

ISL99203

High Efficiency Audio Subsystem

FN7547

Rev 1.00

September 15, 2011

The ISL99203 is a fully integrated high efficiency class-D mono amplifier combined with a capfree headphone amplifier. It is designed to maximize performance for mobile phone applications while saving valuable board space. The application circuit requires a minimum requirement of external components and operates from a 2.4V to 5.5V input supply.

It is capable of delivering 1.5W of continuous output power with less than 10% THD+N driving a 8Ω load from a 5V supply. The speaker amplifier of the ISL99203 features a high-efficiency, low-noise modulation scheme. It operates with 85% efficiency at 400mW into 8Ω from 5V supply and has a signal-to-noise ratio (SNR) that is greater than 95dB. The architecture of the device allows it to achieve very low level pop and click. This minimizes voltage glitches at the output during turn-on and turn-off, thus reducing audible noise on activation and deactivation. EMI suppression is achieved by SRC (Slew Rate Control). The amplifier passes FCC Radiated Emissions Standards with 24 inches of Cable and achieves greater than 20dB margin under FCC limits.

The class-D amplifier is designed to operate without a low pass output filter thus saving cost and board space. The headphone amplifier is a GND-reference capfree amplifier. It can output up to 35mW into 32Ω at 3.3V.

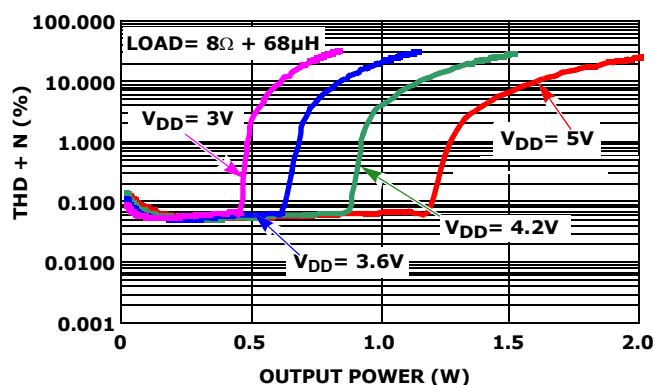

Features

- Operating Voltage 2.4V to 5.5V
- Low Quiescent Current
- Low Shutdown Current
- Low RFI Susceptibility
- Integrated Bypass Switch, I²C Controlled
- I²C Control Interface
- 40 Step Digital Volume Control
- 3 Independent Volume Channels
- 10 Distinct Output Modes
- Speaker Amp Class-D
- Protection for UV/TSD/OC
- Independent Gain Boost for Headphone and Speaker
- All Digital Interfaces 1.8V Compatible
- Exposed Pad at Ground Voltage

Applications* (see page 15)

- Mobile Phones
- PDAs
- Portable Media Players
- Portable Gaming

NOTES:

- Please refer to [TB347](#) for details on reel specifications.
- These Intersil Pb-free WLCSP and BGA packaged products employ special Pb-free material sets; molding compounds/die attach materials and SnAgCu - e1 solder ball terminals, which are RoHS compliant and compatible with both SnPb and Pb-free soldering operations. Intersil Pb-free WLCSP and BGA packaged products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
- For Moisture Sensitivity Level (MSL), please see device information page for [ISL99203](#). For more information on MSL please see tech brief [TB363](#).

Typical Application

Theory of Operation

The ISL99203 supports an I²C bidirectional bus oriented protocol. The protocol defines any device that sends data onto the bus as a transmitter and the receiving device as the receiver. The device controlling the transfer is a master and the device being controlled is the slave. The master always initiates data transfers and provides the clock for both transmit and receive operations. Therefore, the ISL99203 operates as a slave device in all applications.

All communication over the I²C interface is conducted by sending the MSB of each byte of data first.

Protocol Conventions

Data states on the SDA line must change only during SCL LOW periods. SDA state changes during SCL HIGH are reserved for indicating START and STOP conditions (see Figure 28). On power-up of the ISL99203, the SDA pin is in the input mode.

All I²C interface operations must begin with a START condition, which is a HIGH to LOW transition of SDA while SCL is HIGH. The ISL99203 continuously monitors the SDA and SCL lines for the START condition and does not respond to any command until this condition is met (see Figure 29). A START condition is ignored during the power-up of the device.

All I²C interface operations must be terminated by a STOP condition, which is a LOW to HIGH transition of SDA while SCL is HIGH (see Figure 28). A STOP condition at the end of a read operation, or at the end of a write operation places the device in its standby mode.

An ACK, Acknowledge, is a software convention used to indicate a successful data transfer. The transmitting device, either master or slave, releases the SDA bus after transmitting eight bits. During the ninth clock cycle, the receiver pulls the SDA line LOW to acknowledge the reception of the eight bits of data (see Figure 29).

The ISL99203 responds with an ACK after recognition of a START condition followed by a valid Identification Byte, and once again after successful receipt of an Address Byte. The ISL99203 also responds with an ACK after receiving a Data Byte of a write operation. The master must respond with an ACK after receiving a Data Byte of a read operation.

Products

Intersil Corporation is a leader in the design and manufacture of high-performance analog semiconductors. The Company's products address some of the industry's fastest growing markets, such as, flat panel displays, cell phones, handheld products, and notebooks. Intersil's product families address power management and analog signal processing functions. Go to www.intersil.com/products for a complete list of Intersil product families.
