

ISO7840, ISO7840F

SLLSEN2B - JULY 2015 - REVISED APRIL 2016

# ISO7840x High-Performance, 8000-V<sub>PK</sub> Reinforced Quad-Channel Digital Isolator

#### Features 1

- Signaling Rate: Up to 100 Mbps
- Wide Supply Range: 2.25 V to 5.5 V
- 2.25-V to 5.5-V Level Translation
- Wide Temperature Range: -55°C to +125°C
- Low-Power Consumption, Typical 1.7 mA per Channel at 1 Mbps
- Low Propagation Delay: 11 ns Typical (5-V Supplies)
- Industry leading CMTI (Min): ±100 kV/µs
- Robust Electromagnetic Compatibility (EMC)
- System-Level ESD, EFT, and Surge Immunity
- Low Emissions
- Isolation Barrier Life: >40 Years
- Wide Body SOIC-16 Package and Extra-Wide Body SOIC-16 Package Options
- Safety and Regulatory Approvals:
  - 8000-V<sub>PK</sub> Reinforced Isolation per DIN V VDE V 0884-10 (VDE V 0884-10):2006-12
  - 5.7-kV<sub>RMS</sub> Isolation for 1 Minute per UL 1577
  - CSA Component Acceptance Notice 5A, IEC 60950-1 and IEC 60601-1 End Equipment Standards
  - CQC Certification per GB4943.1-2011
  - TUV Certification per EN 61010-1 and EN 60950-1
  - All DW Package Certifications Complete; DWW Package Certifications Complete per UL, VDE, TUV and Planned for CSA and CQC

### 2 Applications

- Industrial Automation
- Motor Control
- **Power Supplies**
- Solar Inverters
- Medical Equipment
- Hybrid Electric Vehicles

### 3 Description

The ISO7840x device is a high-performance, quadchannel digital isolator with a 8000-V<sub>PK</sub> isolation device has reinforced isolation voltage. This certifications according to VDE, CSA, CQC, and TUV. The isolator provides high electromagnetic immunity and low emissions at low-power consumption, while isolating CMOS or LVCMOS digital I/Os. Each isolation channel has a logic input and output buffer separated by a silicon-dioxide (SiO<sub>2</sub>) insulation barrier.

This device comes with enable pins that can be used to put the respective outputs in high impedance for multi-master driving applications and to reduce power consumption. The ISO7840 device has four forward and zero reverse-direction channels. If the input power or signal is lost, the default output is high for the ISO7840 device and low for the ISO7840F device. See the Device Functional Modes section for further details.

Used in conjunction with isolated power supplies, this device helps prevent noise currents on a data bus or other circuits from entering the local ground and interfering with or damaging sensitive circuitry. innovative Through chip design and layout techniques, electromagnetic compatibility of the ISO7840 device has been significantly enhanced to ease system-level ESD, EFT, surge, and emissions compliance.

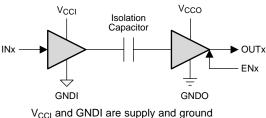

The ISO7840 device is available in 16-pin SOIC wide-body (DW) and extra-wide body (DWW) packages.

#### Device Information<sup>(1)</sup>

| PART NUMBER | PACKAGE  | BODY SIZE (NOM)    |  |  |
|-------------|----------|--------------------|--|--|
| ISO7840     | DW (16)  | 10.30 mm × 7.50 mm |  |  |
| ISO7840F    | DWW (16) | 10.30 mm × 14.0 mm |  |  |

(1) For all available packages, see the orderable addendum at the end of the data sheet.

#### Simplified Schematic

connections respectively for the input channels.

V<sub>CCO</sub> and GNDO are supply and ground connections respectively for the output channels.

### **4** Revision History

2

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

#### Changes from Revision A (March 2016) to Revision B

| • | Added Features 2.25 V to 5.5 V Level Translation  | . 1 |
|---|---|-----|
| • | Changed the number of years for the isolation barrier life in the Features section  | . 1 |
| • | VDE certification is now complete   | . 1 |
| • | Changed the input-to-output test voltage parameter to apparent charge in the Insulation Specifications  | . 7 |
| • | Changed V <sub>CCO</sub> to V <sub>CCI</sub> for the minimum value of the input threshold voltage hysteresis parameter in all electrical characteristics tables | . 9 |
| • | Added V <sub>CM</sub> to the test condition of the common-mode transient immunity parameter in all electrical characteristics tables                            | ; 9 |
| • | Added the lifetime projection graphs for DW and DWW packages to the Safety Limiting Values section  | 14  |
|   |   |     |

#### Changes from Original (July 2015) to Revision A

Submit Documentation Feedback

| • | Changed Features From: Industry leading CMTI To: Industry leading CMTI (MIN)   | . 1 |
|---|--|-----|
| • | Changed the Safety and Regulatory Approvals list of Features   | . 1 |
| • | Added Features "TUV Certification per EN 61010-1 and EN 60950-1"   | . 1 |
| • | Changed text in the first paragraph of the <i>Description</i> From: "certifications according to VDE, CSA, and CQC". To: "certifications according to VDE, CSA, CQC, and TUV." | . 1 |
| • | Added the DWW pinout image   | 4   |
| • | Added the DWW package to the Thermal Information   | 6   |
| • | Changed Package Insulation and Safety-Related Specifications, added the 16-DWW Package information   | . 7 |
| • | Added the DWW package information, added "Climatic category", and deleted Note 1 in Insulation Characteristics   | . 7 |
| • | Added Note 1 to Insulation Characteristics   | 7   |
|   |  |     |

#### www.ti.com

Page

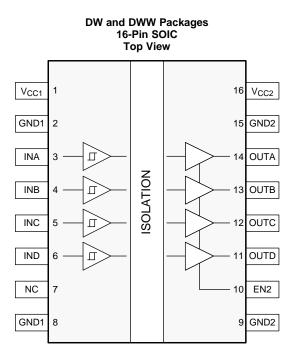

Page

| • | Changed IEC 60664-1 Ratings Table   | 7   |
|---|---|-----|
| • | Added the TUV and DWW package information to the <i>Regulatory Information</i> section and Regulatory Information. Deleted Note 1 in Regulatory Information | 8   |
| • | Changed the Supply Current section of Supply Characteristics—5-V Supply   | . 9 |
| • | Changed the Supply Current section of Supply Current Characteristics—3.3-V Supply   | 10  |
| • | Changed the Supply Current section of Supply Current Characteristics—2.5-V Supply   | 11  |
| • | Changed Device I/O Schematics   | 20  |

### 5 Pin Configuration and Functions

#### **Pin Functions**

| PIN              |                                    | I/O | DESCRIPTION  |  |  |
|------------------|------------------------------------|-----|--|--|--|
| NAME             | NO.                                | 1/0 | DESCRIPTION  |  |  |

### 6 Specifications

#### Absolute Maximum Ratings 6.1

See (1)

|  |              |                  | MIN  | MAX                   | UNIT |
|--|--------------|------------------|------|-----------------------|------|
| V <sub>CC1</sub> ,<br>V <sub>CC2</sub> | Supply volta | e <sup>(2)</sup> | -0.5 | 6                     | V    |
|  |              | INx              | -0.5 | $V_{CCX} + 0.5^{(3)}$ |      |
|  | Voltage      | OUTx             | -0.5 | $V_{CCX} + 0.5^{(3)}$ | V    |
|  |              | EN2              | -0.5 | $V_{CCX} + 0.5^{(3)}$ |      |
| lo                                     | Output curre | it               | -15  | 15                    | mA   |
|  | Surge immu   | ity              |      | 12.8                  | kV   |
| T <sub>stg</sub>                       | Storage tem  | erature          | -65  | 150                   | °C   |

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

All voltage values except differential I/O bus voltages are with respect to the local ground terminal (GND1 or GND2) and are peak (2) voltage values.

(3)Maximum voltage must not exceed 6 V

### 6.2 ESD Ratings

|                   |                            |  | VALUE | UNIT |
|-------------------|----------------------------|--|-------|------|
|                   |                            | Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>                    | ±6000 |      |
| V <sub>(ESD</sub> | D) Electrostatic discharge | Charged device model (CDM), per JEDEC specification JESD22-C101, all $\ensuremath{pins^{(2)}}$ | ±1500 | V    |

JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. (1)

JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. (2)

#### 6.3 Recommended Operating Conditions

|  |                                     |                         | MIN                                 | NOM | MAX                             | UNIT |  |
|--|-------------------------------------|-------------------------|-------------------------------------|-----|---------------------------------|------|--|
| V <sub>CC1</sub> ,<br>V <sub>CC2</sub> | Supply voltage                      |                         | 2.25                                |     | 5.5                             | V    |  |
|  |                                     | $V_{CCO}^{(1)} = 5 V$   | -4                                  |     |                                 |      |  |

(1) Creepage and clearance requirements should be applied according to the specific equipment isolation standards of an application. Care should be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed-circuit board do not reduce this distance. Creepage and clearance on a printed-circuit board become equal in certain cases. Techniques such as inserting grooves, ribs, or both on a printed circuit board are used to help increase these specifications.

(2) This coupler is suitable for *safe electrical insulation* only within the safety ratings. Compliance with the safety ratings shall be ensured by means of suitable protective circuits.

(3) Testing is carried out in air or oil to determine the intrinsic surge immunity of the isolation barrier.

(4) Apparent charge is electrical discharge caused by a partial discharge (pd).

(5) All pins on each side of the barrier tied together creating a two-pin device.

### 6.7 Safety-Related Certifications

Certifications for the DW package are complete. DWW package certifications are complete for UL, VDE and TUV and planned for CSA and CQC.

### 6.8 Safety Limiting Values

Safety limiting intends to minimize potential damage to the isolation barrier upon failure of input or output circuitry. A failure of the I/O can allow low resistance to ground or the supply and, without current limiting, dissipate sufficient power to overheat the die and damage the isolation barrier potentially leading to secondary system failures.

|                | PARAMETER   | TEST CONDITIONS  | MIN | TYP | MAX  | UNIT |
|----------------|---|--|-----|-----|------|------|
|                | $R_{\theta JA} = 78.9^{\circ}C/W, V_I = 5.5 V, T_J = 150^{\circ}C, T_A = 25^{\circ}C$ |  |     | 288 |      |      |
| I <sub>S</sub> | current   | $R_{\theta JA} = 78.9^{\circ}C/W, V_I = 3.6 V, T_J = 150^{\circ}C, T_A = 25^{\circ}C$        |     |     | 440  | mA   |
|                |   | $R_{\theta JA} = 78.9^{\circ}C/W, V_{I} = 2.75 V, T_{J} = 150^{\circ}C, T_{A} = 25^{\circ}C$ |     |     | 576  |      |
| Ps             | Safety input, output, or total power  | R <sub>0JA</sub> = 78.9°C/W, T <sub>J</sub> = 150°C, T <sub>A</sub> = 25°C                   |     |     | 1584 | mW   |
| Τ <sub>S</sub> | Maximum safety temperature  |  |     |     | 150  | °C   |

The maximum safety temperature is the maximum junction temperature specified for the device. The power dissipation and junction-to-air thermal impedance of the device installed in the application hardware determines the junction temperature. The assumed junction-to-air thermal resistance in the *Thermal Information* is that of a device installed on a high-K test board for leaded surface-mount packages. The power is the recommended maximum input voltage times the current. The junction temperature is then the ambient temperature plus the power times the junction-to-air thermal resistance.

(1) Also known as pulse skew.

(2) t<sub>sk(0)</sub> is the skew between outputs of a single device with all driving inputs connected together and the outputs switching in the same direction while driving identical loads.

(3) t<sub>sk(pp)</sub> is the magnitude of the difference in propagation delay times between any terminals of different devices switching in the same direction while operating at identical supply voltages, temperature, input signals and loads.

### 8 Detailed Description

#### 8.1 Overview

The ISO7840 device uses an ON-OFF keying (OOK) modulation scheme to transmit the digital data across a silicon-dioxide based isolation barrier. The transmitter sends a high-frequency carrier across the barrier to represent one digital state and sends no signal to represent the other digital state. The receiver demodulates the signal after advanced signal conditioning and produces the output through a buffer stage. If the EN pin is low then the output goes to high impedance. The ISO7840 device also incorporates advanced circuit techniques to maximize the CMTI performance and minimize the radiated emissions because of the high-frequency carrier and IO buffer switching. The conceptual block diagram of a digital capacitive isolator, Figure 15, shows a functional block diagram of a typical channel.

#### 8.3.1 Electromagnetic Compatibility (EMC) Considerations

0 Reverse

Many applications in harsh industrial environment are sensitive to disturbances such as electrostatic discharge (ESD), electrical fast transient (EFT), surge, and electromagnetic emissions. These electromagnetic disturbances are regulated by international standards such as IEC 61000-4-x and CISPR 22. Although system-level performance and reliability depends, to a large extent, on the application board design and layout, the ISO7840 device incorporates many chip-level design improvements for overall system robustness. Some of these improvements include

- Robust ESD protection cells for input and output signal pins and inter-chip bond pads. ٠
- Low-resistance connectivity of ESD cells to supply and ground pins.
- Enhanced performance of high voltage isolation capacitor for better tolerance of ESD, EFT and surge events.
- Bigger on-chip decoupling capacitors to bypass undesirable high energy signals through a low impedance path.
- PMOS and NMOS devices isolated from each other by using guard rings to avoid triggering of parasitic SCRs.
- Reduced common mode currents across the isolation barrier by ensuring purely differential internal operation.

### 9 Application and Implementation

#### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

#### 9.1 Application Information

The ISO7840 device is a high-performance, quad-channel digital isolator with a 5.7-kV<sub>RMS</sub> isolation voltage. The device comes with enable pins on each side that can be used to put the respective outputs in high impedance for multi-master driving applications and reduce power consumption. The ISO7840 device uses single-ended CMOS-logic switching technology. The supply voltage range is from 2.25 V to 5.5 V for both supplies,  $V_{CC1}$  and  $V_{CC2}$ . When designing with digital isolators, keep in mind that because of the single-ended design structure, digital isolators do not conform to any specific interface standard and are only intended for isolating single-ended CMOS or TTL digital signal lines. The isolator is typically placed between the data controller (that is,  $\mu$ C or UART), and a data converter or a line transceiver, regardless of the interface type or standard.

### 9.2 Typical Application

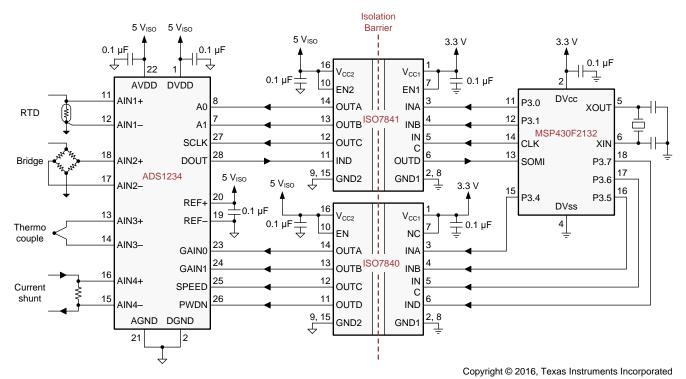

Figure 18. Isolated Data Acquisition System for Process Control

#### **Typical Application (continued)**

#### 9.2.1 Design Requirements

For this design example, use the parameters shown in Table 3.

| Table 3. | Design | Parameters |
|----------|--------|------------|
|----------|--------|------------|

| PARAMETER  | VALUE         |
|--|---------------|
| Supply voltage   | 2.25 to 5.5 V |
| Decoupling capacitor between V <sub>CC1</sub> and GND1 | 0.1 µF        |
| Decoupling capacitor from V <sub>CC2</sub> and GND2    | 0.1 µF        |

#### 9.2.2 Detailed Design Procedure

Unlike optocouplers, which require external components to improve performance, provide bias, or limit current, the ISO7840 device only requires two external bypass capacitors to operate.

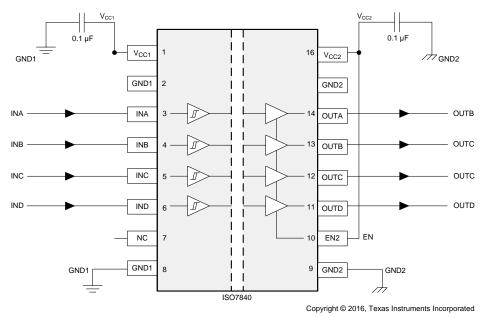

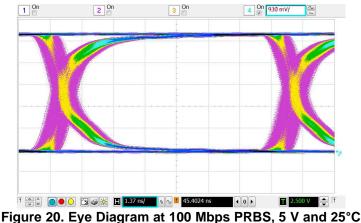

Figure 19. Typical ISO7840 Circuit Hook-Up

#### 9.2.3 Application Curve

The typical eye diagram of the ISO7840 device indicates low jitter and wide open eye at the maximum data rate of 100 Mbps.

### **10 Power Supply Recommendations**

To help ensure reliable operation at data rates and supply voltages, a  $0.1-\mu$ F bypass capacitor is recommended at input and output supply pins (V<sub>CC1</sub> and V<sub>CC2</sub>). The capacitors should be placed as close to the supply pins as possible. If only a single primary-side power supply is available in an application, isolated power can be generated for the secondary-side with the help of a transformer driver such as Texas InstrumentsSN6501. For such applications, detailed power supply design and transformer selection recommendations are available in SN6501 Transformer Driver for Isolated Power Supplies. ISO7840, ISO7840F SLLSEN2B – JULY 2015 – REVISED APRIL 2016

### 11 Layout

#### 11.1 Layout Guidelines

A minimum of four layers is required to accomplish a low EMI PCB design (see Figure 21). Layer stacking should be in the following order (top-to-bottom): high-speed signal layer, ground plane, power plane and low-frequency signal layer.

- Routing the high-speed traces on the top layer avoids the use of vias (and the introduction of their inductances) and allows for clean interconnects between the isolator and the transmitter and receiver circuits of the data link.
- Placing a solid ground plane next to the high-speed signal layer establishes controlled impedance for transmission line interconnects and provides an excellent low-inductance path for the return current flow.
- Placing the power plane next to the ground plane creates additional high-frequency bypass capacitance of approximately 100 pF/inch<sup>2</sup>.
- Routing the slower speed control signals on the bottom layer allows for greater flexibility as these signal links usually have margin to tolerate discontinuities such as vias.

If an additional supply voltage plane or signal layer is needed, add a second power or ground plane system to the stack to keep it symmetrical. This makes the stack mechanically stable and prevents it from warping. Also the power and ground plane of each power system can be placed closer together, thus increasing the high-frequency bypass capacitance significantly.

For detailed layout recommendations, refer to Digital Isolator Design Guide.

#### 11.1.1 PCB Material

For digital circuit boards operating at less than 150 Mbps, (or rise and fall times greater than 1 ns), and trace lengths of up to 10 inches, use standard FR-4 UL94V-0 printed circuit board. This PCB is preferred over cheaper alternatives because of lower dielectric losses at high frequencies, less moisture absorption, greater strength and stiffness, and the self-extinguishing flammability-characteristics.

<sup>(1)</sup> The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW**: Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

<sup>(2)</sup> Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

14-Dec-2016

<sup>(4)</sup> There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

<sup>(5)</sup> Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
