ISL71026M

3.3V CAN Transceiver, 1Mbps, Listen Mode, Loopback

Description

The ISL71026M is a radiation tolerant 3.3V CAN transceiver that is compatible with the ISO11898-2 standard for applications calling for Controller Area Network (CAN) serial communication in satellites and aerospace communications and telemetry data processing in harsh industrial environments.

The transceiver can transmit and receive at bus speeds up to 5Mbps. It can drive a 40m cable at 1Mbps per the ISO11898-2 specification. The device is designed to operate across a common-mode range of -7V to +12V with a maximum of 120 nodes. The device has three discrete selectable driver rise/fall time options, a listen mode feature, and loopback test capability.

The ISL71026M is available in a plastic 14 Ld TSSOP package. It operates across the temperature range of -55° C to $+125^{\circ}$ C. The logic inputs are tolerant with 5V systems.

Applications

- Telemetry data processing in commercial satellites
- Low earth orbits (LEO) applications
- Launch vehicles and high altitude avionics

Features

- Qualified to Renesas Rad Tolerant Screening and QCI Flow (R34TB0004EU)
- ESD protection on all pins: 5kV HBM
- Compatible with ISO11898-2
- Operating supply range: 3.0V to 3.6V
- Bus pin fault protection to ±20V
- Three selectable driver rise and fall times
- High data rates up to 5Mbps
- -7V to +12V common mode input voltage range
- · Hi Z input allows for 120 nodes on the bus
- Cold spare: powered down devices/nodes will not
 affect active devices operating in parallel
- Full fail-safe (open, short, terminated/undriven) receiver
- Quiescent supply current: 7mA (max), Listen mode supply current: 2mA (max)
- Tin (Sn) free lead finish with Ni/Pd/Au-Ag lead finish
- Passes NASA Low Outgassing Specifications
- TID Radiation Lot Acceptance Testing (LDR: <0.01rad(Si)/s)
 - ISL71026M30VZ: 30krad(Si)
 - ISL71026M50VZ: 50krad(Si)
- SEE Characterization
 - No DSEE for VCC = 5.5V, CANL = ±20V and CANH = ±20V at 43MeV•cm²/mg
 - SET < 370µm² with fast slew rate at 43MeV•cm²/mg
 - SET < 14,370µm² with medium slew rate at 43MeV•cm²/mg

1. Pin Information

1.1 Pin Assignments

Figure 3. Pin Assignments - Top View

1.2 Pin Descriptions

Pin Number	Pin Name	Function
1, 4, 7, 8, 10, 14	NC	No connect.
2	D	CAN driver digital input. The bus states are LOW = Dominant and HIGH = Recessive. Internally tied HIGH.
3	GND	Ground connection.
5	VCC	System power supply input (3.0V to 3.6V). The typical voltage for the device is 3.3V.
6	R	CAN Data Receiver Output. The bus states are LOW = Dominant and HIGH = Recessive.
9	LBK	A HIGH on this pin places CANH and CANL pins in a high impedance state. The rest of the circuit remains active so that the TX and RX can loopback diagnostic information. Internally tied LOW.
11	CANL	CAN bus line for low level output.
12	CANH	CAN bus line for high level output.
13	RS	A resistor to GND from this pin controls the rise and fall time of the CAN output waveform. Drive RS HIGH to put into Listen Mode.

2. Specifications

2.1 Absolute Maximum Ratings

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

Parameter	Minimum	Maximum	Unit
VCC to GND	-0.3V	5.5	V
CANH, CANL, VREF		±20	V
I/O Voltages D, R, RS	-0.5	7	V
Receiver Output Current	-10	10	mA
Output Short-Circuit Duration	-	Continuous	
Maximum Junction Temperature	-	+150	°C
Storage Temperature Range	-65	+150	°C
Human Body Model (Tested per JS-001-2014)	-	5	kV
Charged Device Model (Tested per JS-002-2014)	-	2	kV
Machine Model (Tested per JESD22-A115-C)	-	300	V
Latch-up (Tested per JESD-78E; Class 2, Level A) at +125°C	-	100	mA

2.2 Outgas Testing

Specification (Tested per ASTM E 595, 1.5)	Value	Unit
Total Mass Lost ^[1]	0.06	%
Collected Volatile Condensible Material ^[1]	<0.01	%
Water Vapor Recovered	0.03	%

1. Results meet NASA low outgassing requirements of "Total Mass Lost" of <1% and Collected Volatile Condensible Material of <0.1%.

2.3 Thermal Information

Parameter	Package	Symbol	Conditions	Typical Value	Unit
Thermal Resistance	14 Ld TSSOP Package	$\theta_{JA}^{[1]}$	Junction to ambient	92	°C/W
mermantesistance		$\theta_{JC}^{[2]}$	Junction to case	30	°C/W

1. θ_{JA} is measured with the component mounted on a high-effective thermal conductivity test board in free air. See <u>TB379</u>.

2. For $\theta_{JC},$ the case temperature location is taken at the package top center.

2.4 Operating Conditions

Parameter	Minimum	Maximum	Unit
Temperature Range	-55	+125	°C
V _{CC} Supply Voltage	3.0	3.6	V
Voltage on CAN I/O	-7	12	V
V _{IH} Logic Pins (D, LBK)	2	5.5	V
V _{IL} Logic Pins (D, LBK)	0	0.8	V
I _{OH} Driver (CANH - CANL = 1.5V, V _{CC} = 3.3V)	-	-40	mA
I _{OH} Receiver (V _{OH} = 2.4V)	-	-4	mA

Parameter	Minimum	Maximum	Unit
I _{OL} Driver (CANH - CANL = 1.5V, V _{CC} = 3.3V)	-	+40	mA
I _{OL} Receiver (V _{OL} = 0.4V)	-	+4	mA

2.5 Electrical Specifications

Test Conditions: $V_{CC} = 3.0V$ to 3.6V;Typicals are at $T_A = +25^{\circ}C$; unless otherwise specified^[1]. Boldface limits apply across the operating temperature range, -55°C to +125°C.

4. Functional Description

4.1 Overview

The ISL71026M is a 3.3V radiation tolerant CAN transceiver that is compatible with the ISO11898-2 standard for use in Controller Area Network (CAN) serial communication systems.

The device performs transmit and receive functions between the CAN controller and the CAN differential bus. It can transmit and receive at bus speeds of up to 5Mbps. It is designed to operate over a common-mode range of -7V to +12V with a maximum of 120 nodes. The device is capable of withstanding ±20V on the CANH and CANL bus pins.

4.2 Slope Adjustment

The output driver rise and fall time has three distinct selections that can be chosen by using a resistor from the RS pin to GND. Connecting the RS pin directly to GND results in output switching times that are the fastest, limited only by the drive capability of the output stage. RS = $10k\Omega$ provides for a typical slew rate of $8V/\mu s$ and RS = $50k\Omega$ provides for a typical slew rate of $4V/\mu s$.

Putting a high logic level to the RS pin places the device in a low current listen mode. The protocol controller uses this mode to switch between low power listen mode and normal transmit mode.

4.3 Cable Length

The device can work per ISO11898 specification with a 40m cable and stub length of 0.3m and 60 nodes at 1Mbps. This is greater than the ISO requirement of 30 nodes. The cable type specified is twisted pair (shielded or unshielded) with a characteristic impedance of 120Ω . Resistors equal to this are to be terminated at both ends of the cable. Stubs should be kept as short as possible to prevent reflections.

4.4 Cold Spare

High reliability system designers implementing data communications must be sensitive to the potential for single point failures. To mitigate the risk of a failure they use redundant bus transceivers in parallel. In this arrangement both active and quiescent devices can be present simultaneously on the bus. The quiescent devices are powered down for cold spare and do not affect the communication of the other active nodes.

The powered down transceiver (V_{CC} < 200mV) has a resistance between the CANH or CANL bus pin and the V_{CC} supply rail of at least 480k Ω with a typical resistance of 2M Ω . The resistance between CANH and CANL of a powered-down transceiver has a typical resistance of 80k Ω .

The receiver output (R pin) of a powered-down transceiver ($V_{CC} < 200$ mV) is internally connected to ground. Therefore, the receiver outputs of an active transceiver and a cold spare transceiver cannot be connected together in the redundant application.

4.5 Listen Mode

When a high level is applied to the RS pin, the device enters a low power listen mode. The driver of the transceiver is switched off to conserve power while the receiver remains active. In listen mode the transceiver draws 2mA (max) of current. A low level on the RS pin brings the device back to normal operation.

4.6 Loopback Mode

When a high level is applied to the LBK pin, the device enters the loopback state. The transceiver CANH and CANL pins are disconnected from the bus. The driver and receiver circuitry of the transceiver remain active to allow for diagnostic testing of the node.

4.7 Using 3.3V Devices in 5V Systems

The differential voltage of the 3.3V and 5V devices, is the same and the recessive common-mode output is the same. The dominant common-mode output voltage is slightly lower than the 5V counterparts. The receiver specifications are also the same. Though the electrical parameters appear compatible it is advised that necessary system testing be performed to verify interchangeable operation.

5. Radiation Tolerance

The ISL71026M is a radiation tolerant device for commercial space applications, Low Earth Orbit (LEO) applications, high altitude avionics, launch vehicles, and other harsh environments. This device's response to Total Ionizing Dose (TID) radiation effects and Single-Event Effects (SEE) has been measured, characterized, and reported in the following sections. The TID performance of the ISL71026MNZ is not guaranteed through radiation acceptance testing. The ISL71026M30NZ is radiation lot acceptance tested (RLAT) to 30krad(Si), and the ISL71026M50NZ is RLAT to 50krad(Si). The SEE characterized performance is not guaranteed.

5.1 Total Ionizing Dose (TID) Testing

5.1.1 Introduction

This test was conducted to determine the sensitivity of the part to the total dose environment. Down points were 0krad(Si), 10krad(Si), 30krad(Si), and 50krad(Si). The irradiations were followed by a biased anneal for 168 hours at +100°C.

Total dose testing was performed using a Hopewell Designs N40 panoramic ⁶⁰Co irradiator. The irradiations were performed at 0.00875rad(Si)/s. A PbAI box was used to shield the test fixture and devices under test against low energy secondary gamma radiation.

The characterization matrix consisted of 24 samples irradiated under bias and 24 samples irradiated with all pins grounded. Six control units were used to ensure repeatable data. Three different wafers were used. The bias configuration is shown in Figure 53.

Figure 53. Irradiation Bias Configuration and Power Supply Sequencing for the ISL71026M

All electrical testing was performed outside the irradiator using the production Automated Test Equipment (ATE), with data logging at each down point (including anneal). Downpoint electrical testing was performed at room temperature.

5.1.2 Results

Table 2 summarizes the attributes data. "Bin 1" indicates a device that passes all datasheet specification limits.

Dose Rate (mrad(Si)/s)	Bias	Sample Size	Down Point	Bin 1	Rejects
			Pre-rad	24	
			10krad(Si)	24	0
8.75	Figure 53	24	30krad(Si)	24	0
			50krad(Si)	0	
			Anneal	24	0
			Pre-rad	24	
			10krad(Si)	24	0
8.75	Grounded	24	30krad(Si)	30krad(Si) 24	
			50krad(Si)	24	0
			Anneal	24	0

Table 2. ISL71026M Total Dose Test Attributes Data

The plots in Figure 54 through Figure 59 show data for key parameters at all down points. The plots show the average as a function of total dose for each of the irradiation conditions; we chose to use the average because of the relatively large sample sizes. All parts showed excellent stability over irradiation.

Table 3 shows the average of other key parameters with respect to total dose in table form.

5.2 Data Plots

Figure 56. Receiver Input Threshold Voltage Rising/Falling vs TID

Figure 58. Total Loop Delay (Recessive to Dominant) vs TID

Figure 55. Recessive Output Differential Voltage - VOD(REC) vs TID

5.2.1 Conclusion

ATE characterization testing showed no rejects to the datasheet limits at all down points. Variables data for selected parameters is presented in Figure 54 through Figure 59. No differences between biased and unbiased irradiation were noted, and the part is not considered bias sensitive.

Table 3. ISL71026M Response of Key Parameters vs TID (Cont.)

5.3 Single-Event Effects Testing

5.3.1 Introduction

The intense heavy ion environment encountered in space applications can cause a variety of Single-Event Effects (SEE). SEE can lead to system-level performance issues including disruption, degradation, and destruction. For predictable and reliable space system operation, individual electronic components should be characterized to determine their SEE response. The following is a summary of the SEE testing of the ISL71026M.

5.3.2 SEE Test Setup

Testing was performed at the Texas A&M University (TAMU) Cyclotron Institute heavy ion facility. This facility is coupled to a K500 super-conducting cyclotron, which is capable of generating a wide range of test particles with the various energy, flux, and fluence levels needed for advanced radiation testing.

A schematic of the SEE test circuit is shown in Figure 60. The cabling connected to the CANH/CANL pins presents 700pF to GND due to the 20 foot cable connecting the DUT to the oscilloscopes in the control room for SET testing. Other supplies and signals indicated by arrows were also cabled to the control room. Two instantiations of the schematic on a single board allowed two devices to be simultaneously irradiated for SEE testing. The two parts were monitored separately. Digital multimeters and oscilloscopes were used to monitor voltages and currents and to capture SET events.

5.3.3 SEL, SEB, and SEGR Testing Results

Testing for Single Event Latch-Up (SEL), Single Event Burnout (SEB), and Single Event Gate Rupture (SEGR) proceeded with biasing V_{CC} at both 0V and 5.5V (the supply absolute maximum), and the bus pins (CANL and CANH) alternately set to -20V and +20V (the absolute maximum for the bus terminals). This yielded four conditions for irradiations testing for damaging SEE. For the two powered cases the data input was a 50kHz square wave to exercise both the transmitter and receiver at approximately +25°C (ambient) case temperature. DUTs were irradiated with Ag ions at a 0° incident angle, resulting in an LET of 43MeV•cm²/mg. Each irradiation was done to a fluence of $1x10^{7}$ ion/cm² so that each DUT saw a net of $4x10^{7}$ ion/cm².

Operating supply current (I_{CC}) and common-mode current (I_{CM}) were measured pre-radiation and post-radiation for each irradiation. The changes in current for the powered cases ($V_{CC} = 5.5V$) were less than 0.5% and so were considered to indicate no damaging SEE. For the unpowered cases ($V_{CC} = 0V$) the I_{CM} currents were in the low μ A and registered changes only up to 7%. These changes in I_{CM} were interpreted as within the noise on the measurements and again did not indicate damaging SEE.

Before and after each sequence of four irradiations on a DUT a set of four operating currents were measured to characterize the part. These monitor currents were: static recessive I_{CM} for V_{CM} = -7V, static recessive I_{CM} for V_{CM} = +12V, dynamic unloaded I_{CC} for data at 250kHz, and dynamic loaded ICC for data at 250kHz. All of these

operating currents registered less than 1% change as a result of the four irradiations. This was again interpreted as an indication of no damaging SEE.

5.3.4 Single-Event Transient Testing

Single Event Transient (SET) testing was conducted with a supply of 3.0V, data input of a 500kHz square wave, and +25°C (ambient) case temperature. Irradiation was done with various ions (Ag, Kr, Cu, Ar, Ne) at normal incidence to 1×10^{7} ion/cm² for each test. SET were counted for every received pulse deviating by 50ns from the nominal 1000ns. The SET were captured and counted by an oscilloscope. SET testing was done for both the high slew rate (RS = 0 Ω) and the medium slew rate (RS = 10k Ω). The results are summarized in Table 4.

LET (MeV•cm ² /mg)		Fast Slev	v, RS = 0Ω		Medium Slew, RS = 10kΩ			
(Species)	DUT1	DUT2	DUT3	DUT4	DUT1	DUT2	DUT3	DUT4
43 (Ag)	31	8	30	6	1378	990	912	1437
28 (Kr)	3	0	8	0	415	928	867	525
20 (Cu)	0	0	0	0	535	275	226	598
8.5 (Ar)	-	-	-	-	6	34	39	14
2.7 (Ne)	-	-	-	-	0	0	0	0

Table 4. SET Results

1. SET counts of ± 50 ns events on a 500kHz square wave signal taken to a fluence of 1×10^{7} ion/cm² at each test.

The data in Table 4 can be reduced to generate Weibull parameters to run CRÈME96 simulations to get approximate times between events in a solar minimum geosynchronous orbit with 100 mils of aluminum shielding. Carrying out these simulations predicts about 10.7 years between ±50ns events when running at medium slew rate, and 2000 years between events when running at the high slew rate.

5.3.5 Conclusion

The SEE test results clearly demonstrate that the ISL71026M is robust against SEL, SEB, and SEGR to a LET of 43MeV•cm²/mg at a supply voltage up to 5.5V, bus voltages to ±20V, and a case temperature up to +125°C.

SET characterization showed that relatively benign events of ±50ns timing disruption on a 500kHz signal were rare events when ion abundance is considered. Using a solar minimum geosynchronous orbit with 100 mils of aluminum shielding as a benchmark, events when running at the medium slew rate are roughly once every 10.7 years, and events when running at the fast slew rate occur roughly once every 2000 years.

6. Package Outline Drawing

M14.173

14 LEAD THIN SHRINK SMALL OUTLINE PACKAGE (TSSOP) Rev 3, 10/09

NOTES:

- 1. Dimension does not include mold flash, protrusions or gate burrs. Mold flash, protrusions or gate burrs shall not exceed 0.15 per side.
- 2. Dimension does not include interlead flash or protrusion. Interlead flash or protrusion shall not exceed 0.25 per side.
- 3. Dimensions are measured at datum plane H.
- 4. Dimensioning and tolerancing per ASME Y14.5M-1994.
- Dimension does not include dambar protrusion. Allowable protrusion shall be 0.80mm total in excess of dimension at maximum material condition. Minimum space between protrusion and adjacent lead is 0.07mm.
- 6. Dimension in () are for reference only.
- 7. Conforms to JEDEC MO-153, variation AB-1.

1. These Pb-free plastic packaged products employ special Pb-free material sets, molding compounds/die attach materials, and NiPdAu-Ag plate -e4 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations. Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.

2. For Moisture Sensitivity Level (MSL), see the ISL71026M product information page. For more information about MSL, see TB363.

3. For the Pb-Free Reflow Profile, see TB493.

4. Refer to TB347 for details about reel specifications.

8. Revision History

Rev.	Date	Description
2.01	Feb 6, 2025	Updated to the latest template. Updated Features bullets. Added ISL71026M30VZ and ISL71026M50VZ part information throughout document.
2.00	Aug 14, 2020	Changed maximum data rate from 1Mbps to 5Mbps on the following pages: Page 1: Second paragraph and Features section. Page 20: In Overview section. Added curves Figures 50 and 51 in Typical Performance Curves, section 4.
1.00	Mar 26, 2018	Updated to latest layout. Added Outgassing Feature bullet. Updated Ordering information by adding -T and -T7 parts to table and updated Note 1. Added Outgassing specification information. Removed About Intersil section and updated disclaimer.
0.00	May 3, 2017	Initial release
