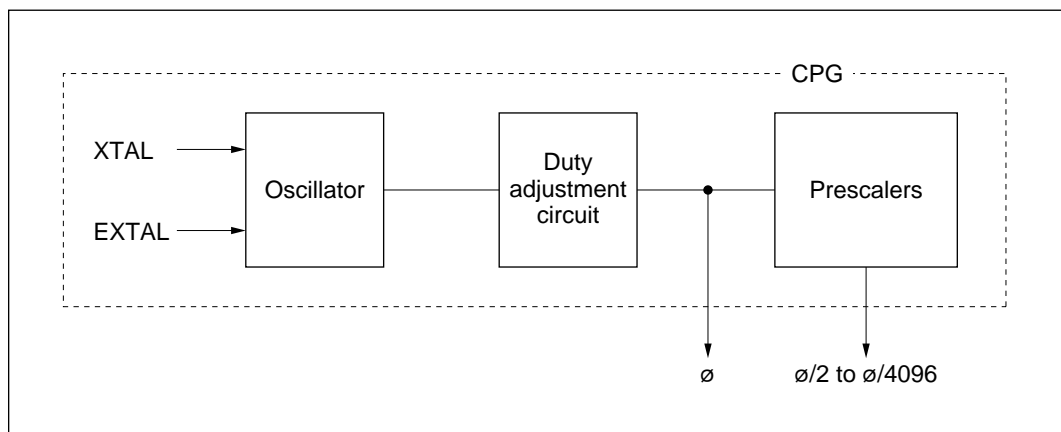

Figure 15-1   Block Diagram of Clock Pulse Generator

15.2 Oscillator Circuit

Clock pulses can be supplied by connecting a crystal resonator, or by input of an external clock signal.

15.2.1 Connecting a Crystal Resonator

Circuit Configuration: A crystal resonator can be connected as in the example in figure 15-2. The damping resistance Rd should be selected according to table 15-1. An AT-cut parallel-resonance crystal should be used.
Figure 15-2   Connection of Crystal Resonator (Example)

Table 15-1   Damping Resistance Value

Frequency (MHz)	2	4	8	10	12	16
Rd (Ω)	1 k	500	200	0	0	0

Crystal Resonator: Figure 15-3 shows an equivalent circuit of the crystal resonator. The crystal resonator should have the characteristics listed in table 15-2.
Figure 15-3   Crystal Resonator Equivalent Circuit

Table 15-2   Crystal Resonator Parameters

Frequency (MHz)	2	4	8	10	12	16
Rs max (Ω)	500	120	80	70	60	50
Co (pF)			7 pF max			

Use a crystal resonator with a frequency equal to the system clock frequency (ø).

Notes on Board Design: When a crystal resonator is connected, the following points should be noted:

Other signal lines should be routed away from the oscillator circuit to prevent induction from interfering with correct oscillation. See figure 15-4.

When the board is designed, the crystal resonator and its load capacitors should be placed as close as possible to the XTAL and EXTAL pins.
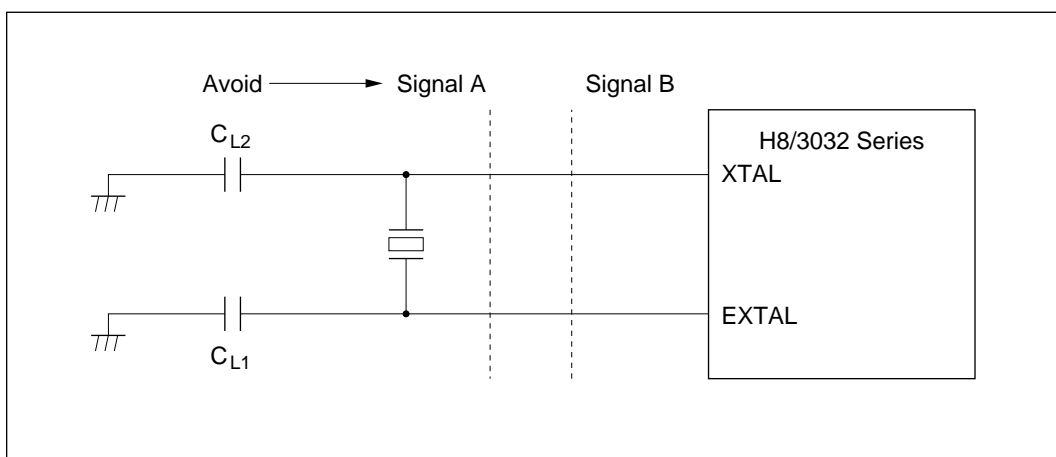

Figure 15-4   Example of Incorrect Board Design

15.2.2 External Clock Input

Circuit Configuration: An external clock signal can be input as shown in the examples in figure 15-5. In example b, the clock should be held high in standby mode.

If the XTAL pin is left open, the stray capacitance should not exceed 10 pF.
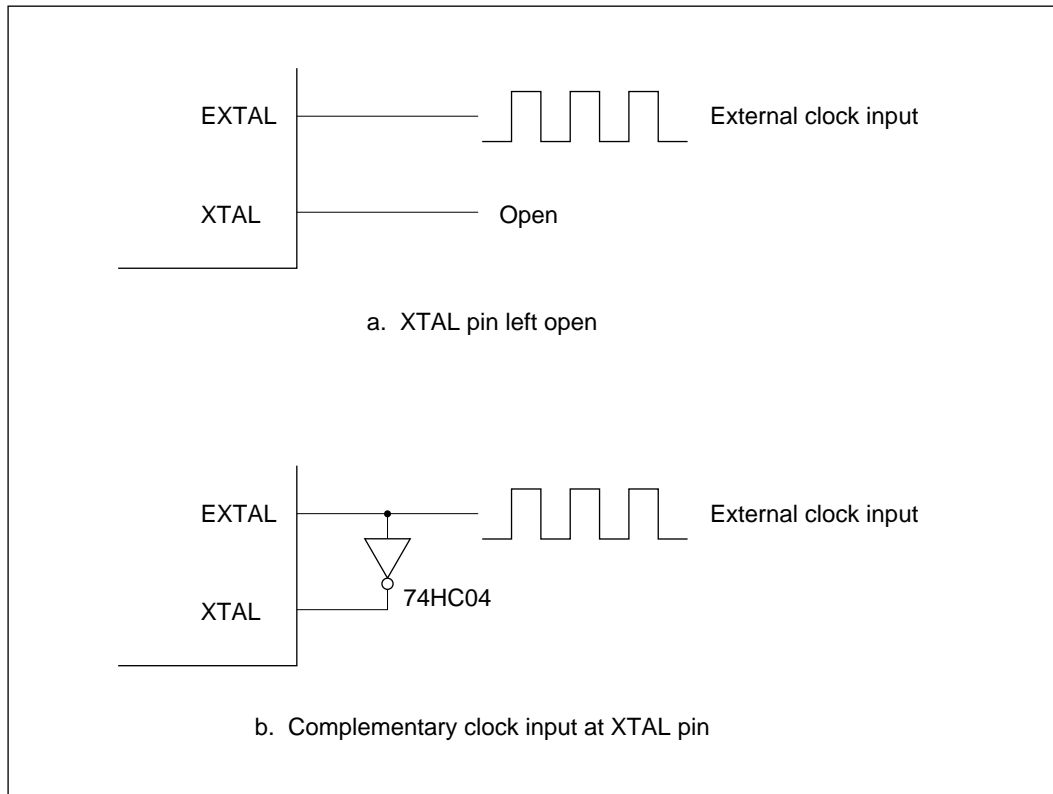

Figure 15-5   External Clock Input (Examples)

External Clock: The external clock frequency should be equal to the system clock frequency (ø). Table 15-3 and figure 15-6 indicate the clock timing.

Table 15-3 Clock Timing

Item	Symbol	V_CC = 2.7 V to 5.5 V		V_CC = 5.0 V ± 10%		Unit	Test Conditions	
		Min	Max	Min	Max			
External clock rise time	t_{EXr}	—	10	—	5	ns	Figure 15-16	
External clock fall time	t_{EXf}	—	10	—	5	ns		
External clock input duty (a/t_cyc)	—	30	70	30	70	%	ø ≥ 5 MHz	Figure 15-6
		40	60	40	60	%	ø < 5 MHz	
ø clock duty (b/t_cyc)	—	40	60	40	60	%	Figure 15-6	
Figure 15-6 External Clock Input Timing

15.3 Duty Adjustment Circuit

When the oscillator frequency is 5 MHz or higher, the duty adjustment circuit adjusts the duty cycle of the clock signal from the oscillator to generate the system clock (ø).

15.4 Prescalers

The prescalers divide the system clock (ø) to generate internal clocks (ø/2 to ø/4096).

Section 16   Power-Down State

16.1 Overview

The H8/3032 Series has a power-down state that greatly reduces power consumption by halting CPU functions. The power-down state includes the following three modes:

- Sleep mode
- Software standby mode
- Hardware standby mode

Table 16-1 indicates the methods of entering and exiting these power-down modes and the status of the CPU and on-chip supporting modules in each mode.

Table 16-1 Power-Down State

Mode	Entering Conditions	State						Exiting Conditions
		Clock	CPU	CPU Registers	Supporting Functions	RAM	I/O Ports	
Sleep mode	SLEEP instruction executed while SSBY = 0 in SYSCR	Active	Halted	Held	Active	Held	Held	• Interrupt • $\overline{\text{RES}}$ • $\overline{\text{STBY}}$
Software standby mode	SLEEP instruction executed while SSBY = 1 in SYSCR	Halted	Halted	Held	Halted and reset	Held	Held	• NMI • $\overline{\text{IRQ}_0}$ to $\overline{\text{IRQ}_2}$ • $\overline{\text{RES}}$ • $\overline{\text{STBY}}$
Hardware standby mode	Low input at $\overline{\text{STBY}}$ pin	Halted	Halted	Undetermined	Halted and reset	Held[*]	High impedance	• $\overline{\text{STBY}}$ • $\overline{\text{RES}}$

Note: * The RAME bit must be cleared to 0 in SYSCR before the transition from the program execution state to hardware standby mode.

Legend
SYSCR: System control register
SSBY: Software standby bit

16.2 Register Configuration

The H8/3032 Series' system control register (SYSCR) controls the power-down state. Table 16-2 summarizes this register.

Table 16-2   Control Register

Address*	Name	Abbreviation	R/W	Initial Value
H'FFF2	System control register	SYSCR	R/W	H'0B

Note: * Lower 16 bits of the address.

User bit enable

Standby timer select 2 to 0
These bits select the
waiting time at exit from
software standby mode

Software standby
Enables transition to
software standby mode

SYSCR is an 8-bit readable/writable register. Bit 7 (SSBY) and bits 6 to 4 (STS2 to STS0) control the power-down state. For information on the other SYSCR bits, see section 3.3, System Control Register.

Bit 7—Software Standby (SSBY): Enables transition to software standby mode. When software standby mode is exited by an external interrupt, this bit remains set to 1 after the return to normal operation. To clear this bit, write 0.

Bit 7 SSBY	Description	
0	SLEEP instruction causes transition to sleep mode	(Initial value)
1	SLEEP instruction causes transition to software standby mode	

Bits 6 to 4—Standby Timer Select (STS2 to STS0): These bits select the length of time the CPU and on-chip supporting modules wait for the clock to settle when software standby mode is exited by an external interrupt. If the clock is generated by a crystal resonator, set these bits according to the clock frequency so that the waiting time will be at least 8 ms. See table 16-3. If an external clock is used, any setting is permitted.

Bit 6 STS2	Bit 5 STS1	Bit 4 STS0	Description	
0	0	0	Waiting time = 8192 states	(Initial value)
		1	Waiting time = 16384 states	
	1	0	Waiting time = 32768 states	
		1	Waiting time = 65536 states	
1	0	—	Waiting time = 131072 states	
	1	—	Illegal setting	

16.3 Sleep Mode

16.3.1 Transition to Sleep Mode

When the SSBY bit is cleared to 0 in the system control register (SYSCR), execution of the SLEEP instruction causes a transition from the program execution state to sleep mode. Immediately after executing the SLEEP instruction the CPU halts, but the contents of its internal registers are retained. The on-chip supporting modules do not halt in sleep mode.

16.3.2 Exit from Sleep Mode

Sleep mode is exited by an interrupt, or by input at the $\overline{\text{RES}}$ or $\overline{\text{STBY}}$ pin.

Exit by Interrupt: An interrupt terminates sleep mode and causes a transition to the interrupt exception handling state. Sleep mode is not exited by an interrupt source in an on-chip supporting module if the interrupt is disabled in the on-chip supporting module. Sleep mode is not exited by an NMI interrupt if masked in the CPU.

Exit by $\overline{\text{RES}}$ Input: Low input at the $\overline{\text{RES}}$ pin exits from sleep mode to the reset state.

Exit by $\overline{\text{STBY}}$ Input: Low input at the $\overline{\text{STBY}}$ pin exits from sleep mode to hardware standby mode.

16.4 Software Standby Mode

16.4.1 Transition to Software Standby Mode

To enter software standby mode, execute the SLEEP instruction while the SSBY bit is set to 1 in SYSCR.

In software standby mode, current dissipation is reduced to an extremely low level because the CPU, clock, and on-chip supporting modules all halt. The on-chip supporting modules are reset. As long as the specified voltage is supplied, however, CPU register contents and on-chip RAM data are retained. The settings of the I/O ports are also held.

16.4.2 Exit from Software Standby Mode

Software standby mode can be exited by input of an external interrupt at the NMI, $\overline{IRQ_0}$, $\overline{IRQ_1}$, or $\overline{IRQ_2}$ pin, or by input at the $\overline{RES}$ or $\overline{STBY}$ pin.

Exit by Interrupt: When an NMI, IRQ_0, IRQ_1, or IRQ_2 interrupt request signal is received, the clock oscillator begins operating. After the oscillator settling time selected by bits STS2 to STS0 in SYSCR, stable clock signals are supplied to the entire H8/3032 Series chip, software standby mode ends, and interrupt exception handling begins. Software standby mode is not exited if the interrupt enable bits of interrupts IRQ_0, IRQ_1, and IRQ_2 are cleared to 0, or if these interrupts are masked in the CPU.

Exit by $\overline{RES}$ Input: When the $\overline{RES}$ input goes low, the clock oscillator starts and clock pulses are supplied immediately to the entire H8/3032 Series chip. The $\overline{RES}$ signal must be held low long enough for the clock oscillator to stabilize. When $\overline{RES}$ goes high, the CPU starts reset exception handling.

Exit by $\overline{STBY}$ Input: Low input at the $\overline{STBY}$ pin causes a transition to hardware standby mode.

16.4.3 Selection of Waiting Time for Exit from Software Standby Mode

Bits STS2 to STS0 in SYSCR should be set as follows.

Crystal Resonator: Set STS2 to STS0 so that the waiting time (for the clock to stabilize) is at least 8 ms. Table 16-3 indicates the waiting times that are selected by STS2 to STS0 settings at various system clock frequencies.

External Clock: Any value may be set in the clock-halving version. Normally the minimum value (STS2 = STS1 = STS0 = 1) is recommended. In the 1:1 clock version, any value other than the minimum value may be set.

Table 16-3 Clock Frequency and Waiting Time for Clock to Settle

STS2	STS1	STS0	Waiting Time	16 MHZ	12 MHz	10 MHz	8 MHz	6 MHz	4 MHz	2 MHz	Unit
0	0	0	8192 states	0.51	0.65	0.8	1.0	1.3	2.0	4.1	ms
0	0	1	16384 states	1.0	1.3	1.6	2.0	2.7	4.1	8.2	
0	1	0	32768 states	2.0	2.7	3.3	4.1	5.5	8.2	16.4	
0	1	1	65536 states	4.1	5.5	6.6	8.2	10.9	16.4	32.8	
1	0	—	131072 states	8.2	10.9	13.1	16.4	21.8	32.8	65.5	
1	1	—				Illegal setting					

☐ : Recommended setting

Note: * This setting cannot be used in the 1:1 clock version.

16.4.4 Sample Application of Software Standby Mode

Figure 16-1 shows an example in which software standby mode is entered at the fall of NMI and exited at the rise of NMI.

With the NMI edge select bit (NMIEG) cleared to 0 in SYSCR (selecting the falling edge), an NMI interrupt occurs. Next the NMIEG bit is set to 1 (selecting the rising edge) and the SSBY bit is set to 1; then the SLEEP instruction is executed to enter software standby mode.

Software standby mode is exited at the next rising edge of the NMI signal .
Figure 16-1   NMI Timing for Software Standby Mode (Example)

16.4.5 Note

The I/O ports retain their existing states in software standby mode. If a port is in the high output state, its output current is not reduced.

16.5 Hardware Standby Mode

16.5.1 Transition to Hardware Standby Mode

Regardless of its current state, the chip enters hardware standby mode whenever the $\overline{STBY}$ pin goes low. Hardware standby mode reduces power consumption drastically by halting all functions of the CPU and on-chip supporting modules. All modules are reset except the on-chip RAM. As long as the specified voltage is supplied, on-chip RAM data is retained. I/O ports are placed in the high-impedance state.

Clear the RAME bit to 0 in SYSCR before $\overline{STBY}$ goes low to retain on-chip RAM data.

The inputs at the mode pins (MD1 to MD0) should not be changed during hardware standby mode.

16.5.2 Exit from Hardware Standby Mode

Hardware standby mode is exited by inputs at the $\overline{STBY}$ and $\overline{RES}$ pins. While $\overline{RES}$ is low, when $\overline{STBY}$ goes high, the clock oscillator starts running. $\overline{RES}$ should be held low long enough for the clock oscillator to settle. When $\overline{RES}$ goes high, reset exception handling begins, followed by a transition to the program execution state.

16.5.3 Timing for Hardware Standby Mode

Figure 16-2 shows the timing relationships for hardware standby mode. To enter hardware standby mode, first drive $\overline{RES}$ low, then drive $\overline{STBY}$ low. To exit hardware standby mode, first drive $\overline{STBY}$ high, wait for the clock to settle, then bring $\overline{RES}$ from low to high.
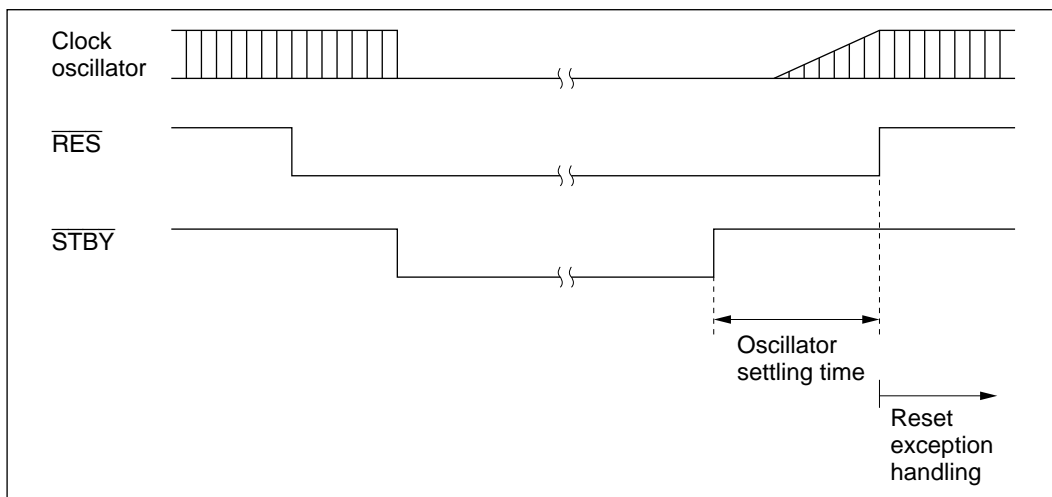

Figure 16-2   Hardware Standby Mode Timing

Section 17   Electrical Characteristics

17.1 Absolute Maximum Ratings

Table 17-1 lists the absolute maximum ratings.

Table 17-1   Absolute Maximum Ratings

—**Preliminary**—

Item	Symbol	Value	Unit
Power supply voltage	V_{CC}	−0.3 to +7.0	V
Programming voltage	V_{PP}	−0.3 to +13.5	V
Input voltage (except port 7)	V_{IN}	−0.3 to V_{CC} +0.3	V
Input voltage (port 7)	V_{IN}	−0.3 to AV_{CC} +0.3	V
Reference voltage	V_{REF}	−0.3 to AV_{CC} +0.3	V
Analog power supply voltage	AV_{CC}	−0.3 to +7.0	V
Analog input voltage	V_{AN}	−0.3 to AV_{CC} +0.3	V
Operating temperature	T_{opr}	Regular specifications: −20 to +75	°C
		Wide-range specifications: −40 to +85	°C
Storage temperature	T_{stg}	−55 to +125	°C

Caution: Permanent damage to the chip may result if absolute maximum ratings are exceeded.

17.2 Electrical Characteristics

17.2.1 DC Characteristics

Table 17-2 lists the DC characteristics. Table 17-3 lists the permissible output currents.

Table 17-2 DC Characteristics

Conditions: V_{CC} = 5.0 V ± 10%, AV_{CC} = 5.0 V ± 10%, V_{REF} = 4.5 V to AV_{CC},
V_{SS} = AV_{SS} = 0 V*, T_a = –20°C to +75°C (regular specifications),
T_a = –40°C to +85°C (wide-range specifications)

Item		Symbol	Min	Typ	Max	Unit	Test Conditions
Schmitt trigger input voltages	Port A,	V_T^-	1.0	—	—	V	
	$P8_0$ to $P8_2$,	V_T^+	—	—	$V_{CC} \times 0.7$	V	
	PB_0 to PB_3	$V_T^+ - V_T^-$	0.4	—	—	V	
Input high voltage	$\overline{RES}$, $\overline{STBY}$, NMI, MD_1, MD_0	V_{IH}	$V_{CC} - 0.7$	—	$V_{CC} + 0.3$	V	
	EXTAL		$V_{CC} \times 0.7$	—	$V_{CC} + 0.3$	V	
	Port 7		2.0	—	$AV_{CC} + 0.3$	V	
	Ports 1, 2, 3, 5, 6, 9, $P8_3$, PB_4 to PB_7		2.0	—	$V_{CC} + 0.3$	V	
Input low voltage	$\overline{RES}$, $\overline{STBY}$, MD_1, MD_0	V_{IL}	–0.3	—	0.5	V	
	NMI, EXTAL, ports 1, 2, 3, 5, 6, 7, 9, $P8_3$, PB_4 to PB_7		–0.3	—	0.8	V	
Output high voltage	All output pins	V_{OH}	$V_{CC} - 0.5$	—	—	V	I_{OH} = −200 µA
			3.5	—	—	V	I_{OH} = −1 mA

Note: * If the A/D converter is not used, do not leave the AV_{CC}, AV_{SS}, and V_{REF} pins open. Connect AV_{CC} and V_{REF} to V_{CC}, and connect AV_{SS} to V_{SS}.

Table 17-2 DC Characteristics (cont)

Conditions: $V_{CC} = 5.0$ V $\pm$ 10%, $AV_{CC} = 5.0$ V $\pm$ 10%, $V_{REF} = 4.5$ V to AV_{CC},
$V_{SS} = AV_{SS} = 0$ V[*1], $T_a = -20°C$ to $+75°C$ (regular specifications),
$T_a = -40°C$ to $+85°C$ (wide-range specifications)

Item		Symbol	Min	Typ	Max	Unit	Test Conditions
Output low voltage	All output pins (except $\overline{RESO}$)	V_{OL}	—	—	0.4	V	$I_{OL} = 1.6$ mA
	Ports 1, 2, 5 and B		—	—	1.0	V	$I_{OL} = 10$ mA
	$\overline{RESO}$		—	—	0.4	V	$I_{OL} = 2.6$ mA
Input leakage current	$\overline{STBY}$, NMI, $\overline{RES}$, MD_1, MD_0	$|I_{IN}|$	—	—	1.0	µA	$V_{IN} = 0.5$ to $V_{CC} - 0.5$ V
	Port 7		—	—	1.0	µA	$V_{IN} = 0.5$ to $AV_{CC} - 0.5$ V
Three-state leakage current (off state)	Ports 1, 2, 3, 4, 5, 6, 8 to B	$|I_{TS1}|$	—	—	1.0	µA	$V_{IN} = 0.5$ to $V_{CC} - 0.5$ V
	$\overline{RESO}$		—	—	10.0	µA	$V_{IN} = 0.5$ to $V_{CC} - 0.5$ V
Input pull-up current	Ports 2 and 5	$-I_P$	50	—	300	µA	$V_{IN} = 0$ V
Input capacitance	NMI	C_{IN}	—	—	50	pF	$V_{IN} = 0$ V
	All input pins except NMI		—	—	15		$f = 1$ MHz $T_a = 25°C$
Current dissipation[*2]	Normal operation	I_{CC}	—	45	60	mA	$f = 16$ MHz
	Sleep mode		—	32	45	mA	$f = 16$ MHz
	Standby mode[*3]		—	0.01	5.0	µA	$T_a \leq 50°C$
			—	—	20.0	µA	$50°C < T_a$

Notes: 1. If the A/D converter is not used, do not leave the AV_{CC}, AV_{SS}, and V_{REF} pins open.
Connect AV_{CC} and V_{REF} to V_{CC}, and connect AV_{SS} to V_{SS}.
2. Current dissipation values are for $V_{IHmin} = V_{CC} - 0.5$ V and $V_{ILmax} = 0.5$ V with all output pins unloaded and the on-chip pull-up transistors in the off state.
3. The values are for $V_{RAM} \leq V_{CC} < 4.5$ V, $V_{IHmin} = V_{CC} \times 0.9$, and $V_{ILmax} = 0.3$ V.

Table 17-2 DC Characteristics (cont)

Conditions: $V_{CC} = 5.0$ V $\pm$ 10%, $AV_{CC} = 5.0$ V $\pm$ 10%, $V_{REF} = 4.5$ V to AV_{CC},
  $V_{SS} = AV_{SS} = 0$ V[*1], $T_a = -20°C$ to $+75°C$ (regular specifications),
  $T_a = -40°C$ to $+85°C$ (wide-range specifications)

Notes: 1. The value is for $4.0 \leq AV_{CC} \leq 5.5$.
2. The value is for $2.7 \leq AV_{CC} < 4.0$.
3. The value is for $3.0 \leq AV_{CC} < 4.0$.
4. The value is for ø ≤ 12 MHz.
5. The value is for ø > 12 MHz.

17.3 Operational Timing

This section shows timing diagrams.

17.3.1 Bus Timing

Bus timing is shown as follows:

- Basic bus cycle: two-state access

   Figure 17-4 shows the timing of the external two-state access cycle.

- Basic bus cycle: three-state access

   Figure 17-5 shows the timing of the external three-state access cycle.

- Basic bus cycle: three-state access with one wait state

   Figure 17-6 shows the timing of the external three-state access cycle with one wait state inserted.
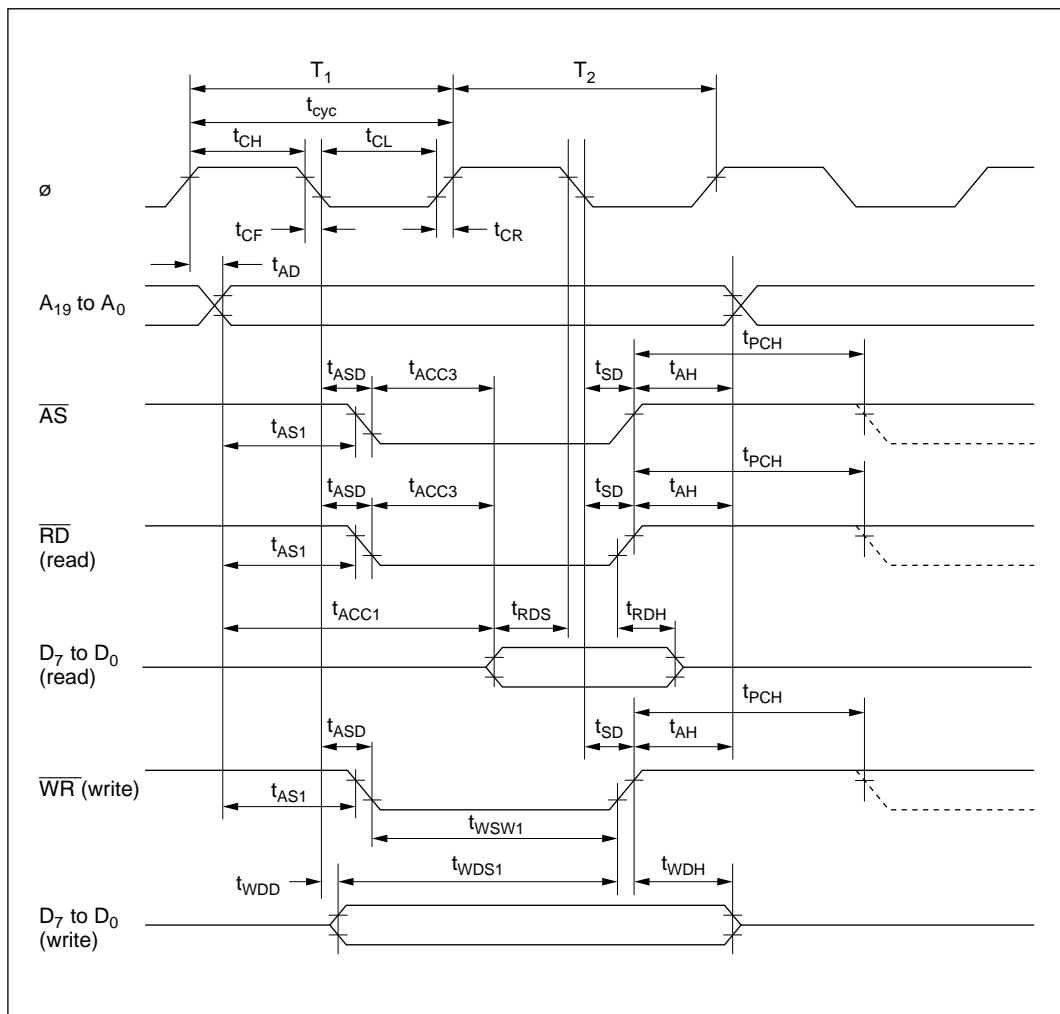

Figure 17-4   Basic Bus Cycle: Two-State Access
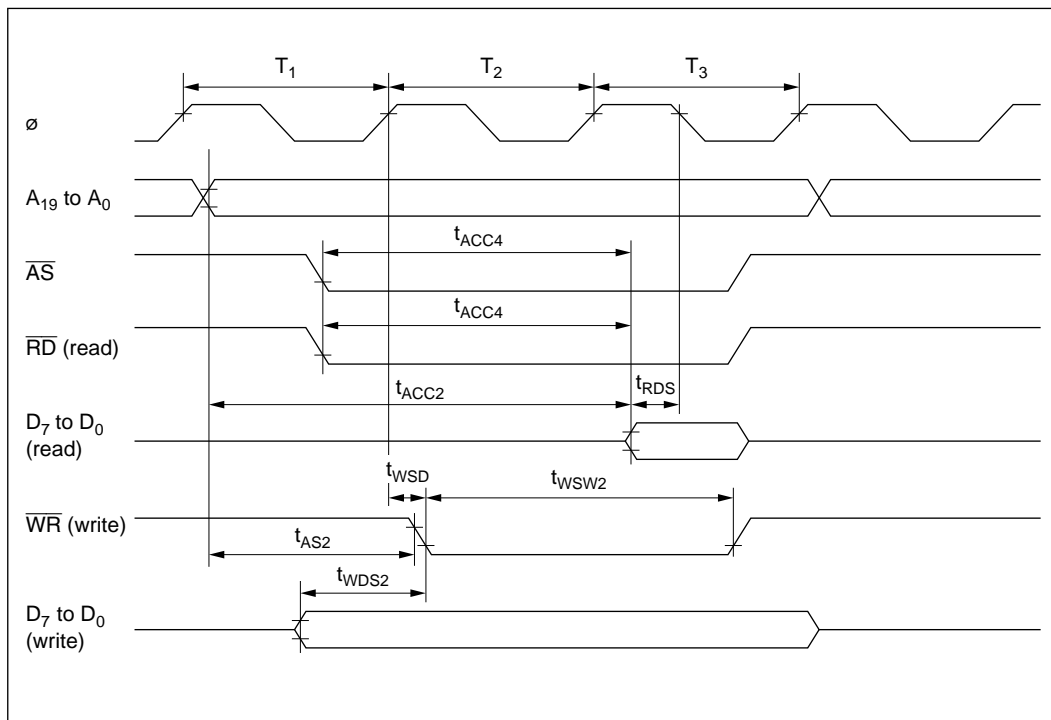

Figure 17-5   Basic Bus Cycle: Three-State Access
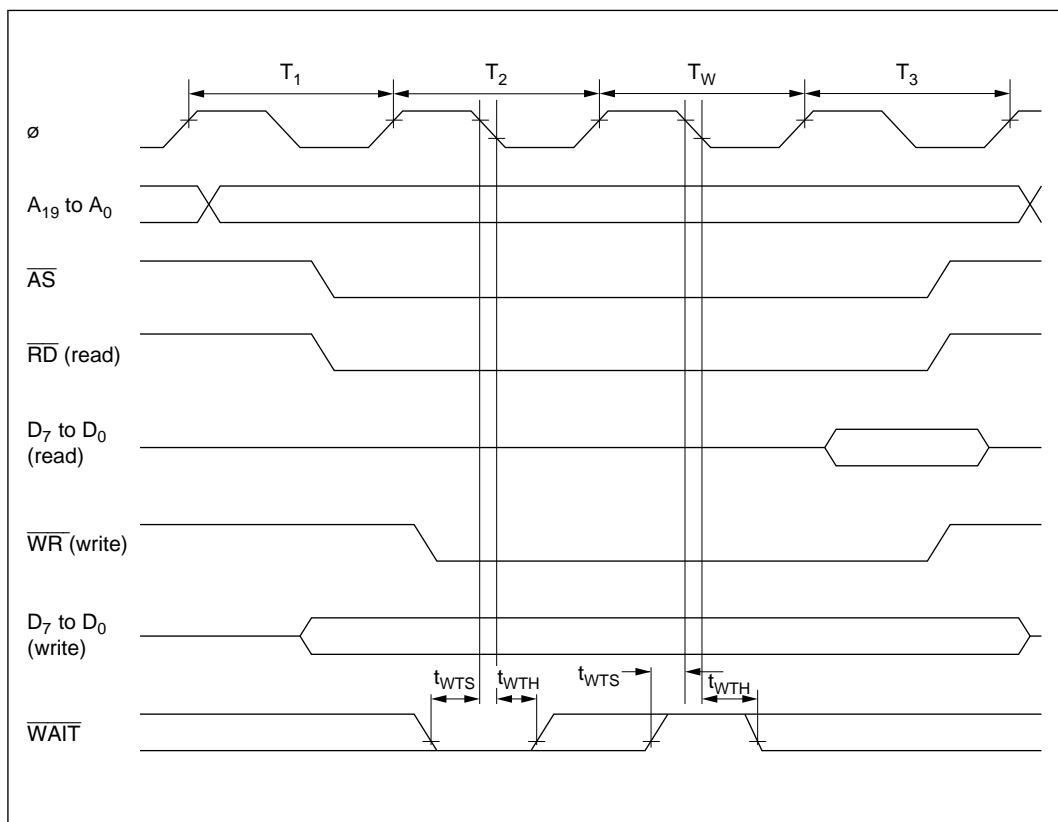

Figure 17-6   Basic Bus Cycle: Three-State Access with One Wait State

17.3.2 Control Signal Timing

Control signal timing is shown as follows:

- Reset input timing

  Figure 17-7 shows the reset input timing.

- Reset output timing

  Figure 17-8 shows the reset output timing.

- Interrupt input timing

  Figure 17-9 shows the input timing for NMI and $\overline{IRQ_4}$ to $\overline{IRQ_0}$.
Figure 17-7   Reset Input Timing
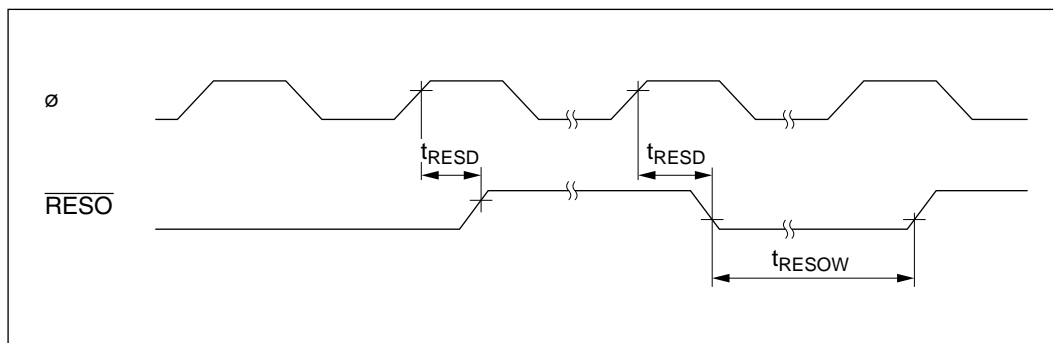

Figure 17-8   Reset Output Timing
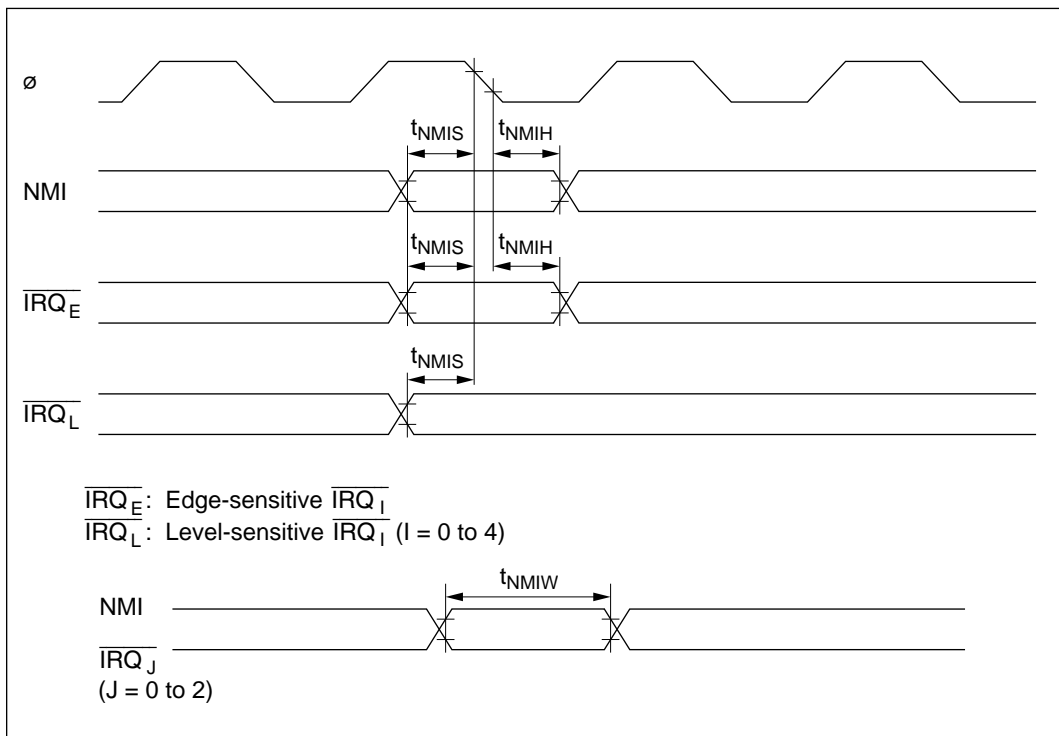

Figure 17-9   Interrupt Input Timing

443

17.3.3 Clock Timing

Clock timing is shown as follows:

* Oscillator settling timing

   Figure 17-10 shows the oscillator settling timing.
Figure 17-10   Oscillator Settling Timing

17.3.4 TPC and I/O Port Timing

TPC and I/O port timing is shown as follows.
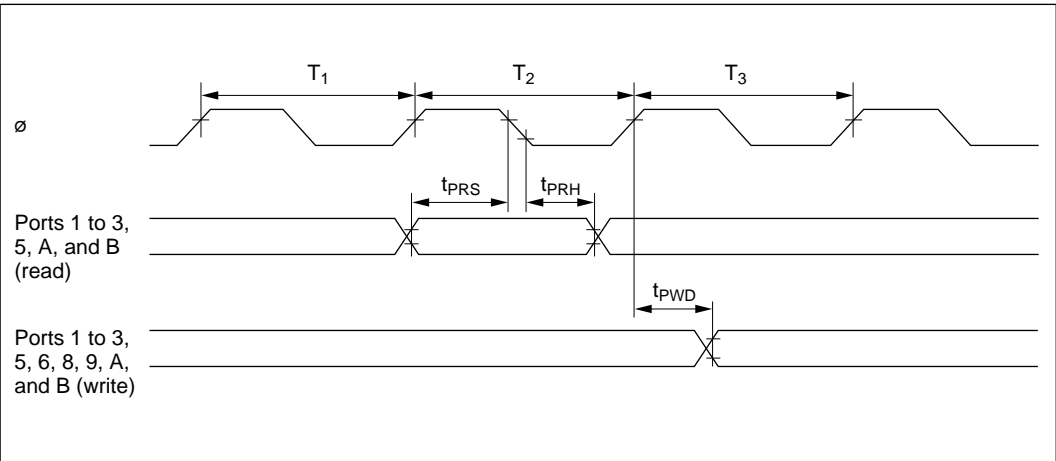

Figure 17-11   TPC and I/O Port Input/Output Timing

17.3.5 ITU Timing

ITU timing is shown as follows:

• ITU input/output timing

  Figure 17-12 shows the ITU input/output timing.

• ITU external clock input timing

  Figure 17-13 shows the ITU external clock input timing.
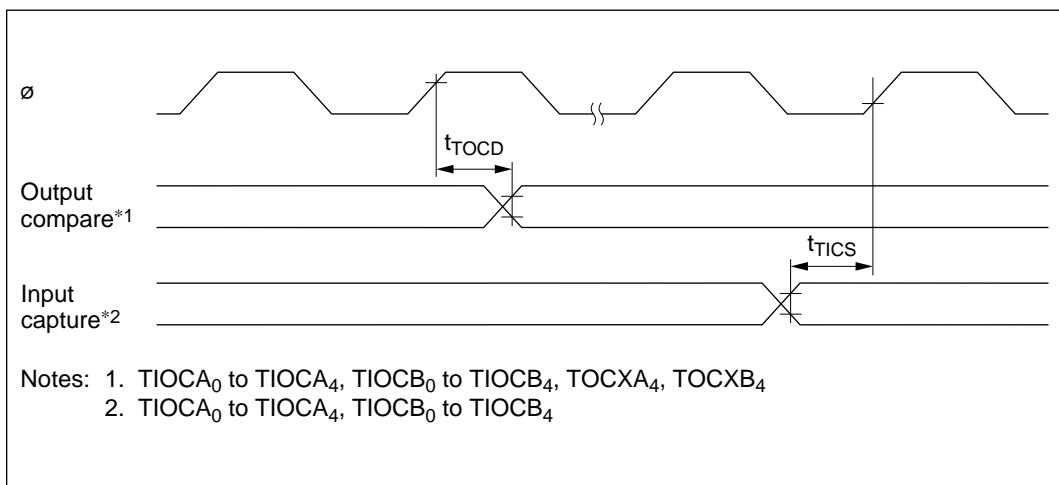

Figure 17-12   ITU Input/Output Timing
Figure 17-13   ITU Clock Input Timing

17.3.6 SCI Input/Output Timing

SCI timing is shown as follows:

•   SCI input clock timing

    Figure 17-14 shows the SCI input clock timing.

•   SCI input/output timing (synchronous mode)

    Figure 17-15 shows the SCI input/output timing in synchronous mode.
Figure 17-14   SCK Input Clock Timing
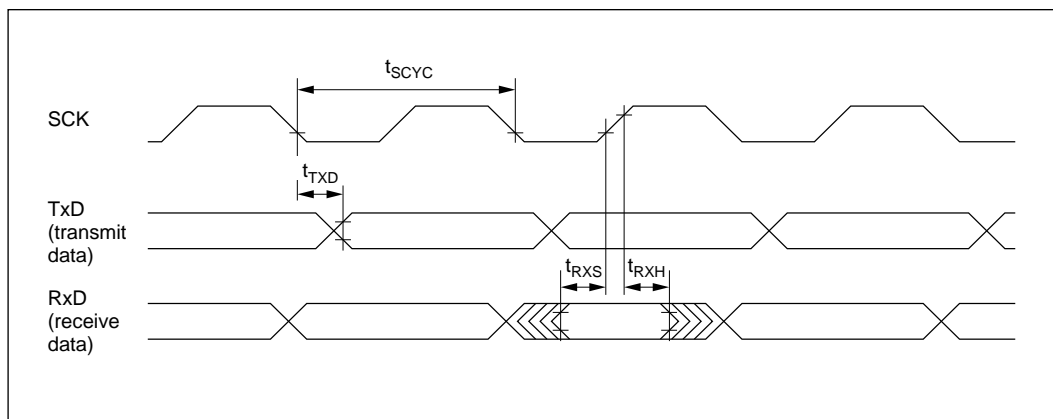

Figure 17-15   SCI Input/Output Timing in Synchronous Mode

Appendix A   Instruction Set

A.1 Instruction List

Operand Notation

Symbol	Description
Rd	General destination register
Rs	General source register
Rn	General register
ERd	General destination register (address register or 32-bit register)
ERs	General source register (address register or 32-bit register)
ERn	General register (32-bit register)
(EAd)	Destination operand
(EAs)	Source operand
PC	Program counter
SP	Stack pointer
CCR	Condition code register
N	N (negative) flag in CCR
Z	Z (zero) flag in CCR
V	V (overflow) flag in CCR
C	C (carry) flag in CCR
disp	Displacement
$\rightarrow$	Transfer from the operand on the left to the operand on the right, or transition from the state on the left to the state on the right
+	Addition of the operands on both sides
−	Subtraction of the operand on the right from the operand on the left
×	Multiplication of the operands on both sides
÷	Division of the operand on the left by the operand on the right
∧	Logical AND of the operands on both sides
∨	Logical OR of the operands on both sides
⊕	Exclusive logical OR of the operands on both sides
¬	NOT (logical complement)
( ), < >	Contents of operand

Note: General registers include 8-bit registers (R0H to R7H and R0L to R7L) and 16-bit registers (R0 to R7 and E0 to E7).

Condition Code Notation

Symbol	Description
↕	Changed according to execution result
*	Undetermined (no guaranteed value)
0	Cleared to 0
1	Set to 1
—	Not affected by execution of the instruction
Δ	Varies depending on conditions, described in notes

Notes: 1. The number of states is the number of states required for execution when the instruction and its operands are located in on-chip memory. For other cases see section A.3, Number of States Required for Execution.

    2. n is the value set in register R4L or R4.

     1 Set to 1 when a carry or borrow occurs at bit 11; otherwise cleared to 0.

     2 Set to 1 when a carry or borrow occurs at bit 27; otherwise cleared to 0.

     3 Retains its previous value when the result is zero; otherwise cleared to 0.

     4 Set to 1 when the adjustment produces a carry; otherwise retains its previous value.

     5 The number of states required for execution of an instruction that transfers data in synchronization with the E clock is variable.

     6 Set to 1 when the divisor is negative; otherwise cleared to 0.

     7 Set to 1 when the divisor is zero; otherwise cleared to 0.

     8 Set to 1 when the quotient is negative; otherwise cleared to 0.

Notes: 1. r is the register designation field.
2. aa is the absolute address field.

A.3 Number of States Required for Execution

The tables in this section can be used to calculate the number of states required for instruction execution by the H8/300H CPU. Table A-3 indicates the number of instruction fetch, data read/write, and other cycles occurring in each instruction. Table A-2 indicates the number of states required per cycle according to the bus size. The number of states required for execution of an instruction can be calculated from these two tables as follows:

Number of states $= I \times S_I + J \times S_J + K \times S_K + L \times S_L + M \times S_M + N \times S_N$

Examples of Calculation of Number of States Required for Execution

Examples: Advanced mode, stack located in external address space, on-chip supporting modules accessed with 8-bit bus width, external devices accessed in three states with one wait state and 16-bit bus width.

BSET #0, @FFFFFC7:8

> From table A-3, $I = L = 2$ and $J = K = M = N = 0$
> From table A-2, $S_I = 4$ and $S_L = 3$
> Number of states $= 2 \times 4 + 2 \times 3 = 14$

JSR @@30

> From table A-3, $I = J = K = 2$ and $L = M = N = 0$
> From table A-2, $S_I = S_J = S_K = 4$
> Number of states $= 2 \times 4 + 2 \times 4 + 2 \times 4 = 24$

Table A-2   Number of States per Cycle

Cycle		On-Chip Memory	On-Chip Supporting Module		External Device			
					8-Bit Bus		16-Bit Bus	
			8-Bit Bus	16-Bit Bus	2-State Access	3-State Access	2-State Access	3-State Access
Instruction fetch	S_I	2	6	3	4	6 + 2m	2	3 + m
Branch address read	S_J							
Stack operation	S_K							
Byte data access	S_L		3		2	3 + m		
Word data access	S_M		6		4	6 + 2m		
Internal operation	S_N	1						

Legend
m: Number of wait states inserted into external device access

B.2 Register Descriptions
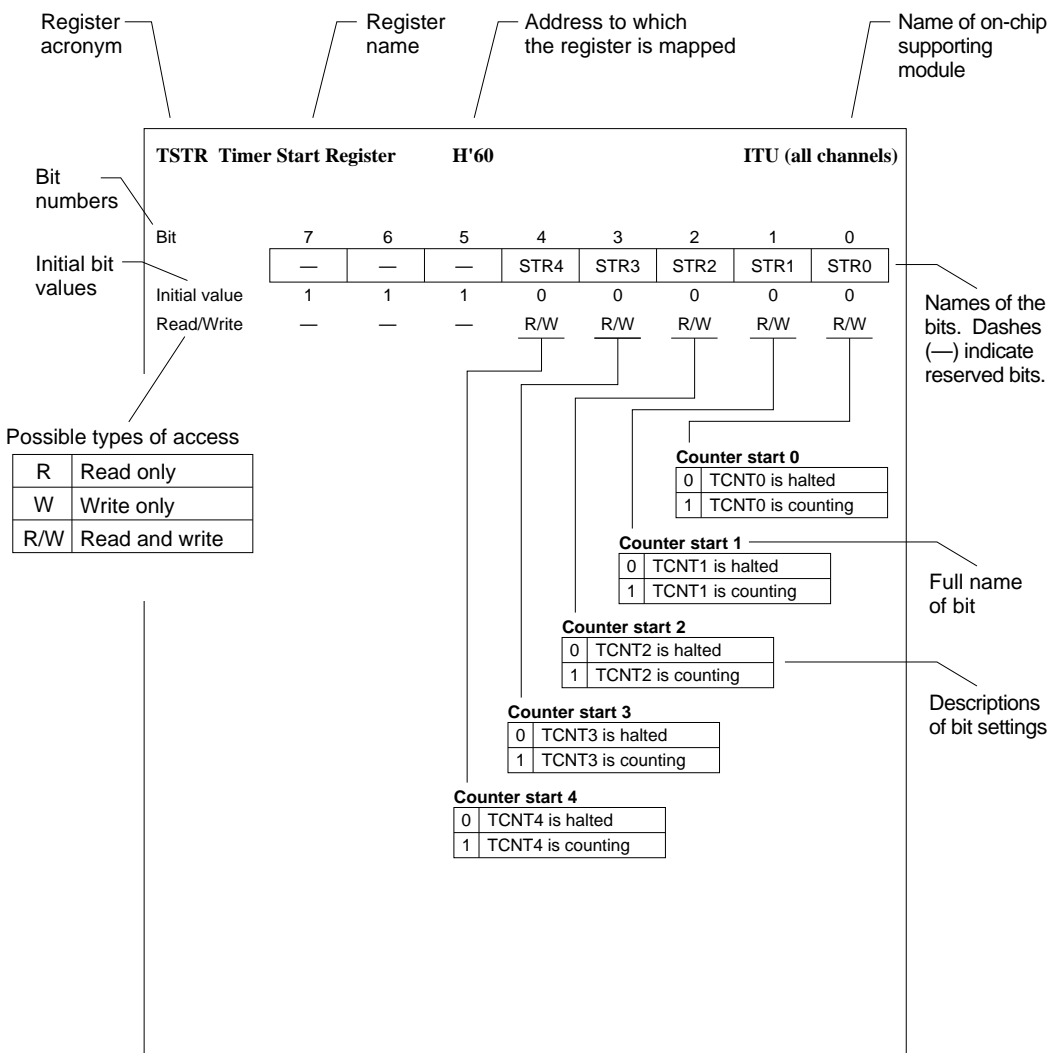

TSTR—Timer Start Register   **H'60**   **ITU (all channels)**

Bit	7	6	5	4	3	2	1	0
	—	—	—	STR4	STR3	STR2	STR1	STR0
Initial value	1	1	1	0	0	0	0	0
Read/Write	—	—	—	R/W	R/W	R/W	R/W	R/W

Counter start 0

0	TCNT0 is halted
1	TCNT0 is counting

Counter start 1

0	TCNT1 is halted
1	TCNT1 is counting

Counter start 2

0	TCNT2 is halted
1	TCNT2 is counting

Counter start 3

0	TCNT3 is halted
1	TCNT3 is counting

Counter start 4

0	TCNT4 is halted
1	TCNT4 is counting
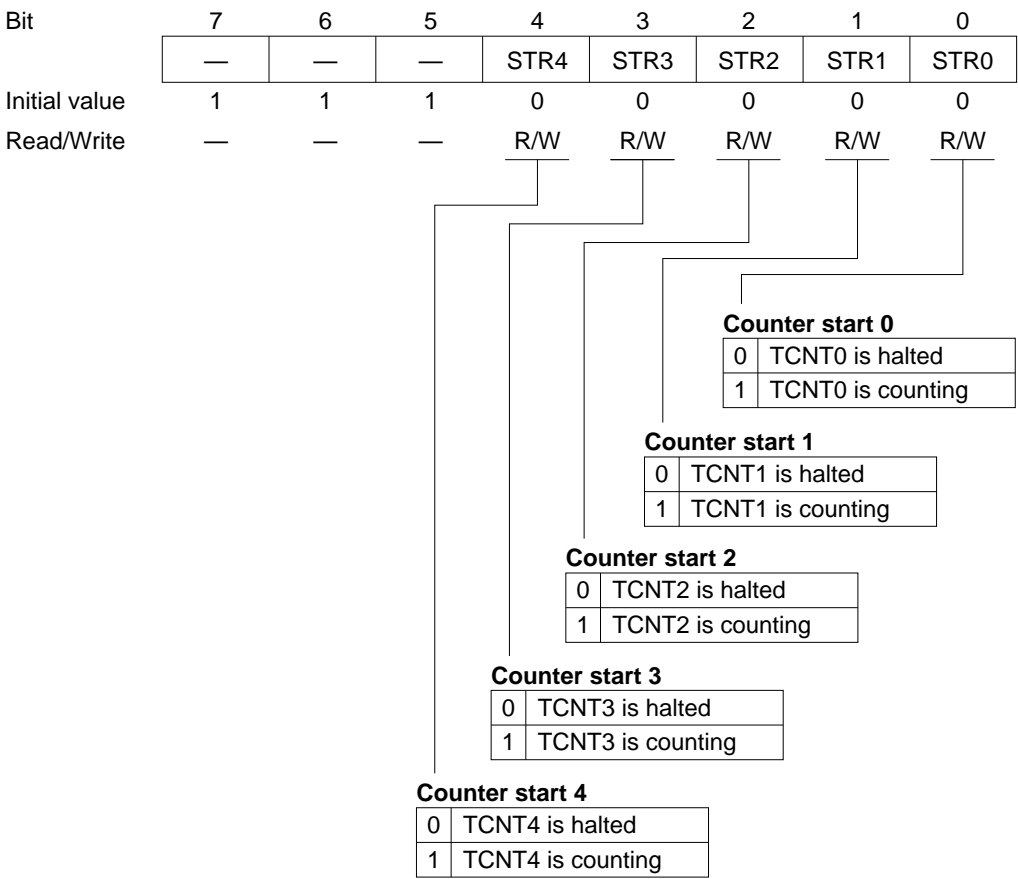

TSNC—Timer Synchro Register **H'61** **ITU (all channels)**

Bit	7	6	5	4	3	2	1	0
	—	—	—	SYNC4	SYNC3	SYNC2	SYNC1	SYNC0
Initial value	1	1	1	0	0	0	0	0
Read/Write	—	—	—	R/W	R/W	R/W	R/W	R/W

Timer sync 0

0	TCNT0 operates independently
1	TCNT0 is synchronized

Timer sync 1

0	TCNT1 operates independently
1	TCNT1 is synchronized

Timer sync 2

0	TCNT2 operates independently
1	TCNT2 is synchronized

Timer sync 3

0	TCNT3 operates independently
1	TCNT3 is synchronized

Timer sync 4

0	TCNT4 operates independently
1	TCNT4 is synchronized

484

Bit	7	6	5	4	3	2	1	0
	—	MDF	FDIR	PWM4	PWM3	PWM2	PWM1	PWM0
Initial value	1	0	0	0	0	0	0	0
Read/Write	—	R/W	R/W	R/W	R/W	R/W	R/W	R/W

PWM mode 0

0	Channel 0 operates normally
1	Channel 0 operates in PWM mode

PWM mode 1

0	Channel 1 operates normally
1	Channel 1 operates in PWM mode

PWM mode 2

0	Channel 2 operates normally
1	Channel 2 operates in PWM mode

PWM mode 3

0	Channel 3 operates normally
1	Channel 3 operates in PWM mode

PWM mode 4

0	Channel 4 operates normally
1	Channel 4 operates in PWM mode

Flag direction

0	OVF is set to 1 in TSR2 when TCNT2 overflows or underflows
1	OVF is set to 1 in TSR2 when TCNT2 overflows

Phase counting mode flag

0	Channel 2 operates normally
1	Channel 2 operates in phase counting mode

485

TFCR—Timer Function Control Register　　　　　　　　**H'63**　　　**ITU (all channels)**

Bit	7	6	5	4	3	2	1	0
	—	—	CMD1	CMD0	BFB4	BFA4	BFB3	BFA3
Initial value	1	1	0	0	0	0	0	0
Read/Write	—	—	R/W	R/W	R/W	R/W	R/W	R/W

Buffer mode A3

0	GRA3 operates normally
1	GRA3 is buffered by BRA3

Buffer mode B3

0	GRB3 operates normally
1	GRB3 is buffered by BRB3

Buffer mode A4

0	GRA4 operates normally
1	GRA4 is buffered by BRA4

Buffer mode B4

0	GRB4 operates normally
1	GRB4 is buffered by BRB4

Combination mode 1 and 0

Bit 5	Bit 4	
CMD1	CMD0	Operating Mode of Channels 3 and 4
0	0	Channels 3 and 4 operate normally
	1	
1	0	Channels 3 and 4 operate together in complementary PWM mode
	1	Channels 3 and 4 operate together in reset-synchronized PWM mode

Bit	7	6	5	4	3	2	1	0
	—	CCLR1	CCLR0	CKEG1	CKEG0	TPSC2	TPSC1	TPSC0
Initial value	1	0	0	0	0	0	0	0
Read/Write	—	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Timer prescaler 2 to 0

Bit 2	Bit 1	Bit 0	
TPSC2	TPSC1	TPSC0	TCNT Clock Source
0	0	0	Internal clock: ø
		1	Internal clock: ø/2
	1	0	Internal clock: ø/4
		1	Internal clock: ø/8
1	0	0	External clock A: TCLKA input
		1	External clock B: TCLKB input
	1	0	External clock C: TCLKC input
		1	External clock D: TCLKD input

Clock edge 1 and 0

Bit 4	Bit 3	
CKEG1	CKEG0	Counted Edges of External Clock
0	0	Rising edges counted
	1	Falling edges counted
1	—	Both edges counted

Counter clear 1 and 0

Bit 6	Bit 5	
CCLR1	CCLR0	TCNT Clear Source
0	0	TCNT is not cleared
	1	TCNT is cleared by GRA compare match or input capture
1	0	TCNT is cleared by GRB compare match or input capture
	1	Synchronous clear: TCNT is cleared in synchronization with other synchronized timers

Bit	7	6	5	4	3	2	1	0
	—	IOB2	IOB1	IOB0	—	IOA2	IOA1	IOA0
Initial value	1	0	0	0	1	0	0	0
Read/Write	—	R/W	R/W	R/W	—	R/W	R/W	R/W

I/O control A2 to A0

Bit 2	Bit 1	Bit 0		
IOA2	IOA1	IOA0	GRA Function	
0	0	0	GRA is an output compare register	No output at compare match
		1		0 output at GRA compare match
	1	0		1 output at GRA compare match
		1		Output toggles at GRA compare match
1	0	0	GRA is an input capture register	GRA captures rising edge of input
		1		GRA captures falling edge of input
	1	0		GRA captures both edges of input
		1		

I/O control B2 to B0

Bit 6	Bit 5	Bit 4		
IOB2	IOB1	IOB0	GRB Function	
0	0	0	GRB is an output compare register	No output at compare match
		1		0 output at GRB compare match
	1	0		1 output at GRB compare match
		1		Output toggles at GRB compare match
1	0	0	GRB is an input capture register	GRB captures rising edge of input
		1		GRB captures falling edge of input
	1	0		GRB captures both edges of input
		1		

TIER0—Timer Interrupt Enable Register 0　　　　　　　　**H'66**　　　　　　**ITU0**

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	OVIE	IMIEB	IMIEA
Initial value	1	1	1	1	1	0	0	0
Read/Write	—	—	—	—	—	R/W	R/W	R/W

Input capture/compare match interrupt enable A

0	IMIA interrupt requested by IMFA is disabled
1	IMIA interrupt requested by IMFA is enabled

Input capture/compare match interrupt enable B

0	IMIB interrupt requested by IMFB is disabled
1	IMIB interrupt requested by IMFB is enabled

Overflow interrupt enable

0	OVI interrupt requested by OVF is disabled
1	OVI interrupt requested by OVF is enabled

TSR0—Timer Status Register 0   **H'67**   **ITU0**

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	OVF	IMFB	IMFA
Initial value	1	1	1	1	1	0	0	0
Read/Write	—	—	—	—	—	R/(W)*	R/(W)*	R/(W)*

Input capture/compare match flag A

0	[Clearing condition]
	Read IMFA when IMFA = 1, then write 0 in IMFA
1	[Setting conditions]
	TCNT = GRA when GRA functions as a compare match register.
	TCNT value is transferred to GRA by an input capture signal, when GRA functions as an input capture register.

Input capture/compare match flag B

0	[Clearing condition]
	Read IMFB when IMFB = 1, then write 0 in IMFB
1	[Setting conditions]
	TCNT = GRB when GRB functions as a compare match register.
	TCNT value is transferred to GRB by an input capture signal, when GRB functions as an input capture register.

Overflow flag

0	[Clearing condition]
	Read OVF when OVF = 1, then write 0 in OVF
1	[Setting condition]
	TCNT overflowed from H'FFFF to H'0000

Note: * Only 0 can be written, to clear the flag.

490

TCNT0 H/L—Timer Counter 0 H/L **H'68, H'69** **ITU0**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Up-counter

GRA0 H/L—General Register A0 H/L **H'6A, H'6B** **ITU0**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Output compare or input capture register

GRB0 H/L—General Register B0 H/L **H'6C, H'6D** **ITU0**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Output compare or input capture register

TCR1—Timer Control Register 1 **H'6E** **ITU1**

Bit	7	6	5	4	3	2	1	0
	—	CCLR1	CCLR0	CKEG1	CKEG0	TPSC2	TPSC1	TPSC0
Initial value	1	0	0	0	0	0	0	0
Read/Write	—	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: Bit functions are the same as for ITU0.

TIOR1—Timer I/O Control Register 1　　　　　　　　　**H'6F**　　　　**ITU1**

Bit	7	6	5	4	3	2	1	0
	—	IOB2	IOB1	IOB0	—	IOA2	IOA1	IOA0
Initial value	1	0	0	0	1	0	0	0
Read/Write	—	R/W	R/W	R/W	—	R/W	R/W	R/W

Note: Bit functions are the same as for ITU0.

TIER1—Timer Interrupt Enable Register 1　　　　　　**H'70**　　　　**ITU1**

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	OVIE	IMIEB	IMIEA
Initial value	1	1	1	1	1	0	0	0
Read/Write	—	—	—	—	—	R/W	R/W	R/W

Note: Bit functions are the same as for ITU0.

TSR1—Timer Status Register 1　　　　　　　　　　　**H'71**　　　　**ITU1**

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	OVF	IMFB	IMFA
Initial value	1	1	1	1	1	0	0	0
Read/Write	—	—	—	—	—	R/(W)*	R/(W)*	R/(W)*

Notes: Bit functions are the same as for ITU0.
　　　* Only 0 can be written, to clear the flag.

TCNT1 H/L—Timer Counter 1 H/L　　　　　　　　　**H'72, H'73**　　**ITU1**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: Bit functions are the same as for ITU0.

GRA1 H/L—General Register A1 H/L   **H'74, H'75**   **ITU1**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: Bit functions are the same as for ITU0.

GRB1 H/L—General Register B1 H/L   **H'76, H'77**   **ITU1**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: Bit functions are the same as for ITU0.

TCR2—Timer Control Register 2   **H'78**   **ITU2**

Bit	7	6	5	4	3	2	1	0
	—	CCLR1	CCLR0	CKEG1	CKEG0	TPSC2	TPSC1	TPSC0
Initial value	1	0	0	0	0	0	0	0
Read/Write	—	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Notes: 1. Bit functions are the same as for ITU0.
2. When channel 2 is used in phase counting mode, the counter clock source selection by bits TPSC2 to TPSC0 is ignored.

Bit	7	6	5	4	3	2	1	0
	—	IOB2	IOB1	IOB0	—	IOA2	IOA1	IOA0
Initial value	1	0	0	0	1	0	0	0
Read/Write	—	R/W	R/W	R/W	—	R/W	R/W	R/W

Note: Bit functions are the same as for ITU0.

TIER2—Timer Interrupt Enable Register 2 H'7A ITU2

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	OVIE	IMIEB	IMIEA
Initial value	1	1	1	1	1	0	0	0
Read/Write	—	—	—	—	—	R/W	R/W	R/W

Note: Bit functions are the same as for ITU0.

TSR2—Timer Status Register 2 H'7B ITU2

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	OVF	IMFB	IMFA
Initial value	1	1	1	1	1	0	0	0
Read/Write	—	—	—	—	—	R/(W)*	R/(W)*	R/(W)*

Bit functions are the same as for ITU0.

Overflow flag

0	[Clearing condition] Read OVF when OVF = 1, then write 0 in OVF
1	[Setting condition] TCNT overflowed from H'FFFF to H'0000 or underflowed from H'0000 to H'FFFF

Note: * Only 0 can be written, to clear the flag.

TCNT2 H/L—Timer Counter 2 H/L H'7C, H'7D ITU2

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Phase counting mode: up/down counter
Other modes: up-counter

GRA2 H/L—General Register A2 H/L   **H'7E, H'7F**   **ITU2**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: Bit functions are the same as for ITU0.

GRB2 H/L—General Register B2 H/L   **H'80, H'81**   **ITU2**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: Bit functions are the same as for ITU0.

TCR3—Timer Control Register 3   **H'82**   **ITU3**

Bit	7	6	5	4	3	2	1	0
	—	CCLR1	CCLR0	CKEG1	CLEG0	TPSC2	TPSC1	TPSC0
Initial value	1	0	0	0	0	0	0	0
Read/Write	—	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: Bit functions are the same as for ITU0.

TIOR3—Timer I/O Control Register 3   **H'83**   **ITU3**

Bit	7	6	5	4	3	2	1	0
	—	IOB2	IOB1	IOB0	—	IOA2	IOA1	IOA0
Initial value	1	0	0	0	1	0	0	0
Read/Write	—	R/W	R/W	R/W	—	R/W	R/W	R/W

Note: Bit functions are the same as for ITU0.

TIER3—Timer Interrupt Enable Register 3 **H'84** **ITU3**

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	OVIE	IMIEB	IMIEA
Initial value	1	1	1	1	1	0	0	0
Read/Write	—	—	—	—	—	R/W	R/W	R/W

Note: Bit functions are the same as for ITU0.

TSR3—Timer Status Register 3 **H'85** **ITU3**

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	OVF	IMFB	IMFA
Initial value	1	1	1	1	1	0	0	0
Read/Write	—	—	—	—	—	R/(W)*	R/(W)*	R/(W)*

Bit functions are the
same as for ITU0

Overflow flag

0	[Clearing condition]
	Read OVF when OVF = 1, then write 0 in OVF
1	[Setting condition]
	TCNT overflowed from H'FFFF to H'0000 or underflowed from H'0000 to H'FFFF

Note: * Only 0 can be written, to clear the flag.

TCNT3 H/L—Timer Counter 3 H/L **H'86, H'87** **ITU3**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Complementary PWM mode: up/down counter
Other modes: up-counter

497

GRA3 H/L—General Register A3 H/L **H'88, H'89** **ITU3**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Output compare or input capture register (can be buffered)

GRB3 H/L—General Register B3 H/L **H'8A, H'8B** **ITU3**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Output compare or input capture register (can be buffered)

BRA3 H/L—Buffer Register A3 H/L **H'8C, H'8D** **ITU3**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Used to buffer GRA

BRB3 H/L—Buffer Register B3 H/L **H'8E, H'8F** **ITU3**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Used to buffer GRB

TOER—Timer Output Enable Register **H'90** **ITU (all channels)**

Bit	7	6	5	4	3	2	1	0
	—	—	EXB4	EXA4	EB3	EB4	EA4	EA3
Initial value	1	1	1	1	1	1	1	1
Read/Write	—	—	R/W	R/W	R/W	R/W	R/W	R/W

Master enable TIOCA3

0	$TIOCA_3$ output is disabled regardless of TIOR3, TMDR, and TFCR settings
1	$TIOCA_3$ is enabled for output according to TIOR3, TMDR, and TFCR settings

Master enable TIOCA4

0	$TIOCA_4$ output is disabled regardless of TIOR4, TMDR, and TFCR settings
1	$TIOCA_4$ is enabled for output according to TIOR4, TMDR, and TFCR settings

Master enable TIOCB4

0	$TIOCB_4$ output is disabled regardless of TIOR4 and TFCR settings
1	$TIOCB_4$ is enabled for output according to TIOR4 and TFCR settings

Master enable TIOCB3

0	$TIOCB_3$ output is disabled regardless of TIOR3 and TFCR settings
1	$TIOCB_3$ is enabled for output according to TIOR3 and TFCR settings

Master enable TOCXA4

0	$TOCXA_4$ output is disabled regardless of TFCR settings
1	$TOCXA_4$ is enabled for output according to TFCR settings

Master enable TOCXB4

0	$TOCXB_4$ output is disabled regardless of TFCR settings
1	$TOCXB_4$ is enabled for output according to TFCR settings

TOCR—Timer Output Control Register H'91 **ITU (all channels)**

Bit	7	6	5	4	3	2	1	0
	—	—	—	XTGD	—	—	OLS4	OLS3
Initial value	1	1	1	1	1	1	1	1
Read/Write	—	—	—	R/W	—	—	R/W	R/W

Output level select 3

0	$TIOCB_3$, $TOCXA_4$, and $TOCXB_4$ outputs are inverted
1	$TIOCB_3$, $TOCXA_4$, and $TOCXB_4$ outputs are not inverted

Output level select 4

0	$TIOCA_3$, $TIOCA_4$, and $TIOCB_4$ outputs are inverted
1	$TIOCA_3$, $TIOCA_4$, and $TIOCB_4$ outputs are not inverted

External trigger disable

0	Input capture A in channel 1 is used as an external trigger signal in reset-synchronized PWM mode and complementary PWM mode*
1	External triggering is disabled

Note: * When an external trigger occurs, bits 5 to 0 in TOER are cleared to 0, disabling ITU output.

TCR4—Timer Control Register 4   **H'92**   **ITU4**

Bit	7	6	5	4	3	2	1	0
	—	CCLR1	CCLR0	CKEG1	CKEG0	TPSC2	TPSC1	TPSC0
Initial value	1	0	0	0	0	0	0	0
Read/Write	—	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: Bit functions are the same as for ITU0.

TIOR4—Timer I/O Control Register 4   **H'93**   **ITU4**

Bit	7	6	5	4	3	2	1	0
	—	IOB2	IOB1	IOB0	—	IOA2	IOA1	IOA0
Initial value	1	0	0	0	1	0	0	0
Read/Write	—	R/W	R/W	R/W	—	R/W	R/W	R/W

Note: Bit functions are the same as for ITU0.

TIER4—Timer Interrupt Enable Register 4   **H'94**   **ITU4**

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	OVIE	IMIEB	IMIEA
Initial value	1	1	1	1	1	0	0	0
Read/Write	—	—	—	—	—	R/W	R/W	R/W

Note: Bit functions are the same as for ITU0.

TSR4—Timer Status Register 4   **H'95**   **ITU4**

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	OVF	IMFB	IMFA
Initial value	1	1	1	1	1	0	0	0
Read/Write	—	—	—	—	—	R/(W)*	R/(W)*	R/(W)*

Notes: Bit functions are the same as for ITU0.
    * Only 0 can be written, to clear the flag.

TCNT4 H/L—Timer Counter 4 H/L H'96, H'97 ITU4

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: Bit functions are the same as for ITU3.

GRA4 H/L—General Register A4 H/L H'98, H'99 ITU4

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: Bit functions are the same as for ITU3.

GRB4 H/L—General Register B4 H/L H'9A, H'9B ITU4

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: Bit functions are the same as for ITU3.

BRA4 H/L—Buffer Register A4 H/L H'9C, H'9D ITU4

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: Bit functions are the same as for ITU3.

BRB4 H/L—Buffer Register B4 H/L　　　　　　　　　　**H'9E, H'9F**　　　　　**ITU4**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: Bit functions are the same as for ITU3.

TPMR—TPC Output Mode Register　　　　　　　　　　**H'A0**　　　　　　　**TPC**

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	G3NOV	G2NOV	G1NOV	G0NOV
Initial value	1	1	1	1	0	0	0	0
Read/Write	—	—	—	—	R/W	R/W	R/W	R/W

Group 0 non-overlap

0	Normal TPC output in group 0. Output values change at compare match A in the selected ITU channel.
1	Non-overlapping TPC output in group 0, controlled by compare match A and B in the selected ITU channel

Group 1 non-overlap

0	Normal TPC output in group 1. Output values change at compare match A in the selected ITU channel.
1	Non-overlapping TPC output in group 1, controlled by compare match A and B in the selected ITU channel

Group 2 non-overlap

0	Normal TPC output in group 2. Output values change at compare match A in the selected ITU channel.
1	Non-overlapping TPC output in group 2, controlled by compare match A and B in the selected ITU channel

Group 3 non-overlap

0	Normal TPC output in group 3. Output values change at compare match A in the selected ITU channel.
1	Non-overlapping TPC output in group 3, controlled by compare match A and B in the selected ITU channel

TPCR—TPC Output Control Register H'A1 **TPC**

Bit	7	6	5	4	3	2	1	0
	G3CMS1	G3CMS0	G2CMS1	G2CMS0	G1CMS1	G1CMS0	G0CMS1	G0CMS0
Initial value	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Group 0 compare match select 1 and 0

Bit 1	Bit 0	
G0CMS1	G0CMS0	ITU Channel Selected as Output Trigger
0	0	TPC output group 0 (TP_3 to TP_0) is triggered by compare match in ITU channel 0
	1	TPC output group 0 (TP_3 to TP_0) is triggered by compare match in ITU channel 1
1	0	TPC output group 0 (TP_3 to TP_0) is triggered by compare match in ITU channel 2
	1	TPC output group 0 (TP_3 to TP_0) is triggered by compare match in ITU channel 3

Group 1 compare match select 1 and 0

Bit 3	Bit 2	
G1CMS1	G1CMS0	ITU Channel Selected as Output Trigger
0	0	TPC output group 1 (TP_7 to TP_4) is triggered by compare match in ITU channel 0
	1	TPC output group 1 (TP_7 to TP_4) is triggered by compare match in ITU channel 1
1	0	TPC output group 1 (TP_7 to TP_4) is triggered by compare match in ITU channel 2
	1	TPC output group 1 (TP_7 to TP_4) is triggered by compare match in ITU channel 3

Group 2 compare match select 1 and 0

Bit 5	Bit 4	
G2CMS1	G2CMS0	ITU Channel Selected as Output Trigger
0	0	TPC output group 2 (TP_{11} to TP_8) is triggered by compare match in ITU channel 0
	1	TPC output group 2 (TP_{11} to TP_8) is triggered by compare match in ITU channel 1
1	0	TPC output group 2 (TP_{11} to TP_8) is triggered by compare match in ITU channel 2
	1	TPC output group 2 (TP_{11} to TP_8) is triggered by compare match in ITU channel 3

Group 3 compare match select 1 and 0

Bit 7	Bit 6	
G3CMS1	G3CMS0	ITU Channel Selected as Output Trigger
0	0	TPC output group 3 (TP_{15} to TP_{12}) is triggered by compare match in ITU channel 0
	1	TPC output group 3 (TP_{15} to TP_{12}) is triggered by compare match in ITU channel 1
1	0	TPC output group 3 (TP_{15} to TP_{12}) is triggered by compare match in ITU channel 2
	1	TPC output group 3 (TP_{15} to TP_{12}) is triggered by compare match in ITU channel 3

NDERB—Next Data Enable Register B   **H'A2**   **TPC**

Bit	7	6	5	4	3	2	1	0
	NDER15	NDER14	NDER13	NDER12	NDER11	NDER10	NDER9	NDER8
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Next data enable 15 to 8

Bits 7 to 0 NDER15 to NDER8	Description
0	TPC outputs TP_{15} to TP_8 are disabled (NDR15 to NDR8 are not transferred to PB_7 to PB_0)
1	TPC outputs TP_{15} to TP_8 are enabled (NDR15 to NDR8 are transferred to PB_7 to PB_0)

NDERA—Next Data Enable Register A   **H'A3**   **TPC**

Bit	7	6	5	4	3	2	1	0
	NDER7	NDER6	NDER5	NDER4	NDER3	NDER2	NDER1	NDER0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Next data enable 7 to 0

Bits 7 to 0 NDER7 to NDER0	Description
0	TPC outputs TP_7 to TP_0 are disabled (NDR7 to NDR0 are not transferred to PA_7 to PA_0)
1	TPC outputs TP_7 to TP_0 are enabled (NDR7 to NDR0 are transferred to PA_7 to PA_0)

TPC output group 0

TCSR—Timer Control/Status Register   **H'A8**   **WDT**

Bit	7	6	5	4	3	2	1	0
	OVF	WT/$\overline{\text{IT}}$	TME	—	—	CKS2	CKS1	CKS0
Initial value	0	0	0	1	1	0	0	0
Read/Write	R/(W)*	R/W	R/W	—	—	R/W	R/W	R/W

Timer enable

0	Timer disabled • TCNT is initialized to H'00 and halted
1	Timer enabled • TCNT is counting • CPU interrupt requests are enabled

Timer mode select

0	Interval timer: requests interval timer interrupts
1	Watchdog timer: generates a reset signal

Overflow flag

0	[Clearing condition] Read OVF when OVF = 1, then write 0 in OVF
1	[Setting condition] TCNT changes from H'FF to H'00

Clock select 2 to 0

0	0	0	ø/2
		1	ø/32
	1	0	ø/64
		1	ø/128
1	0	0	ø/256
		1	ø/512
	1	0	ø/2048
		1	ø/4096

Note: * Only 0 can be written, to clear the flag.

TCNT—Timer Counter H'A9 (read), WDT
H'A8 (write)

Bit	7	6	5	4	3	2	1	0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Count value

RSTCSR—Reset Control/Status Register H'AB (read), WDT
H'AA (write)

Bit	7	6	5	4	3	2	1	0
	WRST	RSTOE	—	—	—	—	—	—
Initial value	0	0	1	1	1	1	1	1
Read/Write	R/(W)*	R/W	—	—	—	—	—	—

Reset output enable

0	Reset signal is not output externally
1	Reset signal is output externally

Watchdog timer reset

0	[Clearing condition]
	Reset signal input at $\overline{\text{RES}}$ pin, or 0 written by software
1	[Setting condition]
	TCNT overflow generates a reset signal

Note: * Only 0 can be written in bit 7, to clear the flag.

SMR—Serial Mode Register   **H'B0**   **SCI**

Bit	7	6	5	7	3	2	1	0
	C/$\overline{A}$	CHR	PE	O/$\overline{E}$	STOP	MP	CKS1	CKS0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Clock select 1 and 0

Bit 1	Bit 0	
CKS1	CKS0	Clock Source
0	0	ø clock
	1	ø/4 clock
1	0	ø/16 clock
	1	ø/64 clock

Multiprocessor mode

0	Multiprocessor function disabled
1	Multiprocessor format selected

Stop bit length

0	One stop bit
1	Two stop bits

Parity mode

0	Even parity
1	Odd parity

Parity enable

0	Parity bit is not added or checked
1	Parity bit is added and checked

Character length

0	8-bit data
1	7-bit data

Communication mode

0	Asynchronous mode
1	Synchronous mode

Bit	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Serial communication bit rate setting

SCR—Serial Control Register H'B2 SCI

Bit	7	6	5	4	3	2	1	0
	TIE	RIE	TE	RE	MPIE	TEIE	CKE1	CKE0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Clock enable 1 and 0

Bit 1	Bit 2		
CKE1	CKE2	Clock Selection and Output	
0	0	Asynchronous mode	Internal clock, SCK pin available for generic input
		Synchronous mode	Internal clock, SCK pin used for serial clock outpu
	1	Asynchronous mode	Internal clock, SCK pin used for clock output
		Synchronous mode	Internal clock, SCK pin used for serial clock outpu
1	0	Asynchronous mode	External clock, SCK pin used for clock input
		Synchronous mode	External clock, SCK pin used for serial clock input
	1	Asynchronous mode	External clock, SCK pin used for clock input
		Synchronous mode	External clock, SCK pin used for serial clock input

Transmit-end interrupt enable

0	Transmit-end interrupt requests (TEI) are disabled
1	Transmit-end interrupt requests (TEI) are enabled

Multiprocessor interrupt enable

0	Multiprocessor interrupts are disabled (normal receive operation)
1	Multiprocessor interrupts are enabled

Receive enable

0	Transmitting is disabled
1	Transmitting is enabled

Transmit enable

0	Transmitting is disabled
1	Transmitting is enabled

Receive interrupt enable

0	Receive-data-full (RXI) and receive-error (ERI) interrupt requests are disabled
1	Receive-data-full (RXI) and receive-error (ERI) interrupt requests are enabled

Transmit interrupt enable

0	Transmit-data-empty interrupt request (TXI) is disabled
1	Transmit-data-empty interrupt request (TXI) is enabled

Bit	7	6	5	4	3	2	1	0
Initial value	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Serial transmit data

SSR—Serial Status Register   **H'B4**   **SCI**

Bit	7	6	5	4	3	2	1	0
	TDRE	RDRF	ORER	FER	PER	TEND	MPB	MPBT
Initial value	1	0	0	0	0	1	0	0
Read/Write	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R	R	R/W

Multiprocessor bit

0	Multiprocessor bit value in receive data is 0
1	Multiprocessor bit value in receive data is 1

Multiprocessor bit transfer

0	Multiprocessor bit value in transmit data is 0
1	Multiprocessor bit value in transmit data is 1

Transmit end

0	[Clearing conditions] Read TDRE when TDRE = 1, then write 0 in TDRE.
1	[Setting conditions] Reset or transition to standby mode. TE is cleared to 0 in SCR. TDRE is 1 when last bit of serial character is transmitted.

Framing error

0	[Clearing conditions] Reset or transition to standby mode. Read FER when FER = 1, then write 0 in FER.
1	[Setting condition] Framing error (stop bit is 0)

Parity error

0	[Clearing conditions] Reset or transition to standby mode. Read PER when PER = 1, then write 0 in PER.
1	[Setting condition] Parity error: (parity of receive data does not match parity setting of O/$\overline{E}$ in SMR)

Overrun error

0	[Clearing conditions] Reset or transition to standby mode. Read ORER when ORER = 1, then write 0 in ORER.
1	[Setting condition] Overrun error (reception of next serial data ends when RDRF = 1)

Receive data register full

0	[Clearing conditions] Reset or transition to standby mode. Read RDRF when RDRF = 1, then write 0 in RDRF.
1	[Setting condition] Serial data is received normally and transferred from RSR to RDR

Transmit data register empty

0	[Clearing conditions] Read TDRE when TDRE = 1, then write 0 in TDRE.
1	[Setting conditions] Reset or transition to standby mode. TE is 0 in SCR Data is transferred from TDR to TSR, enabling new data to be written in TDR.

Note: *Only 0 can be written, to clear the flag.

RDR—Receive Data Register   **H'B5**   **SCI**

Read/Write	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

ADDRCH   ADDRCL

A/D conversion data
10-bit data giving an
A/D conversion result

ADDRD H/L—A/D Data Register D H/L   **H'E6, H'E7**   **A/D**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	AD9	AD8	AD7	AD6	AD5	AD4	AD3	AD2	AD1	AD0	—	—	—	—	—	—
Initial value	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Read/Write	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

ADDRDH   ADDRDL

A/D conversion data
10-bit data giving an
A/D conversion result

ADCR—A/D Control Register   **H'E9**   **A/D**

Bit	7	6	5	4	3	2	1	0
	TRGE	—	—	—	—	—	—	—
Initial value	0	1	1	1	1	1	1	1
Read/Write	R/W	—	—	—	—	—	—	—

Trigger enable

0	A/D conversion cannot be externally triggered
1	A/D conversion starts at the fall of the external trigger signal ($\overline{\text{ADTRG}}$)

ADCSR—A/D Control/Status Register　　　　　　　　　**H'E8**　　　　　　　**A/D**

Bit	7	6	5	4	3	2	1	0
	ADF	ADIE	ADST	SCAN	CKS	CH2	CH1	CH0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/(W)*	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Clock select

0	Conversion time = 266 states (maximum)
1	Conversion time = 134 states (maximum)

Channel select 2 to 0

Group Selection	Channel Selection		Description	
CH2	CH1	CH0	Single Mode	Scan Mode
0	0	0	AN_0	AN_0
		1	AN_1	AN_0, AN_1
	1	0	AN_2	AN_0 to AN_2
		1	AN_3	AN_0 to AN_3
1	0	0	AN_4	AN_4
		1	AN_5	AN_4, AN_5
	1	0	AN_6	AN_4 to AN_6
		1	AN_7	AN_4 to AN_7

Scan mode

0	Single mode
1	Scan mode

A/D start

0	A/D conversion is stopped
1	Single mode: A/D conversion starts; ADST is automatically cleared to 0 when conversion ends Scan mode: A/D conversion starts and continues, cycling among the selected channels, until ADST is cleared to 0 by software, by a reset, or by a transition to standby mode

A/D interrupt enable

0	A/D end interrupt request is disabled
1	A/D end interrupt request is enabled

A/D end flag

0	[Clearing condition] Read ADF while ADF = 1, then write 0 in ADF
1	[Setting conditions] Single mode: A/D conversion ends Scan mode:　A/D conversion ends in all selected channels

Note: * Only 0 can be written, to clear flag.

ASTCR—Access State Control Register   **H'ED**   **Bus controller**

Bit	7	6	5	4	3	2	1	0
	AST7	AST6	AST5	AST4	AST3	AST2	AST1	AST0
Initial value	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Area 7 to 0 access state control

Bits 7 to 0	
AST7 to AST0	Number of States in Access Cycle
0	Areas 7 to 0 are two-state access areas
1	Areas 7 to 0 are three-state access areas

WCR—Wait Control Register   **H'EE**   **Bus controller**

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	WMS1	WMS0	WC1	WC0
Initial value	1	1	1	1	0	0	1	1
Read/Write	—	—	—	—	R/W	R/W	R/W	R/W

Wait mode select 1 and 0

Bit 3	Bit 2	
WMS1	WMS0	Wait Mode
0	0	Programmable wait mode
	1	No wait states inserted by wait-state controller
1	0	Pin wait mode
	1	Pin auto-wait mode

Wait count 1 and 0

Bit 1	Bit 0	
WC1	WC0	Number of Wait States
0	0	No wait states inserted by wait-state controller
	1	1 state inserted
1	0	2 states inserted
	1	3 states inserted

WCER—Wait Controller Enable Register   **H'EF**   **Bus controller**

Bit	7	6	5	4	3	2	1	0
	WCE7	WCE6	WCE5	WCE4	WCE3	WCE2	WCE1	WCE0
Initial value	1	1	1	1	1	1	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Wait state controller enable 7 to 0

0	Wait-state control is disabled (pin wait mode 0)
1	Wait-state control is enabled

MDCR—Mode Control Register   **H'F1**   **System control**

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	MDS1	MDS0
Initial value	1	1	0	0	0	1	—*	—*
Read/Write	—	—	—	—	—	—	R	R

Mode select 1 and 0

Bit 1	Bit 0	
MD_1	MD_0	Operating mode
0	0	—
	1	Mode 1
1	0	Mode 2
	1	Mode 3

Note: * Determined by the state of the mode pins (MD_1 and MD_0).

SYSCR—System Control Register   H'F2   **System control**

Bit	7	6	5	4	3	2	1	0
	SSBY	STS2	STS1	STS0	UE	NMIEG	—	RAME
Initial value	0	0	0	0	1	0	1	1
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	—	R/W

RAM enable

0	On-chip RAM is disabled
1	On-chip RAM is enabled

NMI edge select

0	An interrupt is requested at the falling edge of NMI
1	An interrupt is requested at the rising edge of NMI

User bit enable

0	CCR bit 6 (UI) is used as an interrupt mask bit
1	CCR bit 6 (UI) is used as a user bit

Standby timer select 2 to 0

Bit 6	Bit 5	Bit 4	
STS2	STS1	STS0	Standby Timer
0	0	0	Waiting time = 8192 states
		1	Waiting time = 16384 states
	1	0	Waiting time = 32768 states
		1	Waiting time = 65536 states
1	0	—	Waiting time = 131072 states
	1	—	Illegal setting

Software standby

0	SLEEP instruction causes transition to sleep mode
1	SLEEP instruction causes transition to software standby mode

ISCR—IRQ Sense Control Register　　　　　　　　**H'F4　　Interrupt controller**

Bit	7	6	5	4	3	2	1	0
	—	—	—	IRQ4SC	IRQ3SC	IRQ2SC	IRQ1SC	IRQ0SC
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

$\overline{IRQ_4}$ to $\overline{IRQ_0}$ sense control

0	Interrupts are requested when $\overline{IRQ_4}$ to $\overline{IRQ_0}$ inputs are low
1	Interrupts are requested by falling-edge input at $\overline{IRQ_4}$ to $\overline{IRQ_0}$

IER—IRQ Enable Register　　　　　　　　　　**H'F5　　Interrupt controller**

Bit	7	6	5	4	3	2	1	0
	—	—	—	IRQ4E	IRQ3E	IRQ2E	IRQ1E	IRQ0E
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/(W)	R/(W)	R/(W)	R/(W)	R/(W)	R/(W)	R/(W)	R/(W)

IRQ_4 to IRQ_0 enable

0	IRQ_4 to IRQ_0 interrupts are disabled
1	IRQ_4 to IRQ_0 interrupts are enabled

—	—	—	IRQ4F	IRQ3F	IRQ2F	IRQ1F	IRQ0F
Initial value							
0	0	0	0	0	0	0	0
Read/Write							
—	—	—	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*

IRQ$_4$ to IRQ$_0$ flags

Bits 4 to 0 IRQ4F to IRQ0F	Setting and Clearing Conditions
0	[Clearing conditions] Read IRQnF when IRQnF = 1, then write 0 in IRQnF. IRQnSC = 0, $\overline{\text{IRQn}}$ input is high, and interrupt exception handling is carried out. IRQnSC = 1 and IRQn interrupt exception handling is carried out.
1	[Setting conditions] IRQnSC = 0 and $\overline{\text{IRQn}}$ input is low. IRQnSC = 1 and $\overline{\text{IRQn}}$ input changes from high to low.

(n = 4 to 0

Note: * Only 0 can be written, to clear the flag.

530

IPRA—Interrupt Priority Register A   **H'F8   Interrupt controller**

Bit	7	6	5	4	3	2	1	0
	IPRA7	IPRA6	IPRA5	IPRA4	IPRA3	IPRA2	IPRA1	IPRA0
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Priority level A7 to A0

0	Priority level 0 (low priority)
1	Priority level 1 (high priority)

• Interrupt sources controlled by each bit

	Bit 7 IPRA7	Bit 6 IPRA6	Bit 5 IPRA5	Bit 4 IPRA4	Bit 3 IPRA3	Bit 2 IPRA2	Bit 1 IPRA1	Bit 0 IPRA0
Interrupt source	IRQ_0	IRQ_1	IRQ_2, IRQ_3	IRQ_4	WDT	ITU channel 0	ITU channel 1	ITU channel 2

IPRB—Interrupt Priority Register B   **H'F9   Interrupt controller**

Bit	7	6	5	4	3	2	1	0
	IPRB7	IPRB6	—	—	IPRB3	—	IPRB1	—
Initial value	0	0	0	0	0	0	0	0
Read/Write	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Priority level B7, B6, B3, and B1

0	Priority level 0 (low priority)
1	Priority level 1 (high priority)

• Interrupt sources controlled by each bit

	Bit 7 IPRB7	Bit 6 IPRB6	Bit 5 —	Bit 4 —	Bit 3 IPRB3	Bit 2 —	Bit 1 IPRB1	Bit 0 —
Interrupt source	ITU channel 3	ITU channel 4	—	—	SCI channel	—	A/D converter	—

Appendix D   Pin States

D.1 Port States in Each Mode

Table D-1   Port States

Pin Name	Mode		Reset State	Hardware Standby Mode	Software Standby Mode	Sleep Mode	Program Execution Sleep Mode
ø	—		Clock output	T	H	Clock output	Clock output
P1$_7$ to P1$_0$	1		T	T	keep	keep	Input port (DDR = 0)
			—	—	T	keep	A$_7$ to A$_0$ (DDR = 1)
	2, 3		T	T	keep	keep	I/O port
P2$_7$ to P2$_0$	1		T	T	keep	keep	Input port (DDR = 0)
			—	—	T	keep	A$_{15}$ to A$_8$ (DDR = 1)
	2, 3		T	T	keep	keep	I/O port
P3$_7$ to P3$_0$	1		T	T	T	T	D$_7$ to D$_0$
	2, 3		T	T	keep	keep	I/O port
P5$_3$ to P5$_0$	1		T	T	keep	keep	Input port (DDR = 0)
			—	—	T	keep	A$_{19}$ to A$_{16}$ (DDR = 1)
	2, 3		T	T	keep	keep	I/O port
P6$_0$	1	$\overline{\text{WAIT}}$ pin	—	—	T	T	$\overline{\text{WAIT}}$
		Generic I/O pin	T	T	T	T	I/O port
	2, 3		T	T	T	T	I/O port
P6$_5$ to P6$_3$	1		H	T	T	H	$\overline{\text{WR}}$, $\overline{\text{RD}}$, $\overline{\text{AS}}$
	2, 3		T	T	keep	keep	I/O port

Legend
H: High
L: Low
T: High-impedance state
keep: Input pins are in the high-impedance state; output pins maintain their previous state.
DDR: Data direction register bit

Table D-1   Port States (cont)

Pin Name	Mode	Reset State	Hardware Standby Mode	Software Standby Mode	Sleep Mode	Program Execution Sleep Mode
$P7_7$ to $P7_0$	1 to 3	T	T	T	T	Input port
$P8_3$ to $P8_0$	1 to 3	T	T	keep	keep	I/O port
$P9_4$, $P9_2$, $P9_0$	1 to 3	T	T	keep	keep	I/O port
PA_7 to PA_0	1 to 3	T	T	keep	keep	I/O port
PB_7 to PB_0	1 to 3	T	T	keep	keep	I/O port

Legend

H: High

L: Low

T: High-impedance state

keep: Input pins are in the high-impedance state; output pins maintain their previous state.

DDR: Data direction register bit

D.2 Pin States at Reset

Reset in T$_1$ State: Figure D-1 is a timing diagram for the case in which $\overline{\text{RES}}$ goes low during the T$_1$ state of an external memory access cycle. As soon as $\overline{\text{RES}}$ goes low, all ports are initialized to the input state. $\overline{\text{AS}}$, $\overline{\text{RD}}$, and $\overline{\text{WR}}$ go high, and the data bus goes to the high-impedance state. The address bus is initialized to the low output level 0.5 state after the low level of $\overline{\text{RES}}$ is sampled. Sampling of $\overline{\text{RES}}$ takes place at the fall of the system clock (ø).

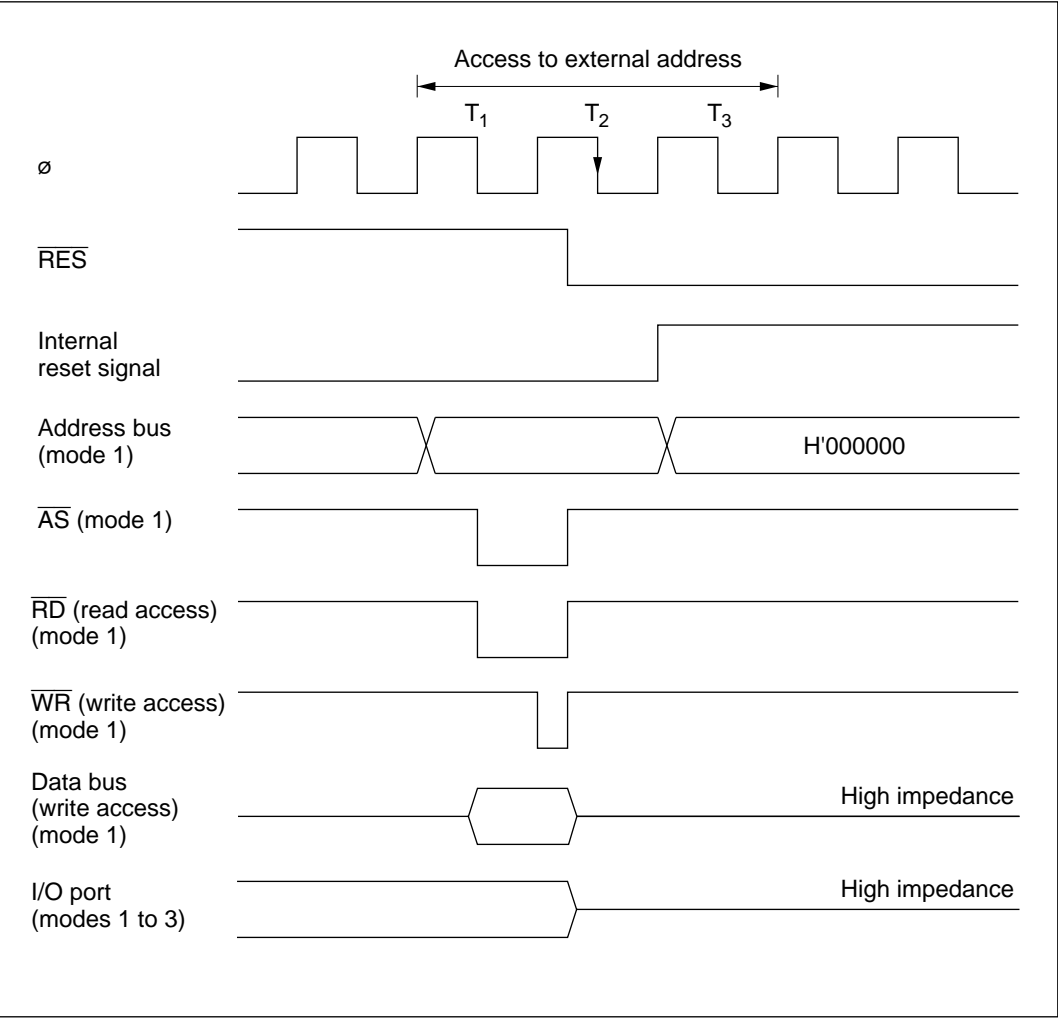

Figure D-1   Reset during Memory Access (Reset during T$_1$ State)

Reset in T$_2$ State: Figure D-2 is a timing diagram for the case in which $\overline{\text{RES}}$ goes low during the T$_2$ state of an external memory access cycle. As soon as $\overline{\text{RES}}$ goes low, all ports are initialized to the input state. $\overline{\text{AS}}$, $\overline{\text{RD}}$, and $\overline{\text{WR}}$ go high, and the data bus goes to the high-impedance state. The address bus is initialized to the low output level 0.5 state after the low level of $\overline{\text{RES}}$ is sampled. The same timing applies when a reset occurs during a wait state (T$_W$).

Figure D-2   Reset during Memory Access (Reset during T$_2$ State)

Reset in T$_3$ State: Figure D-3 is a timing diagram for the case in which $\overline{\text{RES}}$ goes low during the T$_3$ state of an external memory access cycle. As soon as $\overline{\text{RES}}$ goes low, all ports are initialized to the input state. $\overline{\text{AS}}$, $\overline{\text{RD}}$, and $\overline{\text{WR}}$ go high, and the data bus goes to the high-impedance state. The address bus outputs are held during the T$_3$ state. The same timing applies when a reset occurs in the T$_2$ state of an access cycle to a two-state-access area.

Appendix E   Timing of Transition to and Recovery from Hardware Standby Mode

Timing of Transition to Hardware Standby Mode

(1) To retain RAM contents with the RAME bit set to 1 in SYSCR, drive the $\overline{\text{RES}}$ signal low 10 system clock cycles before the $\overline{\text{STBY}}$ signal goes low, as shown below. $\overline{\text{RES}}$ must remain low until $\overline{\text{STBY}}$ goes low (minimum delay from $\overline{\text{STBY}}$ low to $\overline{\text{RES}}$ high: 0 ns).
(2) To retain RAM contents with the RAME bit cleared to 0 in SYSCR, $\overline{\text{RES}}$ does not have to be driven low as in (1).

Timing of Recovery from Hardware Standby Mode: Drive the $\overline{\text{RES}}$ signal low approximately 100 ns before $\overline{\text{STBY}}$ goes high.
Appendix F   Package Dimensions

Figure F-1 shows the FP-80A package dimensions of the H8/3032 Series, and figure F-2 shows the TFP-80C package dimensions.
Unit: mm
