Description

The IRF6620PbF combines the latest HEXFET® Power MOSFET Silicon technology with the advanced DirectFET™ packaging to achieve the lowest on-state resistance in a package that has the footprint of an SO-8 and only 0.7 mm profile. The DirectFET package is compatible with existing layout geometries used in power applications, PCB assembly equipment and vapor phase, infra-red or convection soldering techniques, when application note AN-1035 is followed regarding the manufacturing methods and processes. The DirectFET package allows dual sided cooling to maximize thermal transfer in power systems, improving previous best thermal resistance by 80%.

The IRF6620PbF balances both low resistance and low charge along with ultra low package inductance to reduce both conduction and switching losses. The reduced total losses make this product ideal for high efficiency DC-DC converters that power the latest generation of processors operating at higher frequencies. The IRF6620PbF has been optimized for parameters that are critical in synchronous buck operating from 12 volt bus converters including $R_{ds(on)}$, gate charge and C_{dv}/dt -induced turn on immunity. The IRF6620PbF offers particularly low $R_{ds(on)}$ and high C_{dv}/dt immunity for synchronous FET applications.
