## 10 Memory Tone/Pulse Dialer

### High-Performance Silicon-Gate CMOS

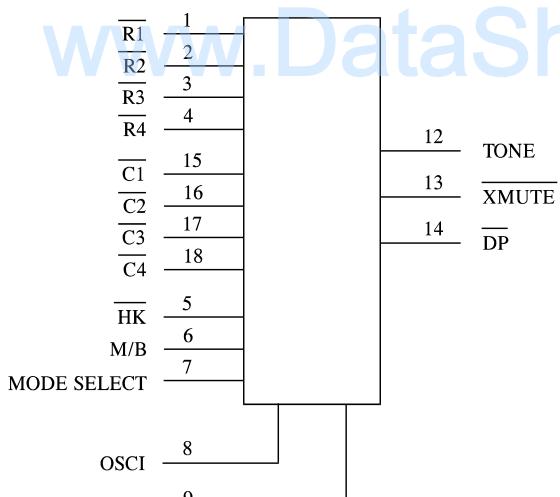

The IL91260C is tone/pulse switchable dialer with ten 16-digit number memories and 32-digit redial memory. Pulse to tone mode switching is performed via a slide switch.

- 32-digit redial memory (31 digits in tone mode)
- Ten indirect memories, 16 digits in pulse mode, 15 digits in tone mode
- Tone/Pulse mode switching via slide switch (4.1 second pause inserted automatically)
- Wide operating voltage: 1.8 V ~ 5.5 V
- Uses 480 KHz ceramic resonator
- Low memory retention current
- Selectable Make/Break ratio
- Dial Pulse Rate: 10 pps

**Pin Description**

Pin No.	Designation	Description
1	R1	Keyinputs. When a row and a column are connected, a key operation is activated.
2	R2	Scanning signals are present on both the row and column pins during a valid key-in condition.
3	R3	
4	R4	
5	HK	Hook switch input. When HK = V <sub>CC</sub> , an ON-Hook state exists. When HK = GND, an Off-Hook state exists.
6	M/B	Dial pulse Make/Break ratio select input. If M/B = V <sub>CC</sub> , the Make/Break ratio is 1/2. If M/B = GND, the Make/Break ratio is 2/3.
7	MODE SELECT	Pulse/DTMF mode select input. If MODE SELECT = V <sub>CC</sub> , Pulse mode is in effect. If MODE SELECT = GND, DTMF mode is in effect.
8 9	OSCI OSC0	Oscillator I/O. A 480 KHz ceramic resonator and two 100 pF serial loading capacitors form a complete oscillator circuit. The circuit is activated when HK is low. Oscillator start-up time is typically 10 ms.
10	V <sub>CC</sub>	Positive power supply.
11	GND	Negative power supply.
12	TONE	DTMF signal output. Pull-down load resistance is 10,000 Ω. The minimum tone and IDP durations are built-in for both normal dialing and redialing.
13	XMUTE	Transmit mute output. This is an N-channel open drain output. The output transistor is switched on while a sequence of digits is being dialed (for both Pulse and Tone modes). Otherwise, it is switched off.
14	DP	Dial pulse output. This pin is an N-channel open drain output. When DP output is low (switched on), it serves as a break signal in Pulse dialing. For other operations, DP output is normally high impedance (switched off).
15	C1	Keyinputs.
16	C2	When a row and a column are connected, a key operation is activated.
17	C3	Scanning signals are present on both the row and column pins during a valid key-in condition.
18	C4

### Functional Description

1. N-Channel Open Drain Output - DP, XMUTE

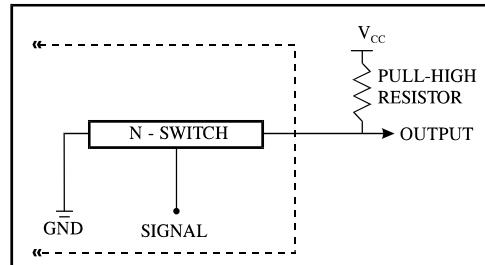

Figure 1.

2. DTMF Generator

The digitally synthesized sinewave of the IN91260 series is well designed, with a 6 level, 12 segment, 1/2 V<sub>CC</sub> reference voltage. The THD (Total Harmonic Distortion) of the DTMF output is typically 1%, when V<sub>CC</sub> = 2.5 V to 5.5 V and frequency is in the 500 HZ to 3400 HZ band.

## MAXIMUM RATINGS\*

Symbol	Parameter	Value	Unit
VCC	DC Supply Voltage (Referenced to GND)	-0.3 to +6.0	V
VIN	DC Input Voltage (Referenced to GND)	-0.3 to VCC +0.3	V
VOUT	DC Output Voltage (Referenced to GND)	-0.3 to VCC +0.3	V
VOUT	DC Output Voltage (DP, XMUTE)	-0.3 to 1.2	V
ITONE	DC Output Current(Tone)	50	mA
P <sub>D</sub>	Power Dissipation in Still Air, Plastic DIP**	500	mW
Tstg	Storage Temperature	-40 to +125	°C

\* Maximum Ratings are those values beyond which damage to the device may occur.

Functional operation should be restricted to the Recommended Operating Conditions.

\*\* Durating: -10 mW/°C from 65°C to 70°C.

## RECOMMENDED OPERATING CONDITIONS

Symbol	Parameter	Min	Max	Unit
V <sub>CC</sub>	DC Supply Voltage (Referenced to GND)	1.8	5.5	V
V <sub>IN</sub>	DC Input Voltage (Referenced to GND)	0	V <sub>CC</sub>	V
V <sub>OUT</sub>	DC Output Voltage (Referenced to GND)	0	V <sub>CC</sub>	V
T <sub>A</sub>	Operating Temperature	-20	+70	°C

This device contains protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high-impedance circuit. For proper operation, V<sub>IN</sub> and V<sub>OUT</sub> should be constrained to the range GND≤(V<sub>IN</sub> or V<sub>OUT</sub>)≤V<sub>CC</sub>.

Unused inputs must always be tied to an appropriate logic voltage level (e.g., either GND or V<sub>CC</sub>). Unused outputs must be left open.
