#### NOTES:

1. The sleep mode pin shuts off all dynamic inputs, except JTAG inputs, when asserted. All static inputs, i.e., PL/FTx and OPTx and the sleep mode pins themselves (ZZx) are not affected during sleep mode.

### Description:

The IDT70T3509M is a high-speed 1024K x 36 bit synchronous Dual-Port RAM. The memory array utilizes Dual-Port memory cells to allow simultaneous access of any address from both ports. Registers on control, data, and address inputs provide minimal setup and hold times. The timing latitude provided by this approach allows systems to be designed with very short cycle times. With an input data register, the IDT70T3509M has been optimized for applications having unidirectional or bidirectional data flow in bursts. An automatic power down feature, controlled by  $\overline{CE}_0$  and CE1, permits the on-chip circuitry of each port to enter a very low standby power mode.

The 70T3509M can support an operating voltage of either 3.3V or 2.5V on one or both ports, controllable by the OPT pins. The power supply for the core of the device (VDD) is at 2.5V.

#### 5682 drw 02d

#### NOTES:

1. All VDD pins must be connected to 2.5V power supply.

- 2. All VDDO pins must be connected to appropriate power supply: 3.3V if OPT pin for that port is set to VDD (2.5V), and 2.5V if OPT pin for that port is set to Vss (0V).
- 3. All Vss pins must be connected to ground supply.
- 4. Package body is approximately 17mm x 17mm x 1.76mm, with 1.0mm ball-pitch.
- 5. This package code is used to reference the package diagram.
- 6. This text does not indicate orientation of the actual part-marking.
- 7. BP-256 package thickness is 1.76mm nominal. This is thicker than the BC-256 package (1.40mm nominal) used for the lower density IDT dual-port products.

Т	MS	Test Mode Select (Input)					
TF	RST	Reset (Initialize TAP Controller) (Input)					
ĪNTL	ĪNTr	Interrupt Flag (Output)					

5682 thl 01

NOTES:

- 1. VDD, OPTx, and VDDox must be set to appropriate operating levels prior to applying inputs on the I/Os and controls for that port.
- 2. OPTx selects the operating voltage levels for the I/Os and controls on that port. If OPTx is set to VDD (2.5V), then that port's I/Os and controls will operate at 3.3V levels and VDDOX must be supplied at 3.3V. If OPTx is set to Vss (0V), then that port's I/Os and address controls will operate at 2.5V levels and VDDOX must be supplied at 2.5V. The OPT pins are independent of one another-both ports can operate at 3.3V levels, both can operate at 2.5V levels, or either can operate at 3.3V with the other at 2.5V.

3. When  $\overline{\text{REPEAT}} x$  is asserted, the counter will reset to the last valid address loaded via ADSx.

4. The sleep mode pin shuts off all dynamic inputs, except JTAG inputs, when asserted. All static inputs, i.e., PL/FTx and OPTx and the sleep mode pins themselves (ZZx) are not affected during sleep mode. It is recommended that boundary scan not be operated during sleep mode.

5. Chip Enables and Byte Enables are double buffered when PL/FT = VIH, i.e., the signals take two cycles to deselect.

#### NOTES:

1. "H" = VIH, "L" = VIL, "X" = Don't Care.

2.  $\overline{\text{ADS}}$ ,  $\overline{\text{CNTEN}}$ ,  $\overline{\text{REPEAT}}$  = X.

IDT70T3509M

3.  $\overline{\text{OE}}$  and ZZ are asynchronous input signals.

4. It is possible to read or write any combination of bytes during a given access. A few representative samples have been illustrated here.

### Truth Table II—Address Counter Control<sup>(1,2)</sup>

Address	Previous Internal Address	Internal Address Used	CLK	ADS	CNTEN	REPEAT <sup>(6)</sup>	I/O <sup>(3)</sup>	MODE
An	Х	An	Ŷ	L <sup>(4)</sup>	Х	Н	Dvo (n)	External Address Used
Х	An	An + 1	Ŷ	Н	L <sup>(5)</sup>	Н	D⊮o(n+1)	Counter Enabled—Internal Address generation <sup>(7)</sup>
Х	An + 1	An + 1	Ŷ	Н	Н	Н	D⊮o(n+1)	External Address Blocked—Counter disabled (An + 1 reused)
Х	Х	An	Ŷ	Х	Х	L <sup>(4)</sup>	Di/o(n)	Counter Set to last valid ADS load
								5682 tbl 03

5682 tbl 02

#### NOTES:

1. "H" = VIH, "L" = VIL, "X" = Don't Care.

2. Read and write operations are controlled by the appropriate setting of R/W, CE0, CE1, BEn and OE.

3. Outputs configured in flow-through output mode: if outputs are in pipelined mode the data out will be delayed by one cycle.

4. ADS and REPEAT are independent of all other memory control signals including CE0, CE1 and BEn

5. The address counter advances if CNTEN = VIL on the rising edge of CLK, regardless of all other memory control signals including CEo, CE1, BEn.

6. When REPEAT is asserted, the counter will reset to the last valid address loaded via ADS. This value is not set at power-up: a known location should be loaded via ADS during initialization if desired. Any subsequent ADS access during operations will update the REPEAT address location.

7. Address A19 must be managed as part of a full depth counter implementation using the IDT70T3509M. For physical addresses 00000H through 7FFFH the value of a A19 is 0, while for physical addresses 80000H through FFFFH the value of A19 is 1. The user needs to keep track of the device counter and make sure that A19 is actively driven from 0-to-1 or 1-to-0 and held as needed at the appropriate address boundaries for full depth counter operation and that A19 is in the appropriate state when using the REPEAT function.

### Recommended Operating Temperature and Supply Voltage <sup>(1)</sup>

Grade	Ambient Temperature	GND	Vdd
Commercial	$0^{\circ}C$ to $+70^{\circ}C$	0V	2.5V <u>+</u> 100mV
Industrial	-40°C to +85°C	0V	2.5V <u>+</u> 100mV
			5692 tbl 04

NOTES:

1. This is the parameter TA. This is the "instant on" case temperature.

### Recommended DC Operating Conditions with VDD0 at 2.5V

Symbol	Parameter	Min.	Тур.	Max.	Unit
Vdd	Core Supply Voltage	2.4	2.5	2.6	V
VDDQ	I/O Supply Voltage <sup>(3)</sup>	2.4	2.5	2.6	V
Vss	Ground	0	0	0	V
Vін	Input High Volltage (Address, Control & Data I/O Inputs) <sup>(3)</sup>	1.7		Vddq + 100mV <sup>(2)</sup>	v
Vih	Input High Voltage - JTAG	1.7		Vdd + 100mV <sup>(2)</sup>	V
Vih	Input High Voltage - ZZ, OPT, PIPE/FT	Vdd - 0.2V		Vdd + 100mV <sup>(2)</sup>	V
VIL	Input Low Voltage	-0.3(1)		0.7	V
Vı∟	Input Low Voltage - ZZ, OPT, PIPE/FT	-0.3(1)		0.2	v

#### NOTES:

5682 tbl 05a

5682 tbl 05b

1. VIL (min.) = -1.0V for pulse width less than tcyc/2 or 5ns, whichever is less.

2. VIH (max.) = VDDQ + 1.0V for pulse width less than tcyc/2 or 5ns, whichever is less.

3. To select operation at 2.5V levels on the I/Os and controls of a given port, the OPT pin for that port must be set to  $V_{SS}(0V)$ , and  $V_{DDOX}$  for that port must be supplied as indicated above.

### Recommended DC Operating Conditions with VDDO at 3.3V

Conditions with VDDQ at 3.3V							
Symbol	Parameter	Min.	Тур.	Max.	Unit		
Vdd	Core Supply Voltage	2.4	2.5	2.6	V		
Vddq	I/O Supply Voltage <sup>(3)</sup>	3.15	3.3	3.45	V		
Vss	Ground	0	0	0	V		
Vih	Input High Voltage (Address, Control &Data I/O Inputs) <sup>(3)</sup>	2.0		Vddq + 150mV <sup>(2)</sup>	V		
Vih	Input High Voltage - JTAG	1.7		VDD + 100mV <sup>(2)</sup>	V		
Vін	Input High Voltage - ZZ, OPT, PIPE/FT	Vdd - 0.2V		VDD + 100mV <sup>(2)</sup>	V		
VIL	Input Low Voltage	-0.3(1)		0.8	V		
VIL	Input Low Voltage - ZZ, OPT, PIPE/FT	-0.3(1)		0.2	V		

#### NOTES:

1. VIL (min.) = -1.0V for pulse width less than tcyc/2, or 5ns, whichever is less.

2. VIH (max.) = VDDQ + 1.0V for pulse width less than tcyc/2 or 5ns, whichever is less.

 To select operation at 3.3V levels on the I/Os and controls of a given port, the OPT pin for that port must be set to VDD (2.5V), and VDDOX for that port must be supplied as indicated above.

### Absolute Maximum Ratings<sup>(1)</sup>

Symbol	Rating	Com'l & Ind	Unit
Vterm (Vdd)	Vod Terminal Voltage with Respect to GND	-0.5 to 3.6	V
Vterm <sup>(2)</sup> (Vddq)	VDDQ Terminal Voltage with Respect to GND	-0.3 to VDDQ + 0.3	V
V <sub>TERM<sup>(2)</sup> (INPUTS and I/O's)</sub>	Input and I/O Terminal Voltage with Respect to GND	-0.3 to VDDQ + 0.3	V
TBIAS <sup>(3)</sup>	Temperature Under Bias	-55 to +125	°C
Tstg	Storage Temperature	-65 to +150	°C
ицТ	Junction Temperature	+150	٥C
IOUT(For VDDQ = 3.3V)	DC Output Current	50	mA
IOUT(For VDDQ = 2.5V)	DC Output Current	40	mA
NOTES			5682 tbl 06

#### NOTES:

- Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- 2. This is a steady-state DC parameter that applies after the power supply has reached its nominal operating value. Power sequencing is not necessary; however, the voltage on any Input or I/O pin cannot exceed VDDo during power supply ramp up.
- 3. Ambient Temperature under DC Bias. No AC Conditions. Chip Deselected.

### Capacitance<sup>(1)</sup>

(TA = +	25°C,	F =	1.0MHz	) BGA ONLY
---------	-------	-----	--------	------------

Symbo	I Parameter	Conditions	Max.	Unit
Cin	Input Capacitance	VIN = 0V	35	рF
Cout <sup>(2</sup>	Output Capacitance	Vout = 0V	35	pF
				5682 tbl 07

#### NOTES:

 These parameters are determined by device characterization, but are not production tested.

2. COUT also references CI/o.

### DC Electrical Characteristics Over the Operating Temperature and Supply Voltage Range (VDD = 2.5V ± 100mV)

			70T35	09MS	
Symbol	Parameter	Test Conditions	Min.	Max.	Unit
Lu	Input Leakage Current <sup>(1)</sup>	VDDQ = Max., $V$ IN = 0 $V$ to $V$ DDQ		20	μA
Lu	JTAG & ZZ Input Leakage Current <sup>(1,2)</sup>	VDD = Max., VIN = 0V to VDD		60	μA
Ilo	Output Leakage Current <sup>(1,3)</sup>	$\overline{CE}_0 = V_{IH} \text{ and } CE_1 = V_{IL}, V_{OUT} = 0V \text{ to } V_{DDQ}$		20	μA
Vol (3.3V)	Output Low Voltage <sup>(1)</sup>	IOL = +4mA, $VDDQ = Min$ .		0.4	V
Voн (3.3V)	Output High Voltage <sup>(1)</sup>	IOH = -4mA, VDDQ = Min.	2.4		V
Vol (2.5V)	Output Low Voltage <sup>(1)</sup>	IOL = +2mA, $VDDQ = Min$ .		0.4	V
Voн (2.5V)	Output High Voltage <sup>(1)</sup>	Ioh = -2mA, VDDQ = Min.	2.0		V

#### NOTES:

1. VDDQ is selectable (3.3V/2.5V) via OPT pins. Refer to p.5 for details.

2. Applicable only for TMS, TDI and TRST inputs.

3. Outputs tested in tri-state mode.

### DC Electrical Characteristics Over the Operating Temperature and Supply Voltage Range (3) (VDD = 2.5V ± 100mV)

•		70T3509MS13: Com'l & Ind				m'l

						56	82 tbl

#### NOTES:

1. At f = fmax, address and control lines (except Output Enable) are cycling at the maximum frequency clock cycle of 1/tcyc, using "AC TEST CONDITIONS".

2. f = 0 means no address, clock, or control lines change. Applies only to input at CMOS level standby.

- 3. Port "A" may be either left or right port. Port "B" is the opposite from port "A".
- 4. VDD = 2.5V, TA = 25°C for Typ, and are not production tested. IDD DC(f=0) = 30mA (Typ).
- 5.  $\overline{CE}x = VIL$  means  $\overline{CE}ox = VIL$  and CE1x = VIH (enabled)
  - $\overline{CE}x = VIH$  means  $\overline{CE}ox = VIH$  and CE1x = VIL (disabled)

 $\overline{CE}x \le 0.2V$  means  $\overline{CE}$ ox  $\le 0.2V$  and  $CE_{1X} \ge V_{DDQ} - 0.2V$  (enabled - CMOS levels)

 $\overline{CEx} \ge VDDQ - 0.2V$  means  $\overline{CE}$   $x \ge VDDQ - 0.2V$  and  $CE_{1x} \le 0.2V$  (disabled - CMOS levels)

"X" represents "L" for left port or "R" for right port.

6. ISB1, ISB2 and ISB4 will all reach full standby levels (ISB3) on the appropriate port(s) if ZZL and/or ZZR = VIH.

NOTES:

1. The Pipelined output parameters (tcvc2, tcb2) apply to either or both left and right ports when FT/PIPEx = Vbb (2.5V). Flow-through parameters (tcvc1, tcb1) apply when FT/PIPE = Vss (0V) for that port.

2. All input signals are synchronous with respect to the clock except for the asynchronous Output Enable (OE), FT/PIPE and OPT. FT/PIPE and OPT should be treated as DC signals, i.e. steady state during operation.

3. These values are valid for either level of VDDQ (3.3V/2.5V). See page 6 for details on selecting the desired operating voltage levels for each port.

4. Guaranteed by design (not production tested).

- 1. DE is asynchronously controlled; all other inputs depicted in the above waveforms are synchronous to the rising clock edge.
- 2.  $\overline{ADS} = V_{IL}$ ,  $\overline{CNTEN}$  and  $\overline{REPEAT} = V_{IH}$ .
- 3. The output is disabled (High-Impedance state) by  $\overline{CE}_0 = V_{IH}$ ,  $CE_1 = V_{IL}$ ,  $\overline{BE}_n = V_{IH}$  following the next rising edge of the clock. Refer to Truth Table 1.
- Addresses do not have to be accessed sequentially since ADS = VIL constantly loads the address on the rising edge of the CLK; numbers are for reference use only.
- 5. If BEn was HIGH, then the appropriate Byte of DATAOUT for Qn + 2 would be disabled (High-Impedance state).
- 6. "x" denotes Left or Right port. The diagram is with respect to that port.

Timing Waveform of Left Port Write to Pipelined Right Port Read<sup>(1,2,4)</sup>

- 1.  $\overline{CE}_{0}$ ,  $\overline{BE}_{n}$ , and  $\overline{ADS} = V_{IL}$ ;  $CE_{1}$ ,  $\overline{CNTEN}$ , and  $\overline{REPEAT} = V_{IH}$ .
- 2.  $\overline{OE} = V_{IL}$  for Port "B", which is being read from.  $\overline{OE} = V_{IH}$  for Port "A", which is being written to.
- 3. If tco ≤ minimum specified, then data from Port "B" read is not valid until following Port "B" clock cycle (ie, time from write to valid read on opposite port will be tco + 2 tcyc2 + tcp2). If tco > minimum, then data from Port "B" read is available on first Port "B" clock cycle (ie, time from write to valid read on opposite port will be tco + tcyc2 + tcp2).
- 4. All timing is the same for Left and Right ports. Port "A" may be either Left or Right port. Port "B" is the opposite of Port "A"

### Timing Waveform with Port-to-Port Flow-Through Read<sup>(1,2,4)</sup>

- 1.  $\overline{CE}_{0}$ ,  $\overline{BE}_{n}$ , and  $\overline{ADS} = V_{IL}$ ;  $CE_{1}$ ,  $\overline{CNTEN}$ , and  $\overline{REPEAT} = V_{IH}$ .
- 2.  $\overline{OE} = V_{IL}$  for the Right Port, which is being read from.  $\overline{OE} = V_{IH}$  for the Left Port, which is being written to.
- If tco ≤ minimum specified, then data from Port "B" read is not valid until following Port "B" clock cycle (i.e., time from write to valid read on opposite port will be tco + tcyc + tcp1). If tco > minimum, then data from Port "B" read is available on first Port "B" clock cycle (i.e., time from write to valid read on opposite port will be tco + tcp1).
- 4. All timing is the same for both left and right ports. Port "A" may be either left or right port. Port "B" is the opposite of Port "A".

Timing Waveform of Pipelined Read-to-Write-to-Read ( $\overline{OE} = VIL$ )<sup>(2)</sup>

#### NOTES:

- Output state (High, Low, or High-impedance) is determined by the previous cycle control signals.
   CE0, BEn, and ADS = VIL; CE1, CNTEN, and REPEAT = VIH. "NOP" is "No Operation".
- Addresses do not have to be accessed sequentially since ADS = VIL constantly loads the address on the rising edge of the CLK; numbers 3. are for reference use only.
- 4. "NOP" is "No Operation." Data in memory at the selected address may be corrupted and should be re-written to guarantee data integrity.

## Timing Waveform of Pipelined Read-to-Write-to-Read (**OE** Controlled)<sup>(2)</sup>

- 1. Output state (High, Low, or High-impedance) is determined by the previous cycle control signals.
- 2.  $\overline{CE}_{0}$ ,  $\overline{BE}_{n}$ , and  $\overline{ADS} = VIL$ ; CE1,  $\overline{CNTEN}$ , and  $\overline{REPEAT} = VIH$ .
- Addresses do not have to be accessed sequentially since ADS = VIL constantly loads the address on the rising edge of the CLK; numbers are for reference 3. use only.
- 4. This timing does not meet requirements for fastest speed grade. This waveform indicates how logically it could be done if timing so allows.

Timing Waveform of Flow-Through Read-to-Write-to-Read ( $\overline{OE} = VIL$ )<sup>(2)</sup> ▲ tCYC1 → tCH1→ tCL1→ CLK  $\overline{CE}_0$ tsc tHC CE1 2 BEn tHW tsw R/W tsw ADDRESS<sup>(3)</sup> An An + 1An + 2 An + 2 An + 3 An + 4 tSA THA

Timing Waveform of Flow-Through Read-to-Write-to-Read (OE Controlled)<sup>(2)</sup>

#### NOTES:

1. Output state (High, Low, or High-impedance) is determined by the previous cycle control signals.

2.  $\overline{CE}_0$ ,  $\overline{BE}_n$ , and  $\overline{ADS} = VIL$ ;  $CE_1$ ,  $\overline{CNTEN}$ , and  $\overline{REPEAT} = VIH$ .

3. Addresses do not have to be accessed sequentially since ADS = VIL constantly loads the address on the rising edge of the CLK; numbers are for reference use only.

4. "NOP" is "No Operation." Data in memory at the selected address may be corrupted and should be re-written to guarantee data integrity.

Timing Waveform of Pipelined Read with Address Counter Advance<sup>(1)</sup>

Timing Waveform of Flow-Through Read with Address Counter Advance<sup>(1)</sup>

- 1.  $\overline{CE}_{0}$ ,  $\overline{OE}$ ,  $\overline{BE}n = VIL$ ; CE1, R/W, and  $\overline{REPEAT} = VIH$ .
- 2. If there is no address change via  $\overline{ADS} = VIL$  (loading a new address) or  $\overline{CNTEN} = VIL$  (advancing the address), i.e.  $\overline{ADS} = VIH$  and  $\overline{CNTEN} = VIH$ , then the data remains constant for subsequent clocks.
- 3. Address A19 must be managed as part of a full depth counter implementation using the IDT70T3509M. For physical addresses 00000H through 7FFFFH the value of a A19 is 0, while for physical addresses 80000H through FFFFH the value of A19 is 1. The user needs to keep track of the device counter and make sure that A19 is actively driven from 0-to-1 or 1-to-0 and held as needed at the appropriate address boundaries for full depth counter operation. As shown this transition reflects An = 7FFFFH or FFFFFH.

### Timing Waveform of Write with Address Counter Advance (Flow-through or Pipelined Inputs)<sup>(1)</sup>

### Timing Waveform of Counter Repeat<sup>(2,6)</sup>

- 2.  $\overline{CE}_{0}$ ,  $\overline{BE}_{n} = VIL$ ;  $CE_{1} = VIH$ .
- 3. The "Internal Address" is equal to the "External Address" when ADS = VIL and equals the counter output when ADS = VIH.
- 4. No dead cycle exists during REPEAT operation. A READ or WRITE cycle may be coincidental with the counter REPEAT cycle: Address loaded by last valid ADS load will be accessed. For more information on REPEAT function refer to Truth Table II. A19 must be in the appropriate state when using the REPEAT function to guarantee the correct address location is loaded.
- 5. CNTEN = VIL advances Internal Address from 'An' to 'An +1'. The transition shown indicates the time required for the counter to advance. The 'An +1'Address is written to during this cycle.
- 6. For Pipelined Mode user should add 1 cycle latency for outputs as per timing waveform of read cycle for pipelined operations.
- 7. Address A19 must be managed as part of a full depth counter implementation using the IDT70T3509M. For physical addresses 00000H through 7FFFH the value of a A19 is 0, while for physical addresses 80000H through FFFFH the value of A19 is 1. The user needs to keep track of the device counter and make sure that A19 is actively driven from 0-to-1 or 1-to-0 and held as needed at the appropriate address boundaries for full depth counter operation. As shown this transition reflects An = 7FFFFH or FFFFFH.

Waveform of Interrupt Timing<sup>(2)</sup>

### NOTES:

- 1.  $\overline{CE}_0 = V_{IL}$  and  $CE_1 = V_{IH}$ .
- 2. All timing is the same for Left and Right ports.

3. Address is for internal register, not the external bus, i.e. address needs to be qualified by one of the Address counter control signals.

Left Port					Right Port					
CLKL	<b>R/₩</b> L <sup>(2)</sup>	CEL <sup>(2)</sup>	A19L-A0L	ĪNTL	CLKr	R/ <b>W</b> R <sup>(2)</sup>	CER <sup>(2)</sup>	A19R-A0R	<b>INT</b> R	Function
Ŷ	L	L	FFFFF	Х	Ŷ	Х	Х	Х	L	Set Right INTR Flag
↑	Х	Х	Х	Х	Ŷ	Н	L	FFFFF	Н	Reset Right INTR Flag
↑	Х	Х	Х	L	Ŷ	L	L	FFFFE	Х	Set Left INTL Flag
Ŷ	Н	L	FFFFE	Н	$\uparrow$	Х	Х	Х	Х	Reset Left INTL Flag

### Truth Table III - Interrupt Flag<sup>(1)</sup>

#### NOTES:

1.  $\overline{INT}_{L}$  and  $\overline{INT}_{R}$  must be initialized at power-up by Resetting the flags.

2. CE0 = VIL and CE1 = VIH, RW and CE are synchronous with respect to the clock and need valid set-up and hold times.

3. Address is for internal register, not the external bus, i.e. address needs to be qualified by one of the Address counter control signals.

### Timing Waveform - Entering Sleep Mode (1,2)

- 1. CE1 = VIH.
- 2. All timing is same for Left and Right ports.
- 3.  $\overline{CE}_0$  has to be deactivated ( $\overline{CE}_0 = V_{IH}$ ) three cycles prior to asserting ZZ (ZZx = V\_{IH}) and held for two cycles after asserting ZZ (ZZx = V\_{IH}). 4.  $\overline{CE}_0$  has to be deactivated ( $\overline{CE}_0 = V_{IH}$ ) one cycle prior to de-asserting ZZ (ZZx = V\_{IL}) and held for three cycles after de-asserting ZZ (ZZx = V\_{IL}).
- 5. The device must be in Read Mode (R/W High) when exiting sleep mode. Outputs are active but data is not valid until the following cycle.

### IDT70T3509M

#### High-Speed 2.5V 1024K x 36 Dual-Port Synchronous Static RAM

### Functional Description

The IDT70T3509M provides a true synchronous Dual-Port Static RAM interface. Registered inputs provide minimal set-up and hold times on address, data, and all critical control inputs. All internal registers are clocked on the rising edge of the clock signal, however, the self-timed internal write pulse width is independent of the cycle time.

An asynchronous output enable is provided to ease asynchronous bus interfacing. Counterenable inputs are also provided to stall the operation of the address counters for fast interleaved memory applications.

The combination of a HIGH on  $\overline{CE}$  oand a LOW on CE1 for one clock cycle will power down the internal circuitry to reduce static power consumption. Multiple chip enables allow easier banking of multiple IDT70T3509Ms for depth expansion configurations. Two cycles are required with  $\overline{CE}$  LOW and CE1 HIGH to re-activate the outputs.

### Width Expansion

The IDT70T3509M can be used in applications requiring expanded width. Through combining the control signals, the devices can be grouped as necessary to accommodate applications needing 72-bits or wider.

### Sleep Mode

The IDT70T3509M is equipped with an optional sleep or low power mode on both ports. The sleep mode pin on both ports is asynchronous and active high. During normal operation, the ZZ pin is pulled low. When ZZ is pulled high, the port will enter sleep mode where it will meet lowest possible power conditions. The sleep mode timing diagram shows the modes of operation: Normal Operation, No Read/Write Allowed and Sleep Mode.

For normal operation all inputs must meet setup and hold times prior to sleep and after recovering from sleep. Clocks must also meet cycle high and low times during these periods. Three cycles prior to asserting ZZ (ZZx = VIH) and three cycles after de-asserting ZZ (ZZx = VIL), the device must be disabled via the chip enable pins. If a write or read operation occurs during these periods, the memory array may be corrupted. Validity of data out from the RAM cannot be guaranteed immediately after ZZ is asserted (prior to being in sleep). When exiting sleep mode, the device must be in Read mode (R/Wx = VIH) when chip enable is asserted, and the chip enable must be valid for one full cycle before a read will result in the output of valid data.

During sleep mode the RAM automatically deselects itself. The RAM disconnects its internal clock buffer. The external clock may continue to run without impacting the RAMs sleep current (Izz). All outputs will remain in high-Z state while in sleep mode. All inputs are allowed to toggle. The RAM will not be selected and will not perform any reads or writes.

#### IDT70T3509M High-Speed 2.5V 1024K x 36 Dual-Port Synchronous Static RAM

### JTAG Functionality and Configuration

The IDT70T3509M is composed of four independent memory arrays, and thus cannot be treated as a single JTAG device in the scan chain. The four arrays (A, B, C and D) each have identical characteristics and commands but must be treated as separate entities in JTAG operations. Please refer to Figure 2.

JTAG signaling must be provided serially to each array and utilize the information provided in the Identification Register Definitions, Scan

Register Sizes, and System Interface Parameter tables. Specifically, all serial commands must be issued to the IDT70T3509M in the following sequence: Array D, Array C, Array B, Array A. Please reference Application Note AN-411, "JTAG Testing of Multichip Modules" for specific instructions on performing JTAG testing on the IDT70T3509M. AN-411 is available at www.idt.com.

### JTAG AC Electrical Characteristics<sup>(1,2,3,4)</sup>

### NOTES:

1. Guaranteed by design.

2. 30pF loading on external output signals.

3. Refer to AC Electrical Test Conditions stated earlier in this document.

4. JTAG operations occur at one speed (10MHz). The base device may run at any speed specified in this datasheet.

### System Interface Parameters

Instruction	Code	Description
EXTEST	000000000000000000000000000000000000000	Forces contents of the boundary scan cells onto the device outputs <sup>(1)</sup> . Places the boundary scan register (BSR) between TDI and TDO.
BYPASS	11111111111111	Places the bypass register (BYR) between TDI and TDO.
IDCODE	0010001000100010	Loads the ID register (IDR) with the vendor ID code and places the register between TDI and TDO.
HIGHZ	0100010001000100	Places the bypass register (BYR) between TDI and TDO. Forces all device output drivers except INTx to a High-Z state.
CLAMP	0011001100110011	Uses BYR. Forces contents of the boundary scan cells onto the device outputs. Places the bypass register (BYR) between TDI and TDO.
SAMPLE/PRELOAD	0001000100010001	Places the boundary scan register (BSR) between TDI and TDO. SAMPLE allows data from device inputs <sup>(2)</sup> to be captured in the boundary scan cells and shifted serially through TDO. PRELOAD allows data to be input serially into the boundary scan cells via the TDI.
RESERVED	0101010101010101, 0111011101110111, 1000100010001000, 100110011001, 1010101010101010, 1011101110111011, 1100110011001100	Several combinations are reserved. Do not use codes other than those identified above.
PRIVATE	0110011001100110,1110111011101110, 11011101	For internal use only.

#### NOTES:

1. Device outputs = All device outputs except TDO.

3. The Boundary Scan Descriptive Language (BSDL) file for this device is available on the IDT website (www.idt.com), or by contacting your local IDT sales representative.

<sup>2.</sup> Device inputs = All device inputs except TDI, TMS, and  $\overline{\text{TRST}}$ .

### NOTES:

1. Contact your local sales office for Industrial temp range in other speeds, packages and powers.

- 2. Green parts available. For specific speeds, packages and powers contact your local sales office.
- LEAD FINISH (SnPb) parts are in EOL process. Product Discontinuation Notice PDN# SP-17-02

3. BP-256 package thickness is 1.76mm nominal. This is thicker than the BC-256 package (1.40mm nominal) used for the lower density IDT dual-port products.

### Datasheet Document History:

11/09/04: 03/24/05:	Initial Public Release of Preliminary Datasheet Page 1 Added I-temp offering to features
	Page 6 Added I-temp information to the Recommended Operating Temperature and Supply Voltage table
	Page 8 Added I-temp values to the DC Electrical Characteristics table
	Page 10 Added I-temp to the heading of the AC Electrical Characteristics table
	Page 23 Added I-temp to ordering information
	Page 1 Added green availability to features
	Page 1 - 23 Removed Preliminary status
06/14/05:	Page1 Added feature to highlight footprint compatibility
	Page 3 & 23 Added a footnote to highlight package thickness of BP-256 vs. BC-256
08/27/07:	Page 1 Functional Block Diagram changed to correct chip enable logic and added footnote 2 referencing Truth Table I
07/28/08:	Page 8 Corrected a typo in the DC Chars table
01/19/09:	Page 23 Removed "IDT" from orderable part number
07/15/14:	Page 23 Added Tape & Reel to Ordering Information
02/14/18:	Page 23 Ordering Information restored from 70T3719_99 to 70T3509M
	Product Discontinuation Notice - PDN# SP-17-02
