microprocessors. It is used in monitor systems for controlling various processes and entities.

Packaged in 8-pin SOP or DIP.

Features:

- Rated supply voltage 5.0 V
- Accurate 5% or 10% microprocessor power supply monitoring
- Programming of watchdog timer overflow time
- Generation of reset signals at power on for correct microprocessor start.

The chip contains reference voltage source, analog comparator, Watchdog timer, circuit for monitoring power supply deviation accuracy.

Functions:

- Reset signal generation after power failure/ error
- Reset signal generation from external “RESET” pushbutton
- Reset signal generation from watchdog timer

* Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
