600V CoolMOS™ SJ S7A Power Device

CoolMOS™ S7T enables the best price performance for low-frequency switching applications. The embedded temperature sensor increases junction temperature sensing accuracy and robustness while keeping an easy and seamless implementation. CoolMOS™ S7T is optimized for “static switching” and high current applications. The new temperature sensor enhances S7 features, allowing the best possible utilization of the power transistor.

Features

- Optimized price performance in low-frequency switching applications
- High pulse current capability
- Seamless diagnostics at the lowest system cost
- Temperature sense feature for protection and optimized thermal device utilization cost

Benefits

- Reduction of external sensing elements, hence a more compact design compared to electromechanical devices
- Increased system performance
- Minimized conduction losses (eliminate/reduce heat sink)
- Increased system performance
- More compact and more straightforward design
- Lower BOM or/and TCO over a prolonged lifetime
- More reliability and longer system lifetime

Potential applications

- Solid state relays and circuit breakers (PLC, Energy storage)
- Line rectification in high power/performance applications (Computing, Telecom, UPS and Solar)

Product validation

Fully qualified according to JEDEC for Industrial Applications

Please note: The source and sense source pins are not exchangeable. Their exchange might lead to malfunction. For paralleling 4pin MOSFET devices the placement of the gate resistor is generally recommended to be on the Driver Source instead of the Gate.
