## Description:

The IDT70V9199/099 is a high-speed 128K x9/x8 bit synchronous Dual-Port RAM. The memory array utilizes Dual-Port memory cells to allow simultaneous access of any address from both ports. Registers on control, data, and address inputs provide minimal setup and hold times. The timing latitude provided by this approach allows systems to be designed with very short cycle times.

With an input data register, the IDT70V9199/099 has been optimized for applications having unidirectional or bidirectional data flow in bursts. An automatic power down feature, controlled by  $\overline{CE_0}$  and  $CE_1$ , permits the on-chip circuitry of each port to enter a very low standby power mode. Fabricated using IDT's CMOS high-performance technology, these devices typically operate on only 500mW of power.

**NOTES:**

1. Transition is measured 0mV from Low or High-impedance voltage with the Output Test Load (Figure 2). This parameter is guaranteed by device characterization, but is not production tested.
2. The Pipelined output parameters (t<sub>CYC2</sub>, t<sub>CD2</sub>) apply to either or both the Left and Right ports when  $\overline{FT}/PIPE = V_{IH}$ . Flow-through parameters (t<sub>CYC1</sub>, t<sub>CD1</sub>) apply when  $\overline{FT}/PIPE = V_{IL}$  for that port.
3. All input signals are synchronous with respect to the clock except for the asynchronous Output Enable ( $\overline{OE}$ ),  $\overline{FT}/PIPE_R$ , and  $\overline{FT}/PIPE_L$ .

### NOTES:

1. Transition is measured 0mV from Low or High-impedance voltage with the Output Test Load (Figure 2).
2.  $\overline{\text{OE}}$  is asynchronously controlled; all other inputs are synchronous to the rising clock edge.
3.  $\text{ADS} = V_{\text{IL}}$  and  $\text{CNTRST} = V_{\text{IH}}$ .
4. The output is disabled (High-Impedance state) by  $\overline{\text{CE}}_0 = V_{\text{IH}}$  or  $\text{CE}_1 = V_{\text{IL}}$  following the next rising edge of the clock. Refer to Truth Table 1.
5. Addresses do not have to be accessed sequentially since  $\text{ADS} = V_{\text{IL}}$  constantly loads the address on the rising edge of the CLK; numbers are for reference use only.
6. 'X' here denotes Left or Right port. The diagram is with respect to that port.

5. Output state (High, Low, or High-impedance) is determined by the previous cycle control signals.
6. No dead cycle exists during counter reset. A READ or WRITE cycle may be coincidental with the counter reset cycle. ADDR0 will be accessed. Extra cycles are shown here simply for clarification.
7.  $\overline{CNTEN} = V_{IL}$  advances Internal Address from 'An' to 'An + 1'. The transition shown indicates the time required for the counter to advance. The 'An + 1' Address is written to during this cycle.

## Functional Description

The IDT70V9199/099 provides a true synchronous Dual-Port Static RAM interface. Registered inputs provide minimal set-up and hold times on address, data, and all critical control inputs. All internal registers are clocked on the rising edge of the clock signal, however, the self-timed internal write pulse is independent of the LOW to HIGH transition of the clock signal.

An asynchronous output enable is provided to ease asynchronous bus interfacing. Counter enable inputs are also provided to staff the operation of the address counters for fast interleaved memory applications.

$\overline{CE_0} = V_{IL}$  and  $CE_1 = V_{IH}$  for one clock cycle will power down the internal circuitry to reduce static power consumption. Multiple chip enables allow easier banking of multiple IDT70V9199/099's for depth expansion configurations. When the Pipelined output mode is enabled, two cycles are required with  $\overline{CE_0} = V_{IH}$  or  $CE_1 = V_{IL}$  to re-activate the outputs.

## Depth and Width Expansion

The IDT70V9199/099 features dual chip enables (refer to Truth Table I) in order to facilitate rapid and simple depth expansion with no requirements for external logic. Figure 4 illustrates how to control the various chip enables in order to expand two devices in depth.

The IDT70V9199/099 can also be used in applications requiring expanded width, as indicated in Figure 4. Since the banks are allocated at the discretion of the user, the external controller can be set up to drive the input signals for the various devices as required to allow for 18/16-bit or wider applications.
