CONTENTS

1 Overview 1
1.1 Block Diagram 2
1.2 Features 3
1.2.1 CPU core 3
1.2.2 Multimedia support 3
1.2.3 Memory sub-system 3
1.2.4 Clock generation and power management 4
1.2.5 On-chip peripherals 4
1.3 Characteristic 6
2 CPU Core 7
3 External Memory Controller 9
3.1 Overview 9
3.2 Pin Description 10
3.3 Physical Address Space Map 11
3.4 Static Memory Interface 13
3.4.1 Register Description 14
3.4.2 Example of Connection 19
3.4.3 Basic Interface 21
3.4.4 Byte Control 25
3.4.5 Burst ROM Interface 28
3.5 NAND Flash Interface 29
3.5.1 Register Description 29
3.5.2 NAND Flash Boot Loader 36
3.5.3 NAND Flash Operation 37
3.6 SDRAM Interface 41
3.6.1 Register Description 42
3.6.2 Refresh Time Constant Register (RTCOR) 49
3.6.3 Example of Connection 51
3.6.4 Address Multiplexing 53
3.6.5 SDRAM Command 56
3.6.6 SDRAM Timing 57
3.6.7 Power-Down Mode 71
3.6.8 Refreshing 72
3.6.9 Initialize Sequence 76
3.7 Bus Control Register (BCR) 80
4 DMA Controller 82

4.1 Features 82

4.2 Register Descriptions 83

4.2.1 DMA Source Address (DSAn, n = 0 ~ 5) 84

4.2.2 DMA Target Address (DTAn, n = 0 ~ 5) 84

4.2.3 DMA Transfer Count (DTCn, n = 0 ~ 5) 84

4.2.4 DMA Request Types (DRTn, n = 0 ~ 5) 85

4.2.5 DMA Channel Control/Status (DCSn, n = 0 ~ 5) 86

4.2.6 DMA Channel Command (DCMn, n = 0 ~ 5) 87

4.2.7 DMA Descriptor Address (DDAn, n = 0 ~ 5) 88

4.2.8 DMA Control 88

4.2.9 DMA Doorbell (DDR) 89

4.2.10 DMA Interrupt Pending (DIRQP) 90

4.3 DMA manipulation 91

4.3.1 Descriptor Transfer 91

4.3.2 No-Descriptor Transfer 94

4.4 DMA Requests 94

4.4.1 Auto Request 94

4.4.2 On-Chip Peripheral Request 94

4.5 DMA Transfer Modes 95

4.5.1 Single Mode 95

4.5.2 Block Mode 95

4.6 Channel Priorities 95

4.6.1 Fixed Mode 95

4.6.2 Round Robin Mode 95

4.7 Examples 96

4.7.1 Memory-to-memory auto request No-Descriptor Transfer 96

5 Clock Reset and Power Controller 97

5.1 Overview 97

5.2 Clock Generation UNIT 98

5.2.1 Pin Description 99

5.2.2 CGU Block Diagram 100

5.2.3 Clock Overview 101

5.2.4 CGU Registers 102

5.2.5 PLL Operation 109

5.2.6 Main Clock Division Change Sequence 110

5.2.7 Change Other Clock Frequencies 111

5.2.8 Change Clock Source Selection 111

5.2.9 EXCLK Oscillator 112

5.3 Power Manager 113

5.3.1 Low-Power Modes and Function 113

5.3.2 Register Description 114

5.3.3 Doze Mode 118

5.3.4 IDLE Mode 118
5.3.5 SLEEP Mode 119
5.4 Reset Control Module 119
5.4.1 Register Description 119
5.4.2 Power On Reset 120
5.4.3 WDT Reset 120

6 Real-Time Clock (RTC).................... 121

6.1 Overview 121
6.1.1 Features 121
6.1.2 Signal Descriptions 121
6.2 Register Description 123
6.2.1 RTC Control Register (RTCCR) 124
6.2.2 RTC Second Register (RTCSR) 126
6.2.3 RTC Second Alarm Register (RTCSAR) 127
6.2.4 RTC Regulator Register (RTCGR) 128
6.2.5 Hibernate Control Register (HCR) 129
6.2.6 HIBERNATE mode Wakeup Filter Counter Register (HWFCR) 130
6.2.7 Hibernate Reset Counter Register (HRCR) 131
6.2.8 HIBERNATE Wakeup Control Register (HWCR) 132
6.2.9 HIBERNATE Wakeup Status Register (HWRSR) 133
6.2.10 Hibernate Scratch Pattern Register (HSPR) 134
6.3 Time Regulation 135
6.3.1 HIBERNATE Mode 136

7 Interrupt Controller.................... 137

7.1 Overview 137
7.2 Register Description 138
7.2.1 Interrupt Controller Source Register (ICSR) 138
7.2.2 Interrupt Controller Mask Register (ICMR) 138
7.2.3 Interrupt Controller Mask Set Register (ICMSR) 139
7.2.4 Interrupt Controller Mask Clear Register (ICMCR) 139
7.2.5 Interrupt Controller Pending Register (ICPR) 140
7.3 Software Considerations 141

8 Timer/Counter Unit 142

8.1 Overview 142
8.2 Pin Description 143
8.3 Register Description 144
8.3.1 Timer Control Register (TCSR) 146
8.3.2 Timer Data FULL Register (TDFR) 147
8.3.3 Timer Data HALF Register (TDHR) 148
8.3.4 Timer Counter (TCNT) 148

8.3.5 Timer Counter Enable Register (TER) 148
8.3.6 Timer Counter Enable Set Register (TESR) 149
8.3.7 Timer Counter Enable Clear Register (TECR) 150
8.3.8 Timer Flag Register (TFR) 151
8.3.9 Timer Flag Set Register (TFSR) 152
8.3.10 Timer Flag Clear Register (TFCR) 153
8.3.11 Timer Mast Register (TMR) 153
8.3.12 Timer Mask Set Register (TMSR) 154
8.3.13 Timer Mask Clear Register (TMCR) 154
8.3.14 Timer Stop Register (TSR) 155
8.3.15 Timer Stop Set Register (TSSR) 156
8.3.16 Timer Stop Clear Register (TSCR) 157
8.4 Operation 158
8.4.1 Basic Operation 158
8.4.2 Disable and Shutdown Operation 159
8.4.3 Pulse Width Modulator (PWM) 159
8.4.4 The flow of using TCU5 159

9 Watchdog Timer 161

9.1 Overview 161
9.2 Register Description 162
9.2.1 Watchdog Control Register (TCSR) 162
9.2.2 Watchdog Enable Register (TCER) 163
9.2.3 Watchdog Timer Data Register (TDR) 163
9.2.4 Watchdog Timer Counter (TCNT) 164
9.3 Watchdog Timer Function 164

10 General-Purpose I/O Ports 165

10.1 Overview 165
10.2 Register Description 172
10.2.1 PORT PIN Level Register (PAPIN, PBPIN, PCPIN, PDPIN) 175
10.2.2 PORT Data Register (PADAT, PBDAT, PCDAT, PDDAT) 175
10.2.3 PORT Data Set Register (PADATS, PBDATS, PCDATS, PDDATS) 176
10.2.4 PORT Data Clear Register (PADATC, PBDATC, PCDATC, PDDATC) 176
10.2.5 PORT Mask Register (PAIM, PBIM, PCIM, PDIM) 177
10.2.6 PORT Mask Set Register (PAIMS, PBIMS, PCIMS, PDIMS) 177
10.2.7 PORT Mask Clear Register (PAIMC, GBPIMC, PCIMC, PDIMC) 178
10.2.8 PORT PULL Disable Register (PAPE, PBPE, PCPE, PDPE) 178
10.2.9 PORT PULL Set Register (PAPES, PBPES, PCPES, PDPES) 179
10.2.10 PORT PULL Clear Register (PAPEC, PBPEC, PCPEC, PDPEC) 179
10.2.11 PORT Function Register (PAFUN, PBFUN, PCFUN, PDFUN) 180
10.2.12 PORT Function Set Register (PAFUNS, PBFUNS, PCFUNS, PDFUNS) 180
10.2.13 PORT Function Clear Register (PAFUNC, PBFUNC, PCFUNC, PDFUNC) 181

10.2.14 PORT Select Register (PASEL, PBSEL, PCFSEL, PDSEL) 181
10.2.15 PORT Select Set Register (PASELS, PBSELS, PCSELS, PDSELS) 182
10.2.16 PORT Select Clear Register (PASELC, PBSELC, PCSELC, PDSELC) 182
10.2.17 PORT Direction Register (PADIR, PBDIR, PCDIR, PDDIR) 182
10.2.18 PORT Direction Set Register (PADIRS, PBDIRS, PCDIRS, PDDIRS) 183
10.2.19 PORT Direction Clear Register (PADIRC, PBDIRC, PCDIRC, PDDIRC) 184
10.2.20 PORT Trigger Register 0, 1, 2 and 3 (PATRG, PBTRG, PCTRG, PDTRG) 184
10.2.21 PORT Trigger Set Register (PATRGS, PBTRGS, PCTRGS, PDTRGS) 185
10.2.22 PORT Trigger Clear Register (PATRGC, PBTRGC, PCTRGC, PDTRGC) 185
10.2.23 PORT FLAG Register (PAFLG, PBFLG, PCFLG, PDFLG) 185
10.2.24 PORT FLAG Clear Register (PAFLGC, PBFLGC, PCFLGC, PDFLGC) 186
10.3 Program Guide 187
10.3.1 GPIO Function Guide 187
10.3.2 Alternate Function Guide 187
10.3.3 Interrupt Function Guide 187
10.3.4 Disable Interrupt Function Guide 188

11 LCD Controller 189

11.1 Overview 189
11.2 Pin Description 190
11.3 Block Diagram 191
11.4 LCD Display Timing 191
11.5 TV Encoder Timing 192
11.6 Register Description 194
11.6.1 Configure Register (LCDCFG) 195
11.6.2 Vertical Synchronize Register (LCDVSYNC) 197
11.6.3 Horizontal Synchronize Register (LCDHSYNC) 197
11.6.4 Virtual Area Setting (LCDVAT) 197
11.6.5 Display Area Horizontal Start/End Point (LCDDAH) 198
11.6.6 Display Area Vertical Start/End Point (LCDDAV) 198
11.6.7 PS Signal Setting (LCDPS) 199
11.6.8 CLS Signal Setting (LCDCLS) 199
11.6.9 SPL Signal Setting (LCDSPL) 200
11.6.10 REV Signal Setting (LCDREV) 200
11.6.11 Control Register (LCDCTRL) 200
11.6.12 Status Register (LCDSTATE) 202
11.6.13 Interrupt ID Register (LCDIID) 202
11.6.14 Descriptor Address Register0, 1 (LCDDA0, 1) 203
11.6.15 Source Address Register0, 1 (LCDSA0, 1) 204
11.6.16 Frame ID Register0 (LCDFID0,1) 204
11.6.17 DMA Command Register0, 1 (LCDCMD0, 1) 205
11.7 LCD Controller Pin Mapping 206
11.7.1 TFT and CCIR656 Pin Mapping 206

11.7.2 Single STN Pin Mapping....208
11.7.3 Dual Panel STN Pin Mapping....209
11.8 Display Timing....210
11.8.1 General 16-bit and 18-bit TFT Timing....210
11.8.2 8-bit Serial TFT Timing....211
11.8.3 Special TFT Timing....212
11.9 Format of Palette....214
11.9.1 STN....214
11.9.2 TFT....214
11.10 Format of Frame Buffer....215
11.10.1 16bpp....215
11.10.2 18bpp....215
11.10.3 24bpp....215
11.11 Format of Data Pin Utilization....215
11.11.1 Mono STN....215
11.11.2 Color STN....216
11.11.3 18-bit Parallel TFT....216
11.11.4 16-bit Parallel TFT....216
11.11.5 8-bit Serial TFT (24bpp)....216
11.12 LCD Controller Operation....216
11.12.1 Set LCD Controller Device Clock and Pixel Clock....216
11.12.2 Enabling the Controller....217
11.12.3 Disabling the Controller....217
11.12.4 Resetting the Controller....218
11.12.5 Frame Buffer & Palette Buffer....218

12 Smart LCD Controller....219

12.1 Overview....219
12.2 Structure....219
12.3 Pin Description....220
12.4 Register Description....220
12.4.1 SLCD Configure Register (MCFG)....221
12.4.2 SLCD Control Register (MCTRL)....222
12.4.3 SLCD Status Register (MSTATE)....223
12.4.4 SLCD Data Register (MDATA)....223
12.4.5 SLCD FIFO (MFIFO)....224
12.5 System Memory Format....225
12.5.1 Data format....225
12.5.2 Command Format....226
12.6 Transfer Mode....227
12.6.1 DMA Transfer Mode....227
12.6.2 Register Transfer Mode....227
12.7 Timing....227

12.7.1 Parallel Timing 227
12.7.2 Serial Timing 228
12.8 Operation Guide 228
12.8.1 DMA Operation 228
12.8.2 Register Operation 228

13 AC97/I2S Controller 230

13.1 Overview 230
13.1.1 Block Diagram 231
13.1.2 Features 231
13.1.3 Interface Diagram 232
13.1.4 Signal Descriptions 234
13.1.5 RESET# / SYS_CLK Pin 234
13.1.6 BIT_CLK Pin 234
13.1.7 SYNC Pin 234
13.1.8 SDATA_OUT Pin 235
13.1.9 SDATA_IN Pin 235
13.2 Register Descriptions 236
13.2.1 AIC Configuration Register (AICFR) 238
13.2.2 AIC Common Control Register (AICCR) 240
13.2.3 AIC AC-link Control Register 1 (ACCR1) 243
13.2.4 AIC AC-link Control Register 2 (ACCR2) 244
13.2.5 AIC I2S/MSB-justified Control Register (I2SCR) 246
13.2.6 AIC Controller FIFO Status Register (AICSR) 247
13.2.7 AIC AC-link Status Register (ACSR) 249
13.2.8 AIC I2S/MSB-justified Status Register (I2SSR) 251
13.2.9 AIC AC97 CODEC Command Address Register (ACCAR) & Data Register (ACCDR)252
13.2.10 AIC AC97 CODEC Status Address Register (ACSAR) & Data Register (ACSDR). 253
13.2.11 AIC I2S/MSB-justified Clock Divider Register (I2SDIV) 254
13.2.12 AIC FIFO Data Port Register (AICDR) 255
13.3 Serial Interface Protocol 256
13.3.1 AC-link serial data format 256
13.3.2 I2S and MSB-justified serial audio format 257
13.3.3 Audio sample data placement in SDATA_IN/SDATA_OUT 259
13.4 Operation 260
13.4.1 Initialization 261
13.4.2 AC ’97 CODEC Power Down 262
13.4.3 Cold and Warm AC ’97 CODEC Reset 262
13.4.4 External CODEC Registers Access Operation 264
13.4.5 Audio Replay 265
13.4.6 Audio Record 266
13.4.7 FIFOs operation 267
13.4.8 Data Flow Control 269

13.4.9 Serial Audio Clocks and Sampling Frequencies 270
13.4.10 Interrupts 274

14 Internal CODEC 275

14.1 Overview 275
14.1.1 Features 275
14.1.2 Signal Descriptions 275
14.1.3 Block Diagram 276
14.2 Register Descriptions 277
14.2.1 CODEC Control Register 1 (CDCCR1) 278
14.2.2 CODEC Control Register 2 (CDCCR2) 280
14.3 Operation 282
14.3.1 Initialization 282
14.3.2 CODEC controlling and typical operations 283
14.3.3 Power saving 285
14.3.4 Pop noise and the reduction of it 286
14.4 Timing parameters 293
14.5 AC & DC parameters 293

15 SAR A/D Controller 294

15.1 Overview 294
15.2 Pin Description 294
15.3 Register Description 295
15.3.1 ADC Enable Register (ADENA) 296
15.3.2 ADC Configure Register (ADCFG) 297
15.3.3 ADC Control Register (ADCTRL) 299
15.3.4 ADC Status Register (ADSTATE) 300
15.3.5 ADC Same Point Time Register (ADSAME) 301
15.3.6 ADC Wait Pen Down Time Register (ADWAIT) 301
15.3.7 ADC Touch Screen Data Register (ADTCH) 301
15.3.8 ADC PBAT Data Register (ADBDAT) 304
15.3.9 ADC SADCIN Data Register (ADSDAT) 305
15.3.10 ADC IP DATA PIN (ADDPIN) 305
15.4 SAR A/D Controller Guide 306
15.4.1 Single Operation (only used as a test mode to check the channel function) 306
15.4.2 A simple Touch Screen Operation 306
15.4.3 PBAT Sample Operation 307
15.4.4 SADCIN Sample Operation 307
15.4.5 Use TSC to support keypad 308

16 MultiMediaCard/Secure Digital Controller 312

16.1 Overview 312
16.2 Block Diagram 313

16.3 MMC/SD Controller Signal I/O Description 314
16.4 Register Description 316
  16.4.1 Start/stop MMC/SD clock Register (MSC_STRPCL) 316
  16.4.2 MSC Status Register (MSC_STAT) 317
  16.4.3 MSC Clock Rate Register (MSC_CLKRT) 319
  16.4.4 MMC/SD Command and Data Control Register (MSC_CMDAT) 320
  16.4.5 MMC/SD Response Time Out Register (MSC_RESTO) 321
  16.4.6 MMC/SD Read Time Out Register (MSC_RDTO) 322
  16.4.7 MMC/SD Block Length Register (MSC_BLKLEN) 322
  16.4.8 MSC/SD Number of Block Register (MSC_NOB) 322
  16.4.9 MMC/SD Number of Successfully-transferred Blocks Register (MSC_SNOB) 322
  16.4.10 MMC/SD Interrupt Mask Register (MSC_IMASK) 323
  16.4.11 MMC/SD Interrupt Register (MSC_IREG) 324
  16.4.12 MMC/SD Command Index Register (MSC_CMD) 325
  16.4.13 MMC/SD Command Argument Register (MSC_ARG) 325
  16.4.14 MMC/SD Response FIFO Register (MSC_RES) 325
  16.4.15 MMC/SD Receive Data FIFO Register (MSC_RXFIFO) 326
  16.4.16 MMC/SD Transmit Data FIFO Register (MSC_TXFIFO) 326
16.5 MMC/SD Functional Description 327
  16.5.1 MSC Reset 327
  16.5.2 MSC Card Reset 327
  16.5.3 Voltage Validation 327
  16.5.4 Card Registry 328
  16.5.5 Card Access 329
  16.5.6 Protection Management 330
  16.5.7 Card Status 334
  16.5.8 SD Status 337
  16.5.9 SDIO 338
  16.5.10 Clock Control 339
  16.5.11 Application Specified Command Handling 339
16.6 MMC/SD Controller Operation 341
  16.6.1 Data FIFOs 341
  16.6.2 DMA and Program I/O 342
  16.6.3 Start and Stop clock 342
  16.6.4 Software Reset 343
  16.6.5 Voltage Validation and Card Registry 343
  16.6.6 Single Data Block Write 345
  16.6.7 Single Block Read 346
  16.6.8 Multiple Block Write 346
  16.6.9 Multiple Block Read 347
  16.6.10 Stream Write (MMC) 348
  16.6.11 Stream Read (MMC) 348
  16.6.12 Erase, Select/Deselect and Stop 349

16.6.13 SDIO Suspend/Resume....349
16.6.14 SDIO ReadWait....350
16.6.15 Operation and Interrupt....350

17 I2C Bus Interface....352

17.1 Overview....352
17.2 Pin Description....353
17.3 Register Description....354
17.3.1 Data Register (I2CDR)....354
17.3.2 Control Register (I2CCCR)....354
17.3.3 Status Register (I2CSR)....355
17.3.4 Clock Generator Register (I2CGR)....355
17.4 I^{2}C-Bus Protocol....356
17.4.1 Bit Transfer....356
17.4.2 Data Validity....356
17.4.3 START and STOP Conditions....356
17.4.4 Byte Format....356
17.4.5 Data Transfer Format....358
17.5 I2C Operation....362
17.5.1 I2C Initialization....362
17.5.2 Write Operation....363
17.5.3 Read Operation....364

18 UART Interface....366

18.1 Overview....366
18.2 Pin Description....367
18.3 Register Description....367
18.3.1 UART Receive Buffer Register (URBR)....368
18.3.2 UART Transmit Hold Register (UTHR)....369
18.3.3 UART Divisor Latch Low/High Register (UDLLR / UDLHR)....369
18.3.4 UART Interrupt Enable Register (UIER)....370
18.3.5 UART Interrupt Identification Register (UIIR)....371
18.3.6 UART FIFO Control Register (UFCR)....372
18.3.7 UART Line Control Register (ULCR)....373
18.3.8 UART Line Status Register (ULSR)....374
18.3.9 UART Modem Control Register (UMCR)....376
18.3.10 UART Modem Status Register (UMSR)....377
18.3.11 UART Scratchpad Register....378
18.3.12 Infrared Selection Register (ISR)....378
18.3.13 Uart M Register (UMR)....379
18.3.14 Uart Add Cycle Register(UACR)....380
18.4 Operation....380
18.4.1 UART Configuration....380

18.4.2 Data Transmission 380
18.4.3 Data Reception 381
18.4.4 Receive Error Handling 381
18.4.5 Modem Transfer 382
18.4.6 DMA Transfer 382
18.4.7 Slow IrDA Asynchronous Interface 382
18.4.8 For any frequency clock to use the Uart 383

19 Image Process Unit 385

19.1 Overview 385
19.2 Features 385
19.3 Block Diagram 385
19.4 Data flow 386
19.4.1 Input Data 386
19.4.2 Output Data 386
19.4.3 Resize Coefficients LUT 386
19.5 Register definition 387
19.5.1 IPU Control Register 387
19.5.2 IPU Status Register 387
19.5.3 Data Format Register 388
19.5.4 Input Y Data Address Register 388
19.5.5 Input U Data Address Register 389
19.5.6 Input V Data Address Register 389
19.5.7 Input Geometric Size Register 389

1 Overview

Jz4725 is a multimedia application processor targeting for PMP. Incorporate the XBurst® CPU core based on leading micro-architecture technology, this processor provides high integration, high performance and low power consumption solution for embedded device.

XBurst® is a high performance and power-efficient 32-bit RISC core with 16K instruction cache and 16K data cache, operating at speed up to 360MHz. The SIMD instruction set implemented by XBurst® core, in together with the on chip Image Processing Unit, provides strong decoding capability. The memory interface supports a variety of memory types that allow flexible design requirements, include the glueless connection to SLC/MLC NAND Flash for cost sensitive applications. On-chip modules such as LCD controller, audio CODEC, 2-channel SAR-ADC and AC97/I2S controller offer designers a rich suite of peripherals for multimedia application.

1.2 Features

1.2.1 CPU core

- XBurst® RISC instruction set to support Linux and WinCE
- XBurst® SIMD instruction set to support multimedia acceleration
- XBurst® 8-stage pipeline micro-architecture up to 360MHz
- 16K I-Cache, 16K D-Cache
- 32-entry dual-pages joint-TLB, 4 entry Instruction TLB and 4 entry data TLB
- Smart prefetch to accelerate multimedia applications

1.2.2 Multimedia support

- IPU (Image Processing Unit)
  - Video frame resize
  - Color space conversion: 420/444/422 YUV to RGB convert

1.2.3 Memory sub-system

- NAND Flash interface
  - Support MLC NAND as well as SLC NAND
  - Support all 8-bit/16-bit NAND Flash devices regardless of density and organization
  - Hamming and Reed-Solomon Hardware ECC for error detection and correction
  - Support automatic boot up from NAND Flash devices
  - Two chip select
- Synchronous DRAM Interface
  - 1 banks with programmable size and base address
  - 16-bit data bus width
  - Multiplexes row/column addresses according to SDRAM capacity
  - Two-bank or four-bank SDRAM is supported
  - Supports auto-refresh and self-refresh functions
  - Supports power-down mode to minimize the power consumption of SDRAM
  - Supports page mode
- Direct Memory Access Controller
  - Six independent DMA channels
  - Descriptor supported
  - Transfer data units: 8-bit, 16-bit, 32-bit, 16-byte or 32-byte
  - Transfer requests can be: auto-request within DMA; and on-chip peripheral module request
  - Interrupt on transfer completion or transfer error
  - Supports two transfer modes: single mode or block mode
- The Jz4725 processor system supports little endian only

1.2.4 Clock generation and power management

- On-chip oscillator circuit for an 32768Hz clock and an 12MHz clock
- On-chip phase-locked loops (PLL) with programmable multiple-ratio. Internal counter are used to ensure PLL stabilize time
- PLL on/off is programmable by software
- ICLK, PCLK, SCLK, MCLK and LCLK frequency can be changed separately for software by setting division ratio
- Supports six low-power modes and function: NORMAL mode; DOZE mode; IDLE mode; SLEEP mode; HIBERNATE mode; and MODULE-STOP function.

1.2.5 On-chip peripherals

- General-Purpose I/O ports
  - Total GPIO pin number is 81
  - Each pin can be configured as general-purpose input or output or multiplexed with internal chip functions
  - Each pin can act as a interrupt source and has configurable rising/falling edge or high/low level detect manner, and can be masked independently
  - Each pin can be configured as open-drain when output
  - Each pin can be configured as internal resistor pull-up

- RTC (Real Time Clock)
  - 32-bit second counter
  - 1Hz from 32768hz
  - Alarm interrupt
  - Independent power
  - A 32-bits scratch register used to indicate whether power down happens for RTC power

- Interrupt controller
  - Total 28 maskable interrupt sources from on-chip peripherals and external request through GPIO ports
  - Interrupt source and pending registers for software handling
  - Unmasked interrupts can wake up the chip in sleep or standby mode

- Timer and counter unit with PWM output
  - Provide five separate channels
  - 16-bit A counter and 16-bit B counter with auto-reload function every channel
  - Support interrupt generation when the A counter underflows
  - Three clock sources: RTCLK (real time clock), EXCLK (external clock input), PCLK (APB Bus clock) selected with 1, 4, 16, 64, 256 and 1024 clock dividing selected
  - PWM output supported
- Watchdog timer
  - 16-bit counter in RTC clock with 1, 4, 16, 64, 256 and 1024 clock dividing selected

  - Generate power-on reset

- LCD controller
  - Single-panel display in active mode, and single- or dual-panel displays in passive mode
  - 2, 4, 16 grayscales and up to 4096 colors in STN mode
  - 2, 4, 16, 256, 4K, 32K, 64K, 256K and 16M colors in TFT mode
  - 18 bit data bus support 1,2,4,8 pins STN panel, 16bit and 18bit TFT and 8bit I/F TFT
  - Display size up to 800×600 pixels
  - 256×16 bits internal palette RAM
  - Support ITU601/656 data format
  - Support smart LCD (SRAM-like interface LCD module)

- AC97/I2S controller
  - Support the on-chip CODEC only

- On-chip audio CODEC
  - 18-bit DAC, SNR: 88dB
  - 16-bit ADC, SNR: 85dB
  - Sample rate: 8/11.025/12/16/22.05/24/32/44.1/48kHz
  - L/R channels line input
  - MIC input
  - L/R channels headphone output amplifier support up to 32ohm load

- SADC
  - 12-bit, 2Mbps, SNR@500kHz is 61dB, THD@500kHz is -71dB
  - Battery voltage input
  - 1 generic input Channel

- MMC/SD/SDIO controller
  - Compliant with “The MultiMediaCard System Specification version 3.3”
  - Compliant with “SD Memory Card Specification version 1.01” and “SDIO Card Specification version 1.0” with 1 command channel and 1 data channels
  - 5~20 Mbps maximum data rate
  - Supports up to 10 cards (including one SD card)
  - Maskable hardware interrupt for SD I/O interrupt, internal status, and FIFO status

- I2C bus interface
  - Only supports single master mode
  - Supports I2C standard-mode and F/S-mode up to 400 kHz
  - Double-buffered for receiver and transmitter
  - Supports general call address and START byte format after START condition

- UART

  - 5, 6, 7 or 8 data bit operation with 1 or 1.5 or 2 stop bits, programmable parity (even, odd, or none)
  - 16x8bit FIFO for transmit and 16x11bit FIFO for receive data
  - Interrupt support for transmit, receive (data ready or timeout), and line status
  - Supports DMA transfer mode
  - Provide complete serial port signal for modem control functions
  - Support slow infrared asynchronous interface (IrDA)
  - IrDA function up to 115200bps baudrate
  - UART function up to 921.6Kbps baudrate

- USB 2.0 device interface
  - Compliant with USB protocol revision 2.0
  - High speed and full speed supported
  - Embedded USB 2.0 PHY

1.3 Characteristic

Item	Characteristic
Process Technology	0.18um CMOS
Power supply voltage	I/O: 3.3 ± 0.3V Core: 1.8 ± 0.2
Package	LQFP 128 14mm * 14mm
Operating frequency	360MHz
Power consumption	200mw @ 360MHz

2 CPU Core

At the heart of the chip is the XBurst® CPU core. XBurst® CPU adopts a brand new micro-architecture which provides superior performance and power consumption than existent industry cores. Detailed description of XBurst® CPU core is specified in document titled “XBurst® Microprocessor Core User Manual”

Key features of XBurst® CPU core implemented in this chip are as following:

Table 2-1 XBurst® CPU Core Features

Item	Features
RISC ISA	• Industry standard Instruction set architecture • 32 32-bit general purpose registers
Ingenic Media ISA	• Implement 60 SIMD like instructions for multimedia acceleration • See document “Ingenic Media Instruction Set Architecture”
Ingenic Floating Point ISA	• Not implemented
Multiply-Divide Unit (MDU)	• Maximum issue rate of one 32x16 multiply every clock • Maximum issue rate of one 32x32 multiply every other clock • Minimum 2 clock cycle, maximum 34 clock cycles for divide
Memory Manager Unit (MMU)	• 4 G-Bytes of address space • 32/16 dual-entry full associative joint TLB plus 4 dual-entry ITLB and 4 dual-entry DTLB respectively • 7 different page size from 4Kb to 16MB supported in any entry • Support entry lock • Space identifier ASID: 8 bits
Data Cache	• Virtually-indexed, physically-tagged • 4 way, 8-word line, alterable size: 4K, 8K, 16K bytes • LRU replacement algorithm • Write-back, write-through • 16-word depth write buffer
Instruction Cache	• Physically-indexed, physically-tagged • 4 way, 8-word line, alterable size: 4K, 8K, 16K bytes • LRU replacement algorithm
Debug&JTAG	• JTAG interface to host machine • ACC mode to accelerate JTAG memory access • Two instruction and one data breakpoint
Branch Target Buffer (BTB)	• Virtally-tagged • Up to 64 entry direct mapped • 2-bit branch history maintained
Bus Interface	• compliance with AHB protocol

3 External Memory Controller

3.1 Overview

The External Memory Controller (EMC) divides the off-chip memory space and outputs control signals complying with specifications of various types of memory and bus interfaces. It enables the connection of static memory, NAND flash memory, synchronous DRAM, etc., to this processor.

- Static memory interface
  - Direct interface to ROM, Burst ROM, SRAM and NOR Flash.
  - Support 4 external chip selection CS4~1#. Each bank can be configured separately.
  - The size and base address of static memory banks are programmable.
  - Output of control signals allowing direct connection of memory to each bank. Write strobe setup time and hold time periods can be inserted in an access cycle to enable connection to low-speed memory
  - Wait state insertion can be controlled by program.
  - Wait insertion by WAIT pin.
  - Automatic wait cycle insertion to prevent data bus collisions in case of consecutive memory accesses to different banks, or a read access followed by a write access to the same bank

- NAND flash interface
  - Support on CS4~CS1, sharing with static memory bank4~bank1.
  - Support most types of NAND flashes, including 8-bit and 16-bit bus width, 512B and 2KB page size. For 512B page size, 3 and 4 address cycles are supported. For 2KB page size, 4 and 5 address cycles are supported.
  - Hardware ECC generation including Hamming and RS codes correction.
  - Support read/erase/program NAND flash memory.
  - Support boot from NAND flash.

- SDRAM Interface
  - Support 1 chip selection DCS#.
  - Support both 32-bit and 16-bit bus width.
  - Support both two-bank and four-bank type SDRAM.
  - Support burst operation.
  - Support both auto-refresh and self-refresh functions.
  - The size and base address of each bank is configurable.
  - Multiplexes row/column addresses according to SDRAM capacity
  - Controls timing of SDRAM direct-connection control signals according to register setting
  - Supports power-down mode to minimize the power consumption of SDRAM
  - Support page mode

3.2 Pin Description

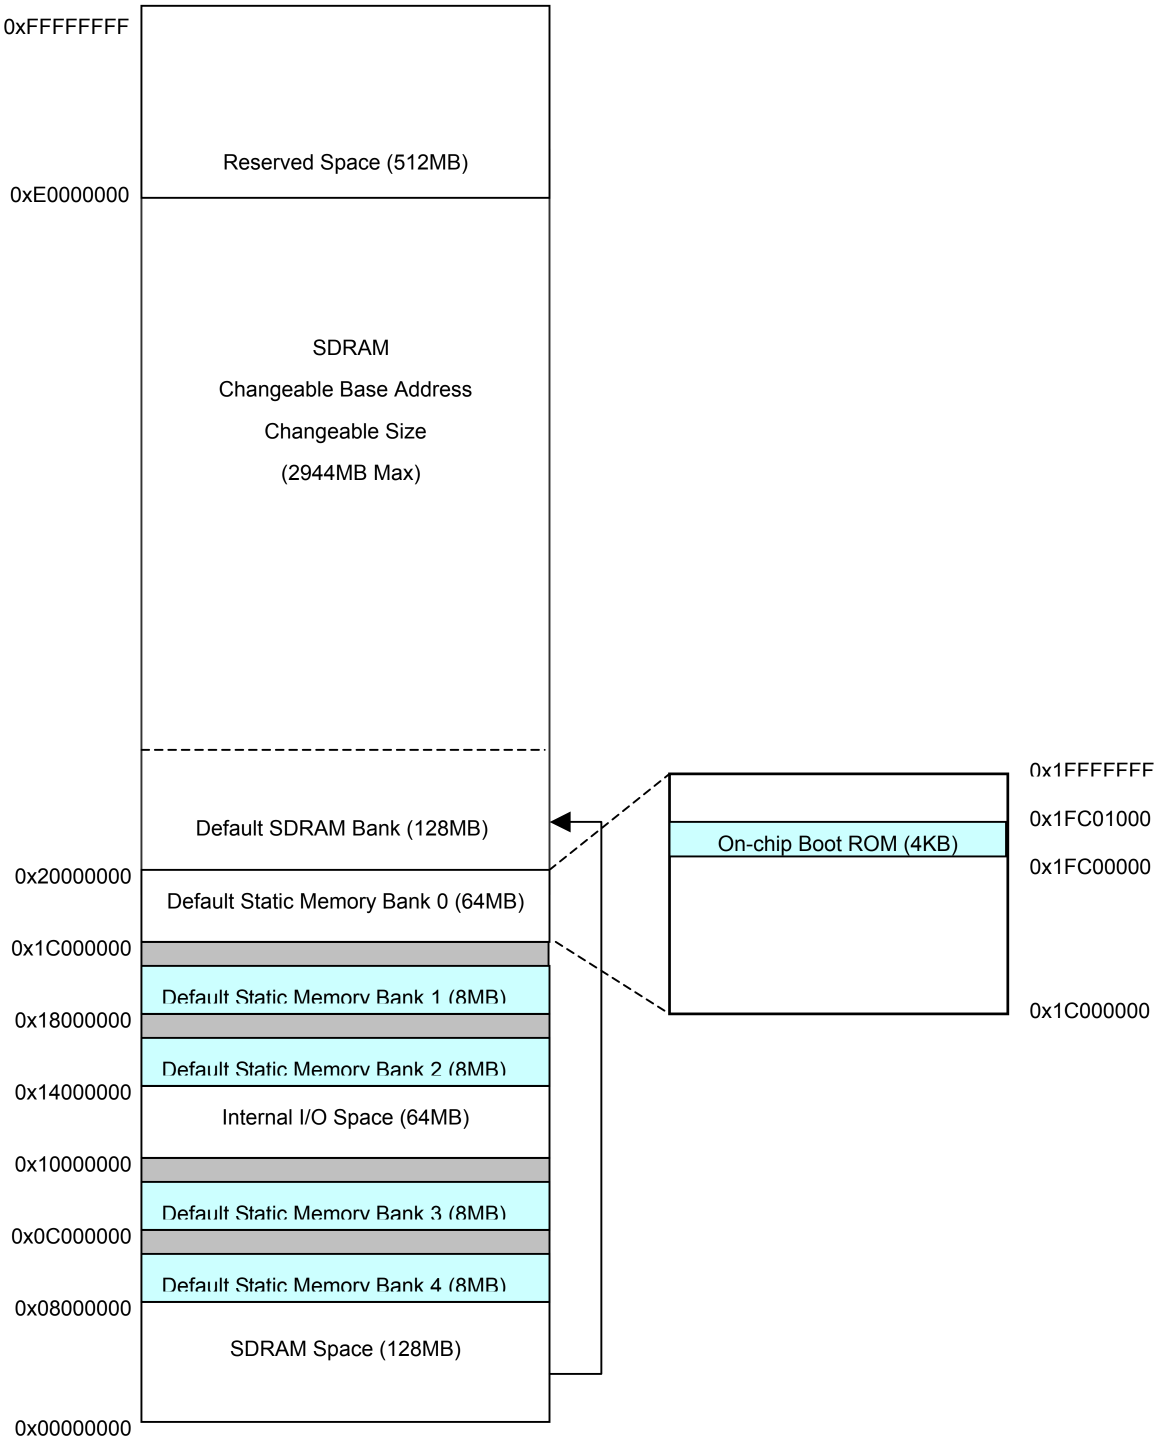
Following table list the EMC pins.

Table 3-1 EMC Pin Description

Pin Name	I/O	Signal	Description
Data Bus	I/O	D31 – D0	Data I/O
Address bus	O	A22–A0	Address output
Static chip select 4 ~ 1	O	CS4~1#	Chip select signal that indicates the static bank being accessed
SDRAM chip select	O	DCS#	Chip select signal that indicates the SDRAM bank being accessed
Read enable	O	RD# /	For Static memory read enable signal
Write enable	O	WE# /	Static memory write enable signal
Column address strobe	O	CAS#	SDRAM column address strobe signal
Row address strobe	O	RAS#	SDRAM row address strobe signal
Read/write	O	RD/WR#	Data bus direction designation signal Also used as SDRAM write enable signal
Byte enable 0	O	WE0# / BE0# / DQM0 /	For non-byte-control static memory , D7-0 write enable signal, For byte-control static memory , D7-0 selection signal For SDRAM, D7–D0 selection signal
Byte enable 1	O	WE1# / BE1# / DQM1/	For non-byte-control static memory , D15-8 write enable signal For byte-control static memory , D15-8 selection signal For SDRAM, D15–D8 selection signal
Byte enable 2	O	WE2# / BE2# / DQM2 /	For non-byte-control static memory, D23-16 write enable signal For byte-control static memory, D23-16 selection signal For SDRAM , D23–D16 selection signal
Byte enable 3	O	WE3# / BE3# / DQM3	For static memory , D31-24 write enable signal For byte-control static memory , D31-24 selection signal For SDRAM, D31–D24 selection signal.
SDRAM Clock enable	O	CKE	Enable the SDRAM clock
Wait	I	Wait# /	External wait state request signal for memory-like devices
NAND flash read enable	O	FRE#	NAND flash read enable signal
NAND flash write enable	O	FWE#	NAND flash write enable signal
NAND flash ready/busy	I	FRB#	Indicates NAND flash is ready or busy (When Nand flash boot, GPC30 is used as FRB# of CS1#)

3.3 Physical Address Space Map

Both virtual spaces and physical spaces are 32-bit wide in this architecture. Virtual addresses are translated by MMU into physical address which is further divided into several partitions for static memory, SDRAM, and internal I/O.



0xFFFFFFFF
Reserved Space (512MB)
0xE0000000
SDRAM
Changeable Base Address
Changeable Size
(2944MB Max)
Default SDRAM Bank (128MB)
0x20000000
Default Static Memory Bank 0 (64MB)
0x1C000000
Default Static Memory Bank 1 (8MB)
0x18000000
Default Static Memory Bank 2 (8MB)
0x14000000
Internal I/O Space (64MB)
0x10000000
Default Static Memory Bank 3 (8MB)
0x0C000000
Default Static Memory Bank 4 (8MB)
0x08000000
SDRAM Space (128MB)
0x00000000
0x1FFFFFFF
0x1FC01000
On-chip Boot ROM (4KB)
0x1FC00000
0x1C000000

Figure 3-1 Physical Address Space Map

Table 3-2 Physical Address Space Map

Start Address	End Address	Connectable Memory	Capacity
H’0000 0000	H’07FF FFF	SDRAM space	128 MB
H’0800 0000	H’0FFF FFFF	Static memory space	128 MB
H’1000 0000	H’13FF FFFF	Internal I/O space	64 MB
H’1400 0000	H’1BFF FFFF	Static memory space	128MB
H’1C00 0000	H’1FBF FFFF	Un-used	60MB
H’1FC0 0000	H’1FC0 0FFF	On-chip boot ROM	4KB
H’1FC0 1000	H’1FFF FFFF	Un-used	4095KB
H’2000 0000	H’BFFF FFFF	SDRAM space	2944 MB
H’D000 0000	H’FFFF FFFF	Reserved space	512 MB

The base address and size of each memory banks are configurable. Software can re-configure these memory banks according to the actual connected memories. Following table lists the default configuration after reset.

Table 3-3 Default Configuration of EMC Chip Select Signals

Chip-Select Signal	Connected Memory	Capacity	Memory Width [*1]	Start Address	End Address
CS1#	Static memory bank 1	8 MB	8, 16, 32	H'1800 0000	H'1BFF FFFF
CS2#	Static memory bank 2	8 MB	8, 16, 32	H'1400 0000	H'17FFFFFFF
CS3#	Static memory bank 3	8 MB	8, 16, 32	H'0C00 0000	H’0FFF FFFF
CS4#	Static memory bank 4	8 MB	8, 16, 32	H'0800 0000	H’0BFF FFFF
DCS#[*3]	SDRAM bank	128 MB	16, 32	H’2000 0000	H’27FF FFFF

Notes:

1. Data width of static memory banks can be configured to 8, 16 or 32 bits by software.

2. The 4KB address space from H’1FC00000 to H’1FC00FFF in bank 0 is mapped to on-chip boot ROM. The other memory spaces in bank 0 are not used.

3. To support large SDRAM space, EMC re-maps the physical address H’00000000-H07FFFFFF to H’20000000-H’27FFFFFF. Software must configure the SDRAM base address by the re-mapped address.

3.4 Static Memory Interface

The static memory controller provides a glueless interface to SRAM's, ROMs (PROMs/EPROMs/FLASH), dual port memory, IO devices, and many other peripherals devices. It can directly control up to 4 devices using four chip select lines. Additional devices may be supported through external decoding of the address bus. The Device Controller shares the data and address busses with the SDRAM controller. Thus, only one memory subsection (SDRAM, memory, or IO) can be active at any time.

Each chip select can directly access memory or IO devices that are 8-bits, 16-bits, or 32-bits wide. Each device connected to a chip select line has 2 associated registers that control its operation and the access timing to the external device. The Static Memory Control Register SMCRn specifies various configurations for the device. The Static Memory Address Configuration Register SACRn specifies the base address and size for each device, enabling any device to be located anywhere in the physical address range.

The static memory interface includes the following signals:

- Four chip selects, CS4~1#
- Twenty-three address signals, A22-A0
- One read enable, RD#
- One write enable, WE#
- Four byte enable, BE3~1#
- One wait pin, WAIT#

The SMT field in SMCRn registers specifies the type of memory and BW field specifies the bus width. BOOT_SEL[1:0] defines whether system boot from Nor or Nand flash and the page size when boot from Nand flash.

3.4.1 Register Description

Table 3-4 Static Memory Interface Registers

Name	Description	RW	Reset Value	Address	Access Width

3.4.1.2 Static Bank Address Configuration Register (SACR1~4)

SACR1~4 defines the physical address for static memory bank 1 to 4, respectively. Each register contains a base address and a mask. When the following equation is met:

$(physical\_address\ [31{:}24]\ \&\ \mathbf{MASK}_n) == \mathbf{BASE}_n$

The bank n is active. The *physical_address* is address output on internal system bus. Static bank regions must be programmed so that each bank occupies a unique area of the physical address space. Bank 0 base address must be 0 because it's system boot address. Programming overlapping bank regions will result in unpredictable error. These registers are initialized by a reset.

SACR1	**0x13010034**
SACR2	**0x13010038**
SACR3	**0x1301003C0x13010040**

3.4.3 Basic Interface

When SMT field in SMCRn (n = 1 to 4) is 0 and BCM field is 0, normal memory (non-burst ROM, Flash, normal SRAM or memory-like device) is connected to bank n. When bank n (n = 1 to 4) is accessed, CSn# is asserted as soon as address is output. In addition, the RD# signal, which can be used as OE#, and write control signals, WE0# to WE3#, are asserted.

The TAS field in SMCRn is the latency from CSn# to read/write strobe. The TAW3 field is the delay time of RD# in read access. TBP3~0 field is the delay time of WE# and WEn# in write access. In addition, any number of waits can be inserted by means of the external pin (WAIT#). The TAH field is the latency from RD# and WEn# negation to CSn# negation, also the hold time to address and write data.

All kinds of normal memories (non-burst ROM, normal SRAM and Flash) have the same read and write timing. There are some requirements for writes to flash memory. Flash memory space must be un-cacheable and un-buffered. Writes must be exactly the width of the populated Flash devices on the data bus (no byte writes to a 32-bit bus or word writes to a 16-bit bus, and so on). Software is responsible for partitioning commands and data, and writing them out to Flash in the appropriate sequence.

Glossary

Th – hold cycle
Tw – wait cycle
Ts – setup cycle
T1 – read inherent cycle or first write inherent cycle
T2 – last write inherent cycle
Tb – burst read inherent cycle

Following figures show the timing of normal memory. A no-wait read access is completed in one cycle and a no-wait write access is completed in two cycles. Therefore, there is no negation period in case of access at minimum pitch.

3.4.4 Byte Control

The byte control SRAM interface is a memory interface that outputs a byte select strobe WEn# in both read and write bus cycles. It has 16 bit data pins, and can be directly connected to SRAM which has an upper byte select strobe and lower byte select strobe function such as UB# and LB#.

In read/write access, RD#/WE# is used as read/write strobe signal and WEn# are used as byte select signals.

Following figure shows an example of byte control SRAM connection to processor.

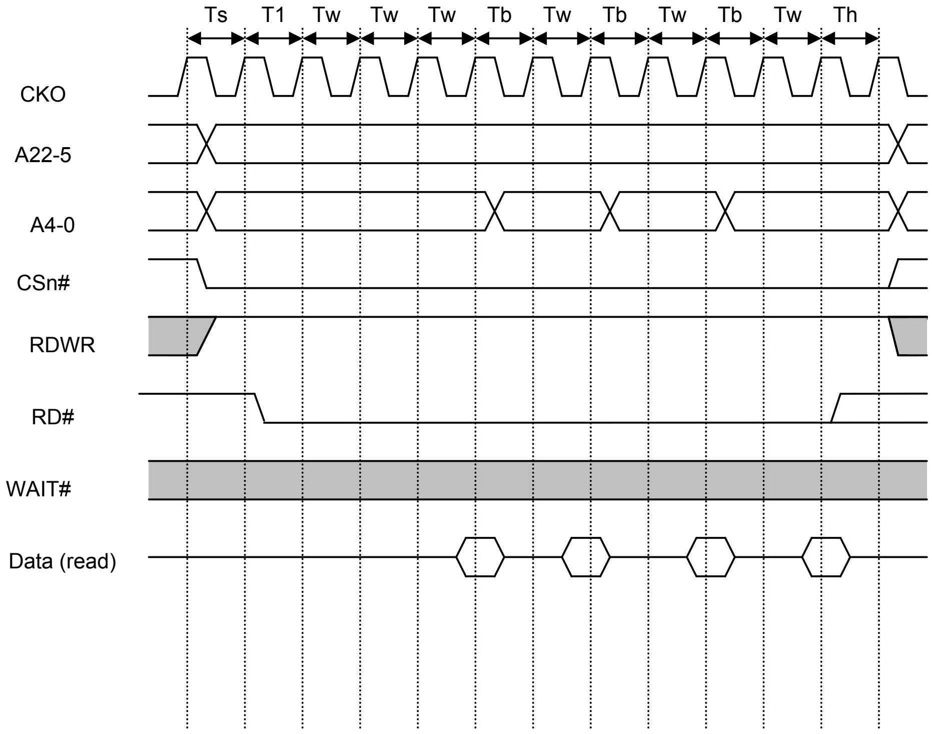
3.4.5 Burst ROM Interface

Setting SMT to 1 in SMCRn allows burst ROM to be connected to bank n (n = 1 to 4). The burst ROM interface provides high-speed access to ROM that has a nibble access function. Basically, access is performed in the same way as for normal memory, but when the first cycle ends, only the address is changed before the next access is executed. When 8-bit burst ROM is connected, the number of consecutive accesses can be set as 4, 8, 16, or 32 with bits BL1~0. When 16-bit ROM is connected, 4, 8, or 16 can be set in the same way. When 32-bit ROM is connected, 4 or 8 can be set.

For burst ROM read, TAW sets the delay time from read strobe to the first data, TBP sets the delay time from consecutive address to data. Burst ROM writes have the same timing as normal memory except TAW instead of TBP is used to set the delay time of write strobe.

WAIT# pin sampling is always performed when one or more wait states are set.

Following figures show the timing of burst ROM.



*In this example, SMT = 1, BL = 0, TAS = 1, TAW = 3,TBP = 1,TAH = 1

Figure 3-13 Burst ROM Read Timing (Software Wait Only)

3.5 NAND Flash Interface

NAND flash can be connected to static memory bank 4~ band 1. Both 8-bit and 16-bit NAND flashes are supported. Hardware ECC generator is implemented (including Hamming and RS codes correction). A mechanism for booting from NAND flash is also supported.

3.5.1 Register Description

Table 3-5 NAND Flash Interface Registers

Name	Description	RW	Reset Value	Address	Access Width
NFCSR	NAND flash control/status register	RW	0x00000000	0x13010050	32

3.5.1.4 NAND Flash Parity Register (NFPARn, n=0,1,2)

NFPAR0, NFPAR1 and NFPAR2 are all 32-bit read/write register that contains the encoding and decoding parity data during RS correction. It is initialized by any reset and ERST of NFECCR.

PARn (n=0~7), total 8 9-bit register together contains the parity data during RS correction. In encoding, they are writtern by hardware and software needs to read out and write into NAND flash spare space after NFINTS.ENCF bit is set to 1. In decoding, they are writtern by software. Software should first read out the 512B nand flash data and then 8 9-bit parity data and write the parity data into PARn registers.

NFPAR0 **0x13010108**

3.5.1.5 NAND Flash Interrupt Status Register (NFINTS)

NFINTS is a 32-bit read-only register that contains the interrupt flag and error count information during RS correction. It is initialized by any reset. Software write 0 to clear the corresponding bit except ERRC.

NFINTS **0x13010114**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Name	Description	RW
31:29	ERRC	**ERR Count:** It indicates the number of errors in the nand flash data block and these bits are also reset by NFECCR.ERST bit. **ERRC** **Description** 0 No errors or uncorrection error occurs (Initial value) 1 One error in the nand flash data block 2 Two errors in the nand flash data block	R

		3 Three errors 4 Four errors	
28:5	Reserved	Writes to these bits have no effect and read always as 0.	R
4	PADF	**Padding Finish:** It indicates that hardware finish padding zero after reading the 512B nand flash data block during RS decoding. **PADF Description** 0 Padding not finish (Initial value) 1 Padding finish	R
3	DECF	**Decoding Finish:** It indicates that hardware finish RS decoding. **PADF Description** 0 Decoding not Finish (Initial value) 1 Decoding Finish	R
2	ENCF	**Encoding Finish:** It indicates that hardware finish RS encoding. **PADF Description** 0 Encoding not Finish (Initial value) 1 Encoding Finish	R
1	UNCOR	**Uncorrection Error:** It indicates that hardware finish RS encoding. **UNCOR Description** 0 No uncorrectable error (Initial value) 1 Uncorrectable error occur	R
0	ERR	**Error:** It indicates that hardware detects error data in the 512B nand flash data block during RS decoding. **ERR Description** 0 No error (Initial value) 1 Error occur	R

3.5.1.6 NAND Flash Interrupt Enable Register (NFINTE)

NFINTE is a 32-bit read/write register that is used to enable/disable nand flash interrupt during RS correction. It is initialized by any reset.

NFINTE **0x13010118**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits	Name	Description	RW
31:25	Reserved	Writes to these bits have no effect and read always as 0.	R
24:16	INDEXn	**Error Symbol Index:** It is used to indicate the location of the error symbol in the 511 symbols. For example, INDEX=1, it means the first symbol has error bits.	R

15:9	Reserved	Writes to these bits have no effect and read always as 0.	R
8:0	MASKn	**Error Symbol Value:** It is used to indicate the error value of the indexed symbol. For example, INDEX=1, and MASK=3, it means the first two bits of the first symbol are wrong, and software need to XOR MASK and the indexed symbol to get the right data.	R

3.5.2 NAND Flash Boot Loader

To support boot from NAND flash, 4KB on-chip Boot ROM is implemented. Following figure illustrates the structure of NAND Flash Boot Loader.

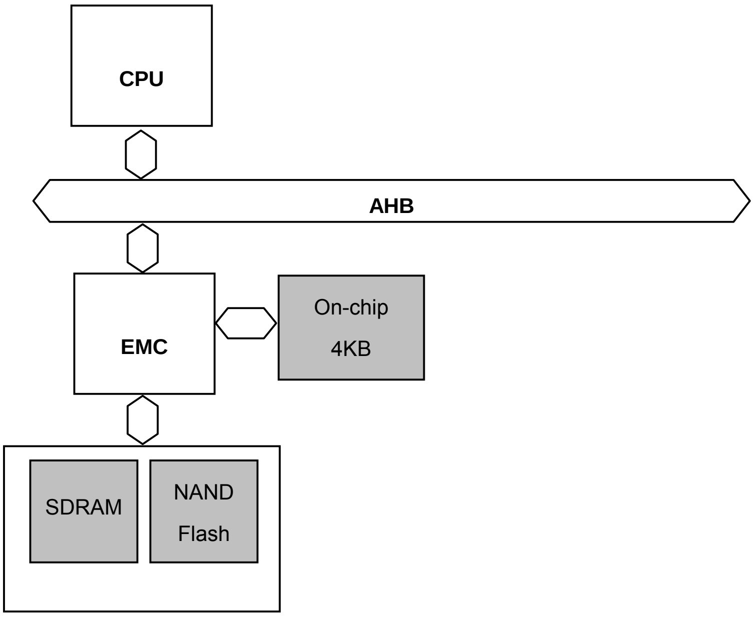

Figure 3-14 Structure of NAND Flash Boot Loader

When system is configured to boot from NAND flash, after reset, the program in Boot ROM is executed and the program will copy the first 4K bytes of NAND flash to internal memory for further initialization.

Generally, the boot code will copy more NAND flash content to SDRAM. Hardware ECC can be utilized to check the data validity. Then the main program will be executed on SDRAM.

When system is configured to boot from NAND flash, software may know the nand flash page size through BOOT_SEL[1:0] pin.

3.5.3 NAND Flash Operation

Set NFEn bit of NAND Flash Control/Status Register (NFCSR) will enable access to NAND flash. The partition of static bank n (n=1~4) is changed as following figure. Writes to any of address space will be translated to NAND flash address cycle. Writes to any of command space will be translated to NAND flash command cycle. Caution: don't read to address and command space, and these two partitions should be uncacheable. Reads and writes to any of data space will be translated to NAND flash data read/write cycle. DMA access to data space is supported to increase the speed of data read/write. The DMA access cannot exceed the page boundary (512 bytes or 2K bytes) of NAND flash.

Figure 3-15 Static Bank 2 Partition When NAND Flash is Used (an example)

The timing of NAND flash access is configured by SMCRn and is same as normal static memory timing, except that CSn# is controlled by NFCE bit NFCSR. CSn# is always asserted when NFCE is 1. When NFCE is 0, CSn# is asserted as normal static memory access.

The control signals for direction connection of NAND flash are CSn#, FRE#, FWE#, FRB#(GPIO), A16 and A15. Following figure shows the connection between processor and NAND Flash.

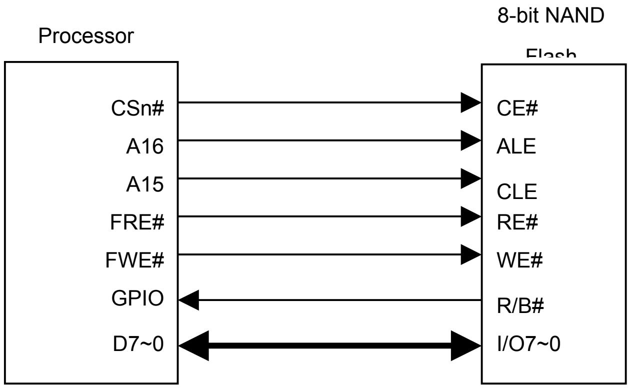

Figure 3-16 Example of 8-bit NAND Flash Connection

Hardware ECC generation for 8-/16-bit organization is implemented. There are two algorithm that could be used.

3.5.3.1 Hamming

When using Hamming algorithm, ECC parity code consists of 24 bits per 512 bytes (256 halfwords) and 22 bits per 256 bytes. Following table shows the ECC code assignment.

Table 3-6 512-Byte ECC Parity Code Assignment Table For 8-bit NAND Flash

ECC2	P8	P8’	P4	P4’	P2	P2’	P1	P1’

24-bit ECC parity code = 16-bit line parity + 8-bit column parity

3.5.3.2 Reed-Solomn

RS controller uses RS(511, 503) codes. The total codes have 511 symbols, each symbol is 9-bit. The message has 503 9-bit symbols. So 512B nand flash data will be split into 9-bit symbols and it is 455 1/9 symbols, and then hardware will padding 47 8/9 zero symbol to build the 503 symbol message. During encoding, after padding zero, hardware will generate 8 9-bit parity symbol, software should read out the parity and write into nand flash spare space. During decoding, after reading out the 512B data and padding zero, hardware will using the parity data in NFPAR0~2 written by software to generate error information in NFERR0~3. Software should first read out the 512B nand flash data and then the parity data and write the parity data into NFPAR0~2.

NAND Flash Initialize Sequence

1. Configure SMCRn (n=1,2,3,4) according to the NAND flash AC characteristics.
2. Set NFEn bit of NFCSR to 1

NAND Flash Program Sequence

1. Set NFCEn bit of NFCSR to 1 to assert CSn# continuously
2. Write 0x80 to command space to issue Page Program command
3. Write 2 or 3 bytes of address to address space
4. Enable and reset the ECC generator by setting ECCE and ERST bits of NFECCR.
5. Select Haming or RS algorithm by setting NFECCR.RSE, 0: Hamming, 1: RS
6. If using RS algorithm, set NFECCR.ENCE to 1
7. Write 256 or 512 bytes data to data space using Hamming, write 512B data using RS
8. When using Hamming, clear ECCE bit of NFECCR to disable ECC generator and read out the ECC parity code from NFECC register, write 16-byte redundant data
9. When using RS, poll NFINTS.ENCF bit or wait for ENCF interrupt, and read out parity data from NFPAR0~2 register and write them into nand flash spare space
10. Write 0x10 to command space to issue Page Program command
11. Clear NFCEn bit of NFCSR to deassert CSn#
12. Check RB bit of NFCSR to wait the program complete

NAND Flash Read Sequence

1. Set NFCEn bit of NFCSR to 1 to assert CSn# continuously
2. Write 0x00 to command space to issue Read command
3. Write 2 or 3 bytes of address-to-address space

4. Enable and reset the ECC generator by setting ECCE and ERST bits of NFECCR.
5. Select Haming or RS algorithm by setting NFECCR.RSE, 0: Hamming, 1: RS
6. Check RB# pin (GPIO) to wait for NAND flash is not busy
7. When using Hamming, Read 256 or 512 bytes from NAND flash (DMA can be used), clear ECCE bit of NFECCR to disable ECC generator and Read 16-byte redundant data from NAND flash, then read out the ECC parity code from NFECC register, compare these two parity codes and correct the error bit or run the error routine
8. When using RS, Read 512 bytes data and 9 bytes parity data from NAND flash (DMA can be used), poll NFINTS.DECF bit or wait for decoding finish interrupt, and then analyze error status in NFINTS register, if there is any error, read NFERR0~3 registers, find the error byte according to NFERRn.INDEXn and XOR NFERRn.MASKn with the indexed bytes to get the correct data
9. If continuous pages are needed to be read, repeat steps from 5 to 9.
10. Clear NFCEn bit of NFCSR to deassert CSn#

ECC Generation Sequence for large page

In large page (2KBX8/1KHWX16 org.), 24-bit ECC code is generated for every 512 bytes or 256 halfwords data. Software gets ECC codes as following steps:

1. Set ERST bit of NFECCR to reset ECC generator
2. Read/write 512 bytes / 256 halfwords data
3. Read out 24-bit ECC code from NFECC register
4. Repeat step 1 to 3 until whole page is completed
5. Write spare area according to above ECC codes.

3.6 SDRAM Interface

The SDRAM controller provides a glueless interface to industry standard SDRAM chip. The SDRAM controller provides one chip selects DCS# supporting 16-bit or 32-bit wide SDRAM.

Both 2-bank and 4-bank SDRAM modules are supported. The bank select signals are always output from the A13 pin and A14 pin of processor.

The SDRAM interface includes the following signals:

- One chip selects, DCS#
- Four byte mask signals, DQM3~0#
- 15 multiplexed bank/row/column address signals, A14-A0
- One write enable, RD/WR#
- One column-address strobe CAS#
- One row-address strobe RAS#
- One clock enable CKE
- One clock CKO

The processor performs auto-refresh (CBR) during normal operation and supports self-refreshing SDRAM during sleep, hibernate, and frequency-change modes. An SDRAM power-down mode bit (DMCR[PDM]]) can be set so that the CKO and the clock-enable signal CKE to SDRAM are automatically deasserted whenever none of the corresponding banks is being accessed.

3.6.1 Register Description

Table 3-9 SDRAM Registers

Name	Description	RW	Reset Value	Address	Access Width
DMCR	DRAM control register	RW	0x0000 0000	0x13010080	32
RTCSR	Refresh time control/status register	RW	0x0000	0x13010084	16
RTCNT	Refresh timer counter	RW	0x0000	0x13010088	16
RTCOR	Refresh time constant register	RW	0x0000	0x1301008C	16
DMAR	SDRAM bank address configuration register	RW	0x000020F8	0x13010090	32
SDMR	Mode register of SDRAM bank	W	--	0x1301A000	8

3.6.1.1 SDRAM Control Register (DMCR)

DMCR is a 32-bit read/write register that specifies the timing, address multiplexing and refresh control of SDRAM. This enables direct connection of SDRAM without external circuits.

The DMCR is initialized to 0x00000000 by any resets. SDRAM bank should not be accessed until initialization is completed.

DMCR **0x13010080**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

10:8	TPC	**RAS Precharge Time:** Specify the minimum number of cycles until the next bank active command is output after precharging. TPC Description 000 1 cycle (Initial value) 001 2 cycles 010 3 cycles 011 4 cycles 100 5 cycles 101 6 cycles 110 7 cycles 111 8 cycles	RW
7	Reserved	Writes to these bits have no effect and always read as 0.	R
6:5	TRWL	**Write Precharge Time:** Set the SDRAM write precharge delay time. In auto-precharge mode, they specify the time until the next bank active command is issued after a write cycle. After a write cycle, the next active command is not issued for a period of TRWL + TPC.	RW

		TRWL **Description** 00 1 cycle (Initial value) 01 2 cycles 10 3 cycles 11 4 cycles	
4:2	TRC	**RAS Cycle Time:** For SDRAM, no bank active command is issued during the period TRC after an auto-refresh command. In self-refresh, these bits also specify the delay cycles to be inserted after CKE assertion. **TRC** **Description** 000 1 cycle (Initial value) 001 3 cycle 010 5 cycle 011 7 cycle 100 9 cycle 101 11 cycle 110 13 cycle 111 15 cycle	RW
1:0	TCL	**CAS Latency:** Specify the delay from read command to data becomes available at the outputs. **TCL** **Description** 00 Inhibit (Initial value) 01 2 cycles 10 3 cycles 11 Inhibit	RW

3.6.1.2 SDRAM Mode Register (SDMR)

SDMR is written to via the SDRAM address bus and is a 10-bit write-only register. It sets SDRAM mode for SDRAM bank. SDMR is undefined after a reset.

Write to the SDRAM mode register use the address bus rather than the data bus. If the value to be set is X and the SDMR address is Y, the value X is written in the SDRAM mode register by writing in address X + Y. Here Y is 0xA000, X is value for SDRAM configuration. For example Y is 0x022, random data is writer to the address offset 0xA022, as a result, 0x022 is written to the SDMR register. The range for value X is 0x000 to 0x3FF.

SDMR **0x1301A000**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Figure 3-17 Synchronous DRAM Mode Register Configuration

3.6.1.3 Refresh Timer Control/Status Register (RTCSR)

RTCSR is a 16-bit readable/writable register that specifies the refresh cycle and the status of RTCNT.

RTCSR is initialized to 0x0000 by a reset.

RTSCR **0x13010084**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Reserved								CMF	Reserved				CKS		
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Name	Description	RW
15:8	Reserved	These bits always read 0. Data written to these bits are ignored	R
7	CMF	**Compare-Match Flag (CMF):** Status flag that indicates a match between the refresh timer counter (RTCNT) and refresh time constant register (RTCOR) values. Writes to 1 of this bit have no effect. **CMF** **Description** 0 RTCNT and RTCOR values do not match (Initial value) Clear condition: When 0 is written 1 RTCNT and RTCOR values match Set condition: When RTCNT = RTCOR	
2:0	CKS	**Refresh Clock Select Bits:** These bits select the clock input to RTCNT. The source clock is the external bus clock (CKO). The RTCNT count clock is CKO divided by the specified ratio. **CKS** **Description** 000 Disable clock input (Initial value) 001 Bus lock CKO/4 010 CKO/16 011 CKO/64 100 CKO/256 101 CKO/1024 110 CKO/2048 111 CKO/4096	

3.6.1.4 Refresh Timer Counter (RTCNT)

RTCNT is a 16-bit read/write register. RTCNT is a 16-bit counter that counts up with input clocks. The clock select bits (CKS2–CKS0) of RTCSR select the input clock. When the refresh bit (RFSH) of the memory control register (DMCR) is set to 1 and the refresh mode is set to auto-refresh, a memory refresh cycle starts when RTCNT matches RTCOR. RTCNT is initialized to 0x0000 by a reset.

RTCNT **0x13010088**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Reserved															
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

3.6.2 Refresh Time Constant Register (RTCOR)

RTCOR is a 16-bit read/write register. The values of RTCOR and RTCNT (bottom 8 bits) are constantly compared. When the refresh bit (RFSH) of the memory control register (DMCR) is set to 1 and the refresh mode bit (RMODE) is set to auto-refresh, a memory refresh cycle starts when RTCNT matches RTCOR. RTCOR is initialized to 0x0000 by a reset.

RTCOR **0x1301008C**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Reserved															
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

3.6.2.1 DRAM Bank Address Configuration Register (DMAR)

DMAR define the physical address for SDRAM bank, respectively. Each register contains a base address and a mask. When the following equation is met:

(*physical_address* [31:24] & $\mathbf{MASK_n}$) == $\mathbf{BASE_n}$

The bank n is active. The *physical_address* is address output on internal system bus. DRAM bank regions must be programmed so that each bank occupies a unique area of the physical address space. Programming overlapping bank regions will result in unpredictable error.

These registers are initialized by a reset.

DMAR **0x13010090**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																	BASE								MASK							
RST																																

Bits	**Name**	**Description**	**RW**
31:16	Reserved	Writes to these bits have no effect and read always as 0.	R
15:8	BASE	**Address Base:** Defines the base address of SDRAM Bank. The initial values are: DMAR.BASE 0x20	RW
23:20	MASK	**Address Mask**: Defines the mask of SDRAM Bank. The initial values are: DMAR.MASK 0xF8	RW

3.6.4 Address Multiplexing

SDRAM can be connected without external multiplexing circuitry in accordance the address multiplex specification bits CA2~0, RA1~0 and BA in DMCR. Table 3-10 shows the relationship between the address multiplex specification bits and the bits output at the address pins.

A14-0 is used as SDRAM address. The original values are always output at these pins.

Table 3-10 SDRAM Address Multiplexing (32-bit data width) *[4]

CA2~0	RA1~0	Output Timing	A0-A9, A10, A11, A12	A13	A14	Note

		Row	A14-A26			

Notes:

1. L/H is a bit used in the command specification; it is fixed at L or H according to the Access mode.
2. Bank address specification
3. If one bank select signal is used (BA = 0), take A13 as bank select signal. If two bank select signals are used (BA = 1), take A13 and A14 as bank select signals
4. The A0 to A14 in table head are output pins. The A2 to A28 in table body are physical address.

3.6.5 SDRAM Command

Commands for SDRAM are specified by RAS#, CAS#, RD/WR and special address signals. The processor accesses SDRAM by using the following subset of standard interface commands.

- Mode Register Set (MRS)
- Bank Activate (ACTV)
- Read (READ)
- Write (WRIT)
- Burst Terminate
- Precharge All Banks (PALL)
- Auto-Refresh (CBR)
- Enter Self-Refresh (SLFRSH)
- No Operation (NOP)

Table 3-12 SDRAM Command Encoding (Notes: 1)

Command	**Processor Pins**							
	CS#	**RAS#**	**CAS#**	**RD/WR#**	**DQM**	**A14-11, A9-0**	**A10**	**Note**
INHIBIT	H	X	X	X	X	X	X	
NOP	L	H	H	H	X	X	X	
MRS	L	L	L	L	X	Op-Code		
ACTV	L	L	H	H	X	Bank, Row	X	2
READ	L	H	L	H	L/H	Bank, Col	L	3
WRIT	L	H	L	L	L/H	Bank, Col	L	3
Burst Terminate	L	H	H	L	X	X	X	
PRE	L	L	H	L	X	Bank	L	
PALL	L	L	H	L	X	X	H	
CBR/SLFRSH	L	L	L	H	X	X	X	4

Note:

- CKE is HIGH for all commands shown except SLFRSH
- A0-A12 provides row address, and A13-A14 determines which bank is active.
- A0-A9 provides column address, and A13-A14 determines which bank is being read from or written to.
- This command is CBR if CKE is HIGH, SLFRSH if CKE is LOW.

3.6.6 SDRAM Timing

The SDRAM bank function is used to support high-speed accesses to the same row address. As SDRAM is internally divided into two or four banks, it is possible to activate one row address in each bank.

When a de-active bank is accessed, an access is performed by issuing an ACTV command following by READ or WRIT command.

When an active bank is accessed and just hit the open row, an access is performed by issuing READ or WRIT command immediately without issuing an ACTV command.

When an active bank is accessed but hit a closed row, a PRE command is first issued to precharge the bank, then the access is performed by issuing an ACTV command followed by a READ or WRIT command.

There is a limit on Tras , the time for placing each bank in the active state. If there is no guarantee that there will not be a cache hit and another row address will be accessed within the period in which this value is maintained by program execution, it is necessary to set auto-refresh and set the refresh cycle to no more than the maximum value of Tras. In this way, it is possible to observe the restrictions on the maximum active state time for each bank. If auto-refresh is not used, measures must be taken in the program to ensure that the banks do not remain active for longer than the prescribed time.

3.6.7 Power-Down Mode

The SDRAM power-down mode is supported to minimize the power consumption. CKE going to low level when SDRAM is idle/active state will drive SDRAM to precharge/active power-down mode. The clock supplies to SDRAM may be stopped also when CKE keep in low level more than two cycles. When a new access start or a refresh request, CKE is driven to high level and clock supplies is re-enabled. In power-down mode, clock of the accessed SDRAM bank pair is supplied. Clock of the other pair is stopped.

Following figures shows the timing of power-down mode and clock stopping.

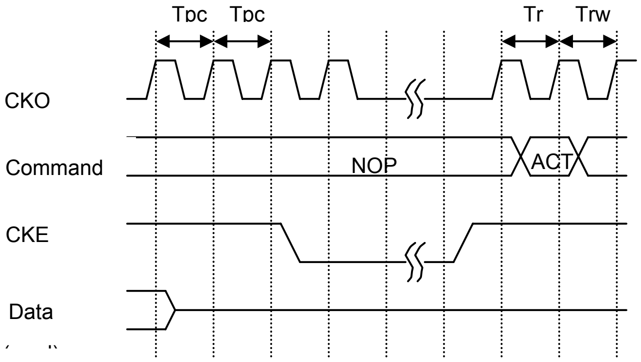

Figure 3-32 SDRAM Power-Down Mode Timing (CKO Stopped)

Following figure shows the power-down mode timing that CKE low level less than two cycles and clock is not stopped.

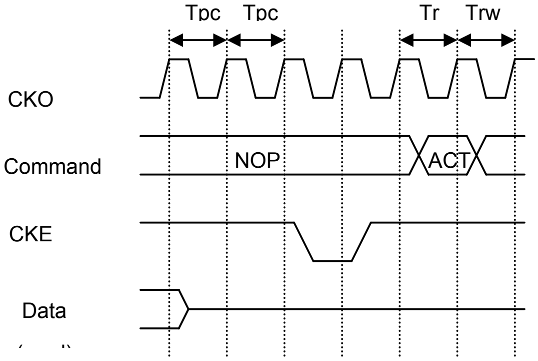

Figure 3-33 SDRAM Power-Down Mode Timing (Clock Supplied)

3.6.8 Refreshing

EMC provide a function for controlling the refresh of synchronous DRAM, Auto-refresh can be performed by clearing the RMODE bit to 0 and setting the RFSH bit to 1 in DMCR. If SDRAM is not accessed for a long period, self-refresh mode can be activated by set both the RMODE bit and the RFSH bit to 1.

3.6.8.1 AUTO-Refresh

Refreshing is performed at intervals determined by the input clock selected by bits CKS2-0 in RTCSR, and the value set in RTCOR. The value of bits CKS2-0 in RTCSR should be set so as to satisfy the refresh interval stipulation for the synchronous DRAM used. First make the settings for RTCOR, RTCNT, and the RMODE and RFSH bits in MCR, and then make the CKS2-CKS0 setting. When the clock is selected by CKS2-CKS0, RTCNT starts counting up from the value at that time. The RTCNT value is constantly compared with the RTCOR value, and if the two values are the same, a refresh request is generated and an auto-refresh is performed. At the same time, RTCNT is cleared to zero and the count-up is restarted. Figure 3-34 shows the auto-refresh cycle operation.

First, a REF command is issued in the TRr cycle. After the TRr cycle, new command output cannot be performed for the duration of the number of cycles specified by the TRC bits in DMCR. The TRC bits must be set so as to satisfy the synchronous DRAM refresh cycle time stipulation (active/active command delay time). Following figure shows the auto-refresh timing when TRC is set to 2.

Auto-refresh is performed in normal operation and sleep mode.

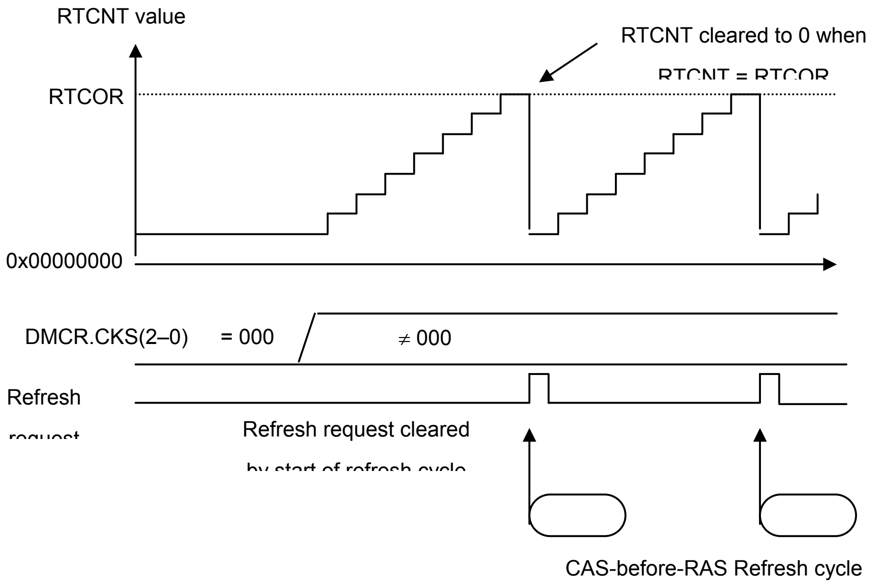

Figure 3-34 Synchronous DRAM Auto-Refresh Operation

A PALL command is issues firstly to precharge all banks. Then a REF command is issued in the TRr cycle.

Figure 3-35 Synchronous DRAM Auto-Refresh Timing

3.6.8.2 SELF-Refresh

Self-refresh mode is a kind of sleep mode in which the refresh timing and refresh addresses are generated within the SDRAM. Self-refreshing is activated by setting both the RMODE bit and the RFSH bit to 1. The self-refresh state is maintained while the CKE signal is low. SDRAM cannot be accessed while in the self-refresh state. Self-refresh mode is cleared by clearing the RMODE bit to 0. After self-refresh mode has been cleared, command issuance is disabled for the number of cycles specified by the TRC bits in DMCR. Trsw cycles are inserted to meet the minimum CKE negation time specified by the TRAS bits in DMCR. Self-refresh timing is shown in following figure. Settings must be made so that self-refresh clearing and data retention are performed correctly, and auto-refresh is performed at the correct intervals. When self-refreshing is activated from the state in which auto-refreshing is set, or when exiting sleep mode other than through a reset, auto-refreshing is restarted if RFSH is set to 1 and RMODE is cleared to 0 when self-refresh mode is cleared. If the transition from clearing of self-refresh mode to the start of auto-refresh takes time, this time should be taken into consideration when setting the initial value of RTCNT. Making the RTCNT value 1 less than the RTCOR value will enable refreshing to be started immediately. After self-refreshing has been set, the self-refresh state continues even if the chip standby state is entered using the processor's sleep function, and is maintained even after recovery from sleep mode other than through a reset. In the case of a reset, the bus state controller's registers are initialized, and therefore the self-refresh state is cleared.

Self-refreshing is performed in normal operation, in idle mode and in sleep mode. In sleep mode, if RFSH bit in DMCR is 1, self-refresh is always performed in spite of RMODE field in DMCR until sleep mode is canceled.

Relationship between Refresh Requests and Bus Cycle Requests:

If a refresh request is generated during execution of a bus cycle, execution of the refresh is deferred until the bus cycle is completed. If a match between RTCNT and RTCOR occurs while a refresh is waiting to be executed, so that a new Refresh request is generated, the previous refresh request is eliminated. In order for refreshing to be performed normally, care must be taken to ensure that no bus cycle is longer than the refresh interval.

A PALL command is issued firstly to precharge all banks.

3.6.9 Initialize Sequence

In order to use SDRAM, mode setting must first be performed after powering on. To perform SDRAM initialization correctly, the EMC registers must first be set, followed by a write to the SDRAM mode register.

In SDRAM mode register setting, the address signal value at that time is latched by MRS command. If the value to be set is X, the bus state controller provides for value X to be written to the synchronous DRAM mode register by performing a write to address offset 0xA000 + X for bank 0. In this operation the data is ignored, but the mode write is performed as a byte-size access. To set burst read/write, CAS latency 2 to 3, wrap type = sequential, and burst length 4 supported by the processor, arbitrary data is written in a byte-size access to the following addresses.

Table 3-13 SDRAM Mode Register Setting Address Example (32-bit)

CAS latency 3	A032	B0C8	C0C8	D0C8

Table 3-14 SDRAM Mode Register Setting Address Example (16-bit)

	Bank 0			
CAS latency 2	A011	B044	C044	D044
CAS latency 3	A019	B064	C064	D064

The value set in DMCR.MRSET is used to select whether a Pre-charge All Banks command (PALL) or a Mode Register Set command (MRS) is issued. The timing for the Pre-charge All Banks command is shown in Figure 3-37, and the timing for the Mode Register Set command in Figure 3-38

Before mode register setting, a 200 µs idle time (depending on the memory manufacturer) must be guaranteed after powering on requested by the synchronous DRAM. If the reset signal pulse width is greater than this idle time, there is no problem in performing initialize sequence immediately.

First, a pre-CHARGE all bank (PALL) command must be issued by performing a write to address offset 0xA000 + X for bank 0, while DMCR.MRSET = 0.

Next the NUMBER of dummy auto-refresh cycles specified by the manufacturer (usually 8) or more must be executed. This is usually achieved automatically while various kinds of initialization are being performed after auto-refresh setting, but a way of carrying this out more dependably is to set a short refresh request generation interval just while these dummy cycles are being executed. With simple read or write access, the address counter in the synchronous DRAM used for auto-refreshing is not initialized, and so the cycle must always be an auto-refresh cycle.

After auto-REFRESH has been executed at least the prescribed number of times, a Mode Register Set command (MRS) is issued in the TMw1 cycle by setting DMCR.MRSET to 1 and performing a write to address offset 0xA000 + X.

An example of SDRAM operation flow is as the following:

1. Disable Bus release

   Write 0x00000000 to BCR
2. Initialize RTCOR and RTCNT for auto-refresh cycle

   Before configure SDRAM SDMR, SDRAM needs to execute auto-refresh, the number of times depends on the type of SDRAM. It's better to set a short refresh request generation interval here. For example, set RTCOR to 0x0000000F, and set RTCNT 0x00000000.
3. Initialize DMCR for Precharge all bank and auto-refresh

   When DMCR.RMODE=0 and DMCR.RFSH=1, enter auto-refresh mode;

   When DMCR.MRSET=0, write SDMR whill generates Precharge all bank cycle.

   DMCR.TPC must be defined for precharge.
4. Disable refresh counter clock

   Write 0x00000000 to RTCSR
5. Execute Precharge all bank before auto-refresh

   Because DMCR.MRSET=0, writing SDMR generates a Precharge all bank cycle, for example, write address (0x1301A000).
6. Enable fast refresh counter clock for auto-refresh cycle

   For example, write 0x00000001 to RTCSR
7. Wait for number of auto-refresh cycles (defined by SDRAM chip)

   When RTCSR.CMF=1, it indicates value of RTCOR and RTCNT match and an auto-refresh cycle occurs.
8. Configure DMCR for SDRAM MODE Register Set

   When DMCR.MRSET=1, write SDMR generate MRSET cycle.

   For example, write 0x059A5231 to DMCR, so that:

   Bus-width: 32-bit; Column Address: 9-bit; Row Address: 12-bit; Auto-refresh mode; SDMR Set mode; 4-bank; etc..
9. SDRAM Mode Register Set

   Because DMCR.MRSET=1, for example, write address 0x1301A022 to configure SDMR as:

   Burst Length: 4 burst

   Burst Type: Sequential

   CAS Latency: 2
10. Set normal auto-refresh counter clock

    For example, write 0x00000005 to RTCSR
11. Then Read/Write SDRAM can be executed

3.7 Bus Control Register (BCR)

BCR is used to specify the behavior of EMC on system bus and indicate the BOOT_SEL[1:0] status which defines the boot configure. It is initialized to 0x00000001 by any reset.

BOOT_SEL[1:0] pins define the boot time configurations as listed in the following table.

Table 3-15 Boot Configuration

Boot_sel[1]	Boot_sel[0]	Description
0	0	Boot from external ROM at CS3_
0	1	Boot from USB device
1	0	Boot from 512 Byte page NAND flash at CS1_
1	1	Boot from 2k Byte page NAND flash at CS1_

Name	Description	RW	Reset Value	Address	Access Width

Bits	Name	Description	RW
31:30	BT_SEL	**BOOT_SEL (BT_SEL[1:0]):** Status of BOOT_SEL pins that indicate the boot configure. See the above boot configuration table.	R
29:2	Reserved	Writes to these bits has no effect and always read as 0.	R
1	BRE	**Bus Release Enable**: When clear, once a transaction to EMC begins on the system bus; it must be completed before another transaction starts. When set, the system bus may be released to allow other transaction before EMC prepare the read data or be able to receipt the write data. If slow memory devices are used in the system, setting this bit will improve the efficiency of the whole system. The efficiency of SDRAM access may be improved by setting this bit. But the power consumption is increased if this bit is set. **BRE** **Description**	RW

		0 The system bus can not be released during an access (Initial value) 1 The system bus can be released during an access	
0	Endian	**Endian:** Indicates the system is little-endian.	R

4 DMA Controller

DMA controller (DMAC) is dedicated to transfer data between on-chip peripherals (MSC, AIC, UART, etc.), external memories, and memory-mapped external devices.

4.1 Features

- Support up to 6 independent DMA channels
- Descriptor or No-Descriptor Transfer
- Transfer data units: byte, 2-byte (half word), 4-byte (word), 16-byte or 32-byte
- Transfer number of data unit: 1 ~ 2^{24}
- Independent source and target port width: 8-bit, 16-bit, 32-bit
- Two channel priority modes: fixed, round robin.

Bits	Name	Description	RW
31:6	Reserved	Write has no effect, read as zero.	R
5:0	CIRQn	CIRQn (n=0~5) denotes pending status for corresponding channel 0, no abnormal situation or normal DMA transfer is in progress 1, abnormal situation occurred or normal DMA transfer done	RW

4.3 DMA manipulation

4.3.1 Descriptor Transfer

To do proper Descriptor DMA transfer, do as following steps:

1. First of all, check whether the status of DMA controller are available, that is, for global control (DMAC), ensure that DMAC.AR=0 and DMAC.HLT=0; while for expected channels, ensure that DCSn.AR=0, DCSn.HLT=0, DCSn.TT=0, DTCn=0 and DCSn.INV=0.
2. Set DMAC.DMAE=1 and expected DCSn.CTE=1 to launch DAM transfer
3. For Descriptor transfer, guarantee DCSn.NDES=0
4. Build descriptor in memory. Write the first descriptor address in DDAn and the address must be 16Bytes aligned. The descriptor address includes two parts: Base and Offset address. If the descriptor is linked, the 32-bit address of next descriptor is composed of 20-bit Base address in DDAn and 8-bit Offset address in DES3.DOA and the four LSB is 0x0. See Table 4-4 for the detailed 4-word descriptor structure.
5. Set 1 to the corresponding bit in DDR to initiate descriptor fetch
6. Hardware clears the corresponding bit in DDR as soon as it starts to fetch the descriptor.
7. If DES0.V =0 and DES0.VM=1, DMAC stops and set DCSn.INV=1. Otherwise, it waits for dma request from peripherals to start dma transfer
8. After DMAC completes the current descriptor dma transfer, if DES0.VM=1, it clears DES0.V to 0 and writes back to memory. If DES0.Link=1, it sets DCSn.CT to 1, otherwise it sets DCSn.TT to 1. If the interrupt enabled, it will generates the corresponding interrupts.
9. If DES0.LINK=1, after DMAC completes the current descriptor dma transfer and return to fetch the next descriptor and continues dma transfer until completes the descriptor dma transfer which DES0.LINK=0.

Table 4-4 Descriptor Structure

Word	Bit	Name	Function
1st (DES0)	31	EACKS	External DMA DACKn output polarity select
	30	EACKM	External DMA DACKn output Mode select
	29-28	ERDM	External DMA request detection Mode

4.3.2 No-Descriptor Transfer

To do proper DMA transfer, do as following steps:

1. First of all, check whether the status of DMA controller are available, that is, for global control (DMAC), ensure that DMAC.AR=0 and DMAC.HLT=0; while for expected channels, ensure that DCSn.AR=0, DCSn.HLT=0 and DCSn.TT=0 and DTCn=0.
2. For each channel n, initialize DSAn, DTAn, DTCn, DRTn, DCSn, DCMn properly
3. Set DMAC.DMAE=1 and expected DCSn.CTE=1 and DCSn.NDES=1 to launch DAM transfer

For a channel with auto-request (DRTn.RT=0x8), the transfer begins automatically when the DCSn.CTE bit and DMAC.DMAE bit are set to 1. While for a channel with other request types, the transfer does not start until a transfer request is issued and detected.

For any channel n, The DTCn value is decremented by 1 for each successful transaction of a data unit. When the specified number of transfer data unit has been completed (DTCn = 0), the transfer ends normally. Meanwhile corresponding bit of DIRQP is set to 1. If DCMn.TIE bit is set to 1, an interrupt request is sent to the CPU. However, during the transfer, if a DMA address error occurs, the transfer is suspended, both DCSn.AR and DMAC.AR are set to 1 as well as corresponding bit of DIRQP. Then an interrupt request is sent to the CPU despite of DCMn.TIE.

Sometimes, for example, an UART parity error occurs for a channel that is transferring data between such UART and another terminal. In the case, both DCSn.HLT and DMAC.HLT are set to 1 and the transfer is suspended. Software should identify halt status by checking such two bits and re-configure DMA to let DMA rerun properly later.

4.4 DMA Requests

DMA transfer requests are normally generated from either the data transfer source or target, but also they can be issued by on-chip peripherals that are neither the source nor the target. There are two DMA transfer request types: auto-request, and on-chip peripheral request. For any channel n, its transfer request type is determined through DRTn.

4.4.1 Auto Request

When there is no explicit transfer request signal available, for example, memory-to-memory transfer or memory to some on-chip peripherals like GPIO, the auto-request mode allows the DMA to automatically generate a transfer request signal internally. Therefore, when DMA initialization done, once the DMAC.DMAE and DCSn.CTE are set to 1, the transfer begins immediately in channel n which DRTn=0x8.

4.4.2 On-Chip Peripheral Request

In the mode, transfer request signals come from on-chip peripherals. All request types except 0x8 (value of DRT) belong to the mode. Both single and block transfer mode are available. Note that in single mode, the transfer byte number for one request detection according to DCMn.RDIL must be equal or less than the byte number according to receive or transmit trigger value of source or target devices.

4.5 DMA Transfer Modes

Each channel can toggles between two transfer modes: single and block

4.5.1 Single Mode

A channel with single mode will periodically detect the request signal according to presetting detection interval length (DCMn.RDIL). Moreover, during the transfer, after a transaction of a data unit (8-bit, 16-bit, 32-bit, 16-byte, or 32-byte), an internal arbitrator in the DMA will arbitrate all active channels again to select one to represent DMA's bus request to participate the AHB bus arbitration.

Above process will repeat when the channel captures the bus again until corresponding DCSn.TT bit equals to 1 or abnormal situation (address error, halt) occurs.

4.5.2 Block Mode

Once a channel with block mode captures the bus, it will do data transfer continuously until all data units are transferred or abnormal situation occurs. During the process, it does not release the bus so that neither other channels nor other bus masters can take up the bus. In the mode, the channel just detects the request signal once and corresponding DCMn.RDIL is ignored.

4.6 Channel Priorities

There are two priority modes: fixed, round robin

4.6.1 Fixed Mode

The relative channel priorities are unvaried in the mode.

- CH0 > CH1 > CH2 > CH3 > CH4 > CH5 > CH6 > CH7
- CH0 > CH2 > CH3 > CH1 > CH4 > CH6 > CH7 > CH5
- CH2 > CH0 > CH1 > CH3 > CH6 > CH4 > CH5 > CH7

4.6.2 Round Robin Mode

In the mode, there are two priority groups: CH0~CH3 and CH4~CH7. Round robin is performed in each group, and CH0~CH3 always has higher priority than CH4~CH7.

Table 4-5 Relationship among DMA Transfer connection, Request Mode and Transfer Mode

Transfer Connection	Request Mode	Transfer Mode	Data Size (bits)	Channel
External memory or memory-mapped external device and on-chip peripheral module	Auto on-chip	Block/Single	8/16/32 16-byte/32-byte	0~5

4.7 Examples

4.7.1 Memory-to-memory auto request No-Descriptor Transfer

Suppose you want to do memory move between two different memory regions through channel 3, for example, moving 1KB data from address 0x20001000 to 0x20011000, do as following steps:

a) Check if (DMAC.AR==0 && DMAC.HLT==0 && DCS3.AR==0 && DCS3.HLT==0 && DCS3.CT==0 && DCS3.NDES=1 && DTC3==0)

b) If above condition is true, set value 0 to DCS3.CTE to disable the channel 3 temporarily

c) Set source address 0x20001000 to DSA3 and target address 0x20011000 to DTA3

d) Suppose the data unit is word, set transfer count number 256 (1024/4) to DTC3

e) Set auto-request (0x8) to DRT3

f) Up to now, only the most important channel control register DCM3 is left, set it carefully:

- ➢ Set value 1 to SAI and DAI[*1]
- ➢ Ignore RDIL because in the case there is no explicit request signal can be detected
- ➢ Set word size (0) to SP and DP[*2]
- ➢ Set single mode (0) to TM[*3]
- ➢ Set value 1 to TIE to let CPU do some post process after the transfer done

g) Set value 1 to DCS3.CTE and DMAC.DMAE to launch the transfer in channels 3

h) When the transfer terminates normally (DTC3==0 && DCS3.TT==1), DIRQP.CIRQ3 will automatically be set value 1 and an interrupt request will be sent to CPU

i) When CPU grants the interrupt request, in the corresponding IRQ handler, software must clear the DCS3.CT to value 0, and the behavior will automatically clear DIRQP.CIRQ3.

NOTES:

1. Either source or target is a FIFO, must not enable corresponding address increment
2. When either source or target need be accessed through EMC (external memory controller), the real port with of the device is encapsulated by EMC, so you can set any favorite port with for it despite of the real one
3. Block mode may block bus for a long time, do not use the mode unless the data are emergency

5 Clock Reset and Power Controller

5.1 Overview

The Clock & Power management block consists of three parts: Clock control, PLL control, and Power control, Reset control.

The Clock control logic can generate the required clock signals including CCLK for CPU, HCLK for the AHB bus peripherals, and PCLK for the APB bus peripherals. This chip has one Phase Locked Loops (PLL): for CCLK, HCLK, and PCLK, MSCLK, UHCCLK, LDCLK, LPCLK. The clock control logic can make slow clocks without PLL and connect/disconnect the clock to each peripheral block by software, which will reduce the power consumption.

For the power control logic, there are various power management schemes to keep optimal power consumption for a given task. The power management block can activate four modes: NORMAL mode, DOZE mode, IDLE mode, SLEEP mode.

For reset control logic, the reset module controls or distributes all of the system reset signals.

5.2 Clock Generation UNIT

The clock generation unit (CGU) contains one PLL driven by an external oscillator and the clock generation circuit from which the following clocks are derived:

Signal	Description
CCLK	Fast clock for internal operations such as executing instructions from the cache. It can be gated during doze and idle mode when all the criteria to enter a low power are met.
HCLK	System clock—This signal appears as the HCLK input to the CPU and the HCLK to the system. This is a continuous clock (when the system is not in sleep mode) It can be gated during Sleep mode when all the criteria to enter a low power are met
PCLK	Peripheral clock – APB BUS device clock
MCLK	Clock for EMC controller
CKO	SDRAM Clock
LDCLK	LCD device clock
LPCLK	LCD pixel clock
CIM_MCLK	Clock output from CIM module
CIM_PCLK	Clock input to CIM module
I2SCLK	I2S codec clock
MSCCLK	MSC clock
SSICLK	SSI clock
EXCLK	12M clock output for UART I2C SSI TCU USB2.0-PHY

Feature:

- On-chip 2MHz~24MHZ oscillator circuit
- On-chip 32.768KHZ oscillator circuit
- One On-chip phase-locked loops (PLL) with programmable multiplier
- CCLK, PCLK, HCLK, MCLK , CKO and UHCCLK, LDCLK, LPCLK, I2SCLK, MSCCLK frequency can be changed separately for software by setting registers.
- SSI supports fast clock
- Switchable clock source
- Functional-unit clock gating

5.2.1 Pin Description

Name	I/O	Description
RTCLK_XI	Input	32.768KHZ Oscillator input signal
RTCLK_XO	Output	32.768KHZ Oscillator output signal
EXCLK	Input	Oscillator input signal
EXCLKO	Output	Oscillator output signal
CIM_MCLK	Output	Clock output from CIM module signal
CIM_PCLK	Input	Clock input to CIM module signal
LPCLK	Output	LCD pix clock signal
CKO	Output	SDRAM clock signal
MSC_CLK	Output	Clock output For MMC/SD Card signal
SSI_CLK	Output	Clock output from SSI module signal

Figure 5-1 CGU Block Diagram

5.2.3 Clock Overview

There is an internal PLL in this chip. PLL input clock is an external input clock EXCLK. Theoretically, EXCLK can be 2MHz ~ 20MHz.

CCLK is CPU clock. It is usually the fastest clock in the chip. This clock represents the chip speed.

HCLK is for on chip high speed peripherals connected to AHB bus.

PCLK is for on chip slow speed peripherals connected to APB bus.

MCLK is external memory bus clock. MCLK represents the SDRAM speed.

CCLK, HCLK, PCLK and MCLK are synchronous clocks that may have different frequencies. They are from the same clock source, the on chip PLL output clock in most cases. HCLK frequency can be equal to CCLK or divided CCLK by an integer. PCLK frequency can be equal to HCLK or divided HCLK by an integer. MCLK frequency can be equal to or half of HCLK.

USB device and host controllers need a 48MHz USB clock. USB clock can be selected by software divided PLL output clock.

AC97 in AIC module needs a 12.288MHz BIT clock. It is input from the external AC97 CODEC chip or other clock source.

Besides PLL input, EXCLK also provides device clock or one of device clocks for many peripherals, such as, UART, I2C, TCU, SSI and WDT

Device clock of MSC (MMC/SD) is taken from software divided PLL output clock.

LCD’s device clock and pixel clock are generated from PLL output clock, which are divided by two independent dividers.

The slowest clock is RTCLK, which is usually 32768Hz.

5.2.4 CGU Registers

All CGU register 32bit access address is physical address.

Table 5-1 CGU Registers Configuration

Name	description	RW	Reset Value	Address	Access Size
CPCCR	Clock Control Register	RW	0x42040000	0x10000000	32

5.2.4.1 Clock Control Register

The Clock Control Register (CPCCR) is a 32-bit read/write register, which controls CCLK, HCLK, PCLK, MCLK and LDCLK division ratios. It is initialized to 0x42040000 by any reset. Only word access can be used on CPCCR.

CPCCR **0x10000000**

Bits	Name	Description	RW
31:4	Reserved	Writes to these bits have no effect and always read as 0.	R
3:0	UHCCDR	Divider for UHC Frequency. Specified the UHC 48M device clock division ratio, which varies from 1 to 16 (division ratio = UHCCDR + 1).	RW

5.2.4.6 UHC PHY test point Register

UHC PHY test point Register (UHCTST) is a 32-bit read/write register. This register is initialized to 0x00000000. only by any reset. Only word access can be used on UHCTST

UHCTST **0x10000070**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

6	dp	UHC PHY dp input	R
5	Testmod	UHC test mode	RW
4	txenl		RW
3	speed		RW
2	Txse0		RW
1	txdm		RW
0	txdp		RW

5.2.4.7 SSI device clock divider Register

SSI device clock divider Register (SSICDR) is a 32-bit read/write register that specifies the divider of SSI device clock . This register is initialized to 0x00000004 only by any reset. Only word access can be used on SSICDR

SSICDR **0x10000074**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SCS	Reserved																											SSICDR			
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0

Bits	Name	Description	RW
31	SCS	SSI Clock Source Selection. Selects the SSI clock source between PLL output and pin EXCLK. 0: SSI clock source is pin EXCLK 1: SSI clock source is PLL output	RW
30:4	Reserved	Writes to these bits have no effect and always read as 0.	R
3:0	SSICDR	Divider for SSI Frequency. Specified the SSI device clock division ratio, which varies from 1 to 16 (division ratio = SSICDR + 1).	RW

5.2.4.8 PLL Control Register

The PLL Control Register (CPPCR) is a 32-bit read/write register, which controls PLL multiplier, on/off state and stabilize time. It is initialized to 0x28080011 only by any reset. Only word access can be used on CPPCR.

CPPCR **0x10000010**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PLLM									PLLN					PLLOD		Reserved					PLLS	PLLBP	PLLEN	PLLST							
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Name	Description	RW
31:23	PLLM	the PLL feedback 9-bit divider	RW
22:18	PLLN	the PLL input 5-bit divider	RW
17:16	PLLOD	00: divide by 1 01: divide by 2 10: divide by 2 11: divide by 4	RW
15:11	Reserved	Writes to these bits have no effect and always read as 0	R
10	PLLS	PLL Stabilize Flag 0: PLL is off or not stable 1: PLL is on and stable	R
9	PLLBP	PLL Bypass. If PLLEN is 1, set this bit to1 will bypass PLL. The PLL is still running background but the source of associated dividers is switched to 12-M. If PLLEN is 0, set this bit to 1 has no effect. If PLLEN is 1, clear this bit to 0 will switch the source of associated dividers to PLL output.	RW
8	PLLEN	PLL Enable. When PLLEN is set to 1, PLL starts to lock phase. After PLL stabilizes, PLLS bit is set. If PLLBP is 0, the source of associated dividers, is switched to PLL output. When PLLEN is clear to 0, PLL is shut off and the source of associated dividers is switched to 12-MHz in spite of PLLBP bit	RW
7:0	PLLST	PLL Stabilize Time. Specifies the PLL stabilize time by unit of RTCCLK (approximate 32kHz) cycles. It is used when change PLL multiplier or change PLL from off to on. It is initialized to H'11	RW

5.2.5 PLL Operation

The PLL developed as a macro cell for clock generator. It can generate a stable high-speed clock from a slower clock signal. The output frequency is adjustable and can be up to 500MHz. The PLL integrates a phase frequency detector (PFD), a low pass filter (LPF), a voltage controlled oscillator (VCO) and other associated support circuitry. All fundamental building blocks as well as fully programmable dividers are integrated on the core. It is useful for clock multiplication of stable crystal oscillator sources and for de-skew clock signals.

The PLL block diagram is shown in following figure

Figure 5-2 Block Diagram of PLL

5.2.5.1 PLL Configuration

- PLL Divider Value Setting

  There are 3 divider values (N, M and NO) to set the PLL output clock frequency CLKOUT:

  - Input Divider Value N

    N = PLLN of CPPCR + 2

  - Feedback Divider Value M

    M = PLLM of CPPCR + 2

  - Output Divider Value NO

Output Divider Setting (OD)	Output Divider Value (NO)
0	1

1	2
2	2
3	4

- The PLL output frequency, CLK_OUT, is determined by the ratio set between the value set in the input divider and the feedback divider. PLL output frequency CLK_OUT is calculated from the following equations:

CLKOUT = XIN x (M / N) x (1/ NO)

M = F0 *1 + F1*2 + F2*4 + F3*8 + F4*16 + F5*32 + F6*64 + F7*128 + F8*256 + 2
N = R0*1 + R1*2 + R2*4 + R3*8 + R4*16 + 2
NO = $2^{od0+od1}$

Where:
CLK_OUT represents the output frequency
XIN represents PLL input frequency
N represents input divider value
M represents feedback divider value
NO represents output divider value

< Attention >
1. 1MHZ ≤ XIN/N ≤ 15MHZ
2. 100MHZ ≤ CLK_OUT x NO ≤ 500MHZ

5.2.5.2 PLL out clock frequency selection

PLL-freq = PLL-freq-raw / NO, where NO = 1, 2, 4
PLL-freq-raw = EXCLK * M / N, where M = integer of 2 ~ 513, N = integer of 2 ~ 33

So, to generate a specified PLL-freq, there are many valid sets of NO, M and N value.

Smaller PLL-freq-raw is better since it consumes less power. Reduce PLL-freq-raw from 200MHz to 100MHz saving a few milliwatts. Please beware not put PLL-freq-raw less than 100MHz.

If EXCLK is in small jitter, like a crystal-generated clock, a smaller N is better.

5.2.6 Main Clock Division Change Sequence

Main clock (CCLK, HCLK, PCLK and MCLK) frequencies can be changed separately or simultaneously by changing division ratio. Following conditions must be obeyed:

- CCLK must be integral multiple of HCLK
- The frequency ratio of CCLK and HCLK can not be 24 and 32

- HCLK must be equal to MCLK or twice of MCLK
- HCLK and MCLK must be integral multiple of PCLK.

Don't violate this limitation, otherwise unpredictable error may occurs.

In normal mode, if CE bit of CPCCR is 1, changing CDIV, HDIV, PDIV or MDIV will start a Division Change Sequence immediately. If CE bit of CPCCR is 0, changing CDIV, HDIV, PDIV or MDIV will not start Division Change Sequence.

5.2.7 Change Other Clock Frequencies

The divider of LCD device clock (LDCLK), LCD pixel clock (LPCLK), I2S device clock, SSI device clock, MSC device clock and USB clock can be changed by programming LDIV, LPCDR , I2SCDR, SSICDR, UHCDR, MSCCDR and UDIV, respectively.

Change LDIV LPCDR I2SCDR SSICDR UHCCDR MSCCDR and UDIV as following steps:

1.3 Stop related devices with clock-gate function. Clock supplies to the devices are stopped.
1.3 Change LDIV, LPCDR, I2SCDR, SSICDR , UHCCDR MSCCDR or UDIV. If CE is 1, clock frequencies are changed immediately. If CE is 0, clock frequencies are not changed until PLL Multiplier Change Sequence is started.
1.3 Cancel above clock-gate function.

5.2.8 Change Clock Source Selection

USB, I2S ,SSI device clocks and LCD pix clock can be selected from two sources. Before change clock source, corresponding devices should be stopped using clock-gate function.

- When USB clock source is changed (UCS bit of CPCCR), USB clock should be stopped.
- When I2S clock source is changed (I2CS bit of CPCCR), AIC should be stopped.
- When SSI clock source is changed (SCS bit of SSICDR), SSI should be stopped
- When LCD pix clock source is changed (LCS bit of LPCDR), LCD should be stopped

When UCS, I2CS ,SCS LCS bit is changed, clock source is changed immediately.

5.2.9 EXCLK Oscillator

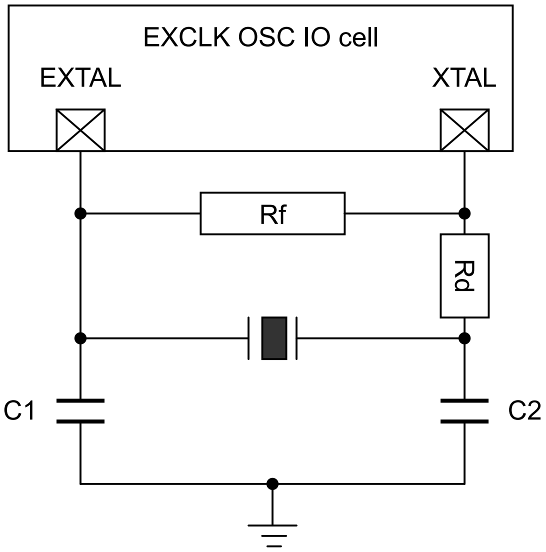

Figure 5-3 Oscillating circuit for fundamental mode

To turn on the oscillator, the oscillating circuit must provide the negative resistance (-Re) at least five times the equivalent series resistance (ESR) of the crystal sample. For larger -Re value, faster turn on the crystal. Higher gm provides larger -Re therefore can start-up the crystal with higher ESR for the same load capacitance (CL). However, it's required higher power consumption.

There are two key parameters to turn on oscillator. Which are CL and the maximum ESR at the target frequency. By reducing the CL, the -Re can be increased thus; shorter turn on time can be achieved. However, if CL is too small, the deviation from the target frequency will increase because of the capacitance variation. So, a trade-off relationship between short turn on time and small frequency deviation in deciding CL value. The smaller ESR of the crystal sample will reduce turn on time but the price is higher. The typical CL and ESR values for difference target frequencies are listed in Table 5-2.

Table 5-2 Typical CL and the corresponding maximum ESR

Target Frequency (Hz)	2M ~ 3M	3M ~ 6M	6M ~ 10M	10M ~ 20M
CL (pf)	25	20	16	12
Maximum ESR (ohm)	1K	400	100	80

Figure 5-3 shows the oscillating circuit is connected with the oscillator I/O cell. Components feedback resistor (Rf), damping resistor (Rd), C1 and C2 are used to adjust the turn on time, keep stability and accurate of the oscillator.

Rf is used to bias the inverter in the high gain region. It cannot be too low or the loop may not oscillate. For mega Hertz range applications, Rf of 1Mohm is applied.

Rd is used to increase stability, low power consumption, suppress the gain in high frequency region and also reduce -Re of the oscillator. Thus, proper Rd cannot be too large to cease the loop oscillating.

C1 and C2 are deciding regard to the crystal or resonator CL specification. In the steady state of oscillating, CL is defined as (C1*C2)/(C1+C2). Actually, the I/O ports, bond pad, and package pin all contribute the parasitic capacitance to C1 and C2. Thus, CL can be rewrite to (C1'*C2')/(C1'+C2'), where C1'=(C1+Cin,stray) and C2'=(C2+Cout,stray). In this case, the required C1 and C2 will be reduced.

Notice, this oscillating circuit is for parallel resonate but not series resonate. Because C1, C2, Rd and Rf are varying with the crystal specifications; therefore there is no single magic number of all the applications.

5.3 Power Manager

In the Low-Power mode, part or whole processor is halted. This will reduce power consumption. The Power Management Controller contains low-power mode control and reset sequence control

5.3.1 Low-Power Modes and Function

The processor supports six low-power modes and function:

- NORMAL mode

  In Normal mode, all peripherals and the basic blocks including power management block, the CPU core, the bus controller, the memory controller, the interrupt controller, DMA, and the external master may operate completely. But, the clock to each peripheral, except the basic blocks, can be stopped selectively by software to reduce the power consumption.

- DOZE mode

  DOZE mode is entered by setting DOZE bit of LCR to 1. In DOZE mode, clock is burst to CPU core and the clock duty is set by DUTY field of LCR. DOZE mode is canceled by reset, interrupt or clearing DOZE bit to 0. Continuous clock is supplied immediately after DOZE mode is canceled. The other Clocks except CCLK run continuously in DOZE mode.

- IDLE mode

  In IDLE mode, the clock to the CPU core is stopped except the bus controller, the memory controller, the interrupt controller, and the power management block. To exit the IDLE mode, the any interrupts should be activated.

- SLEEP mode

  In SLEEP mode, all clocks except RTC clock are disabled. PLL is disabled also. SLEEP mode is canceled by reset or interrupt. When SLEEP mode is canceled, PLL is restarted , the PLL needs clock stabilization time (PLL lock time). This PLL stabilization time is automatically inserted by the internal logic with lock time count register. and all clocks start operating after PLL stability time.

- CLOCK GATE function

  CLOCK GATE function is used to gate specified on-chip module when it is not used. Set specified CLKG0~15 bits in CLKGR will enter specified CLK gate function. CLOCK gate function is canceled by reset or clearing specified CLKGR0~15 to 0.

5.3.2 Register Description

All PMC register 32bit access address is physical address.

Table 5-3 Power/Reset Management Controller Registers Configuration

Name	description	RW	Initial Value	Address	Access Size
LCR	Low Power Control Register	RW	0x000000F8	0x10000004	32
CLKGR	Clock Gate Register	RW	0x00000000	0x10000020	32
SCR	Sleep Control Register	RW	0x00001500	0x10000024	32

5.3.2.1 Low Power Control Register

The Low Power Control Register (LCR) is a 32-bit read/write register that controls low-power mode status. It is initialized to 0x000000F8 by any reset.

LCR **0x10000004**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

3	I2C	
2	RTC	The second counter is still counting
1	TCU	
0	UART0	

5.3.2.3 Sleep Control Register (SCR)

The Sleep Control Register is a 32-bit read/write register that specifies some special controls of SLEEP mode. It is initialized to 0x00001500 by reset.

SCR **0x10000024**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TPE_ADC	TPE_CDC	Reserved														O1ST								SPENDH	SPENDD	Reserved	O1SE	Reserved			
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1	0	1	0	0	0	0	0	0	0	0

Bits	Name	Description	RW
31	TPE_ADC	Test SADC point .	RW
30	TPE_CDC	Test Codec point	RW
31:16	Reserved	Writes to these bits have no effect and always read as 0	R
15:8	O1ST	12MHz Oscillator Stabilize Time. This filed specifies the 12Mhz oscillator stabilize time by unit of 16 RTCCLK periods (oscillator stable time O1ST × 16 / 32768) cycles. It is initialized to H'15.	RW
7	SPENDH	Force UHC phy to enter suspend mode 0: UHC phy hasn't forced to entered SUSPEND mode 1: UHC phy has forced to entered SUSPEND mode	RW
6	SPENDN	force UDC phy to enter suspend mode 0: UDC phy has forced to entered SUSPEND mode	RW

		1: UDC phy hasn’t forced to entered SUSPEND mode	
5	Reserved	Writes to these bits have no effect and always read as 0	R
4	O1SE	12MHz Oscillator Sleep Mode Enable. This filed controls the state of the 12Mhz oscillator in Sleep mode. 0: 12M oscillator is disabled in Sleep mode 1: 12M oscillator is enabled in Sleep mode	RW
3:0	Reserved	Writes to these bits have no effect and always read as 0	R

5.3.3 Doze Mode

Firstly, software should set the DUTY bits of LCR. Then set DOZE bit of LCR to 1 to enter doze mode. When slot controller of PMC indicates that the CPU clock's time-slot has expired, CPU is halted but its register contents are retained. During doze mode, program can modify clock duty-cycle according to core resource requirement. Clock control is in increments of approximately 3% (1/31).

Doze is exited by software, interrupt, reset or SLEEP instruction.

5.3.4 IDLE Mode

In normal or mode, when LPM bits in LCR are 0 and SLEEP instruction is executed, the processor enters idle mode. CPU is halted but its register contents are retained All critical application must be finished and peripherals must be configured to generate interrupts when they need CPU attention.

The procedure of entering sleep mode is shown blow:

1. Set LPM bits in LCR to 0.
2. Executes SLEEP instruction.
3. When current operation of CPU core has finished and CPU core is idle, CCLK supply to CPU core is stopped.

IDLE mode is exited by an interrupt (IRQ or on-chip devices) or a reset.

5.3.5 SLEEP Mode

In normal mode, when LPM bits in LCR is 1 and SLEEP instruction is executed, the processor enter SLEEP mode. CPU and on-chip devices are halted, except some wakeup-logic. PLL is shut off. Clock output from CKO pin is also stopped. SDRAM content is preserved by driving into self-refresh state. CPU registers and on-chip devices registers contents are retained

Before enter SLEEP mode, software should ensure that all peripherals are not running. The procedure of entering SLEEP mode is shown blow:

1. Set LPM bit in LCR to 1.
2. Execute a SLEEP instruction.
3. When current access on system bus complete, the arbiter will not grant any following request. EMC will drive SDRAM from auto-refresh mode to self-refresh mode.
4. When system bus is idle state and SDRAM is self-refresh mode, internal clock supplies are stopped.

SLEEP mode can be exited by an interrupt (IRQ or on-chip devices), WDT reset or a poweron reset via the RESETP pin.

5.4 Reset Control Module

5.4.1 Register Description

All RCM register 32bit access address is physical address.

Name	description	RW	Initial Value	Address	Access Size
RSR	Reset Status Register	RW	0x????????	0x10000008	32

5.4.1.1 Reset Status Register (RSR)

The Reset Status Register (RSR) is a 32-bit read/write register which records last cause of reset. Each RSR bit is set by a different source of reset. Please refer to Reset Sequence Control for reset sources description.

RSR **0x10000008**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Reserved																														WR	PR
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	?	?	?

Bits	Name	Description	RW
31:2	Reserved	Writes to these bits have no effect and always read as 0	R
1	WR	WDT Reset. When a WDT reset is detected, WR is set and remains set until software clears it or another reset occurs. This bit can only be written with 0. Write with 1 will be ignored 0: WDT reset has not occurred since the last time the software clears this bit 1: WDT reset has occurred since the last time the software clears this bit	RW
0	PR	Power On Reset. When a poweron reset via PRESET pin is detected, PR is set and remains set until software clears it or another reset occurs. This bit can only be written with 0. Write with 1 is ignored 0: Power on reset has not occurred since the last time the software clears this bit 1: Power on reset has occurred since the last time the software clears this bit	RW

5.4.2 Power On Reset

Power on reset is generated when PRESET pin is driven to low. Internal reset is asserted immediately. All pins return to their reset states.

PRESET pin must be held low until power stabilizes and the 12MHz oscillator stabilize. CPU and peripherals are clocked by 12MHz oscillator output directly. PLL is reset to off state. All internal modules are initialized to their predefined reset states.

5.4.3 WDT Reset

WDT reset is generated when WDT overflow. Internal reset is asserted within two RTCCLK cycles. All pins return to their reset states.

Then WDT reset source is cleared because of internal reset. The internal reset is asserted for about 10 milliseconds. CPU and peripherals are clocked by 12MHz oscillator output directly. PLL is reset to off state.

6 Real-Time Clock (RTC)

6.1 Overview

The Real-Time Clock (RTC) unit can be operated in either chip main power is on or the main power is down but the RTC power is still on. In this case, the RTC power domain consumes only a few micro watts power.

The RTC contains a 32768Hz oscillator, the real time and alarm logic, and the power down and wakeup control logic

6.1.1 Features

RTC module has following features:

- Embedded 32768Hz oscillator for 32k clock generation with an external 32k crystal
- 32-bits second counter
- Programmable and adjustable counter to generate accurate 1 Hz clock
- Alarm interrupt, 1Hz interrupt
- Stand alone power supply, work in hibernating mode
- Power down controller
- Alarm wakeup
- External pin wakeup with up to 2s glitch filter

6.1.2 Signal Descriptions

RTC has 5 signal IO pins and 1 power pin. They are listed and described in.

Pin Names	Pin Loc	IO	IO Cell Char.	Pin Description	Power
RTCLK		AI	32768Hz	RTCLK: 32768 clock input or OSC input	VDD$_{RTC}$
RTCLKO		AO		RTCLKO: OSC output	VDD$_{RTC}$
PWRON_		AO	~2mA, Open-Draw	PWRON_: Power on/off control of main power	VDD$_{RTC}$
WKUP_ PD29		AI AI	Schmitt	WKUP_: Wake signal after main power down PD29: GPIO group D bit 29, input/interrupt only	VDD$_{RTC}$
PPRST_		AI	Schmitt	PPRST_: RTC power on reset and RESET-KEY reset input	VDD$_{RTC}$
VDDRTC		P		VDDRTC: 3.3V power for RTC and hibernating mode controlling that never power down	-

- **RTCLK/RTCLKO** pins. We have an embedded oscillator for 32768Hz crystal. These two pins are the crystal XTALI and XTALO connection pins. If an input clock is used instead, please input it to RTCLKO pin.

- **PWRON_** pin: this pin is used to control the main power on/off. Output low voltage means on and high-Z means off.
- **WKUP_** pin: hibernating mode wakeup input
- **PPRST_** pin: This pin should be set to low voltage only in two cases

  (1) When RTC power is turned on (so that whole chip is power on)

  (2) A RESET-KEY is pressed

  Don't set this pin to low voltage when wakeup from hibernating mode. When entering/exiting to/from hibernating mode (in another word, in main power up/down procedure), please avoid putting both WKUP_ and PPRST_ in low voltage. Because the RTC registers, for instance, the second counter and others may be changed.

6.2 Register Description

Table 6-1 Registers for real time clock

Name	Description	RW	Reset Value	Address	Access Size
RTCCR	RTC Control Register	RW	0x00000081[1][2]	0x10003000	32
RTCSR	RTC Second Register	RW	0x????????	0x10003004	32
RTCSAR	RTC Second Alarm Register	RW	0x????????	0x10003008	32
RTCGR	RTC Regulator Register	RW	0x0???????	0x1000300C	32

Note:

1. Unless otherwise stated, the reset value is for PPRST_ and Hibernating wakeup reset. WDT reset doesn't change the value.
2. The reset value can be either of 0x00000081, 0x00000091, 0x00000089, 0x00000099

Table 6-2 Registers for hibernating mode

Name	Description	RW	Reset Value	Address	Access Size
HCR	Hibernate Control Register	RW	0x00000000[1]	0x10003020	32
HWFCR	Wakeup filter counter Register in Hibernate mode	RW	0x0000???0	0x10003024	32
HRCR	Hibernate reset counter Register in Hibernate mode	RW	0x00000??0	0x10003028	32
HWCR	Wakeup control Register in Hibernate mode	RW	0x00000000[1]	0x1000302C	32
HWRSR	Wakeup Status Register in Hibernate mode	RW	0x00000000[1]	0x10003030	32
HSPR	Scratch pattern register	RW	0x????????	0x10003034	32

Note: 1. Unless otherwise stated, the reset value is for PPRST_ and Hibernating wakeup reset. WDT reset doesn't change the value.

All these registers, include those for real time clock and for hibernating mode control, except otherwise stated, are implemented in 32k clock domain. When write to these registers, it needs about 35 ~ 65 us to actually change the register's value and allow the next write access. A bit RTCCR.WRDY is used to indicate it. When RCR.WRDY is 1, it means the previous write is finished, a right value can be read from the target register, and a new write access can be issued. So before any write access, please make sure RCR.WRDY = 1.

6.2.1 RTC Control Register (RTCCR)

RTCCR contains bits to configure the real time clock features. Unless otherwise stated, the reset value is for PPRST_ and Hibernating wakeup reset. WDT reset doesn't change the value.

RTCCR **0x10003000**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Reserved																								WRDY	1HZ	1HZIE	AF	AIE	AE	Reserved	RTCE
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1[1]	0[1]	0[1]	?	?	0	0	1

Note: 1. These bits are reset in all resets: PPRST_ input pin reset, hibernating reset and WDT reset.

Bits	Name	Description	RW
31:7	Reserved	Writes to these bits have no effect and always read as 0	R
7	WRDY	Write ready flag. It is 0 when a write is currently processing and the value has not been written to the writing target register. No write to any RTC registers can be issued in this case, or the result is undefined. The read value from the target register is also undefined. The reading is meaningful and another write can be issued when it is 1. Please reference to descriptions in 6.2 for some more details. This bit is read only and write to it is ignored.	R
6	1HZ	1Hz flag. This bit is set by hardware once every 1 second through the 1Hz pulse if the real time clock is enabled (RTCCR.RTCE = 1). This bit can be cleared by software. Write 1 to this bit is ignored. Writing to this bit takes effect immediately without delay.	RW
5	1HZIE	1Hz interrupt enable. Writing to this bit takes effect immediately without delay. **1HZIE** / **Description** 0 / 1Hz interrupt is disabled 1 / 1Hz interrupt is enabled. RTC issues interrupt when 1HZ bit is set	RW
4	AF	Alarm flag. This bit is set by hardware when alarm match (RTCSR = RTCSAR) is found and alarm is enabled (RTCCR.AE = 1) and the real time clock is enabled (RTCCR.RTCE = 1). This bit can be cleared by software. Write 1 to this bit is ignored. Writing to this bit takes effect immediately.	RW
3	AIE	Alarm interrupt enable. **AIE** / **Description** 0 / Alarm interrupt is disabled 1 / Alarm interrupt is enabled. RTC issues interrupt when AF is set	RW

<table>
<tr><td>2</td><td>AE</td><td>Alarm enable.<table><tr><th>AE</th><th>Description</th></tr><tr><td>0</td><td>Alarm function is disabled</td></tr><tr><td>1</td><td>Alarm function is enabled</td></tr></table></td><td>RW</td></tr>

</table>

6.2.2 RTC Second Register (RTCSR)

RTCSR is a 32-bit width second counter. It can be read and write by software. It is increased by 1 at every 1Hz pulse if the real time clock is enabled (RTCCR.RTCE = 1). When read, it should be read continued more than once and take the value if the adjacent results are the same. RTCSR is not initialized by any reset.

RTCSR **0x10003004**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

6.2.3 RTC Second Alarm Register (RTCSAR)

RTCSAR serves as a second alarm register. Alarm flag (RTCCR.AF) is set to 1 when the RTCSR equals the RTCSAR in the condition of alarm is enabled (RTCCR.AE = 1) and the real time clock is enabled (RTCCR.RTCE = 1). RTCSAR can be read and write by software and is not initialized by any reset.

RTCSAR **0x10003008**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	?	?	?	?	?	?	?	0	0	0	0	0

Bits	Name	Description	RW
31:12	Reserved	Writes to these bits have no effect and always read as 0	R
11:5	HRCR	HIBERNATE Reset waiting time. Number of 32 RTCLK cycles. Maximum 125 ms	RW
4:0	Reserved	Writes to these bits have no effect and always read as 0	R

6.2.8 HIBERNATE Wakeup Control Register (HWCR)

The HIBERNATE Wakeup Control Register is a 32-bit read/write register that controls real time clock alarm wake up enable. The reset value is for PPRST_ and Hibernating wakeup reset. WDT reset doesn't change the value.

HWCR **0x1000302C**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Reserved																															EALM
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Name	Description	RW
31:1	Reserved	Writes to these bits have no effect and always read as 0	R
0	EALM	RTC Alarm wakeup enable 0: disable 1: enable	RW

6.2.9 HIBERNATE Wakeup Status Register (HWRSR)

The HIBERNATE Wakeup Status Register is a 32-bit read/write register that reflects wakeup status bits.

HWRSR **0x10003030**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Reserved																										HR	PPR	Reserved		PIN	ALM

Bits	**Name**	**Description**	**RW**
31:0	PAT	The pattern	RW

6.3 Time Regulation

Because of the inherent inaccuracy of crystal and other variables, the time counter may be inaccurate. This requires a slight adjustment. The application processor, through the RTCGR, lets you adjust the 1Hz time base to an error of less than 1ppm. Such that if the Hz clock were set to be 1Hz, there would be an error of less than 5 seconds per month.

To determine the value programmed into the RTCGR, you must first measure the output frequency at the oscillator multiplex (approximately 32 kHz) using an accurate time base, such as a frequency counter. This clock is externally visible by selecting the alternate function of GPIO[?]
To gain access to the clock, program this pin as an output and then switch to the alternate function. To trim the clock, divide the output of the oscillator by an integer value and fractional adjust it by periodically deleting clocks from the stream driving this integer divider.

After the true frequency of the oscillator is known, it must be split into integer and fractional portions. The integer portion of the value (minus one) is loaded into the DIV field of the RTCGR.

The fractional part of the adjustment is done by periodically deleting clocks from the clock stream driving the Hz divider. The trim interval period is hardwired to be 1024 1Hz clock cycles (approximately 17 minutes). The number of clocks (represented by ADC field of RTCGR) are deleted from the input clock stream per trim interval. If ADC is programmed to be zero, then no trim operations occur and the RTC is clocked with the raw 32 kHz clock. The relationship between the Hz clock frequency and the nominal 32 kHz clock (f1 and f32K, respectively) is shown in the following equation.

$$\mathrm{f1} = \frac{2\text{^}10 \times (\mathrm{DIV} + 1)}{2\text{^}10 \times (\mathrm{DIV} + 1) + \mathrm{ADC}} \times \frac{\mathrm{f32k}}{\mathrm{DIV} + 1}$$

f1 = actual frequency of 1Hz clock
f32k = frequency of either 32.768KHz crystal output or 3.6864MHz crystal output further divided down to 32.914KHz

6.3.1 HIBERNATE Mode

When Software writes 1 to PD bit of HCR, the system at once enters HIBERNATE mode. The powers of CORE and IO are disconnected by PWRON_ pin, no power consumption to core and IO. When a wakeup event occurs, the core enters through a hibernate reset. Only CPM wake up logic and RTC is operating in HIBERNATE mode.

6.3.1.1 Procedure to Enter HIBERNATE mode

Before enter HIBERNATE mode, software must complete following steps:

- Finish the current operation and preserve all data to flash
- Configure the wake-up sources properly by configure HWCSR
- Set HIBERNATE MODE (Set PD bit in HCR to 1.)

6.3.1.2 Procedure to Wake-up from HIBERNATE mode

- The internal hibernate reset signal will be asserted if one of the wake-up sources is issued.
- Check RSR to determine what caused the reset
- Check PIN/ALM bits of HWCSR in order to know whether or not the power-up is caused by which wake-up from HIBERNATE mode.
- Configure the SDRAM memory controller.
- Recover the data from flash

7 Interrupt Controller

7.1 Overview

This chapter describes the interrupt controller included in the JZ4XX Processor, explains its modes of operation, and defines its registers. The interrupt controller controls the interrupt sources available to the processor and contains the location of the interrupt source to allow software to determine source of all interrupts. It also determines whether the interrupts cause an IRQ to occur and masks the interrupts.

Features:

- Total 32 interrupt sources
- Each interrupt source can be independently enabled
- Priority mechanism to indicate highest priority interrupt
- All the registers are accessed by CPU.
- Unmasked interrupts can wake up the chip in sleep mode.

7.2 Register Description

Table 7-1 INTC Register lists the registers of Interrupt Controller. All of these registers are 32bit, and each bit of the register represents or controls one interrupt source that list in Table 7-1 INTC Register.

All INTC register 32bit access address is physical address.

Name	Description	RW	Reset Value	Address	Access Size
ICSR	Interrupt controller Source Register	R	0x00000000	0x10001000	32
ICMR	Interrupt controller Mask Register	RW	0xFFFFFFFF	0x10001004	32
ICMSR	Interrupt controller Mask Set Register	W	0x????????	0x10001008	32
ICMCR	Interrupt controller Mask Clear Register	W	0x????????	0x1000100C	32
ICPR	Interrupt controller Pending Register	R	0x00000000	0x10001010	32

Table 7-1 INTC Register

7.2.1 Interrupt Controller Source Register (ICSR)

This register contains all the interrupts' status. A "1" indicates that the corresponding interrupt is pending . A "0" indicates that the interrupt is not pending now. The register is read only.

ICSR **0x10001000**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits Of ICSR	Description
0	The corresponding interrupt source is not pending
1	The corresponding interrupt source is pending

7.2.2 Interrupt Controller Mask Register (ICMR)

This register is used to mask the interrupt input sources and defines which active sources are allowed to generate interrupt requests to the processor. Its value can be changed either by writing ICMSR and ICMCR or by writing itself. The masked interrupts are invisible to the processor.

ICMR **0x10001004**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits Of ICMSR	Description
0	ignore
1	Will set the corresponding interrupt mask bit

7.2.4 Interrupt Controller Mask Clear Register (ICMCR)

This register is used to clear bits in the interrupt mask register. This register is write only.

ICMCR **0x1000100C**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Reserved	LCD	IPU	GPIO0	GPIO1	GPIO2	GPIO3	UDC	TCU0	TCU1	TCU2	DMA	Reserved	AIC	CIM	SSI	RTC	MSC	Reserved	SADC	Reserved	Reserved	UART0	Reserved	Reserved	Reserved	Reserved	Reserved	UHC	EMC	I2C	Reserved
RST	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?

Bits Of ICMCR	Description
0	ignore
1	Will clear the corresponding interrupt mask bit

7.2.5 Interrupt Controller Pending Register (ICPR)

This register contains the status of the interrupt sources after masking. This register is read only.

ICPR **0x10001010**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Reserved	LCD	IPU	GPIO0	GPIO1	GPIO2	GPIO3	UDC	TCU0	TCU1	TCU2	DMA	Reserved	AIC	CIM	SSI	RTC	MSC	Reserved	SADC	Reserved	Reserved	UART0	Reserved	Reserved	Reserved	Reserved	Reserved	UHC	EMC	I2C	Reserved
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits Of ICPR	Description
0	The corresponding interrupt is not active or is masked
1	The corresponding interrupt is active and is not masked to the processor.

Note: Reserved bits in ICMR, ICMSR and ICMCR are normal bits to be written into and read out. Reserved bits in ICSR and ICPR are read-only and always 0.

7.3 Software Considerations

The interrupt controller is reflecting the status of interrupts sources in the peripheral .

Software should perform the task - determine the interrupt source from in ICPR. In this chip, pending interrupts have two levels in structure. Interrupting module in the system that contains more than one interrupt sources need software to determine how to service it by reading interrupt status registers within it.

In the interrupt handler, the serviced interrupt source needs to be cleared in the interrupting device. In order to make certain the cleared source request status has been reflected at the corresponding ICPR bit, software should wait enough time before exiting interrupt state.

The procedure is described following:

1. Interrupt generated.
2. CPU query interrupt sources, saves the current environment and then goes to interrupt common service routine.
3. Get ICPR.
4. Find the highest priority interrupt and vector it. (The software decides which one has the highest priority).
5. Mask the chosen interrupt by writing the register ICMSR.
6. Enable the system interrupt to allow the interrupt nesting.(software decided)
7. Execute the interrupt handler and unmask it by writing the register ICMCR when exit the handler.
8. CPU restores the saved environment and exit the interrupt state.

8 Timer/Counter Unit

8.1 Overview

The TCU (Timer/Counter with PWM output) contains 8 channels of 16-bit programmable timers (timers 0 to 7). They can be used as Timer or PWM.

TCU has the following features:

- Six independent channels, each consisting of
  - — Counter
  - — Data register (FULL and HALF)
  - — Control register
- Independent clock for each counter, selectable by software
  - — PCLK, EXTAL and RTCCLK can be used as the clock for counter
  - — The division ratio of the clock can be set to 1, 4, 16, 64, 256 and 1024 by software
- FULL interrupt and HALF interrupt can be generated for each channel using the compare data registers
  - — Timer 0 and Timer 1 have separated interrupt.
  - — Timer 2-7 has one interrupt in common.
  - — Timer 0-7 can be used as PWM (Set the initial signal level)

8.2 Pin Description

Table 8-1 PWM Pins Description

Name	I/O	Description
PWM [7:0]	Output	PWM channel output signals.

8.3 Register Description

In this section, we will describe the registers in timer. Following table lists all the registers definition. All timer register's 32bit address is physical address. And detailed function of each register will be described below.

Name	Description	RW	Reset Value	Address	Access Size
TSR	Timer STOP Register	R	0x00	0x1000201C	8
TSSR	Timer STOP Set Register	W	0x00	0x1000202C	8
TSCR	Timer STOP Clear Register	W	0x00	0x1000203C	8
TER	Timer Counter Enable Register	R	0x00	0x10002010	8
TESR	Timer Counter Enable Set Register	W	0x??	0x10002014	8
TECR	Timer Counter Enable Clear Register	W	0x??	0x10002018	8

TCSR7	Timer Control Register 7	RW	0x0000	0x100020BC	16

8.3.1 Timer Control Register (TCSR)

The TCSR is a 16-bit read/write register. It contains the control bits for each channel. It is initialized to 0x00 by any reset.

TCSR0, TCSR1, TCSR2, TCSR3, TCSR4, TCSR5, TCSR6, TCSR7 — **0x1000204C, 0x1000205C, 0x1000206C, 0x1000207C, 0x1000208C, 0x1000209C, 0x100020AC, 0x100020BC**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Reserved						SD	INITL	PWM_EN	Reserved	PRESCALE			EXT_EN	RTC_EN	PCK_EN
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Name	Description	RW
15:10	Reserved	These bits always read 0, and written are ignored.	R
9	SD	Shut Down (SD) the PWM output. 0: Graceful shutdown 1: Abrupt shutdown Graceful shutdown: The output level for PWM output will keep the level after the comparison match of FULL. Abrupt shutdown: The output level for PWM output will keep the level.	RW
8	INITL	Selects an initial output level for PWM output. 1: High 0: Low	RW
7	PWM_EN	PWM output pin control bit 1: PWM pin output enable 0: PWM pin output disable, and the PWM pin will be set to the initial level according to INITL.	RW
6	Reserved	These bits always read 0, and written are ignored.	R
5:3	PRESCALE	These bits select the TCNT count clock frequency. Don't change this field when the channel is running	RW

Bit 2	Bit1	Bit 0	Description
0	0	0	Internal clock: CLK/1
0	0	1	Internal clock: CLK/4
0	1	0	Internal clock: CLK/16

<table>
<tr><td></td><td></td><td><table><tr><td>0</td><td>1</td><td>1</td><td>Internal clock: CLK/64</td></tr><tr><td>1</td><td>0</td><td>0</td><td>Internal clock: CLK/256</td></tr><tr><td>1</td><td>0</td><td>1</td><td>Internal clock: CLK/1024</td></tr><tr><td colspan="3">110~111</td><td>Reserved</td></tr></table></td><td></td></tr>
<tr><td>2</td><td>EXT_EN</td><td>Select EXTAL as the timer clock input.
1: Enable
0: Disable</td><td>RW</td></tr>
<tr><td>1</td><td>RTC_EN</td><td>Select RTCCLK as the timer clock input.
1: Enable
0: Disable</td><td>RW</td></tr>
<tr><td>0</td><td>PCK_EN</td><td>Select PCLK as the timer clock input.
1: Enable
0: Disable</td><td>RW</td></tr>
</table>

Note:

The input clock of timer and the PCLK should keep to the rules as follows:

Input clock of timer: IN_CLK	**Clock generated from the frequency divider (PRESCALE): DIV_CLK**
PCK_EN == 0, RTC_EN == 1 and EXT_EN == 0 (IN_CLK = RTCCLK)	$f_{DIV\_CLK} < ½ f_{PCLK}$
PCK_EN == 0, RTC_EN == 0 and EXT_EN == 1 (IN_CLK = EXTAL)	$f_{DIV\_CLK} < ½ f_{PCLK}$
PCK_EN == 1, RTC_EN == 0 and EXT_EN == 0 (IN_CLK = PCLK)	ANY

8.3.2 Timer Data FULL Register (TDFR)

The comparison data FULL registers TDFR is used to store the data to be compared with the content of the up-counter TCNT. This register can be directly read and written. (Default: indeterminate)

TDFR0, TDFR1, TDFR2,	**0x10002040, 0x10002050, 0x10002060,**
TDFR3, TDFR4, TDFR5,	**0x10002070, 0x10002080, 0x10002090,**
TDFR6, TDFR7	**0x100020A0, 0x100020B0**

Bit		15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
		TDFR															
RST		?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?

8.3.3 Timer Data HALF Register (TDHR)

The comparison data HALF registers TDHR is used to store the data to be compared with the content of the up-counter TCNT. This register can be directly read and written. (Default: indeterminate)

TDHR0, TDHR1, TDHR2, **0x10002044, 0x10002054, 0x10002064,**
TDHR3, TDHR4, TDHR5, **0x10002074, 0x10002084, 0x10002094,**
TDHR6, TDHR7 **0x100020A4, 0x100020B4**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TDHR															
RST	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?

8.3.4 Timer Counter (TCNT)

TCNT is a 16-bit read/write register. The up-counter TCNT can be reset to 0 by software and counts up using the prescaler output clock. When TCNT count up to equal to TDFR, it will reset to 0 and continue to count up. The data can be read out at any time. The counter data can be written at any time. This makes it possible to change the interrupt and/or clock output cycles temporarily. (Default: indeterminate)

TCNT0, TCNT1, TCNT2, **0x10002048, 0x10002058, 0x10002068,**
TCNT3, TCNT4, TCNT5, **0x10002078, 0x10002088, 0x10002098,**
TCNT6, TCNT7 **0x100020A8, 0x100020B8**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TCNT															
RST	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?

8.3.5 Timer Counter Enable Register (TER)

The TER is an 8-bit read-only register. It contains the counter enable control bits for each channel. It is initialized to 0x00 by any reset. It can only be set by register TESR and TECR. Since the timer enable control bits are located in the same addresses, two or more timers can be started at the same time.

TER **0x10002010**

Bit	7	6	5	4	3	2	1	0

		TCEN 7	TCEN 6	TCEN 5	TCEN 4	TCEN 3	TCEN 2	TCEN 1	TCEN 0
RST		0	0	0	0	0	0	0	0

Bits	Name	Description	RW
7	TCEN 7	Enable the counter in timer 7. 1: Begin counting up 0: Stop counting up	R
6	TCEN 6	Enable the counter in timer 6. 1: Begin counting up 0: Stop counting up	R
5	TCEN 5	Enable the counter in timer 5. 1: Begin counting up 0: Stop counting up	R
4	TCEN 4	Enable the counter in timer 4. 1: Begin counting up 0: Stop counting up	R
3	TCEN 3	Enable the counter in timer 3. 1: Begin counting up 0: Stop counting up	R
2	TCEN 2	Enable the counter in timer 2. 1: Begin counting up 0: Stop counting up	R
1	TCEN 1	Enable the counter in timer 1. 1: Begin counting up 0: Stop counting up	R
0	TCEN 0	Enable the counter in timer 0. 1: Begin counting up 0: Stop counting up	R

8.3.6 Timer Counter Enable Set Register (TESR)

The TCCSR is an 8-bit write-only register. It contains the counter enable set bits for each channel. Since the timer enable control set bits are located in the same addresses, two or more timers can be started at the same time.

TESR **0x10002014**

Bit		7	6	5	4	3	2	1	0

		TCST 7	TCST 6	TCST 5	TCST 4	TCST 3	TCST 2	TCST 1	TCST 0
RST		?	?	?	?	?	?	?	?

Bits	Name	Description	RW
7	TCST 7	Set TCEN 7 bit of TER. 1: Set TCEN 7 bit to 1 0: Ignore	W
6	TCST 6	Set TCEN 6 bit of TER. 1: Set TCEN 6 bit to 1 0: Ignore	W
5	TCST 5	Set TCEN 5 bit of TER. 1: Set TCEN 5 bit to 1 0: Ignore	W
4	TCST 4	Set TCEN 4 bit of TER. 1: Set TCEN 4 bit to 1 0: Ignore	W
3	TCST 3	Set TCEN 3 bit of TER. 1: Set TCEN 3 bit to 1 0: Ignore	W
2	TCST 2	Set TCEN 2 bit of TER. 1: Set TCEN 2 bit to 1 0: Ignore	W
1	TCST 1	Set TCEN 1 bit of TER. 1: Set TCEN 1 bit to 1 0: Ignore	W
0	TCST 0	Set TCEN 0 bit of TER. 1: Set TCEN 0 bit to 1 0: Ignore	W

8.3.7 Timer Counter Enable Clear Register (TECR)

The TECR is an 8-bit write-only register. It contains the counter enable clear bits for each channel. Since the timer enable clear bits are located in the same addresses, two or more timers can be stop at the same time.

TECR **0x10002018**

Bit		7	6	5	4	3	2	1	0

	TCCL 7	TCCL 6	TCCL 5	TCCL 4	TCCL 3	TCCL 2	TCCL 1	TCCL 0
RST	?	?	?	?	?	?	?	?

Bits	Name	Description	RW

8.3.15 Timer Stop Set Register (TSSR)

The TCSR is an 8-bit write-only register. It contains the timer stop set bits for each channel and WDT timer. Since the timer stop control set bits are located in the same addresses, two or more timers can be started at the same time.

TSSR **0x1000202C**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

1	STPC 1	Set STOP 1 bit of TSR. 1: Set STOP 1 bit to 0 0: Ignore	W
0	STPC 0	Set STOP 0 bit of TSR. 1: Set STOP 0 bit to 0 0: Ignore	W

8.4 Operation

8.4.1 Basic Operation

The value of TDFR should be bigger than TDHR, and the minimum settings are TDHR = 0 and TDFR = 1. In this case, the timer output clock cycle is the input clock × 1/2. If TDHR > TDFR, no comparison TFHR signal is generated.

Before the timer counter begin to count up, we need to do as follows:
If you want to use PWM you should keep TCSR.PWM_EN to be 0 before you initial TCU.

1. Setting TCSR.
   (1) Writing TCSR.INITL to initialize PWM output level.
   (2) Writing TCSR.SD to setting the shutdown mode (Abrupt shutdown or Graceful shutdown).
   (3) Writing TCSR.PRESCALE to set TCNT count clock frequency.

2. Setting TCNT, TDHR and TDFR.

3. Setting TCSR.

(1) Writing TCSR.PWM_EN to set whether enable PWM or disable PWM.
(2) Writing TCSR.EXT_EN, TCSR.RTC_EN or TCSR.PCK_EN to 1 to select the input clock and enable the input clock. Only one of TCSR.EXT_EN, TCSR.RTC_EN and TCSR.PCK_EN can be set to 1.

After initialize the register of timer, we should start the counter as follows:

4. Setting the TESR.TCST bit to 1 to enable the TCNT.

Note: The input clock and PCLK should follows the rules advanced before.

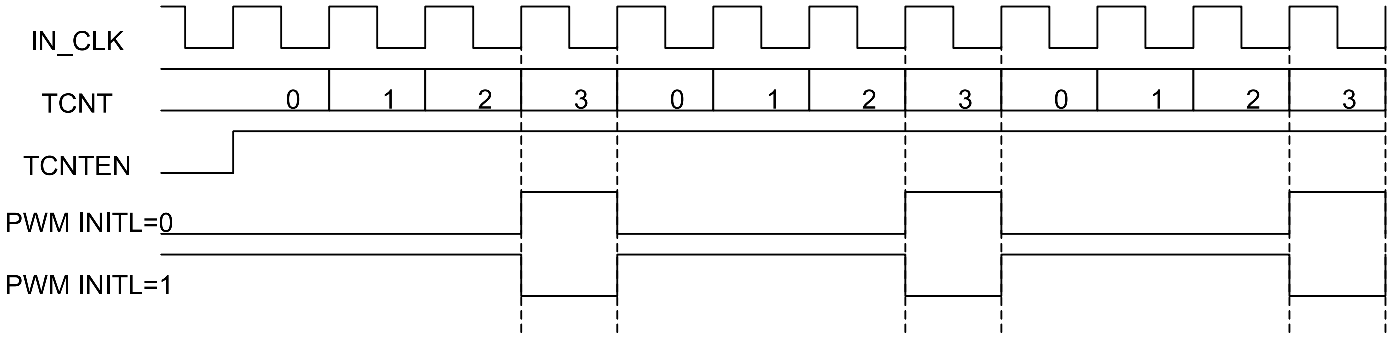
8.4.2 Disable and Shutdown Operation

Setting the TECR.TCCL bit to 1 to disable the TCNT.

8.4.3 Pulse Width Modulator (PWM)

Timer 0~7 can be used as Pulse Width Modulator (PWM). The PWM can be used to control the back light inverter or adjust bright or contrast of LCD panel.

FULL comparison match signal and HALF comparison match signal can determine an attribute of the PWM_OUT waveform. FULL comparison match signal specifies the clock cycle for the PWM module clock. HALF comparison match signal specifies the duty ratio for the PWM module clock.



8.4.4 The flow of using TCU5

Here is the basic flow of using TCU5

Step 1: make sure the counter clock is stop
Set TMR.FMASK5 = 1, TMR.HMASK5 = 1; TCSR5.PRESCALE = 0;
TCSR5.RTC_EN = 0, TCSR5.EXT_EN = 0, TCSR5.PCK_EN = 0;

Step 2: Initial TDFR5 and TDHR5. These registers must be initialed in case of the counter clock is stopped. Only abrupt shutdown mode can be used, which needs set TCSR5.SD to 1. To use PWM output, set TCSR5.INITL to choose start level

Step 3: Initial TCNT5 in case of select and enable pclk without dividing as the counter clock

TCSR5.RTC_EN = 0, TCSR5.EXT_EN = 0, TCSR5.PCK_EN = 1, TCSR5.PRESCALE = 0

Step4: If PWM5 is used, set TCSR5.PWM_EN = 1, in the same condition of above

Step 5: stop the pclk as counter clock by, set TCSR5.PCK_EN = 0

Step 6: set clock divider parameter TCSR.PRESCALE

Step 7: enable the selected clock by set one of TCSR.RTC_EN, TCSR.EXT_EN or TCSR.PCK_EN to 1

Step 8: start counter by write 1 to TESR.TCST5 and enable the corresponding interrupt if needed

Step 9: after counter matching interrupt, please do

- Stop counter by write 1 to TESR.TCCL5
- Disable the selected counter clock by clear the TCSR.RTC_EN, TCSR.EXT_EN or TCSR.PCK_EN
- Disable more interrupt by change TDFR or TDHR to make them not equal to TCNT
- Clear interrupt flag

Note: In TCU5, in any case, if TDFR or TDHR is equal to TCNT, the interrupt flag will be set.

9 Watchdog Timer

9.1 Overview

The watchdog timer is used to resume the controller operation whenever it is disturbed by malfunctions such as noise and system errors. The watchdog timer can generate the reset signal.

Features:

- Generates WDT reset.
- A 16-bit Data register and a 16-bit counter.
- Counter clock uses the input clock selected by software.
  - — PCLK, EXTAL and RTCCLK can be used as the clock for counter
  - — The division ratio of the clock can be set to 1, 4, 16, 64, 256 and 1024 by software

9.2 Register Description

In this section, we will describe the registers in WDT. Following table lists all the registers definition. All WDT register's 32bit address is physical address. And detailed function of each register will be described below.

Name	Description	RW	Reset Value	Address	Access Size
TDR	Watchdog Timer Data Register	RW	0x????	0x10002000	16
TCER	Watchdog Counter Enable Register	RW	0x00	0x10002004	8
TCNT	Watchdog Timer Counter	RW	0x????	0x10002008	16
TCSR	Watchdog Timer Control Register	RW	0x0000	0x1000200C	16

9.2.1 Watchdog Control Register (TCSR)

The TCSR is a 16-bit read/write register. It contains the control bits for WDT. It is initialized to 0x00 by any reset.

TCSR **0x1000200C**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Reserved										PRESCALE			EXT_EN	RTC_EN	PCK_EN
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Name	Description	RW
15:6	Reserved	These bits always read 0, and written are ignored.	R
5:3	PRESCALE	These bits select the TCNT count clock frequency.	RW

Bit 2	Bit1	Bit 0	Description
0	0	0	Internal clock: CLK/1
0	0	1	Internal clock: CLK/4
0	1	0	Internal clock: CLK/16
0	1	1	Internal clock: CLK/64
1	0	0	Internal clock: CLK/256
1	0	1	Internal clock: CLK/1024
110~111			Reserved

Bits	Name	Description	RW
2	EXT_EN	Select EXTAL as the timer clock input. 1: Enable 0: Disable	RW
1	RTC_EN	Select RTCCLK as the timer clock input.	RW

		1: Enable 0: Disable	
0	PCK_EN	Select PCLK as the timer clock input. 1: Enable 0: Disable	RW

Note:

The input clock of timer and the PCLK should keep to the rules as follows:

Input clock of timer: IN_CLK	**Clock generated from the frequency divider (PRESCALE): DIV_CLK**
PCK_EN == 0, RTC_EN == 1 and EXT_EN == 0 (IN_CLK = RTCCLK)	$f_{DIV\_CLK} < ½ f_{PCLK}$
PCK_EN == 0, RTC_EN == 0 and EXT_EN == 1 (IN_CLK = EXTAL)	$f_{DIV\_CLK} < ½ f_{PCLK}$
PCK_EN == 1, RTC_EN == 0 and EXT_EN == 0 (IN_CLK = PCLK)	ANY

9.2.2 Watchdog Enable Register (TCER)

The TCER is an 8-bit read/write register. It contains the counter enable control bits for watchdog. It is initialized to 0x00 by any reset.

TCER **0x10002004**

Bit	7	6	5	4	3	2	1	0
	Reserved							TCEN
RST	0	0	0	0	0	0	0	0

Bits	Name	Description	RW
7:1	Reserved	These bits always read 0, and written are ignored.	R
0	TCEN	Counter enable control. 0: Timer stop. 1: Timer running.	RW

9.2.3 Watchdog Timer Data Register (TDR)

The watchdog timer data register TDR is used to store the data to be compared with the content of the watchdog timer up-counter TCNT. This register can be directly read and written. (Default: indeterminate)

TDR **0x10002000**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TDR															
RST	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?

9.2.4 Watchdog Timer Counter (TCNT)

The watchdog timer counter (TCNT) is a 16-bit read/write counter. The up-counter TCNT can be reset to 0 by software and counts up using the prescaler output clock. When TCNT count up to equal to TDR, the comparison match signal will be generated and a WDT reset is generated. The data can be read out at any time. The counter data can be written at any time. (Default: indeterminate)

TCNT **0x10002008**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TCNT															
RST	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?

9.3 Watchdog Timer Function

The following describes steps of using WDT:

1. Setting the PRESCALE of input clock in register TCSR.
2. Set register TDR and TCNT.
3. Select the input clock and enable the input clock in register TCSR.

After initialize the register of timer, we should start the counter as follows:

4. Set TCEN bit in TCER to 1. The counter TCNT begins to count.
5. If TCNT = TDR, a WDT reset will be generated.

Note1: The input clock and PCLK should follows the rules advanced before.

Note2: The clock of WDT can be stopped by setting register TSR, and register TSR can only be set by register TSSR or TSCR. The content of register TSR, TSSR and TSCR can be found in TCU spec.

10 General-Purpose I/O Ports

10.1 Overview

General Purpose I/O Ports (GPIO) is used in generating and capturing application-specific input and output signals. Each port can be programmed as an output, an input or function port that serves certain peripheral. As input, pull up/down can be enabled/disabled for the port and the port also can be configured as level or edge tripped interrupt source.

Features:

- Each port can be configured as an input, an output or an alternate function port.
- Each port can be configured as an interrupt source of low/high level or rising/falling edge triggering. Every interrupt source can be masked independently.
- Each port has an internal pull-up or pull-down resistor connected. The pull-up/down resistor can be disabled.

The GPIO ports, named PA00~31, PB00~31, PC00~31 and PD00~31 are divided into 4 GPIO groups with maximum of 32 GPIO in each group. Group A includes PA00~PA31. Group B includes PB00~31; Group C includes PC00~PC31 and Group D include PD00~PD31. GPIO output 4 interrupts, 1 for every group, to INTC.

For every group, 23 memory-mapped 32-bit registers can be used to operate the GPIO ports:

- PAPIN, PBPIN, PCPIN, PDPIN - PORT PIN Level Register
- PADAT, PBDAT, PCDAT, PDDAT - PORT Data Register
- PADATS, PBDATS, PCDATS, PDDATS - PORT Data Set Register
- PADATC, PBDATC, PCDATC, PDDATC - PORT Data Clear Register
- PAIM, PBIM, PCIM, PDIM - PORT Interrupt Mask Register
- PAIMS, PBIMS, PCIMS, PDIMS - PORT Interrupt Mask Set Register
- PAIMC, PBIMC, PCIMC, PDIMC - PORT Interrupt Mask Clear Register
- PAPE, PBPE, PCPE, PDPE - PORT PULL Disable Register
- PAPES, PBPES, PCPES, PDPES - PORT PULL Disable Set Register
- PAPEC, PBPEC, PCPEC, PDPEC - PORT PULL Disable Clear Register
- PAFUN, PBFUN, PCFUN, PDFUN - PORT Function Register
- PAFUNS, PBFUNS, PCFUNS, PDFUNS - PORT Function Set Register
- PAFUNC, PBFUNC, PBFUNC, PDFUNC - PORT Function Clear Register
- PASEL, PBSEL, PCSEL, PDSEL - PORT Select Register
- PASELS, PBSELS, PCSELS, PDSELS - PORT Select Set Register
- PASELC, PBSELC, PCSELC, PDSELC - PORT Select Clear Register
- PADIR, PBDIR, PCDIR, PDDIR - PORT Direction Register
- PADIRS, PBDIRS, PCDIRS, PDDIRS - PORT Direction Set Register

- PADIRC, PBDIRC, PCDIRC, PDDIRC - PORT Direction Clear Register
- PATRG, PBTRG, PCTRG, PDTRG - PORT Trigger Mode Register
- PATRGS, PBTRGS, PCTRGS, PDTRGS - PORT Trigger Mode Set Register
- PATRGC, PBTRGC, PCTRGC, PDTRGC - PORT Trigger Mode Clear Register
- PAFLG, PBFLG, PCFLG, PDFLG - PORT FLAG Register

Notes:

1. PC30: GPIO group C bit 30. If NAND flash is used, this pin must be used as NAND FRB. (NAND flash ready/busy).
2. PC31: GPIO group C bit 31. No corresponding pin exists for this GPIO. It is only used to select the function between UART and JTAG, which share the same set of pins, by using register PCSEL [31]
   When PCSEL [31]=0, select JTAG function.
   When PCSEL [31]=1, select UART function
3. PD14 is output 0 during the reset (PPRST_, WDT-reset and hibernating-reset) period.
4. The input/output direction of GPD16 pin is controlled by PDDIR[15] when GPD16 is used as GPIO function
5. PD29 is only used as input and interrupt only, and with no pull-up and pull-down.
6. This GPIO pin is not available in Jz4725
7. This GPIO pin is not available in Jz4720

10.2 Register Description

Table 10-2 summarized all memory-mapped registers, which can be programmed to operate GPIO port and alternate function port sharing configuration.

All registers are in 32-bits width. Usually, 1 bit in the register affects a corresponding GPIO port and every GPIO port can be operated independently.

Table 10-2 GPIO Registers

Name	Description	RW	Reset Value	Address	Size
GPIO PORT A					
PAPIN	PORT A PIN Level Register	R	0x00000000	0x10010000	32
PADAT	PORT A Data Register	R	0x00000000	0x10010010	32
PADATS	PORT A Data Set Register	W	0x????????	0x10010014	32

Note: PX**** in the description of register as follows means PA****, PB****, PC**** and PD****.

10.2.1 PORT PIN Level Register (PAPIN, PBPIN, PCPIN, PDPIN)

PAPIN, PBPIN, PCPIN and PDPIN are four 32-bit PORT PIN level registers. They are read-only registers.

PAPIN, PBPIN, PCPIN, PDPIN **0x10010000, 0x10010100, 0x10010200, 0x10010300**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PINL31	PINL30	PINL29	PINL28	PINL27	PINL26	PINL25	PINL24	PINL23	PINL22	PINL21	PINL20	PINL19	PINL18	PINL17	PINL16	PINL15	PINL14	PINL13	PINL12	PINL11	PINL10	PINL09	PINL08	PINL07	PINL06	PINL05	PINL04	PINL03	PINL02	PINL01	PINL00
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Name	Description	R/W
n	PINL n	Where n = 0 ~ 31 and PINL n = PINL0 ~ PINL31. The PORT PIN level can be read by reading PINL n bit in register PXPIN.	R

PAPIN bits 31-0 correspond to PA31-0; PBPIN to PB31-0; PCPIN to PC31-0 and PDPIN to PD 31-0.

10.2.2 PORT Data Register (PADAT, PBDAT, PCDAT, PDDAT)

PADAT, PBDAT, PCDAT and PDDAT are four 32-bit PORT DATA registers. They are read-only registers.

PADAT, PBDAT, PCDAT, PDDAT **0x10010010, 0x10010110, 0x10010210, 0x10010310**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DATA31	DATA30	DATA29	DATA28	DATA27	DATA26	DATA25	DATA24	DATA23	DATA22	DATA21	DATA20	DATA19	DATA18	DATA17	DATA16	DATA15	DATA14	DATA13	DATA12	DATA11	DATA10	DATA09	DATA08	DATA07	DATA06	DATA05	DATA04	DATA03	DATA02	DATA01	DATA00
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Name	Description	R/W
n	DATA n	Where n = 0 ~ 31 and DATA n = DATA0 ~ DATA31. The register is used as GPIO data register. When GPIO is used as interrupt the register is no used.	R

PADAT bits 31-0 correspond to PA31-0; PBDAT to PB31-0; PCDAT to PC31-0 and PDDAT to PD 31-0.

10.2.3 PORT Data Set Register (PADATS, PBDATS, PCDATS, PDDATS)

PADATS, PBDATS, PCDATS and PDDATA are four 32-bit PORT DATA set registers. They are write-only registers.

PADATS, PBDATS, PCDATS, PDDATS **0x10010014, 0x10010114, 0x10010214, 0x10010314**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DATAS31	DATAS30	DATAS29	DATAS28	DATAS27	DATAS26	DATAS25	DATAS24	DATAS23	DATAS22	DATAS21	DATAS20	DATAS19	DATAS18	DATAS17	DATAS16	DATAS15	DATAS14	DATAS13	DATAS12	DATAS11	DATAS10	DATAS09	DATAS08	DATAS07	DATAS06	DATAS05	DATAS04	DATAS03	DATAS02	DATAS01	DATAS00
RST	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?

Bits	Name	Description	R/W
n	DATAS n	Writing 1 to DATAS n will set DATA n to 1 in register PXDAT. Writing 0 to DATAS n will no use.	W

PADATS bits 31-0 correspond to PA31-0; PBDATS to PB31-0; PCDATS to PC31-0 and PDDATS to PD 31-0.

10.2.4 PORT Data Clear Register (PADATC, PBDATC, PCDATC, PDDATC)

PADATC, PBDATC, PCDATC and PDDATC are four 32-bit PORT DATA clear registers. They are write-only registers.

PADATC, PBDATC, PCDATC, PDDATC **0x10010018, 0x10010118, 0x10010218, 0x10010318**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

RST	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?

Bits	Name	Description	R/W
n	DATAC n	Writing 1 to DATAC n will set DATA n to 0 in register PXDAT. Writing 0 to DATAC n will no use.	W

PADATC bits 31-0 correspond to PA31-0; PBDATC to PB31-0; PCDATC to PC31-0 and PDDATC to PD 31-0.

10.2.5 PORT Mask Register (PAIM, PBIM, PCIM, PDIM)

PAIM, PBIM, PCIM and PDIM are four 32-bit PORT MASK registers. They are read-only registers.

PAIM, PBIM, PCIM, PDIM **0x10010020, 0x10010120, 0x10010220, 0x10010320**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MASK31	MASK30	MASK29	MASK28	MASK27	MASK26	MASK25	MASK24	MASK23	MASK22	MASK21	MASK20	MASK19	MASK18	MASK17	MASK16	MASK15	MASK14	MASK13	MASK12	MASK11	MASK10	MASK09	MASK08	MASK07	MASK06	MASK05	MASK04	MASK03	MASK02	MASK01	MASK00
RST	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bits	Name	Description	R/W
n	MASK n	Where n = 0 ~ 31 and MASK n = MASK0 ~ MASK31. MASK n is used for mask the interrupt of GPIO n. 0: Enable the pin as an interrupt source. 1: Disable the pin as an interrupt source.	R

PAIM bits 31-0 correspond to PA31-0; PBIM to PB31-0; PCIM to PC31-0 and PDIM to PD 31-0.

10.2.6 PORT Mask Set Register (PAIMS, PBIMS, PCIMS, PDIMS)

PAIMS, PBIMS, PCIMS and PIMS are four 32-bit PORT MASK set registers. They are write-only registers.

PAIMS, PBIMS, PCIMS, PDIMS **0x10010024, 0x10010124, 0x10010224, 0x10010324**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MASKS31	MASKS30	MASKS29	MASKS28	MASKS27	MASKS26	MASKS25	MASKS24	MASKS23	MASKS22	MASKS21	MASKS20	MASKS19	MASKS18	MASKS17	MASKS16	MASKS15	MASKS14	MASKS13	MASKS12	MASKS11	MASKS10	MASKS09	MASKS08	MASKS07	MASKS06	MASKS05	MASKS04	MASKS03	MASKS02	MASKS01	MASKS00
RST	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?

Bits	Name	Description	R/W
n	MASKS n	Writing 1 to MASKS n will set MASK n to 1 in register PXIM. Writing 0 to MASKS n will no use.	W

PAIMS bits 31-0 correspond to PA31-0; PBIMS to PB31-0; PCIMS to PC31-0 and PDIMS to PD 31-0.

10.2.7 PORT Mask Clear Register (PAIMC, GBPIMC, PCIMC, PDIMC)

PAIMC, PBIMC, PCIMC and PDIMC are four 32-bit PORT MASK clear registers. They are write-only registers.

PAIMS, PBIMC, PCIMC, PDIMC **0x10010028, 0x10010128, 0x10010228, 0x10010328**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

RST	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?

Bits	Name	Description	R/W
n	MASKC n	Writing 1 to MASKC n will set MASK n to 0 in register PXIM. Writing 0 to MASKC n will no use.	W

PAIMC bits 31-0 correspond to PA31-0; PBIMC to PB31-0; PCIMC to PC31-0 and PDIMC to PD 31-0.

10.2.8 PORT PULL Disable Register (PAPE, PBPE, PCPE, PDPE)

PAPE, PBPE, PCPE and PDPE are four 32-bit PORT PULL disable registers. They are read-only registers.

PAPE, PBPE, PCPE, PDPE **0x10010030, 0x10010130, 0x10010230, 0x10010330**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits	Name	Description	R/W
n	TRIGC n	Writing 1 to TRIGC n will set TRIG n to 0 in register PXTRG. Writing 0 to TRIGC n will no use.	W

PATRGC bits 31-0 correspond to PA31-0; PBTRGC to PB31-0; PCTRGC to PC31-0 and PDTRGC to PD 31-0.

10.2.23 PORT FLAG Register (PAFLG, PBFLG, PCFLG, PDFLG)

PAFLG, PBFLG, PCFLG and PDFLG are four 32-bit GPIO FLAG registers. They are read-only registers.

PAFLG, PBFLG, PCFLG, PDFLG **0x10010080, 0x10010180, 0x10010280, 0x10010380**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	FLAG31	FLAG30	FLAG29	FLAG28	FLAG27	FLAG26	FLAG25	FLAG24	FLAG23	FLAG22	FLAG21	FLAG20	FLAG19	FLAG18	FLAG17	FLAG16	FLAG15	FLAG14	FLAG13	FLAG12	FLAG11	FLAG10	FLAG09	FLAG08	FLAG07	FLAG06	FLAG05	FLAG04	FLAG03	FLAG02	FLAG01	FLAG00
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Name	Description	R/W
n	FLAG n	Where n = 0 ~ 31 and FLAG n = FLAG00 ~ FLAG31 FLAG n is interrupt flag bit for checking the interrupt whether to happen. When GPIO is used as interrupt function and the interrupt happened, the FLAG n in PXFLG will be set to 1.	R

PAFLG bits 31-0 correspond to PA31-0; PBFLG to PB31-0; PCFLG to PC31-0 and PDFLG to PD 31-0.

10.2.24 PORT FLAG Clear Register (PAFLGC, PBFLGC, PCFLGC, PDFLGC)

PAFLGC, PBFLGC, PCFLGC and PDFLGC are four 32-bit GPIO FLAG Clear registers. They are read-only registers.

PAFLGC, PBFLGC, PCFLGC, PDFLGC **0x10010014, 0x10010114, 0x10010214, 0x10010314**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	FLAGC31	FLAGC30	FLAGC29	FLAGC28	FLAGC27	FLAGC26	FLAGC25	FLAGC24	FLAGC23	FLAGC22	FLAGC21	FLAGC20	FLAGC19	FLAGC18	FLAGC17	FLAGC16	FLAGC15	FLAGC14	FLAGC13	FLAGC12	FLAGC11	FLAGC10	FLAGC09	FLAGC08	FLAGC07	FLAGC06	FLAGC05	FLAGC04	FLAGC03	FLAGC02	FLAGC01	FLAGC00
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Name	Description	R/W
n	FLAGC n	When GPIO is used as interrupt function and when write 1 to the bit, the bit FLAG n in PXFLG will be cleared.	R

PAFLGC bits 31-0 correspond to PA31-0; PBFLGC to PB31-0; PCFLGC to PC31-0 and PDFLGC to PD 31-0.

10.3 Program Guide

10.3.1 GPIO Function Guide

1. Set PXFUN to choose the function of GPIO / Interrupt by writing 1 to register PXFUNC.
2. Set PXSEL to choose the function of GPIO by writing 1 to register PXSELC.
3. Set PXDIR to choose the direction of GPIO by writing 1 to register PXDIRS or PXDIRC.
4. Others.

(1) You can read the PORT PIN level by reading register PXPIN.

(2) You can use register PXDAT as normal data register. The register can be set by register PXDATS and PXDATC.

(3) You can set PXPE by writing 1 to register PXPES or PXPE to use Internal pull-up/down resistor or not.

10.3.2 Alternate Function Guide

1. Set PXFUN to 0 by writing 1 to register PXFUNC. (Ready state)

2. Set PXTRG to choose the alternate function group 0 by writing 1 to register PXTRGC.
   Set PXTRG to choose the alternate function group 1 by writing 1 to register PXTRGS.

3. Set PXSEL to choose the alternate function 0 by writing 1 to register PXSELC.
   Set PXSEL to choose the alternate function 1 by writing 1 to register PXSELS.

4. Set PXFUN to choose the function of alternate function by writing 1 to register PXFUNS.

10.3.3 Interrupt Function Guide

First you should keep GPIO status.

1. Set PXIM by writing 1 to register PXIMS.

2. Set PXTRG to choose the interrupt trigger mode by writing 1 to register PXTRGS or PXTRGC.

3. Set PXFUN to choose the function of GPIO / Interrupt by writing 1 to register or PXFUNC.
4. Set PXSEL to choose the Interrupt function by writing 1 to register PXSELS.

5. Set PXDIR to choose the direction of interrupt trigger by writing 1 to register PXDIRS or PXDIRC.

6. Set the PXFLGC register to clear the interrupt flag.
7. Clear PXIM by writing 1 to register PXIMC to enable the GPIO interrupt.

8. Others.

You should check the level interrupt whether to happen as follows:

(1) When the PIN level read from register PXPIN is the same with what you have set in register PXTRG and PXDIR, then the level interrupt happened.

(2) When the PIN level read from register PXPIN is different from what you have set in register PXTRG and PXDIR, then the level interrupt did not happen.

10.3.4 Disable Interrupt Function Guide

1. Set PXIM by writing 1 to register PXIMS.

2. Set PXTRG to 0 by writing 1 to register PXTRGC.
3. Set PXDIR to 0 by writing 1 to register PXDIRC.

4. Set PXFUN to 0 by writing 1 to register or PXFUNC.
5. Set PXSEL to 0 by writing 1 to register PXSELC.

11 LCD Controller

11.1 Overview

The JZ integrated LCD controller has the capabilities to driving the latest industry standard STN and TFT LCD panels. It also supports some special TFT panels used in consuming electronic products. The controller performs the basic memory based frame buffer and palette buffer to LCD panel data transfer through use of a dedicated DMA controller. Temporal dithering (frame rate modulation) is supported for STN LCD panels.

Features:

(1) Basic Features:

- Support ITU601/656 data format.
- Single and Dual panel displays in STN mode.
- Single panel displays in TFT mode.
- Display size up to 800x600.
- Internal palette RAM 256x16 bits.

(2) Colors Supports:

- Encoded pixel data of 1, 2, 4, 8 or 16 BPP in STN mode.
- Support 2, 4, 16 grayscales and up to 4096 colors in STN mode.
- Encoded pixel data of 1, 2, 4, 8, 16, 18 or 24 BPP in TFT mode.
- Support 65,536(65K), 262,144(260K) and up to 16,777,216 (16M) colors in TFT mode.

(3) Panel Supports:

- Support 1, 2, 4, 8 data output pins in STN mode.
- Support 8-bit serial data output for 1bpp, 2bpp, 4bpp, 8bpp, 16bpp, 18bpp and 24bpp in TFT mode.
- Support 16-bit parallel data output for 1bpp, 2bpp, 4bpp, 8bpp and 16bpp in TFT mode.
- Support 18-bit parallel data output for 1bpp, 2bpp, 4bpp, 8bpp, 16bpp, 18bpp and 24bpp in TFT mode.

11.2 Pin Description

Table 11-1 LCD Controller Pins Description

Name	I/O	Description
Lcd_pclk	Input/Output	Display device pixel clock
Lcd_vsync	Input/Output	Display device vertical synchronize pulse
Lcd_hsync	Input/Output	Display device horizontal synchronize pulse
Lcd_de	Output	Display device is STN: AC BIAS Pin Display device is NOT STN: data enable Pin
Lcd_d[17:0]	Output	Display device data pins
Lcd_spl*[1]	Output	Programmable special pin for generating control signals
Lcd_cls*[1]	Output	Programmable special pin for generating control signals
Lcd_ps*[1]	Output	Programmable special pin for generating control signals
Lcd_rev*[1]	Output	Programmable special pin for generating control signals

Note1:

The mode and timing of special pin Lcd_spl, Lcd_cls, Lcd_ps and Lcd_rev can be seen in **part 1.7 LCD Controller Pin Mapping.**

Figure 11-2 Display Parameters

Note1:

VPS === 0
VSYNC pulse always start at point (0,0)

Note2:

H: Horizontal	V: Vertical	T: Total
D: Display Area	P: Pulse	
S: Start point	E: End point	

In the (H, V) Coordinates:

1. The gray rectangle (0, 0) to (HT, VT) is "Virtual Area";
2. The blue rectangle (HDS, VDS) to (HDE, VDE) is "Display Area";
3. VPS, VPE defines the VSYNC signal timing; (VPS always be zero)
4. HPS, HPE defines the HSYNC signal timing;

All timing parameters start with "H" is measured in lcd_pclk ticks.
All timing parameters start with "V" is measured in lcd_hsync ticks.

This diagram describes the general LCD panel parameters, these can be set via the registers that describes in next section.

11.5 TV Encoder Timing

Some of Video Encoders for TV (Tele Vision) require interlaced timing interface.

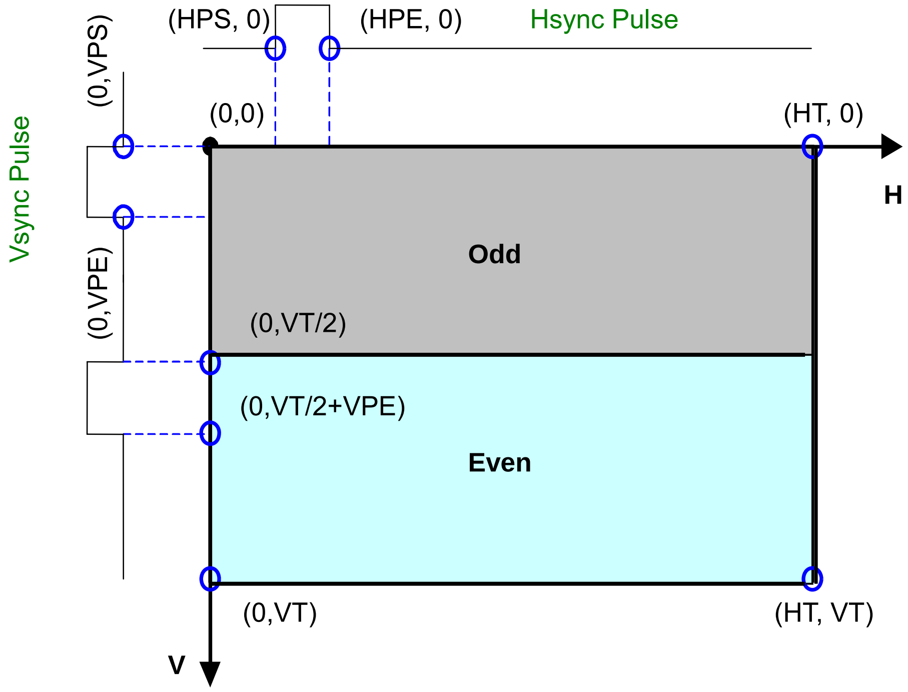

Figure 11-2 TV-Encoder Display Parameters

Note1:

Even Field contains one more blank line.

e.g. For standard PAL timing, Odd filed has 312 lines while even field has 313 lines.

Note2:

Interlace mode generate 2 vsync pulse for each field. The second vsync start at (VT/2), end at (VT/2 + VPE)

Note3:

Display Area & Virtual Area has the same size. VDS=HDS=0, VDE=VT, HDE=HT

11.6 Register Description

0	LDD	LCD disable: 0 – not been normal disabled, 1 – been normal disabled	RW

11.6.13 Interrupt ID Register (LCDIID)

LCDIID is a read-only register that contains a copy of the Frame ID register (LCDFID) from the descriptor currently being processed when a start of frame (SOF) or end of frame (EOF) interrupt is generated. LCDIID is written to only when an unmasked interrupt of the above type is signaled and there are no other unmasked interrupts in the LCD controller pending. As such, the register is considered to be sticky and will be overwritten only when the signaled interrupt is cleared by writing the LCD controller status register. For dual-panel displays, LCDIID is written only when both channels have reached a given state.

LCDIID is written with the last channel to reach that state. (i.e. LCDFID of the last channel to reach SOF would be written in LCDIID if SOF interrupts are enabled). Reserved bits must be written with zeros and reads from them must be ignored.

LCDIID **0x13050038**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	IID																															
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Name	Description	RW
31:0	IID	A copy of Frame ID register, which transferred from Descriptor.	RW

11.6.14 Descriptor Address Register0, 1 (LCDDA0, 1)

A frame descriptor is a 4-word block, aligned on 4-word (16-byte) boundary, in external memory:

WORD [0] contains the physical address for next LCDDAx
WORD [1] contains the physical address for LCDSAx
WORD [2] contains the value for LCDFIDx
WORD [3] contains the value for LCDCMDx

Software must write the physical address of the first descriptor to LCDDAx before enabling the LCD Controller. Once the LCD Controller is enabled, the first descriptor is read, and all 4 registers are written by the DMAC. The next frame descriptor pointed to by LCDDAx is loaded into the registers for the associated DMA channel after all data for the current descriptor has been transferred.

Note: If only one frame buffer is used in external memory, the LCDDAx field (word [0] of the frame descriptor) must point back to itself. That is to say, the value of LCDDAx is the physical address of itself.

Read/write registers LCDDA0 and LCDDA1, corresponding to DMA channels 0 and 1, contain the physical address of the next descriptor in external memory. The DMAC fetches the descriptor at this location after finishing the current descriptor. On reset, the bits in this register are zero. The target address must be aligned to 16-byte boundary. Bits [3:0] of the address must be zero.

LCDDA0, LCDDA1 **0x13050040, 0x13050050**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits	Name	Description	RW
31:0	DA0, 1	Next descriptor physical address. And descriptor structure as following: WORD [0]: next descriptor physical address. WORD [1]: the buffer physical address. WORD [2]: the buffer ID value. (Only for debug) WORD [3]: the buffer property. The value is same as LCDCMD.	RW

11.6.15 Source Address Register0, 1 (LCDSA0, 1)

Registers LCDSA0 and LCDSA1, corresponding to DMA channels 0 and 1, contain the **physical** address of frame buffer or palette buffer in external memory. The address must be aligned on an 4, 8, or 16 word boundary according to register LCDCTRL .BST. If this descriptor is for palette data, LCDSA0 points to the memory location of the palette buffer. If this descriptor is for frame data, LCDSAx points to the memory location of the frame buffer. This address is incremented by hardware as the DMAC fetches data from memory. If desired, the Frame ID Register can be used to hold the initial frame source address.

LCDSA0, LCDSA1 **0x13050044, 0x13050054**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits	Name	Description	RW
31:0	SA0, 1	Buffer start address. (Only for driver debug)	R

11.6.16 Frame ID Register0 (LCDFID0,1)

Registers LCDFID0 and LCDFID1, corresponding to DMA channels 0 and 1, contain an ID field that describes the current frame. The particular use of this field is up to the software. This ID register is copied to the LCD Controller Interrupt ID Register when an interrupt occurs.

LCDFID0, LCDFID1 **0x13050048, 0x13050058**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits	Name	Description	RW
31:0	FID0, 1	Frame ID. (Only for debug)	R

11.6.17 DMA Command Register0, 1 (LCDCMD0, 1)

LCDCMD0, LCDCMD1 **0x1305004C, 0x1305005C**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SOFINT	EOFINT	Reserved	PAL	Reserved				LEN																							
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Name	Description	RW
31	SOFINT	Enable start of frame interrupt. When SOFINT =1, the DMAC sets the start of frame bit (LCDSTATE.SOF) when starting a new frame. The SOF bit is set after a new descriptor is loaded from memory and before the palette/frame data is fetched. In dual-panel mode, LCDSTATE.SOF is set only when both channels reach the start of frame and both frame descriptors have SOFINT set. SOFINT must not be set for palette descriptors in dual-panel mode, since only one channel is ever used to load the palette descriptor.	R
30	EOFINT	Enable end of frame interrupt. When EOFINT =1, the DMAC sets the end of frame bit (LCDSTATE.EOF) after fetching the last word in the frame buffer. In dual-panel mode, LCDSTATE.EOF is set only when both channels reach the end of frame and both frame descriptors have EOFINT set. EOFINT must not be set for palette descriptors in dual-panel mode, since only one channel is ever used to load the palette descriptor.	R
29	Reserved	These bits always read 0, and written are ignored.	R

28	PAL	The descriptor contains a palette buffer. PAL indicates that data being fetched will be loaded into the palette RAM. If PAL =1, the palette RAM data is loaded via DMA channel 0 as follows: In bpp1, 2, 4, 8 mode, software must load the palette at least once after enabling the LCD. In bpp16 mode, PAL must be 0.	R
27:24	Reserved	These bits always read 0, and written are ignored.	R
23:0	LEN	The buffer length value (in WORD). The LEN bit field determines the number of bytes of the buffer size pointed by LCDSAx. LEN = 0 is not valid. DMAC fetch data according to LEN. Each time one or more word(s) been fetched, LEN is decreased automatically. Software can read LEN.	R

11.7 LCD Controller Pin Mapping

There are several mapping schemes for different LCD panels.

11.7.1 TFT and CCIR656 Pin Mapping

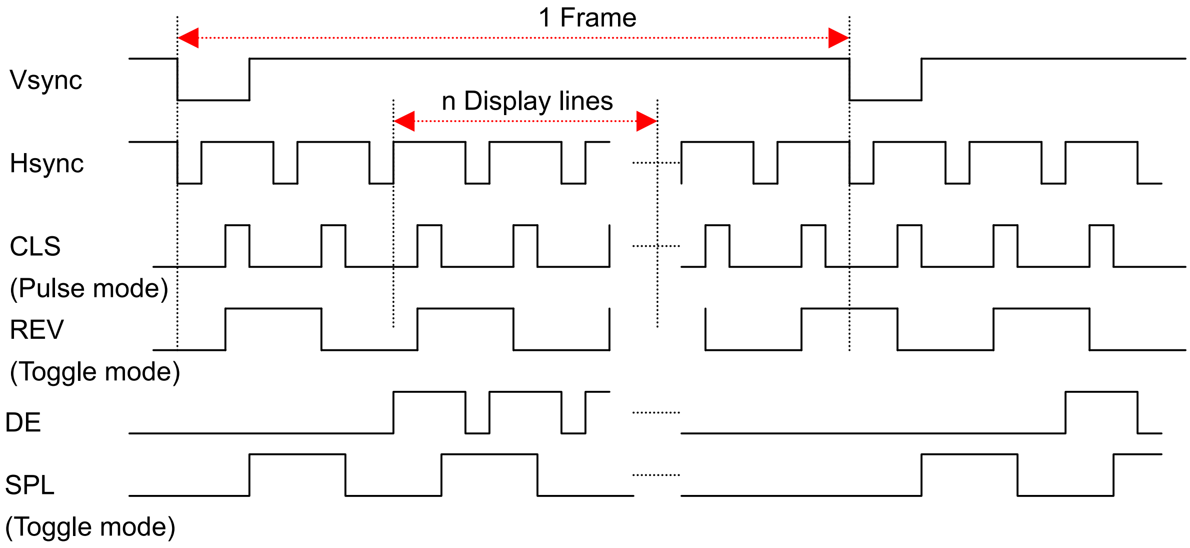
11.8.3 Special TFT Timing

Based on the general TFT LCD support, this controller also provides 4 special signals that can be programmed to general some special timing used for some panel. All 4 signals are worked in two modes: pulse mode and toggle mode. Signal "CLS" is fixed in pulse mode, and "REV" in toggle mode. The work mode of signals "SPL" and "PS" are defined in the special TFT LCD mode 1 to mode 3, either pulse mode or toggle mode. The position and polarity of these 4 signals can be programmed via registers. The Figures show the two modes as follows: (The toggle mode of signal "SPL" is different with the others signal. "SPL" does toggle after display line.)



1 Frame
n Display lines

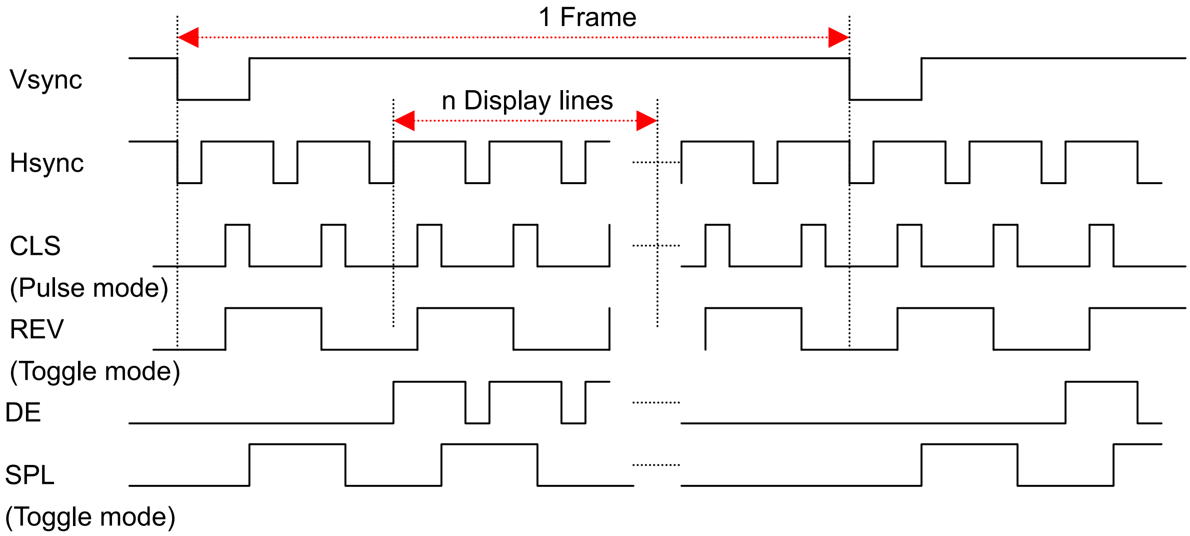
Figure 11-3 Special TFT LCD Timing 1



1 Frame
n Display lines
Vsync
Hsync
CLS
(Pulse mode)
REV
(Toggle mode)
DE
SPL
(Toggle mode)

Figure 11-4 Special TFT LCD Timing 2

These two Figures show the timing of pulse mode and toggle mode, the pulse mode timing is same and the toggle mode timing is different. Timing 1 shows the condition when the total lines in 1 frame is odd (the number of display is even and the number of blank is odd), so the phase of REV inverse at the first line of each frame and the phase of SPL dose not inverse at the first line of each frame. Timing 2 shows the condition when the total lines in 1 frame is even (the number of display is even and the number of blank is even), so the phase of REV and SPL dose not inverse at the first line of each frame.

When LCDC is enabled ,there will be a null line to be add before transferring data to LCD panel. So the toggle mode exept SPL signal of special 3 TFT mode is when reset level is high,the first valid edge will be rising edge. SPL signal of special 3 TFT mode is when reset level is high,the first valid edge will be falling edge.

11.9 Format of Palette

This LCD controller contains a palette RAM with 256-entry x 16-bit used only for BPP8, BPP4, BPP2 and BPP1. Palette RAM data is loaded directly from the external memory palette buffer by DMAC channel 0. Each word of palette buffer contains 2 palette entries.

- In 8-bpp modes, palette buffer size is128 words.
- In 4-bpp modes, palette buffer size is 8 words.
- In 2-bpp modes, palette buffer size is 2 words.
- In 1-bpp modes, palette buffer size is 1 word.
- In 16/18/24-bpp modes, has no palette buffer.

Palette buffer base address	Bit: 31 . . . 16	Bit: 15 . . . 0
Palette entry	Entry-1 bit: 15 . . . 0	Entry-0 bit: 15 . . . 0
Palette buffer base address + 4	Bit: 31 . . . 16	Bit: 15 . . . 0
Palette entry	Entry-3 bit: 15 . . . 0	Entry-2 bit: 15 . . . 0
Palette buffer base address + 8	Bit: 31 . . . 16	Bit: 15 . . . 0
Palette entry	Entry-5 bit: 15 . . . 0	Entry-4 bit: 15 . . . 0

11.9.1 STN

For STN Panel, 16-bpp pixel data is encoded with RGB 565 or RGB 555.
Please refer to register LCDCTRL.RGB.

D7	D6	D5	D4	D3	D2	D1	D0

11.12 LCD Controller Operation

11.12.1 Set LCD Controller Device Clock and Pixel Clock

The LCD Controller has 2 clock input: device clock and pixel clock. The both clocks are generated by CPM (Clock and Power Manager). The frequency of the 2 clocks can be set by CPM registers. CPM registers CPCCR.LDIV and CPCCR.PCS set LCD device clock division ratio, and LPCDR set LCD pixel clock division ratio. Please refer to CPM spec for detail.

LCD device clock is the LCD controller’s internal clock while LCD pixel clock is output to drive LCD panel. There have 2 rules for LCD clocks:

(1) For TFT Panel, the frequency of LCD device clock must be at least 1.5 times of LCD pixel clock.
(2) For STN Panel, the frequency of LCD device clock must be at least 3 times of LCD pixel clock.

LCD panel determines the frequency of LCD pixel clock.

11.12.2 Enabling the Controller

If the LCD controller is being enabled for the first time after system reset or sleep reset, all of the LCD registers must be programmed as follows:

(1) Write the frame descriptors and, if needed, the palette descriptor to memory.

(2) Program the entire LCD configuration registers except the Frame Descriptor Address Registers (LCDDAx) and the LCD Controller enable bit (LCDCTRL.ENA).

(3) Program LCDDAx with the memory address of the palette/frame descriptor.

(4) Enable the LCD controller by writing to LCDCTRL.ENA.

If the LCD controller is being re-enabled, there has not been a reset since the last programming; only the registers LCDDAx and LCDCTRL.ENA need to be reprogrammed. The LCD Controller Status Register (LCDSTATE) must also be written to clear any old status flags before re-enabling the LCD controller.

Once the LCD controller has been enabled, do not write new values to LCD registers except LCDCTRL.ENA or DIS or LCDDA0/1.

11.12.3 Disabling the Controller

The LCD controller can be disabled in two ways: regular and quick.

(1) Regular disabling:
Regular disabling is accomplished by setting the disable bit, LCDCTRL.DIS. The other bits in LCDCTRL must not be changed — read the register, set the DIS bit, and rewrite the register. This method causes the LCD controller to stop cleanly at the end of a frame. The LCD Disable Done bit, LCDSTATE.LDD, is set when the LCD controller finishes displaying the last frame, and the enable bit, LCDCTRL.ENA, is cleared automatically by hardware.
LCDCTRL.DIS must be set zero when enabling the controller.

(2) Quick disabling:

Quick disabling is accomplished by clearing the enable bit, LCDCTRL.ENA. The LCD controller will finish any current DMA transfer, stop driving the panel, setting the LCD Quick Disable bit (LCDSTATE.QD) and shut down immediately. This method is intended for situations such as a battery fault, where system bus traffic has to be minimized immediately so the processor can have enough time to store critical data to memory before the loss of power. The LCD controller must not be re-enabled until the QD bit is set, indicating that the quick shutdown is complete. Do not set the DIS bit when a quick disabling command has been issued.

Note: It is strongly recommended that software set the "LCD Module Stop Bit" in PMC to shut down LCDC clock supply to save power consumption after disable LCDC. Please refer to PMC for detailed information.

11.12.4 Resetting the Controller

At reset, the LCD Controller is disabled. All LCD Controller Registers are reset to the conditions shown in the register descriptions.

11.12.5 Frame Buffer & Palette Buffer

The starting address of frame buffer stored in external memory must be aligned to 4, 8 or 16 words boundary according to register LCDCTRL.BST. The length of buffer must be multiple of word (32-bit).

If LCDCTRL .BST = 0, align frame and palette buffer to 16 word boundary
If LCDCTRL .BST = 1, align frame and palette buffer to 8 word boundary
If LCDCTRL .BST = 2, align frame and palette buffer to 4 word boundary

One frame buffer contains encoded pixel data of multiple of screen lines; each line of encoded pixel data must be aligned to word boundary. If the length of a line is not the multiple of word, extra bits must be applied to reach a word boundary. It is suggested that the extra bits to be set zero.

12 Smart LCD Controller

12.1 Overview

The Smart LCD Controller transfers data from the display buffer to the LCD Module. It supports DMA operation and register operation.

Features:

- Supports a large variety of LCD Module from different vendors.
- Supports parallel and serial interfaces.
- Supports different size of display panel.
- Supports different width of pixel data.
- Supports DMA operation and register operation.
- Supports Write Operation. Read Operation is not supported.

12.2 Structure

LCD Module

12.3 Pin Description

Table 12-1 SLCD Pins Description

Name	I/O	Description	Interface
SLCD_RS	O	Command/Data Select Signal. The polarity of the signal can be programmable.	Serial: RS Parallel: RS
SLCD_CS	O	Chip Select Signal. The polarity of the signal can be programmable.	Serial: CS Parallel: Sample Data with the edge of CS
SLCD_CLK	O	The clock of SLCD. The polarity of the clock can be programmable.	Serial or not used
SLCD_DAT[*1] [17:0]	O	The data of SLCD.	Serial: SLCD_DAT [15] Parallel: SLCD_DAT [17:0] SLCD_DAT [15:0] SLCD_DAT [7:0]

Note*[1]: SLCD_DAT [15] is also use as data pin for serial. The SLCD pins are shared with LCDC. You can see the set of register LCDCFG.LCDPIN in LCDC spec.

12.4 Register Description

In this section, we will describe the registers in Smart LCD controller. Following table lists all the registers definition. All register's 32bit address is physical address. And detailed function of each register will be described below.

Name	Description	RW	Reset Value	Address	Access Size
MCFG	SLCD Configure Register	RW	0x0000	0x130500A0	32
MCTRL	SLCD Control Register	RW	0x00	0x130500A4	8
MSTATE	SLCD Status Register	RW	0x00	0x130500A8	8
MDATA	SLCD Data Register	RW	0x00000000	0x130500AC	32
MFIFO	SLCD FIFO	RW	0x00000000	0x130500B0	32

12.4.1 SLCD Configure Register (MCFG)

The register MCFG is used to configure SLCD.

MCFG **0x130500A0**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TRIGGER		Reserved	DWIDTH			CWIDTH		Reserved			CSPLY	RSPLY	Reserved	CLKPLY	TYPE
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Name	Description	RW
15:14	TRIGGER	FIFO trigger for DMA Operation. Trigger Length Selection **TRIGGER** – Trigger Length 00 – 4 word 01 – 8 word 10 – Reserved 11 – Reserved	RW
13	Reserved	These bits always read 0, and written are ignored.	R
12:10	DWIDTH[*1]	Data Width. **DWIDTH** – **Data Width** 000 – 18-bit once Parallel/Serial 001 – 16-bit once Parallel/Serial 010 – 8-bit third time Parallel 011 – 8-bit twice Parallel 100 – 8-bit once Parallel/Serial 111 – 9-bit twice Parallel 101~110 – Reserved	RW
9:7	CWIDTH[*1]	Command Width. **CWIDTH** – **Command Width** 00 – 16-bit once 01 – 8-bit once 10 – 18-bit once 11 – Reserved	RW
7:5	Reserved	These bits always read 0, and written are ignored.	R
4	CSPLY	CS Polarity. (CS initial level will be different from CS Polarity) 0: Active Level is Low 1: Active Level is High	RW

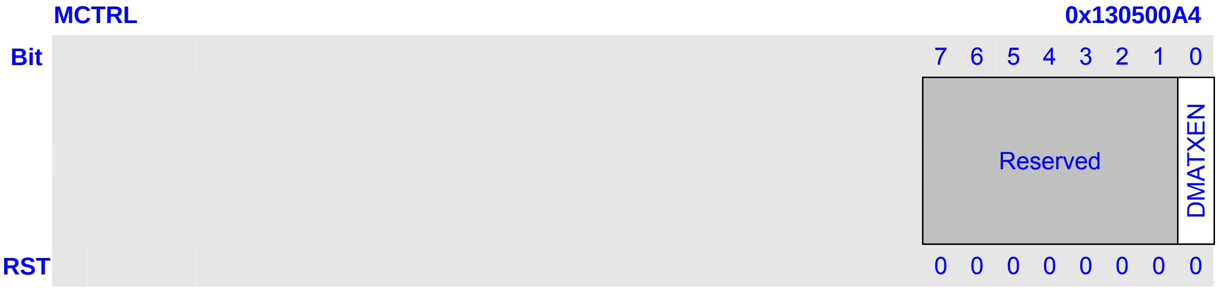
3	RSPLY	RS Polarity. 0: Command RS = 0, Data RS = 1 1: Command RS = 1, Data RS = 0	RW
2	Reserved	These bits always read 0, and written are ignored.	R
1	CLKPLY	LCD_CLK Polarity. 0: Active edge is Falling 1: Active edge is Rising	RW
0	TTYPE	Transfer Type: 0: Parallel 1: Serial	RW

Note*1: The set of DWIDTH and CWIDTH should keep to the rules as follows:

Interface Mode	Command Width	Data Width	Color
Parallel	18-bit	18-bit once	
	16-bit	16-bit once	
		9-bit twice	
	8-bit	8-bit once	
		8-bit twice	
		8-bit third times	
Serial	18-bit	18-bit once	
	16-bit	16-bit once	
	8-bit	8-bit once	
		8-bit twice	
		8-bit third times	

12.4.2 SLCD Control Register (MCTRL)

MCTRL is SLCD Control Register.



Bits	Name	Description	RW
7:1	Reserved	These bits always read 0, and written are ignored.	R

0	DMATXEN	SLCD DMA Transfer Enable. This bit is only used for DMA automatic transfer. (1) This bit starts the automatic transfer of image data from system memory to LCDM. (2) When DMAC finishes transferring the data, and the MSTATE.BUSY bit is 0, you can clear DMATXEN bit to stop DMA mode.	RW

12.4.3 SLCD Status Register (MSTATE)

The register of MSTATE is SLCD status register.

MSTATE **0x130500A8**

Bit	7	6	5	4	3	2	1	0
	Reserved							BUSY
RST	0	0	0	0	0	0	0	0

Bits	Name	Description	RW
7:1	Reserved	These bits always read 0, and written are ignored.	R
0	BUSY	Transfer is working or not. This bit will be set to 1 when transfer is working. It will be cleared by hardware when transfer is finished. 0: not busy 1: busy	RW

12.4.4 SLCD Data Register (MDATA)

The register MDATA is used to send command or data to LCM. When RS=0, the low 24-bit is used as command. When RS=1, the low 24-bit is used as data.

MDATA **0x130500AC**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RS	Reserved							DATA / CMD																							
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Name	Description	RW
31	RS	The RS bit of data register is used to decide the meanings of the low 24-bit. 0: data 1: command	RW
30:24	Reserved	These bits always read 0, and written are ignored.	R
23:0	DATA/CMD	Data or Command Register.	RW

12.4.5 SLCD FIFO (MFIFO)

The FIFO is used to send command or data to LCM. When RS=0, the low 24-bit is used as command. When RS=1, the low 24-bit is used as data.

MFIFO **0x130500B0**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RS	Reserved							DATA / CMD																							
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Name	Description	RW
31	RS	The RS bit of FIFO is used to decide the meanings of the low 24-bit. 0: data 1: command	RW
30:24	Reserved	These bits always read 0, and written are ignored.	R
23:0	DATA/CMD	Data or Command Register.	RW

12.5 System Memory Format

The format of Command and Data in system memory is as follows:

Command	RS [31] = 1	XXX [30:n+1]	Command [n:0]
Data	RS [31] = 0	XXX [30:24]	Data [23:0]
	RS [31] = 0	XXX [30:16]	Data [15:0]
	RS [31] = 0	XXX [30:8]	Data [7:0]

12.5.1 Data format

(1) 24-bit color

31	**30**	**29**	**28**	**27**	**26**	**25**	**24**	**23**	**22**	**21**	**20**	**19**	**18**	**17**	**16**
0	X	X	X	X	X	X	X	R7	R6	R5	R4	R3	R2	R1	R0
15	**14**	**13**	**12**	**11**	**10**	**9**	**8**	**7**	**6**	**5**	**4**	**3**	**2**	**1**	**0**
G7	G6	G5	G4	G3	G2	G1	G0	B7	B6	B5	B4	B3	B2	B1	B0

(2) 18-bit color

31	**30**	**29**	**28**	**27**	**26**	**25**	**24**	**23**	**22**	**21**	**20**	**19**	**18**	**17**	**16**

C15	C14	C13	C12	C11	C10	C9	C8	C7	C6	C5	C4	C3	C2	C1	C0

(3) 8-bit command once

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
1	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X
15	**14**	**13**	**12**	**11**	**10**	**9**	**8**	**7**	**6**	**5**	**4**	**3**	**2**	**1**	**0**
X	X	X	X	X	X	X	X	C7	C6	C5	C4	C3	C2	C1	C0

(4) 8-bit command twice (Command = command part + data part, twice transfer)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
1	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X
15	**14**	**13**	**12**	**11**	**10**	**9**	**8**	**7**	**6**	**5**	**4**	**3**	**2**	**1**	**0**
X	X	X	X	X	X	X	X	C7	C6	C5	C4	C3	C2	C1	C0

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
1	X	X	X	X	X	X	X	X	X	X	X	X	X	X	X
15	**14**	**13**	**12**	**11**	**10**	**9**	**8**	**7**	**6**	**5**	**4**	**3**	**2**	**1**	**0**
X	X	X	X	X	X	X	X	D7	D6	D5	D4	D3	D2	D1	D0

Note: The command is made up of command part and data part, but need twice transfer, and the first transfer is command part and the second transfer is data part. You need to divide the command into two parts by software.)

12.6 Transfer Mode

Two transfer modes can be used: DMA Transfer Mode and Data Register Transfer Mode.

12.6.1 DMA Transfer Mode

Command and data can be recognized by RS bit coming from memory. The format of DMA transfer can be as follows:

(1) Command and Data

C	D	D	C	C	D	D	D	C	C	C	D	D	D	D

(2) Only Data

D	D	D	D	D	D	D	D	D	D	D	D	D	D	D

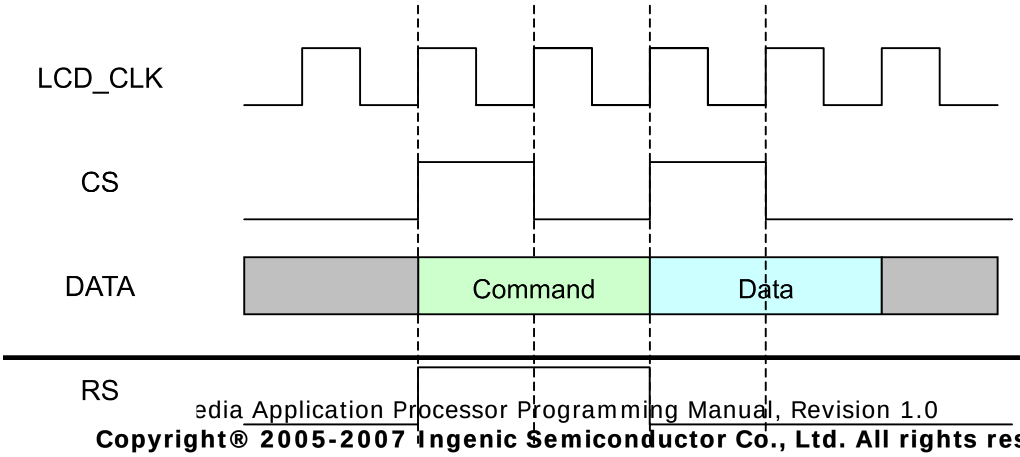
12.6.2 Register Transfer Mode

Each time you can write a command or a data to the register, then it will transfer the RS signal and data or command to LCM. Command and data can be recognized by RS bit coming from data register. The format of data register transfer can be as follows:

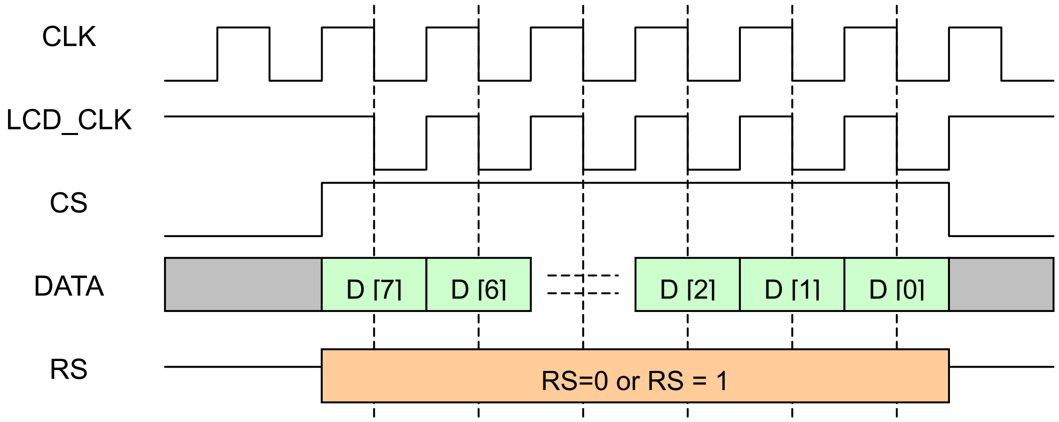
RS	Data Or Command

12.7 Timing

12.7.1 Parallel Timing



12.7.2 Serial Timing



12.8 Operation Guide

12.8.1 DMA Operation

(1) Start DMA transfer

(1) Initial DMAC.

(2) Set MCFG to configure SLCD.

(3) Before starting DMA, Wait for MSTATE.BUSY == 0.

(4) Set MCTRL.DMATXEN to 1 to start DMA transfer. (If you don't want to stop DMA transfer, you need not to check MSTATE.BUSY.)

(2) Stop DMA transfer

(1) Check the status of DMAC, and stop DMAC.

(2) Wait MSTATE.BUSY == 0

(3) Set MCTRL.DMATXEN to 0 to stop DMA transfer.

(3) Restart DMA transfer

When MCTRL.DMATXEN is set to 0, and then you want to restart DMA transfer at once, you should ensure that MCTRL.DMATXEN must keep low level at least three cycles of PIXCLK.

12.8.2 Register Operation

(1) Set MCFG to configure SLCD.

(2) Wait for MSTATE.BUSY == 0.

(3) Set MDATA register.

(4) Wait for MSTATE.BUSY == 0.

(5) Set MDATA register.

(6) Wait for MSTATE.BUSY == 0.

(7) … …

13 AC97/I2S Controller

13.1 Overview

This chapter describes the AIC (AC'97 and I^2S Controller) included in this processor.

The AIC supports the Audio Codec '97 Component Specification 2.3 for AC-link format and I2S or IIS (for inter-IC sound), a protocol defined by Philips Semiconductor. Both normal I2S and the MSB-justified I2S formats are supported by AIC.

AIC consists of buffers, status registers, control registers, serializers, and counters for transferring digitized audio between the processor's processor system memory and an internal I2S CODEC, an external AC97 or I2S CODEC. AIC can record digitized audio by storing the samples in system memory. For playback of digitized audio or production of synthesized audio, the AIC retrieves digitized audio samples from system memory and sends them to a CODEC through the serial connection with AC-link or I2S formats. The internal or external digital-to-analog converter in the CODEC then converts the audio samples into an analog audio waveform. The audio sample data can be stored to and retrieved from system memory either by the DMA controller or by programmed I/O.

The AC-link is a synchronous, fixed-rate serial bus interface for transferring CODEC register control and status information in addition to digital audio. Where both normal I2S and MSB-justified-I2S work with a variety of clock rates, which can be obtained either by dividing the PLL clock by two programmable dividers or from an external clock source.

For I2S systems that support the L3 control bus protocol, additional pins are required to control the external CODEC. CODECs that use an L3 control bus require 3 signals: L3_CLK, L3_DATA, and L3_MODE for writing bytes into the L3 bus register. The AIC supports the L3 bus protocol via software control of the general-purpose I/O (GPIO) pins. The AIC does not provide hardware control for the L3 bus protocol.

To control the internal CODEC, internal CODEC spec can be referenced.

This chapter describes the programming model for the AIC. The information in this chapter requires an understanding of the AC'97 specification, Revision 2.3.

13.1.2 Features

AIC support following AC97/I2S features:

- 8, 16, 18, 20 and 24 bit audio sample data sizes supported
- DMA transfer mode supported
- Stop serial clock supported
- Programmable Interrupt function supported
- Support mono PCM data to stereo PCM data expansion on audio play back
- Support endian switch on 16-bits audio samples play back
- Support variable sample rate in AC-link format
- Multiple channel output and double rated supported for AC-link format
- Power Down Mode and two Wake-Up modes Supported for AC-link format
- Internal programmable or external serial clock and optional system clock supported for I2S or MSB-Justified format
- Internal I2S CODEC supported
- Two FIFOs for transmit and receive respectively with 32 samples capacity in every direction.

13.1.4 Signal Descriptions

There are all 5 pins used to connect between AIC and an external audio CODEC device. If an internal CODEC is used, these pins are not needed. They are listed and described in Table 13-1.

Table 13-1 AIC Pins Description

Name	I/O	Description
RESET# SYS_CLK	O	RESET#: AC-link format, active-low CODEC reset. SYS_CLK: I2S/MSB-Justified formats, supply system clock to CODEC
BIT_CLK	I I/O	12.288 MHz bit-rate clock input for AC-link, and sample rate dependent bit-rate clock input/output for I2S/MSB-Jistified.
SYNC	O	48-kHz frame indicator and synchronizer for AC-link format
	I/O	Indicates the left- or right-channel for I2S/MSB-Justified format
SDATA_OUT	O	Serial audio output data to CODEC
SDATA_IN	I	Serial audio input data from CODEC

13.1.5 RESET# / SYS_CLK Pin

RESET# is AC97 active-low CODEC reset, which outputs to CODEC. The CODEC's registers are reset when this RESET# is asserted. This pin is useful only in AC-link format. If AIC is disabled, it retains the high.

SYS_CLK outputs the system clock to CODEC. This pin is useful only in I2S/MSB-justified format. It generates a frequency between approximately 2.048 MHz and 24.576 MHz by dividing down the PLL clock with a programmable divisor. This frequency can be 256, 384, 512 and etc. times of the audio sampling frequency. Or it can be set to a wanted frequency. If AIC is disabled, it retains the high.

13.1.6 BIT_CLK Pin

BIT_CLK is the serial data bit rate clock, at which AC97/I2S data moves between the CODEC and the processor. One bit of the serial data is transmitted or received each BIT_CLK period. It is fixed to 12.288 MHz in AC-link format, which inputs from the CODEC. In I2S and MSB-justified format it inputs from the CODEC in slave mode and outputs to CODEC in master mode. In the master mode, the clock is generated internally that is 64 times the sampling frequency. Table 13-7 lists the available sampling frequencies based on an internal clock source. If AIC is disabled, AICFR.AUSEL and AICFR.BCKD determine the direction. And it retains the low if it is output and the state is undefined if it is input.

13.1.7 SYNC Pin

In AC-link format, SYNC provides frame synchronization, fixed to 48kHz, by specifying beginning of an audio sample frame and outputs to CODEC. In I2S/MSB-Justified formats, SYNC is used to indicate left- or right-channel sample data and toggled in sample rate frequency. It outputs to CODEC in master mode and inputs from CODEC in slave mode. If AIC is disabled, AICFR.AUSEL and AICFR.BCKD determine the direction. And it retains the low if it is output and the state is undefined if it is input.

13.1.8 SDATA_OUT Pin

SDATA_OUT is AIC output data pin, which outputs serial audio data or data of AC97 CODEC register control to an external audio CODEC device. If AIC is disabled, it retains the low.

13.1.9 SDATA_IN Pin

SDATA_IN is AIC inputs data pin, which inputs serial audio data or data of AC97 CODEC register status from an external audio CODEC device. If AIC is disabled, its state is undefined.

13.2 Register Descriptions

AIC software interface includes 13 registers and 1 FIFO data port. They are mapped in IO memory address space so that program can access them to control the operation of AIC and the outside CODEC.

Table 13-2 AIC Registers Description

Name	Description	RW	Reset value	Address	Size
AICFR	AIC Configuration Register	RW	0x00007800	0x10020000	32

- AICFR is used to control FIFO threshold, AC-link or I2S/MSB-justified selection, AIC reset, master/slave selection, and AIC enable.
- AICCR is used to control DMA mode, FIFO flush, interrupt enable, internal loop-back, play back and recording enable. It also controls sample size and signed/unsigned data transfer.
- ACCR1 is used to reflect/control valid incoming/outgoing slots of AC97.
- ACCR2 is used to control interrupt enable, output/input sample size, and alternative control of RESET#, SYNC and SDATA_OUT pins in AC-link.
- I2SCR is used to control BIT_CLK stop, audio sample size, I2S or MSB-justified selection in I2S/MSB-justified.
- AICSR is used to reflect FIFOs status
- ACSR is used to reflect the status of the connected external CODEC in AC-link.

- I2SSR is used to reflect AIC status in I2S/MSB-justified.
- ACCAR and ACCDR are used to hold address and data for AC-link CODEC register read/write.
- ACSAR and ACSDR are used to receive AC-link CODEC registers address and data
- I2SDIV is used to set clock divider for BIT_CLK generating in I2S/MSB-justified format.
- AICDR is act as data input/output port to/from transmit/receive FIFO when write/read.

13.2.1 AIC Configuration Register (AICFR)

AICFR contains bits to control FIFO threshold, AC-link or I2S/MSB-justified selection, AIC reset, master/slave selection, and AIC enable.

AICFR **0x10020000**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Reserved																RFTH				TFTH				Reserved	LSMP	ICDC	AUSEL	RST	BCKD	SYNCD	ENB
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0	0	0	0	0	0	0	0

Bits	Name	Description	RW
31:16	Reserved	Writes to these bits have no effect and always read as 0	R
15:12	RFTH	Receive FIFO threshold for interrupt or DMA request. The RFTH valid value is 0 ~ 15. This value represents a threshold value of (RFTH + 1) * 2. When the sample number in receive FIFO, indicated by AICSR.RFL, is great than or equal to the threshold value, AICSR.RFS is set. Larger RFTH value provides lower DMA/interrupt request frequency but have more risk to involve receive FIFO overflow. The optimum value is system dependent.	RW
11:8	TFTH	Transmit FIFO threshold for interrupt or DMA request. The TFTH valid value 0 ~ 15. This value represents a threshold value of TFTH * 2. When the sample number in transmit FIFO, indicated by AICSR.TFL, is less than or equal to the threshold value, AICSR.TFS is set. Smaller TFTH value provides lower DMA/interrupt request frequency but have more risk to involve transmit FIFO underflow. The optimum value is system dependent.	RW
7	Reserved	Writes to these bits have no effect and always read as 0	R
6	LSMP	Select between play last sample or play ZERO sample in TX FIFO underflow. ZERO sample means sample value is zero. This bit is better be changed while audio replay is stopped. **LSMP** / **CODEC used** 0: Play ZERO sample when TX FIFO underflow 1: Play last sample when TX FIFO underflow	RW
5	ICDC	Internal CODEC used. Select between internal or external CODEC. **ICDC** / **CODEC used** 0: External CODEC 1: Internal CODEC	RW
4	AUSEL	Audio Unit Select. Select between AC-link and I2S/MSB-justified. Change this bit in case of BIT_CLK is stopped (I2SCR.STPBK = 1)	RW

<table>
<tr><td></td><td></td><td><table><tr><th>AUSEL</th><th>Selected</th></tr><tr><td>0</td><td>Select AC-link format</td></tr><tr><td>1</td><td>Select I2S/MSB-justified format</td></tr></table></td><td></td></tr>
<tr><td>3</td><td>RST</td><td>Reset AIC. Write 1 to this bit reset AIC registers and FIFOs except AICFR and I2SDIV register. Writing 0 to this bit has no effect and this bit is always reading 0.</td><td>W</td></tr>
<tr><td>2</td><td>BCKD</td><td>BIT_CLK Direction. This bit specifies input/output direction of BIT_CLK. It is only valid in I2S/MSB-justified format. When AC-link format is selected, BIT_CLK is always input and this bit is ignored. Change this bit in case of BIT_CLK is stopped (I2SCR.STPBK = 1)<table><tr><th>BCKD</th><th>BIT_CLK Direction</th></tr><tr><td>0</td><td>BIT_CLK is input from an external source.</td></tr><tr><td>1</td><td>BIT_CLK is generated internally and driven out to the CODEC.</td></tr></table></td><td>RW</td></tr>
<tr><td>1</td><td>SYNCD</td><td>SYNC Direction. This bit specifies input/output direction of SYNC in I2S/MSB-justified format. When AC-link format is selected, SYNC is always output and this bit is ignored. Change this bit in case of BIT_CLK is stopped (I2SCR.STPBK = 1)<table><tr><th>SYNCD</th><th>SYNC Direction</th></tr><tr><td>0</td><td>SYNC is input from an external source.</td></tr><tr><td>1</td><td>SYNC is generated internally and driven out to the CODEC.</td></tr></table></td><td>RW</td></tr>
<tr><td>0</td><td>ENB</td><td>Enable AIC function. This bit is used to enable or disable the AIC function.<table><tr><th>ENB</th><th>Description</th></tr><tr><td>0</td><td>Disable AIC Controller</td></tr><tr><td>1</td><td>Enable AIC Controller</td></tr></table></td><td>RW</td></tr>
</table>

The BCKD bit (bit 2) and SYNCD bit (bit 1) configure the mode of I2S/MSB-justified interface. This is compliant with I2S specification.

BCKD	SYNCD	Description
0 (input)	0 (input)	AIC roles the slave of I2S/MSB-justified interface.
	1 (output)	AIC roles the master with external serial clock source of I2S/MSB-justified interface.
1 (output)	0 (input)	Reserved
	1 (output)	AIC roles the master of I2S/MSB-justified interface

13.2.2 AIC Common Control Register (AICCR)

AICCR contains bits to control DMA mode, FIFO flush, interrupt enable, internal loop-back, play back and recording enable. It also controls sample size and signed/unsigned data transfer.

AICCR **0x10020004**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

13.2.9 AIC AC97 CODEC Command Address Register (ACCAR) & Data Register (ACCDR)

ACCAR and ACCDR are used to hold register address and data for external AC-link CODEC register read/write operation through SDATA_OUT. The format of ACCAR.CAR and ACCDR.CDR is compliant with AC’97 Component Specification 2.3 where ACCAR.CAR[19] of “1” specifies CODEC register read operation, of “0” specifies CODEC register write operation. The write access to ACCAR and ACCDR signals AIC to issue this operation. Please reference to 13.4.4 for software flow. These registers are valid only in AC-link. It is ignored in I2S/MSB-justified format.

ACCAR **0x10020020**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

13.2.10 AIC AC97 CODEC Status Address Register (ACSAR) & Data Register (ACSDR)

ACSAR and ACSDR are used to receive the external AC-link CODEC registers address and data from SDATA_IN. When AIC receives CODEC register status from SDATA_IN, it set ACSR.SADR bit and put the address and data to ACSAR.SAR and ACSDR.SDR. Please reference to 13.4.4 for software flow. These registers are valid only in AC-link format and are ignored in I2S/MSB-justified format.

ACSAR **0x10020028**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits	Name	Description	RW
31:4	Reserved	Writes to these bits have no effect and always read as 0	R
3:0	DV	Audio BIT_CLK clock divider value minus 1. I2SDIV.DV is used to control the generating of BIT_CLK from dividing SYS_CLK. The dividing value should be even and I2SDIV.DV should be set to the dividing value minus 1. So I2SDIV.DV bit0 is fixed to 1. BIT_CLK frequency is fixed to 64 f_S in AIC, where f_S is the audio sample frequency. I2SDIV.DV depends on SYS_CLK frequency f_{SYS_CLK}, which is selected according to external CODEC's requirement and internal PLL frequency. Please reference to 13.4.9 "Serial Audio Clocks and Sampling Frequencies" for further description.	RW

13.2.12 AIC FIFO Data Port Register (AICDR)

AICDR is act as data input port to transmit FIFO when write and data output port from receive FIFO when read, one audio sample every time. The FIFO width is 24 bits. Audio sample with size N that is less than 24 is located in LSB N-bits. The sample size is specified by ACCR2.OASS and ACCR2.IASS in AC-link, and by I2SCR.WL in I2S/MSB-justified. The sample order is specified by ACCR1.XS and ACCR1.RS in AC-link. In I2S/MSB-justified, the left channel sample is prior to the right channel sample.

Care should be taken to monitor the status register to insure that there is room for data in the FIFO when executing a program read or write transaction. This is taken care automatically in DMA.

AICDR **0x10020034**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

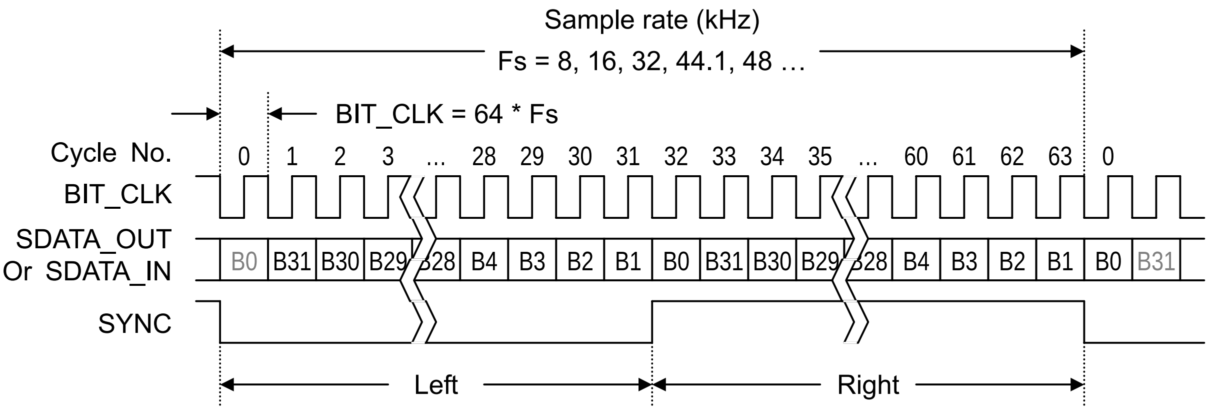
Bits	Name	Description	RW
31:24	Reserved	Writes to these bits have no effect and always read as 0	R
23:0	DATA	FIFO port. When write to it, data is push to the transmit FIFO. When read from it, data is pop from the receiving FIFO.	RW

13.3.2 I2S and MSB-justified serial audio format

Normal I2S and MSB-justified are similar protocols for digitized stereo audio transmitted over a serial path.

The BIT_CLK supplies the serial audio bit rate, the basis for the external CODEC bit-sampling logic. Its frequency is 64 times the audio sampling frequency. Divided by 64, the resulting 8 kHz to 48 kHz or even higher signal signifies timing for left and right serial data samples passing on the serial data paths. This left/right signal is sent to the CODEC on the SYNC pin. Each phase of the left/right signal is accompanied by one serial audio data sample on the data pins SDATA_IN and SDATA_OUT.



Sample rate (kHz)
Fs = 8, 16, 32, 44.1, 48 …
BIT_CLK = 64 * Fs

Right

Figure 13-10 MSB-justified data format

Figure 13-9 and Figure 13-10 provide timing diagrams that show formats for the normal I2S and MSB-justified modes of operations. Data is sampled on the rising edge of the BIT_CLK and data is sent out on the falling edge of the BIT_CLK.

Data is transmitted and received in frames of 64 BIT_CLK cycles. Each frame consists of a left sample and a right sample. Each sample holds 8, 16, 18, 20 or 24 bits of valid data. The LSB other bits of each sample is padded with zeroes.

- In the normal I2S mode, the SYNC is low for the left sample and high for the right sample. Also, the MSB of each data sample lags behind the SYNC edges by one BIT_CLK cycle.
- In the MSB-justified mode, the SYNC is high for the left sample and low for the right sample. Also, the MSB of each data sample is aligned with the SYNC edges.

When use with the internal CODEC, the BIT_CLK and SYNC signals are provided by the internal CODEC from the 12MHz clock.

13.3.3 Audio sample data placement in SDATA_IN/SDATA_OUT

The placement of audio sample in incoming/outgoing serial data stream for all formats support in AIC is MSB (Most Significant Bit) justified. Suppose n bit sample composed by

S_{n-1}	S_{n-2}	…	S_2	S_1	S_0

Table 13-3 described the how sample data bits are transferred.

Table 13-3 Sample data bit relate to SDATA_IN/SDATA_OUT bit

13.4 Operation

The AIC can be accessed either by the processor using programmed I/O instructions or by the DMA controller. The processor uses programmed I/O instructions to access the AIC and can access the following types of data

- The AIC memory mapped registers data—All registers are 32 bits wide and are aligned to word boundaries.
- AIC controller FIFO data—An entry is placed into the transmit FIFO by writing to the I2S controller's Serial Audio Data register (AICDR). Writing to AICDR updates a transmit FIFO entry. Reading AICDR flushes out a receive FIFO entry.
- The external CODEC registers for I2S CODEC—CODEC registers can be accessed through the L3 bus. The L3 bus operation is emulated by software controlling three GPIO pins.
- The external CODEC registers for AC97 CODEC—An AC97 audio CODEC can contain up to sixty-four 16-bit registers. A CODEC uses a 16-bit address boundary for registers. The AIC supplies access to the CODEC registers through several registers.
- The internal CODEC registers can be accessed via memory mapped registers in the CODEC.

The DMA controller can only access the FIFOs. Accesses are made through the data registers, as explained in the previous paragraph. The DMA controller responds to the following DMA requests made by the I2S controller:

- The transmit FIFO request is based on the transmit trigger-threshold (AICFR.TFTH) setting. See 13.2.1 for further details regarding AICFR.TFTH.
- The receive FIFO request is based on the receive trigger-threshold (AICFR.RFTH) setting. See 13.2.1 for further details regarding AICFR.RFTH.

Before operation to AIC, you may need to set proper PIN function selection from GPIO using if the pin is shared with GPIO.

Please also reference to "AC '97 Component Specification Revision 2.3, 2002" when deal with AIC AC-link operations.

13.4.1 Initialization

At power-on or other hardware reset (WDT and etc), AIC is disabled. Software must initiate AIC and the internal or external CODEC after power-on or reset. If errors found in data transferring, or in other places, software must initial AIC and optional, the internal or external CODEC. Here is the initial flow.

1. Select internal or external CODEC (AICFR.ICDC).
2. If external CODEC is selected, select AC-link or I2S/MSB-Justified (AICFR.AUSEL). If internal CODEC is used, select I2S/MSB-Justified format (AICFR.AUSEL=1). If the resettlement without involving link format and architecture changing, this step can be skip.
3. If I2S/MSB-Justified is selected, select between I2S and MSB-Justified (I2SCR.AMSL), decide BIT_CLK direction (AICFR.BCKD) and SYNC direction (AICFR.SYNCD). If BIT_CLK is configured as output, BIT_CLK divider I2SDIV.DV must be set to what correspond with the values as shown in Table 13-7. And the clock selection and the divider between PLL clock out and AIC also must be set (CFCR.I2S and I2SCDR in CPM). If internal CODEC is used, select 12MHz clock input (via set proper value in CFCR.I2S and I2SCDR), I2S format (I2SCR.AMSL=0), input BIT_CLK (AICFR.BCKD=0), input SYNC (AICFR.SYNCD=0).
4. Enable AIC by write 1 to AICFR.ENB
5. If it needs to reset AIC registers and flush FIFOs, write 1 to AICFR.RST. If it need only flush FIFOs, write 1 to AICCR.FLUSH. BIT_CLK must exist here and after.
6. In AC-link format, issue a warm or cold CODEC reset.
7. In AC-link format, configure AC ’97 CODEC via ACCAR and ACCDR registers. If the resettlement doesn’t involving AC’97 CODEC registers changing, this step can be skip.
8. In case of external CODEC with I2S/MSB-Justified format, configure I2S/MSB-justified CODEC via the control bus connected to the CODEC, for instance I2C or L3, depends on CODEC. In case of internal CODEC, configure CODEC via CODEC’s memory mapped registers. If the resettlement without involving I2S/MSB-justified CODEC or ADC/DAC function changing, this step can be skip.

13.4.2 AC ’97 CODEC Power Down

AC ‘97 CODEC can be placed in a low power mode. When the CODEC’s power-down register (26h), is programmed to the appropriate value, the CODEC will be put in a low power mode and both BIT_CLK and SDATA_IN will be brought to and held at a logic low voltage level.

Once powered down, re-activation of the AC-link via re-assertion of the SYNC signal must not occur for a minimum of four audio frame times following the frame in which the power down was triggered. When AC-link powers up it indicates readiness via the CODEC Ready bit (input slot 0, bit 15).

13.4.3 Cold and Warm AC ’97 CODEC Reset

AC-link reset operations occur when the system is initially powered up, when resuming from a lower powered sleep state, and in response to critical subsystem failures that can only be recovered from with a reset.

13.4.3.1 Cold AC ‘97 CODEC Reset

A cold reset is achieved by asserting RESET# for the minimum specified time. By driving RESET# low, BIT_CLK, and SDATA_IN will be activated, or re-activated as the case may be, and all AC ‘97 CODEC registers will be initialized to their default power on reset values.

RESET# is an asynchronous AC ‘97 CODEC input.

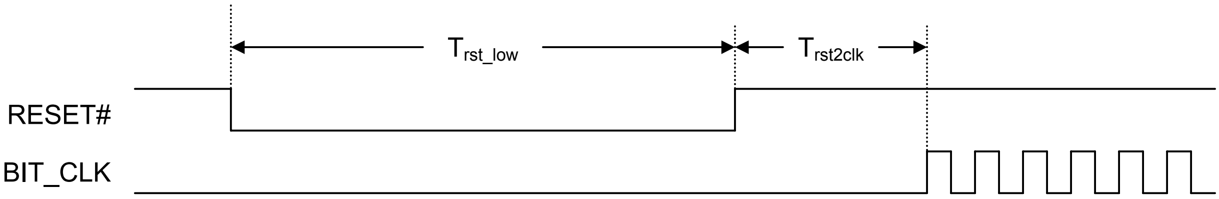

Figure 13-11 Cold AC ’97 CODEC Reset Timing

Table 13-4 Cold AC ’97 CODEC Reset Timing parameters

Parameter	Symbol	Min	Type	Max	Units
RESET# active low pulse width	T_{rst_low}	1.0	-	-	μs
RESET# inactive to BIT_CLK startup delay	$T_{rst2clk}$	162.8	-	-	ns

13.4.3.2 Warm AC ‘97 CODEC Reset

A warm AC‘97 reset will re-activate the AC-link without altering the current AC‘97 register values. Driving SYNC high for a minimum of 1 µs in the absence of BIT_CLK signals a warm reset.

Within normal audio frames SYNC is a synchronous AC ‘97 CODEC input. However, in the absence of BIT_CLK, SYNC is treated as an asynchronous input used in the generation of a warm reset to AC ’97 CODEC.

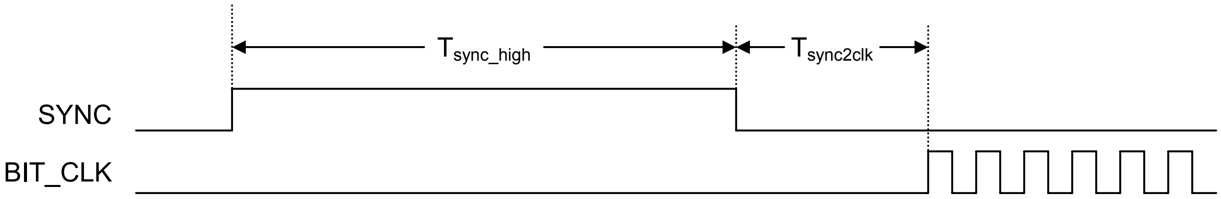

Figure 13-12 Warm AC ’97 CODEC Reset Timing

Table 13-5 Warm AC ’97 CODEC Reset Timing Parameters

Parameter	Symbol	Min	Type	Max	Units
SYNC active high pulse width	T_{sync_high}	1.0	-	-	µs
SYNC inactive to BIT_CLK startup delay	$T_{sync2clk}$	162.8	-	-	ns

13.4.4 External CODEC Registers Access Operation

The external audio CODEC can be configured/controlled by its internal registers. To access these registers, an I2S/MSB-justified CODEC usually employs L3 bus, SPI bus, I2C bus or other control bus. The L3 bus operation can be emulated by software controlling 3 GPIO pins of the chip. For AC ’97, “AC ’97 Component Specification” defines the CODEC register access protocol. Several registers are provided in AIC to accomplish this task.

The ACCAR and ACCDR are used to send a register accessing request command to external AC ’97 CODEC. The ACSAR and ACSDR are used to receive a register’s content from external AC’97 CODEC. The register accessing request and the register’s content returning is asynchronous.

The AC’97 CODEC register accessing request flow:

1. If ACSR.CADT is 0, wait for 25.4μs. If no previous accessing request, this step can be skip.
2. Clear ACSR.CADT.
3. If read access, write read-command and register address to ACCAR, if write access, write write-command and register address to ACCAR and write data to ACCDR. Any order of write ACCAR and ACCDR is OK.
4. Polling for ACSR.CADT changing to 1, which means the request has been send to CODEC via AC-link.

The AC’97 CODEC register content receiving flow by polling:

1. Polling for ACSR.SADR changing to 1
2. Read the CODEC register’s address from ACSAR and content from ACSDR
3. Clear ACSR.SADR

The AC’97 CODEC register content receiving flow by interrupt:

1. Before accessing request, clear ACSR.SADR and set ACCR2.ESADR.
2. Waiting for the interrupt. When the interrupt is found, check if ACSR.SADR is 1, if not, repeat this step again.
3. Read the CODEC register’s address from ACSAR and content from ACSDR
4. Clear ACSR.SADR

13.4.5 Audio Replay

Outgoing audio sample data (from AIC to CODEC) is written to AIC transmit FIFO from processor via store instruction or from memory via DMA. AIC then takes the data from the FIFO, serializes it, and sends it over the serial wire SDATA_OUT to an external CODEC or over an internal wire to an internal CODEC.

The audio transmission is enabled automatically when the AIC is enabled by set AICFR.ENB. But all replay data is zero at this time except both of the following conditions are true:

1. AICCR.ERPL must be 1. If AICCR.ERPL is 0, value of zero is send to CODEC even if there are samples in transmit FIFO.
2. At least one audio sample data in the transmit FIFO. If the transmit FIFO is empty, value of zero or last sample depends on AICFR.LSMP, is send to CODEC even if AICCR.ERPL is 1.

Here is the audio replay flow:

1. Configure the CODEC as needed.
2. Configure sample size by AICCR.OSS
3. Configure sample rate by clock dividers (for I2S/MSB-Justified format with BIT_CLK is provided internally) or by CODEC registers (for AC-link or BIT_CLK provided by external CODEC) or by CODEC memory mapped registers (for internal CODEC)
4. For AC-link, configure replay channels by ACCR1.XS
5. Some other configurations: mono to stereo, endian switch, signed/unsigned data transfer, transmit FIFO configuration, play ZERO or last sample when TX FIFO under-run, and etc.
6. Write 1 to AICCR.ERPL. It is suggested that at least a frame of PCM data is pre-filled in the transmit FIFO to prevent FIFO under-run flag (AICSR.TUR).
7. Fill sample data to the transmit FIFO. Repeat this till finish all sample data. In this procedure, please control the FIFO to make sure no FIFO under-run and other errors happen. When the transmit FIFO under-run, noise or pause may be heard in the audio replay, AICSR.TUR is 1, and if AICCR.ETUR is 1, AIC issues an interrupt. Please reference to 13.4.7 for detail description on FIFO.
8. Waiting for AICSR.TFL change to 0. So that all samples in the transmit FIFO has been replayed, then we can have a clean start up next time
9. Write 0 to AICCR.ERPL.

13.4.6 Audio Record

Incoming audio sample data (from CODEC to AIC) is received from SDATA_IN (for an external CODEC) or an internal wire (for an internal CODEC) serially and converted to parallel word and stored in AIC receive FIFO. Then the data can be taken from the FIFO to processor via load instruction or to memory via DMA.

The audio recording is enabled automatically when the AIC is enabled by set AICFR.ENB. But all received data is discarded at this time except both of the following conditions are true:

1. AICCR.EREC must be 1. If AICCR.EREC is 0, the received data is discarded even if there are rooms in the receive FIFO.
2. At least one room left in the receive FIFO. If the receive FIFO is full, the received data is discarded even if AICCR.EREC is 1.

Here is the audio record flow:

1. Configure the CODEC as needed.
2. Configure sample size by AICCR.ISS
3. Configure sample rate by clock dividers (for I2S/MSB-Justified format with BIT_CLK is provided internally) or by CODEC registers (for AC-link or BIT_CLK provided by external CODEC) or by CODEC memory mapped registers (for internal CODEC)
4. Some other configurations: signed/unsigned data transfer, receive FIFO configuration, and etc.
5. Write 1 to AICCR.EREC. Make sure there are rooms available in the receive FIFO before set AICCR.EREC. Usually, it should empty the receive FIFO by fetch data from it before set AICCR.EREC
6. Take sample data form the receive FIFO. Repeat this till the audio finished. In this procedure, please control the FIFO to make sure no FIFO over-run and other errors happen. When the receive FIFO over-run, same recorded audio samples will be lost, AICSR.ROR is 1, and if AICCR.EROR is 1, AIC issues an interrupt. Please reference to 13.4.7 for detail description on FIFO. For AC-link, ACCR1.RS tells which channels are recorded.
7. Write 0 to AICCR.EREC.
8. Take sample data from the receive FIFO until AICSR.RFL change to 0. So that all samples in the receive FIFO has been taken away, then we can have a clean start up next time. When the receive FIFO is empty, read from it returns zero.

13.4.7 FIFOs operation

AIC has two FIFOs, one for transmit audio sample and one for receive. All AIC played/recorded audio sample data is taken from/send to transmit/receive FIFOs. The FIFOs are in 24 bits width and 32 entries depth, one entry for keep one audio sample regardless of the sample size. AICDR.DATA provides the access point for processor/DMA to write to transmit FIFO and read from receive FIFO. One time access to AICDR.DATA process one sample. The sample data should be put in LSB (Least Significant Bit) in memory or processor registers. For transmitting, bits exceed sample are discarded. For receiving, these bits are set to 0. Figure 13-13 illustrates the FIFOs access.

Figure 13-13 Transmitting/Receiving FIFO access via APB Bus

The software and bus initiator must guarantee the right sample placement at the bus.

In case of DMA bus initiator, one 24, 20, 18 bits audio sample must occupies one 32-bits word in memory, so 32-bits width DMA must be used. One 16 bits sample occupies one 16-bits half word in memory, so 16-bits width DMA must be used. One 8-bits sample occupies one byte in memory, and use 8-bits width DMA.

In case of processor bus initiator, any type of the audio sample must occupies one CPU general-purpose register at LSB, and read/write from/to AICDR.DATA with 32-bits load/store instruction. When process small sample size, 16-bits or 8-bits, software may need to do the data pack/unpack.

The AICFR.TFTH and AICFR.RFTH are used to set the FIFO level thresholds, which are the trig levels of DMA request and/or FIFO service interrupt. The AICFR.TFTH and AICFR.RFTH should be set to proper values, too small or too big are not good. When it is too small, the DMA burst length or the number of sample can be processed by processor is too small, which harms the bus or processor efficiency. When it is too big, the bus or the interrupt latency left for under-run/over-run is too small, which may causes replay/record errors.

AICSR.TUR is set to 1 during transmit under-run conditions. If AICCR.ETUR is 1, this can trigger an interrupt. During transmit under-run conditions, zero or last sample is continuously sent out across the serial link. Transmit under-run can occur under the following conditions:

1. Valid transmit data is still available in memory, but the DMA controller/processor starves the transmit FIFO, as it is busy servicing other higher-priority tasks.
2. The DMA controller/processor has transferred all valid data from memory to the transmit FIFO.

AICSR.ROR is set to 1 during receive over-run conditions. If AICCR.EROR is 1, this can trigger an interrupt. During receive over-run conditions, data sent by the CODEC is lost and is not recorded.

When replay/record two channels data, the left channel is always the first data in FIFOs and in the serial link. If multiple channels in AC-link are used, the channel sample order is follows the slot order.

13.4.8 Data Flow Control

There are three approaches provided to control/synchronize the audio incoming/outgoing data flow.

13.4.8.1 Polling and Processor Access

AICSR.RFL and AICSR.TFL reflect how many samples exist in receiving and transmitting FIFOs. Through read these register fields, processor can detect when there are samples in receiving FIFO in audio record and then load them from the RX-FIFO, and when there are rooms in transmitting FIFO in audio replay and then store samples to the TX-FIFO.

Polling approach is in very low efficiency and is not recommended.

13.4.8.2 Interrupt and Processor Access

Set proper values to AICFR.TFTH and AICFR.RFTH, the FIFO interrupts trig thresholds. Set AICCR.ETFS and/or AICCR.ERFS to 1 to enable transmitting and/or receiving FIFO level trigger interrupts. When the interrupt found, it means there are rooms or samples in the TX or RX FIFO, and processor can store or load samples to or from the FIFO.

Interrupt approach is more efficient than polling approach.

13.4.8.3 DMA Access

Audio data is real time stream, though it is in low data bandwidth, usually less than 1.2Mbps. DMA approach is the most efficient and is the recommended approach.

To enable DMA operation, set AICCR.TDMS and AICCR.RDMS to 1 for transmit and receive respectively. It also needs to allocate two channels in DMA controller for data transmitting and receiving respectively. Please reference to the processor's DMAC spec for the details.

The AICFR.TFTH and AICFR.RFTH are used to set the transmitting and receiving FIFO level thresholds, which determine the issuing of DMA request to DMA controller. To respond the request, DMAC initiator and controls the data movement between memory and TX/RX FIFO.

13.4.9 Serial Audio Clocks and Sampling Frequencies

For internal CODEC, CODEC module containing the audio CODEC circuit/logic and corresponding controlling registers. CODEC needs a 12MHz clock from CPM and provides BIT_CLK and LR_CLK (left-right clock which is the sample rate as SYNC) to AIC for outgoing and incoming audio respectively. These clocks change when change the sample rate in CODEC controlling registers.

For AC-link, the bit clock is input from chip external and is fixed to 12.288MHz. The sample frequency of 48kHz is supported in nature. Variable Sample Rate feature is supported in this AIC. If the CODEC supports this feature, sample rate other than 48kHz audio data can be replay directly. Otherwise, software has to do the rate transfer to replay other sample rate audio data. Double rate, 96kHz or even 88.2kHz audio is also supported with proper CODEC.

Following are for BIT_CLK/SYS_CLK configuration in I2S/MSB-Justified format with external CODEC.

The BIT_CLK is the rate at which audio data bits enter or leave the AIC. BIT_CLK can be supplied either by the CODEC or an internally PLL. If it is supplied internally, BIT_CLK is configured as output pins, and is supplied to the CODEC. If BIT_CLK is supplied by the CODEC, then it is configured as an input pin. Register bit AICFR.BCKD is used to select BIT_CLK direction.

The audio sampling frequency is the frequency of the SYNC signal, which must be 1/64 of BIT_CLK, $f_{BIT\_CLK} = 64\ f_S$.

SYS_CLK is only for CODEC. It usually takes one of the two roles, as CODEC master clock input or as CODEC over-sampling clock input. If SYS_CLK roles as CODEC master clock input, it usually should be set to a fixed frequency according to CODEC requirement but independent to audio sample rate. In this case, usually there is a PLL in the CODEC and CODEC roles master mode. See Figure 13-4 for the interface diagram. This is the recommended AIC CODEC system configuration.

If SYS_CLK roles as CODEC over-sampling clock, its frequency is usually 4, 6, 8 or 12 times of BIT_CLK frequency, which are 256, 384, 512 and 768 times of audio sample rates. Table 13-6 lists the relation between sample rate, BIT_CLK and SYS_CLK frequencies.

Table 13-6 Audio Sampling rate, BIT_CLK and SYS_CLK frequencies

Sample Rate f_S (kHz)	**BIT_CLK (MHz) $f_{BIT\_CLK} = 64\ f_S$**	**SYS_CLK (MHz)**			
		256 f_S	**384 f_S**	**512 f_S**	**768 f_S**
48	3.072	12.288	18.432	24.576	36.864
44.1	2.8224	11.2896	16.9344	22.5792	33.8688
32	2.048	8.192	12.288	16.384	24.576
24	1.536	6.144	9.216	12.288	18.432
22.05	1.4112	5.6448	8.4672	11.2896	16.9344

16	1.024	4.096	6.144	8.192	12.288
11.025	0.7056	2.8224	4.2336	5.6448	8.4672
8	0.512	2.048	3.072	4.096	6.144

In this processor, SYS_CLK can be selected from EXCLK or generated by dividing the PLL output clock in a CPM divider controlled by I2SCDR. If BIT_CLK is chosen as an output, another divider in AIC is used to divide SYS_CLK for it. Figure 13-14 illustrates the AIC clock generation scheme.

The setting of I2SDIV.DV is shown in Table 13-7.

Table 13-7 BIT_CLK divider setting

I2SDIV.DV	f_{SYS_CLK}	f_{BIT_CLK}	f_{SYS_CLK} / f_{BIT_CLK}
0x1	128 f_S	64 f_S	2
0x2	196 f_S	64 f_S	3
0x3	256 f_S	64 f_S	4
0x5	384 f_S	64 f_S	6
0x7	512 f_S	64 f_S	8
0xB	768 f_S	64 f_S	12

As we observe in Table 13-6, if SYS_CLK is taken as over-sampling clock by CODEC, the common multiple of all SYS_CLK frequencies is much bigger than the PLL output clock frequency. To generate all different SYS_CLK frequencies, one approach is change PLL frequency according to sample rate. This is not realistic, since frequently change PLL frequency during normal operation is not recommended.

Another approach is to found some approximate common multiples of all SYS_CLK frequencies according to the fact that there tolerance in audio sample rate. Take f_{SYS_CLK} = 256 f_S, Table 13-8 list most frequencies, which are less than 400MHz, with relatively small sample rate errors. It is suggested to set PLL frequency as close to the frequencies listed as possible, then use clock dividers to generate different SYS_CLK/BIT_CLK for different sample rate.

Table 13-8 Approximate common multiple of SYS_CLK for all sample rates

Approximate Common Frequency (MHz)	Max Error Caused in Audio Sample Rate (%)
123.53	0.53
147.11	0.24
170.68	0.79
235.5	0.87
247.06	0.53

299	10	358.8	0.69%
247	8	370.5	0.55%
351	11	382.91	0.55%
230	7	394.29	0.27%

The BIT_CLK should be stopped temporary when change the divider settings, or when change BIT_CLK source (from internal or external), to prevent clock glitch. Register I2SCR.STPBK is provided to assist the task. When I2SCR.STPBK = 1, BIT_CLK is disabled no matter whether it is generated internally or inputted from the external source. The operation flow is described in following.

1. Stop all replay/record by clear AICCR.ERPL and AICCR.EREC.
2. Polling I2SSR.BSY till it is 0
3. Stop the BIT_CLK by write 1 to I2SCR.STPBK
4. Operations concerning BIT_CLK
5. Resume the BIT_CLK by write 0 to I2SCR.STPBK

13.4.10 Interrupts

The following status bits, if enabled, interrupt the processor:

- Receive FIFO Service (AICSR.RFS). It's also DMA Request
- Transmit FIFO Service (AICSR.TFS). It's also DMA Request
- Transmit Under-Run (AICSR.TUR)
- Receive Over-Run (AICSR.ROR)
- Command Address and Data Transmitted, AC-link only (ACSR.CADT)
- External CODEC Registers Status Address and Data Received, AC-link only (ACSR.SADR)
- External CODEC Registers Read Status Time Out, AC-link only (ACSR.RSTO)

For further details, see the corresponding register description sections.

14 Internal CODEC

14.1 Overview

This chapter describes internal audio CODEC embedded in the processor and related software interface.

The internal CODEC is an I2S audio CODEC with 18 bits DAC and 16 bits ADC. It also has several memory mapped registers used to control and configure the CODEC. AIC is used to interface to the CODEC for audio data replaying and recording.

14.1.1 Features

The following are internal CODEC features:

- DAC: 18 bits sample size, SNR 90dB
- ADC: 16 bits sample size, SNR 85dB
- Sample rate: 8kHz, 11.025kHz, 12kHz, 16kHz, 22.05kHz, 24kHz, 32kHz, 44.1kHz and 48kHz
- Head phone amplifier to support up to 16ohm load.
- Anti-pop for head phone out
- Low power dissipation mode
- Digital volume control

14.1.2 Signal Descriptions

CODEC has 5 ~ 7 signal IO pins depending on various chips. They are listed and described in Table 14-1.

Table 14-1 CODEC signal IO pin description

Pin Names	IO	4740 Loc	4720 Loc	IO Cell Char.	Pin Description	Power
LHPO	AO	E14			LHPO: Left headphone out	VDD_{CDC}

14.2 Register Descriptions

The internal CODEC software interface includes 2 registers. They are mapped in IO memory address space so that program can access them to control the operations of the CODEC.

Table 14-2 Internal CODEC Registers Description

Name	Description	RW	Reset value	Address	Size
CDCCR1	CODEC Control Register 1	RW	0x021B2302	0x10020080	32
CDCCR2	CODEC Control Register 2	RW	0x00170803	0x10020084	32

- CDCCR1 is used to control MIC input, LINE input, headphone out, ADC, DAC, CODEC suspend/reset and anti-pop procedures.
- CDCCR2 is used to control values or gains of MIC input, LINE input and headphone, and audio sample rate.

14.2.1 CODEC Control Register 1 (CDCCR1)

CDCCR1 contains bits to control MIC input, LINE input, headphone out, ADC, DAC, CODEC suspend/reset and anti-pop procedures. Set AICFR.ICDC to 1 before write to this register, or the effect is undefined.

CDCCR1 **0x10020080**

14.2.2 CODEC Control Register 2 (CDCCR2)

CDCCR2 contains bits to control values or gains of MIC input, LINE input and headphone, and audio sample rate. Set AICFR.ICDC to 1 before write to this register, or the effect is undefined.

CDCCR2 **0x10020084**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Reserved											AINVOL					Reserved				SMPR				Reserved		MICBG		Reserved		HPVOL	
RST	0	0	0	0	0	0	0	0	0	0	0	1	0	1	1	1	0	0	0	0	1	0	0	0	0	0	0	0	0	0	1	1

Bits	Name	Description	RW
31:21	Reserved	Writes to these bits have no effect and always read as 0	R
20:16	AINVOL	The audio input programmable gain amplifier volume control. It influences both MIC input and line input volume. AINVOL | Gain 0 | -34.5 dB 1 | -33.0 dB … | (AINVOL * 1.5) – 34.5 23 | 0 dB … | … 30 | +10.5 dB 31 | +12.0 dB	RW
15:12	Reserved	Writes to these bits have no effect and always read as 0	R
11:8	SMPR	The audio sample rate. There is an error of 0.04% exists for some sample rates. The sample rate for ADC and DAC is the same if they work in the same time. SMPR should be changed during AIC register AICCR.EREC=0 and AICCR.ERPL=0, or noise may be recorded/heard. SMPR | Nominal Sample Rate (kHz) | Actual Sample Rate (kHz) 0000 | 8 | 8 0001 | 11.025 | 11.029 0010 | 12 | 12 0011 | 16 | 16 0100 | 22.05 | 22.059 0101 | 24 | 24 0110 | 32 | 32 0111 | 44.1 | 44.118 1000 | 48 | 48	RW
7:6	Reserved	Writes to these bits have no effect and always read as 0	R

5:4	MICBG	MIC Boost Gain. **MICBG** | **MIC Boost Gain** 00 | 0 dB 01 | 6 dB 10 | 12 dB 11 | 20 dB	RW
3:2	Reserved	Writes to these bits have no effect and always read as 0	R
1:0	HPVOL	Headphone amplifier volume control. In case of HPVOL=’b11, the maximum positive sample data produces 0 voltage in HPOUT while maximum negative sample data produces VDDHP voltage. The maximum peak-to-peak voltage is VDDHP. In case of HPVOL=’b00, The maximum HPOUT peak-to-peak voltage is half of VDDHP and the middle of the wave is still VREF voltage. **HPVOL** | **Gain** 00 | 0 dB 01 | 2 dB 10 | 4 dB 11 | 6 dB	RW

14.3 Operation

The internal CODEC can be accessed by the processor using programmed I/O instructions via memory mapped registers. CODEC memory mapped registers are only for the CODEC controlling. The audio data transferring, i.e. audio replaying and recording, is down by AIC. AIC still takes the role of I2S controller where CODEC memory mapped registers take the role of CODEC controlling interface just like L3 bus or I2C bus for an external CODEC. We will refer to many AIC operations and registers in the following audio operation descriptions. Please reference to AIC spec for the details.

14.3.1 Initialization

At power-on or other hardware reset (WDT, wakeup from hibernating mode and etc), The CODEC is reset and is put in suspend mode. The CODEC is also be reset at the time it leaves suspend mode. So if there's error found in the CODEC, set CDCCR.SUSPD to 1 and then set it to 0 will reset CODEC from the error.

To use the internal CODEC with AIC, several AIC registers should be set as,

AICFR.ICDC = 1
AICFR.AUSEL = 1
AICFR.BCKD = 0
AICFR.SYNCD = 0
I2SCR.AMSL = 0

14.3.2 CODEC controlling and typical operations

Table 14-3 CODEC settings in various applications

SUSPD	ELININ	EMIC	Set MICBG	Set AINVOL	EADC	SW1ON	EDAC	SW2ON	Set SMPR	HP Amp	HPMUTE	Set HPVOL	Applications
0	0	0	N	N	0	0	1	1	Y	ON	0	Y	Audio data replay

0	1	1	Y	Y	1	?	0	?	Y	OFF	?	N	Record MIC/LINE mixed input audio without playback 2[2]
0	1	1	Y	Y	1	1	0	0	Y	ON	0	Y	Record MIC/LINE mixed input audio with playback
1	?	?	?	?	?	?	?	?	?	?	?	?	CODEC is off, no action can be taken

Notes:

1. HP amplifier turn on/turn off procedures are complicate and may produce noise.
2. Turn off HP amplifier can save power

Table 14-3 lists the CODEC settings in many applications. Following are more details for some typical operations.

14.3.2.1 Audio data replay

To replay audio data to the internal CODEC, please consult the following steps.

1. Turn HP amplifier on if it is off or the CODEC is suspended.
2. Set CDCCR1.ELININ=0, CDCCR1.EMIC=0, CDCCR1.EADC=0, CDCCR1.SW1ON=0, CDCCR1.EDAC=1, CDCCR1.SW2ON=1, CDCCR1.HPMUTE=0

3. Set proper HP amplifier volume CDCCR2.HPVOL
4. Set proper sample rate CDCCR2.SMPR
5. Set proper sample size AICCR.OSS
6. Configure other audio replaying features
7. Configure AIC TX-FIFO, interrupt
8. Setup DMA and interrupt for audio data
9. Set AICCR.ERPL=1 to replay
10. After finished the data replaying, set AICCR.ERPL=0

14.3.2.2 Audio data replay while record MIC input without playback

To replay audio data to the internal CODEC, in the same time, record audio from the internal CODEC MIC input without playback them, please consult the following steps.

1. Turn HP amplifier on if it is off or the CODEC is suspended.
2. Set CDCCR1.ELININ=0, CDCCR1.EMIC=1, CDCCR1.EADC=1, CDCCR1.SW1ON=0, CDCCR1.EDAC=1, CDCCR1.SW2ON=1, CDCCR1.HPMUTE=0
3. Set proper MIC boost gain volume CDCCR2.MICBG, input amplifier volume CDCCR2.AINVOL and HP amplifier volume CDCCR2.HPVOL
4. Set proper ADC and DAC sample rate CDCCR2.SMPR
5. Set proper DAC sample size AICCR.OSS and ADC sample size AICCR.ISS to 16 bits
6. Configure other audio replaying features
7. Configure AIC TX-FIFO, RX-FIFO, interrupt
8. Setup DMA and interrupt for both incoming and outgoing audio data
9. Set AICCR.ERPL=1 to replay and AICCR.EREC=1 to record
10. After finished the data replaying, set AICCR.ERPL=0
11. After finished the record, set AICCR.EREC=0

14.3.2.3 Playback LINE input audio

To playback audio LINE input in the internal CODEC, please consult the following steps.

1. Turn HP amplifier on if it is off or the CODEC is suspended.
2. Set CDCCR1.ELININ=1, CDCCR1.EMIC=0, CDCCR1.EADC=0, CDCCR1.SW1ON=1, CDCCR1.EDAC=0, CDCCR1.SW2ON=0, CDCCR1.HPMUTE=0
3. Set proper input amplifier volume CDCCR2.AINVOL and HP amplifier volume CDCCR2.HPVOL

14.3.2.4 Record LINE input audio with playback

To record audio from the internal CODEC LINE input, in the same time playback them, please consult the following steps.

1. Turn HP amplifier on if it is off or the CODEC is suspended.
2. Set CDCCR1.ELININ=1, CDCCR1.EMIC=0, CDCCR1.EADC=1, CDCCR1.SW1ON=1, CDCCR1.EDAC=0, CDCCR1.SW2ON=0, CDCCR1.HPMUTE=0
3. Set proper input amplifier volume CDCCR2.AINVOL and HP amplifier volume CDCCR2.HPVOL
4. Set proper sample rate CDCCR2.SMPR
5. Set sample size AICCR.ISS to 16 bits
6. Configure other audio record features
7. Configure AIC RX-FIFO, interrupt
8. Setup DMA and interrupt for audio data
9. Set AICCR.EREC=1 to record
10. After finished the record, set AICCR.EREC=0

14.3.2.5 Record MIC input audio without playback 2

To record audio from the internal CODEC MIC input without playback them, please consult the following steps.

1. If HP amplifier is on, turn it off.
2. Set CDCCR1.SUSPD=0, CDCCR1.ELININ=0, CDCCR1.EMIC=1, CDCCR1.EADC=1, CDCCR1.EDAC=0
3. Set proper MIC boost gain volume CDCCR2.MICBG and input amplifier volume CDCCR2.AINVOL
4. Set proper sample rate CDCCR.SMPR
5. Set sample size AICCR.ISS to 16 bits
6. Configure other audio record features
7. Configure AIC RX-FIFO, interrupt
8. Setup DMA and interrupt for audio data
9. Set AICCR.EREC=1 to record
10. After finished the record, set AICCR.EREC=0

14.3.3 Power saving

14.3.4 Pop noise and the reduction of it

The internal CODEC includes an amplifier for headphone output. The pop noise when headphone amplifies turning on and turning off (power on/off) is normally an issue for an audio CODEC. In this processor, we provide several approaches to reduce the pop noise.

The sound of the headphone depends on the voltage change of the HPOUT pins. The HPOUT voltage changing speed decides the sound tune and the changing range decides the sound magnitude. VREF is the reference voltage. It will be Vm, the half of VDDCDC and is the middle voltage of HPOUT when CODEC is working. The HPOUT and VREF voltage should be bring to Vm after this chip and the CODEC power on and before play audio from it. No noise will be found when start play audio in case of HPOUT and VREF are Vm. So the key point is bring VREF and HPOUT to Vm in a noise free and fast procedure.

14.3.4.1 Charge and discharge of VREF and HPOUT

The timing values listed in the following tables are measured in the condition of:

- Two 220uF capacitors are connected to HPOUTL and HPOUTR pins respectively
- 0.1uF + 10uF capacitors are connected to VREF pin
- Room temperature

The standard deviation (σ) of the timing is also listed as well as the average timing value. According to statistical theory, the average timing ±3σ covers 99.7% cases, ±4σ covers 99.994% cases. So the (average + 4σ) timing value is recommended.

Table 14-4 Charge VREF to the middle voltage Vm

Operation	Timing	No Noise Condition
Set CDCCR1 = 0x000b2302	VREF 0→Vm: 0.8±?s	
Set CDCCR1 = 0x00002302?	VREF 0→Vm: 50±?ms?	

Note:

In case of CDCCR1 = 0x000b2302, the whole CODEC power consumption is about 410uA.

In case of CDCCR1 = 0x00002302, the whole CODEC power consumption is about ?uA.

Table 14-5 Charge HPOUT to the middle voltage Vm

Operation	Timing	No Noise Condition
Replay data from 0x1FFFF to 0	HPOUT 0→Vm: 500±?ms	VREF = Vm, HPOUT start from 0V, CDCCR2.HPVOL=3, CDCCR1.HPOV0=0

Table 14-6 Charge VREF and HPOUT to the middle voltage Vm

Operation	Timing	No Noise Condition
Set CDCCR1 = 0x00033302	VREF 0→Vm: 0.8±?s HPOUT 0→Vm: 1.5±?s	Both VREF and HPOUT start from 0V
	HPOUT (Vm – 0.1V)→Vm: 0.7±?s	VREF = Vm, HPOUT > (Vm – 0.1V)

Note:

In case of CDCCR1 = 0x00033302, the whole CODEC power consumption is about 1mA.

Table 14-7 Discharge HPOUT to 0V

Operation	Timing	No Noise Condition
Set CDCCR1 = 0x001b2102	HPOUT Vm→0: 1.7±?s	Change to CDCCR1 = 0x001b2302 first

Note:

In case of CDCCR1 = 0x001b2102, the whole CODEC power consumption is < 0.1uA.

Table 14-8 Discharge VREF to 0V

Operation	Timing	No Noise Condition
Set CDCCR1 = 0x001f2302	VREF Vm→0: 3±?ms	

Note:

In case of CDCCR1 = 0x001f2302, the whole CODEC power consumption is < 0.1uA.

Table 14-9 Discharge VREF and HPOUT to 0V

Operation	Timing	No Noise Condition
Set CDCCR1 = 0x001f2102	HPOUT Vm→0: 1.7±?s VREF Vm→0: 3±?ms	Change to CDCCR1 = 0x001b2302 first

Note:

In case of CDCCR1 = 0x001f2102, the whole CODEC power consumption is about 500uA.

14.3.4.2 Leakage of HPOUT and VREF

Set CDCCR1 to 0x001b2302 after HPOUT and VREF are charged Vm, the electrons in HPOUT and VREF capacitors will leak slowly and the voltage will be down slowly. The voltage down speed is greatly depends on the system environment, the HPOUT/VREF capacitance, PCB, capacitor leakage characteristics, temperature, humidity and etc.

Please measure the HPOUT leak 0.1V time, TL01, for your system at the worst case: the highest working temperature and humidity. The steps are

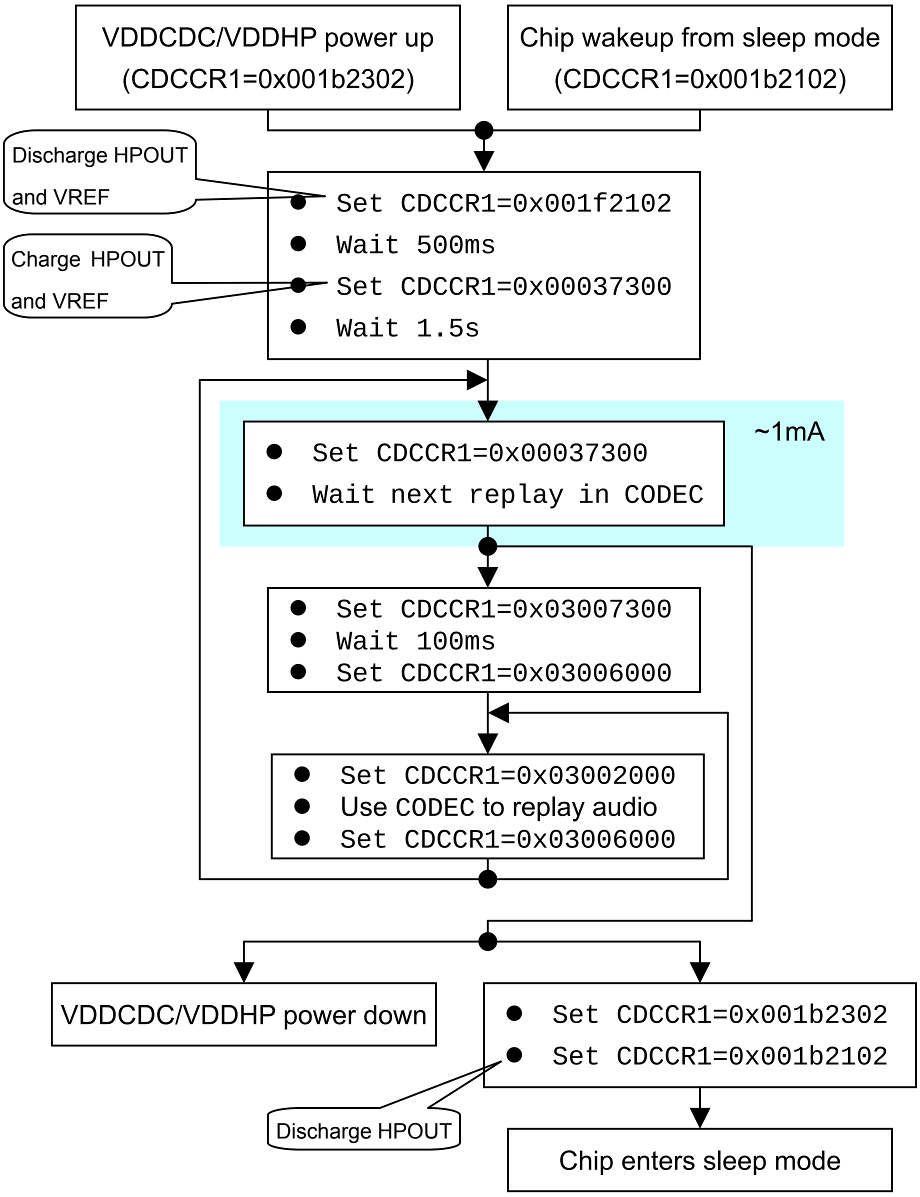
1. Set CDCCR1 = 0x00033302, which charge HPOUT to Vm
2. Set CDCCR1 = 0x001b2302 and start count the time
3. When HPOUT = Vm – 0.1V, stop count the time. (caution: please notice the voltage measurement

instrument causes leakage)

TL01 is the time counted.

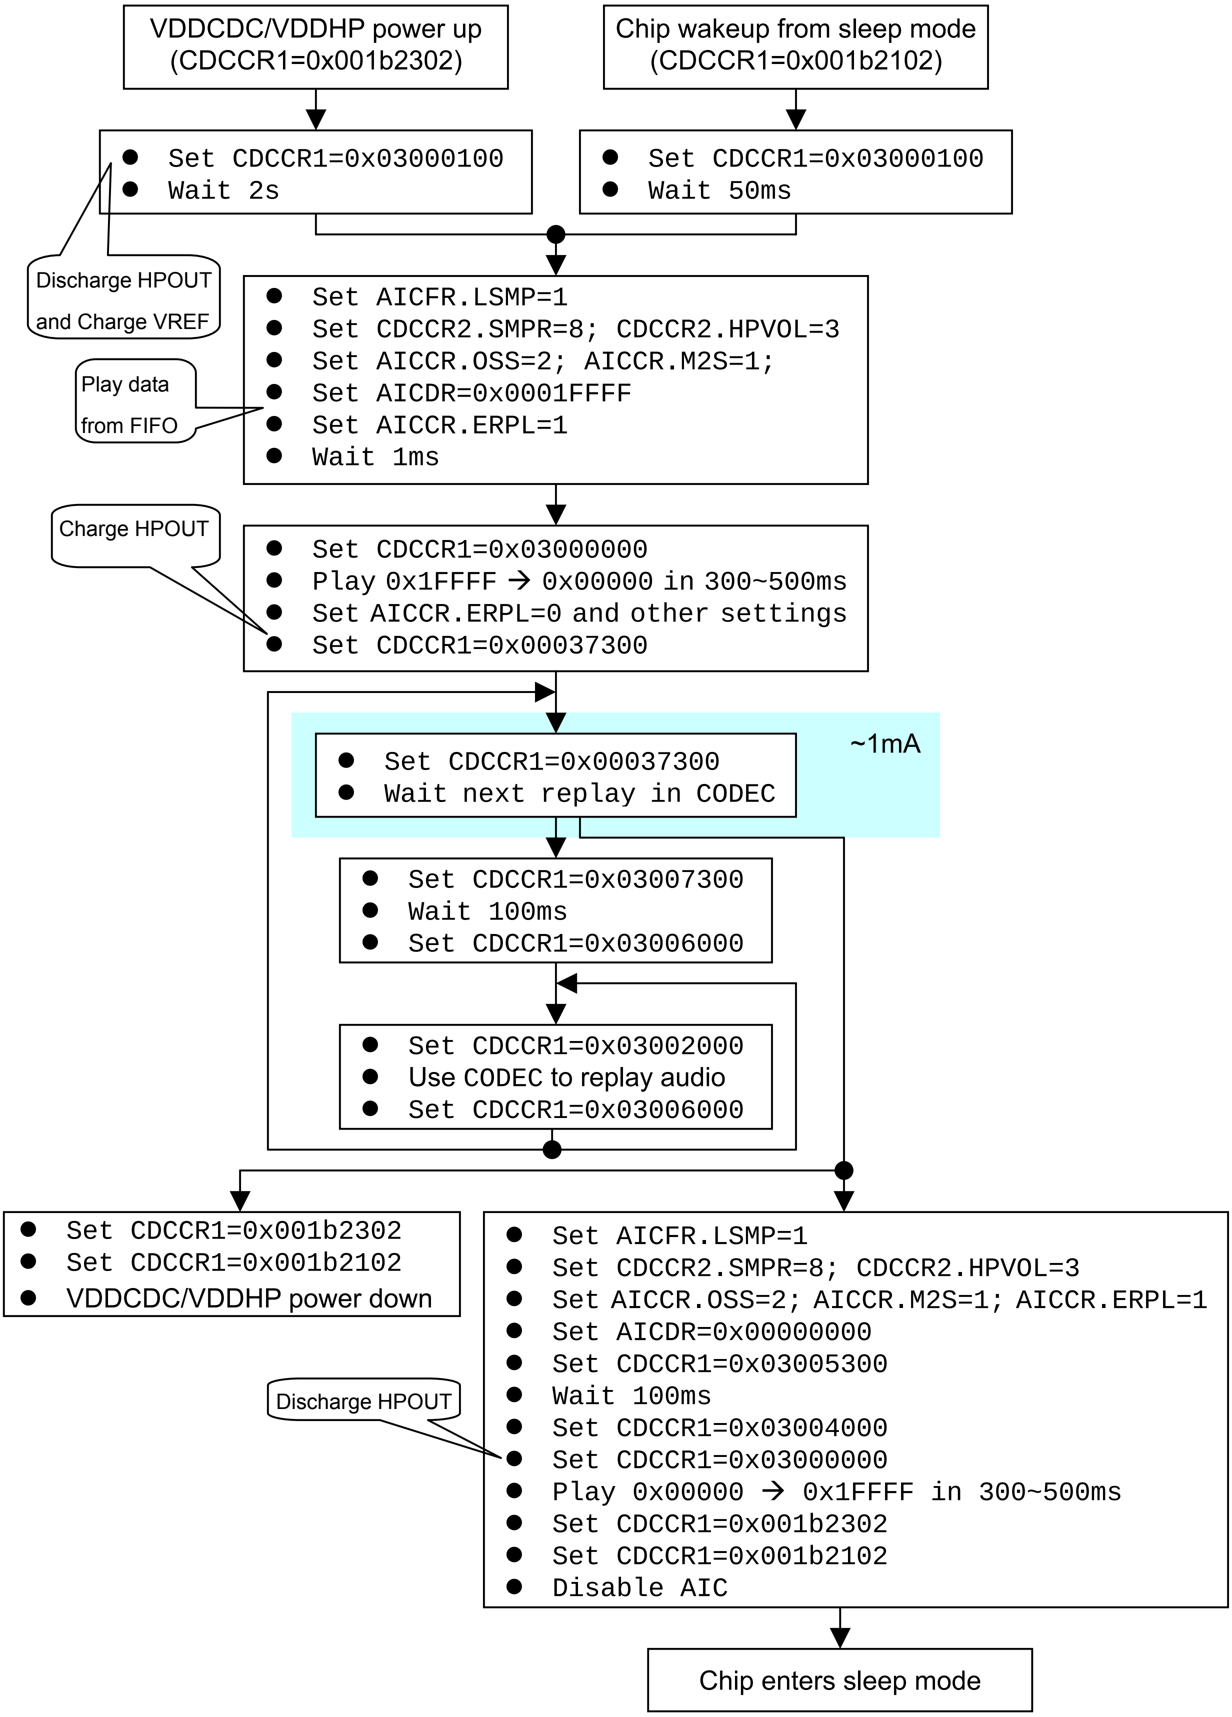
This measurement is not needed if user doesn't use complex anti-pop approach.

14.3.4.3 Simple-slow anti-pop approach



VDDCDC/VDDHP power up
(CDCCR1=0x001b2302)
Chip wakeup from sleep mode
(CDCCR1=0x001b2102)
Discharge HPOUT and VREF
Charge HPOUT and VREF
Set CDCCR1=0x001f2102
Wait 500ms
Set CDCCR1=0x00037300
Wait 1.5s
~1mA
Set CDCCR1=0x00037300
Wait next replay in CODEC
Set CDCCR1=0x03007300
Wait 100ms
Set CDCCR1=0x03006000
Set CDCCR1=0x03002000
Use CODEC to replay audio
Set CDCCR1=0x03006000
VDDCDC/VDDHP power down
Set CDCCR1=0x001b2302
Set CDCCR1=0x001b2102
Discharge HPOUT
Chip enters sleep mode

14.3.4.4 Simple-fast anti-pop approach



VDDCDC/VDDHP power up (CDCCR1=0x001b2302)

- Set CDCCR1=0x03000100
- Wait 2s

Chip wakeup from sleep mode (CDCCR1=0x001b2102)

- Set CDCCR1=0x03000100
- Wait 50ms

- Set AICFR.LSMP=1
- Set CDCCR2.SMPR=8; CDCCR2.HPVOL=3
- Set AICCR.OSS=2; AICCR.M2S=1;
- Set AICDR=0x0001FFFF
- Set AICCR.ERPL=1
- Wait 1ms

- Set CDCCR1=0x03000000
- Play 0x1FFFF → 0x00000 in 300~500ms
- Set AICCR.ERPL=0 and other settings
- Set CDCCR1=0x00037300

- Set CDCCR1=0x00037300
- Wait next replay in CODEC

~1mA

- Set CDCCR1=0x03007300
- Wait 100ms
- Set CDCCR1=0x03006000

- Set CDCCR1=0x03002000
- Use CODEC to replay audio
- Set CDCCR1=0x03006000

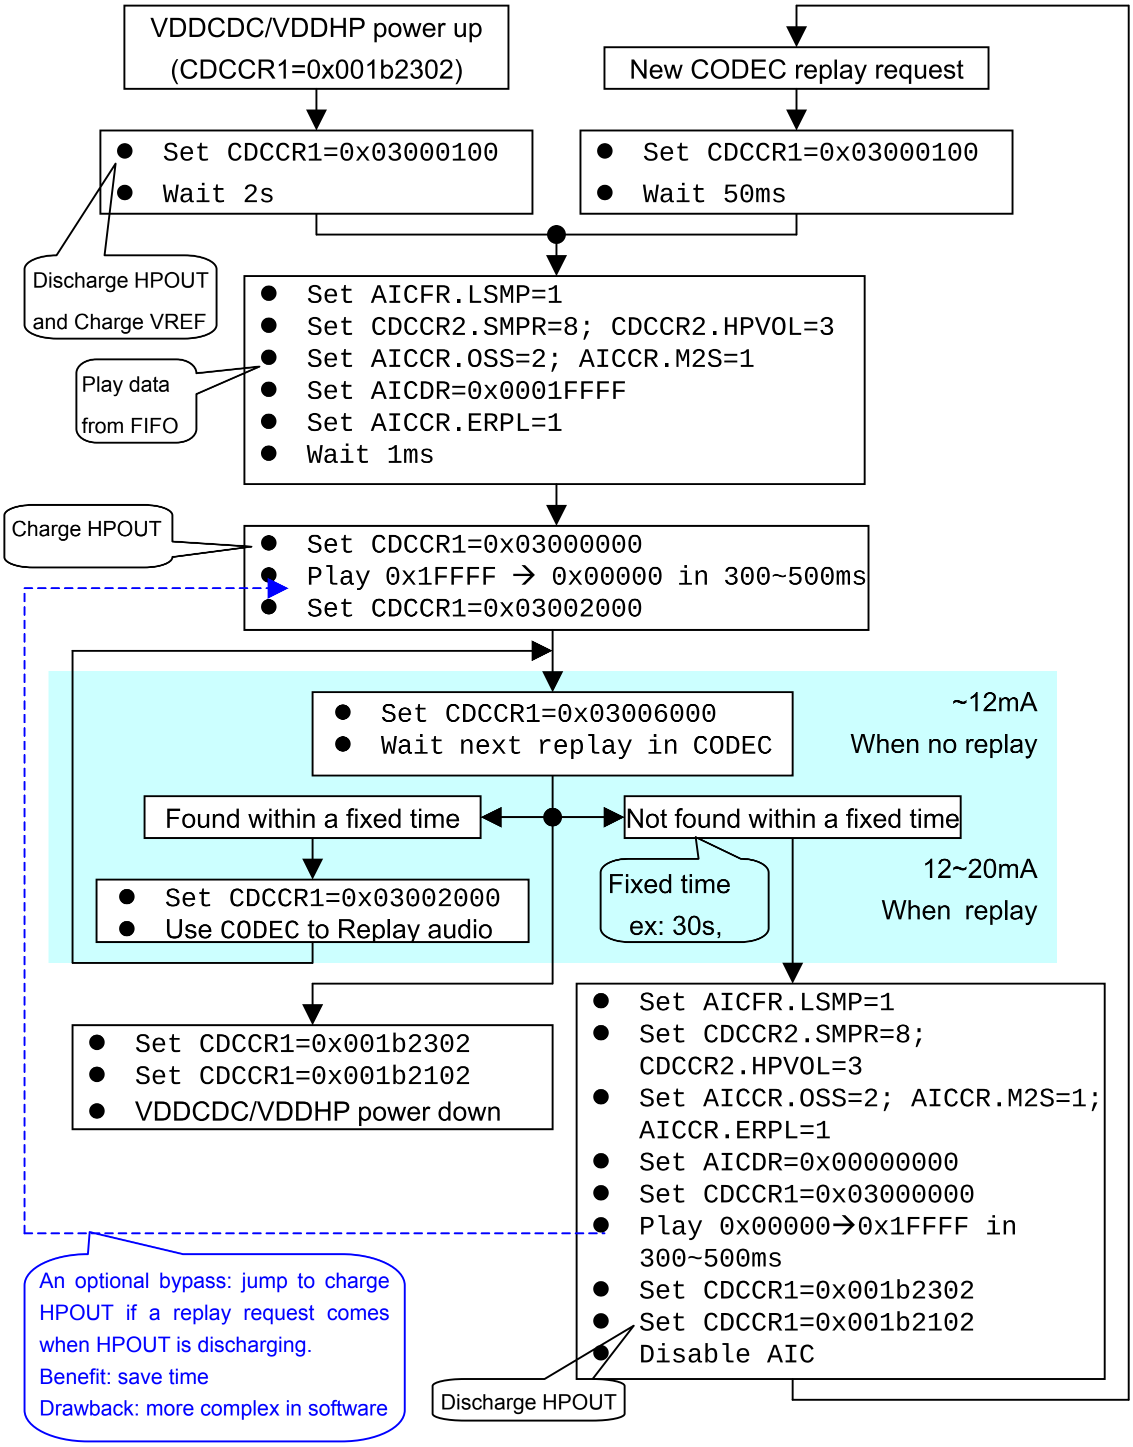
- Set CDCCR1=0x001b2302
- Set CDCCR1=0x001b2102
- VDDCDC/VDDHP power down

- Set AICFR.LSMP=1
- Set CDCCR2.SMPR=8; CDCCR2.HPVOL=3
- Set AICCR.OSS=2; AICCR.M2S=1; AICCR.ERPL=1
- Set AICDR=0x00000000
- Set CDCCR1=0x03005300
- Wait 100ms
- Set CDCCR1=0x03004000
- Set CDCCR1=0x03000000
- Play 0x00000 → 0x1FFFF in 300~500ms
- Set CDCCR1=0x001b2302
- Set CDCCR1=0x001b2102
- Disable AIC

Chip enters sleep mode

14.3.4.5 Improved anti-pop approach

There is a small pop (about 20~30mV voltage change in HPOUT) when CDCCR1 changed from 0x00033302 to 0x03002000. This approach eliminates this pop.



VDDCDC/VDDHP power up
(CDCCR1=0x001b2302)
New CODEC replay request
● Set CDCCR1=0x03000100
● Wait 2s
● Set CDCCR1=0x03000100
● Wait 50ms
Discharge HPOUT and Charge VREF
● Set AICFR.LSMP=1
● Set CDCCR2.SMPR=8; CDCCR2.HPVOL=3
● Set AICCR.OSS=2; AICCR.M2S=1
● Set AICDR=0x0001FFFF
● Set AICCR.ERPL=1
● Wait 1ms
Play data from FIFO
Charge HPOUT
● Set CDCCR1=0x03000000
● Play 0x1FFFF → 0x00000 in 300~500ms
● Set CDCCR1=0x03002000
● Set CDCCR1=0x03006000
● Wait next replay in CODEC
~12mA
When no replay
Found within a fixed time
Not found within a fixed time
● Set CDCCR1=0x03002000
● Use CODEC to Replay audio
Fixed time ex: 30s,
12~20mA
When replay
● Set CDCCR1=0x001b2302
● Set CDCCR1=0x001b2102
● VDDCDC/VDDHP power down
● Set AICFR.LSMP=1
● Set CDCCR2.SMPR=8; CDCCR2.HPVOL=3
● Set AICCR.OSS=2; AICCR.M2S=1; AICCR.ERPL=1
● Set AICDR=0x00000000
● Set CDCCR1=0x03000000
● Play 0x00000→0x1FFFF in 300~500ms
● Set CDCCR1=0x001b2302
● Set CDCCR1=0x001b2102
● Disable AIC
An optional bypass: jump to charge HPOUT if a replay request comes when HPOUT is discharging.
Benefit: save time
Drawback: more complex in software
Discharge HPOUT

14.3.4.6 Complex anti-pop approach

14.4 Timing parameters

14.5 AC & DC parameters

15 SAR A/D Controller

15.1 Overview

The A/D embedded in this processor is a CMOS low-power dissipation 12bit SAR analog to digital converter. It operates with 3.3/1.8V power supply. Circuits needed by touch screen function and battery voltage measurement are also included.

The SAR A/D controller is dedicated to control A/D to work at three different modes: Touch Screen (measure pen position and pen down pressure), Battery (check the battery power), and SADCIN (external ADC input). Touch Screen can transfer the data to memory though the DMA or CPU. Battery and SADCIN can transfer the data to memory though CPU.

Features:

- 6 Channel
- Resolution: 12-bit
- Integral nonlinearity: ±0.5 LSB
- Differential nonlinearity: ±0.4 LSB
- Resolution/speed: up to12bit 187.5ksps
- Max Frequency: 6.0MHz
- Power-down current: 1uA
- Support touch screen measurement (Through pin XP, XN, YP, YN)
- Support voltage measurement (Through pin PBAT)
- Support external SAR-ADC input (Through pin SADCIN)
- Separate Channel Conversion Mode
- Single-end and Differential Conversion Mode
- Auto X/Y, X/Y/Z and X/Y/Z1/Z2 position measurement

15.2 Pin Description

Table 15-1 SADC Pins Description

Name	I/O	Description
XN	AI	Touch screen analog differential X- position input
YN	AI	Touch screen analog differential Y- position input
XP	AI	Touch screen analog differential X- position input
YP	AI	Touch screen analog differential Y- position input
ADIN0 (PBAT)	AI	Analog input for VBAT measurement.
ADIN1 (SADCIN)	AI	External SAR-ADC input

15.3 Register Description

In this section, we will describe the registers in SAR A/D controller. Following table lists all the registers definition. All register's 32bit address is physical address. And detailed function of each register will be described below.

Name	Description	RW	Reset Value	Address	Access Size
ADENA	ADC Enable Register	RW	0x00	0x10070000	8
ADCFG	ADC Configure Register	RW	0x0002002C	0x10070004	32
ADCTRL	ADC Control Register	RW	0x00	0x10070008	8
ADSTATE	ADC Status Register	RW	0x00	0x1007000C	8
ADSAME	ADC Same Point Time Register	RW	0x0000	0x10070010	16
ADWAIT	ADC Wait Time Register	RW	0x0000	0x10070014	16
ADTCH	ADC Touch Screen Data Register	RW	0x00000000	0x10070018	32
ADBDAT	ADC PBAT Data Register	RW	0x0000	0x1007001C	16
ADSDAT	ADC SADCIN Data Register	RW	0x0000	0x10070020	16
ADDPIN	ADC IP DATA PIN	R	0x0000	0x10070024	16

15.3.1 ADC Enable Register (ADENA)

The register ADENA is used to trigger A/D to work.

ADENA **0x10070000**

Bit	7	6	5	4	3	2	1	0
	ADEN	Reserved				TCHEN	PBATEN	SADCINEN
RST	0	0	0	0	0	0	0	0

Bits	Name	Description	RW
7	ADEN[*1]	A/D Enable Control. (Only used in test mode) Check the channel function of ADC. When A/D finish sampling the data, ADEN will be cleared by hardware auto. 0: disable 1: enable	RW
6:3	Reserved	These bits always read 0, and written are ignored.	R
2	TCHEN[*2]	Touch Screen Enable Control. 0: disable 1: enable	RW
1	PBATEN[*2]	PBAT Enable Control. Sample the voltage of battery, PBATEN can be set to 1 no matter TCHEN is disable or enable, and when the voltage of battery is ready. PBATEN will be cleared by hardware auto.	RW
0	SADCINEN[*2]	SADCIN Enable Control. Sample SADCIN, SADCINEN can be set to 1 no matter TCHEN is disable or enable, and when SADCIN is ready, SADCINEN will be cleared by hardware auto.	RW

Note:

*1. When ADEN is set to 1, other bits cannot be set to 1 at the same time. This mode only used in test mode.

*2. TCHEN, PBATEN and SADCINEN can be set to 1 at the same time. The priority of the three mode is SADCIN > PBAT > TCH.

15.3.2 ADC Configure Register (ADCFG)

The register ADCFG is used to configure the A/D.

ADCFG **0x10007004**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SPZZ	EX_IN	Reserved											CLKOUTD	NUM		DMA_EN	XYZ		SNUM			CLKDIV					BAT_MD	CMD			
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	1	0	1	1	0	0

<table>
<tr><th>Bits</th><th>Name</th><th>Description</th><th>RW</th></tr>
<tr><td>31</td><td>SPZZ[*1]</td><td>The $X_dY_dZ_mZ_n$ of different point measure can be different.
But the $X_dY_dZ_mZ_n$ of the same point measure can be same or different.
0:The $X_dY_dZ_mZ_n$ of the same point measure is all the same.
(X_dY_dZ1Z2, X_dY_dZ1Z2, X_dY_dZ1Z2, X_dY_dZ1Z2 … X_dY_dZ1Z2)
1: The $X_dY_dZ_mZ_n$ of the same point measure maybe different.
(X_dY_dZ1Z2, X_dY_dZ3Z4, X_dY_dZ3Z4, X_dY_dZ1Z2 … X_dY_dZ1Z2)</td><td>RW</td></tr>
<tr><td>30</td><td>EX_IN</td><td>Choose external driver or internal driver.
0: X_sY_s or X_sY_sZ
1: X_dY_d or X_dY_dZ
It is no use for $X_dY_dZ_mZ_n$.

It is no use when ADCFG.XYZ = 10.
It is useful when ADCFG.XYZ = 00/01.</td><td>RW</td></tr>
<tr><td>29:19</td><td>Reserved</td><td>These bits always read 0, and written are ignored.</td><td>R</td></tr>

<tr><td>4</td><td>BAT_MD</td><td>When AD is used as PBAT measure the following channel mode can be chose to measure the battery power.
0: PBAT (full battery voltage>=2.5V)
1: PBAT (full battery voltage<2.5V)</td><td>RW</td></tr>
</table>

<table>
<tr><td>3:0</td><td>CMD</td><td>CMD is used to choose the current sample command when adc_en_r is set to 1 (single channel test mode).
<table>
<tr><td>CMD</td><td>Function</td><td>Reference mode</td></tr>
<tr><td>0000</td><td>Measure X Position (X-plate is driven by external DC power)</td><td>Single-end</td></tr>
<tr><td>0001</td><td>Measure Y Position (Y-plate is driven by external DC power)</td><td>Single-end</td></tr>
<tr><td>0010</td><td>Measure X Position</td><td>Differential</td></tr>
<tr><td>0011</td><td>Measure Y Position</td><td>Differential</td></tr>
<tr><td>0100</td><td>Measure Z1 Position</td><td>Differential</td></tr>
<tr><td>0101</td><td>Measure Z2 Position</td><td>Differential</td></tr>
<tr><td>0110</td><td>Measure Z3 Position</td><td>Differential</td></tr>
<tr><td>0111</td><td>Measure Z4 Position</td><td>Differential</td></tr>
<tr><td>1000</td><td>Measure Touch Pressure Z</td><td>Single-end</td></tr>
<tr><td>1001</td><td>Measure PBAT (>=2.5V)</td><td>Single-end</td></tr>
<tr><td>1010</td><td>Measure PBAT (<2.5V)</td><td>Single-end</td></tr>
<tr><td>1011</td><td>Measure SADCIN</td><td>Single-end</td></tr>
<tr><td>1100</td><td colspan="2">INT_PEN enable, this mode is the default value.</td></tr>
<tr><td>1101~1111</td><td colspan="2">Reserved</td></tr>
</table>
</td><td>RW</td></tr>
</table>

Note[*1]:

X_s, Y_s, Z_s means the reference mode of X, Y, Z is single-end mode.

X_d, Y_d, $Z1_d$, $Z2_d$, $Z3_d$, Z4d means the reference mode of X, Y, Z1, Z2, Z3, Z4 is differential mode.

When you measure Xs you need to make sure that X-plate is driven by external DC power.

When you measure Ys you need to make sure that Y-plate is driven by external DC power.

15.3.3 ADC Control Register (ADCTRL)

The register ADCTRL is used to control A/D to work.

ADCTR **0x10070008**

Bit	7	6	5	4	3	2	1	0
	Reserved			PENDM	PENUM	DTCHM	DRDYM	SRDYM
RST	0	0	0	0	0	0	0	0

Bits	Name	Description	RW
7:5	Reserved	These bits always read 0, and written are ignored.	R
4	PENDM	Pen down interrupt mask. 0= enabled 1= masked	RW

3	PENUM	Pen up interrupt mask. 0= enabled 1= masked	RW
2	DTCHM	Touch Screen Data Ready interrupt mask. 0= enabled 1= masked	RW
1	DRDYM	Data ready interrupt mask. (ADCEN = 1) PBAT data ready interrupt mask. 0= enabled 1= masked	RW
0	SRDYM	SADCIN Data Ready interrupt mask. 0= enabled 1= masked	RW

15.3.4 ADC Status Register (ADSTATE)

The register ADCSTATE is used to keep the status of A/D.

ADSTS **0x1007000C**

Bit	7	6	5	4	3	2	1	0
	Reserved			PEND	PENU	DTCH	DRDY	SRDY
RST	0	0	0	0	0	0	0	0

Bits	Name	Description	RW
7:5	Reserved	These bits always read 0, and written are ignored.	R
4	PEND	Pen down interrupt flag. Write 1 to this bit, the bit will clear this bit. 1: active 0: not active	RW
3	PENU	Pen up interrupt flag. Write 1 to this bit, the bit will clear this bit. 1: active 0: not active	RW
2	DTCH	Touch screen data ready interrupt flag. Write 1 to this bit, the bit will clear this bit. 1: active 0: not active	RW

1	DRDY	Data ready interrupt flag when ADCEN = 1. PBAT data ready interrupt flag. Write 1 to this bit, the bit will clear this bit. 1: active 0: not active	RW
0	SRDY	SADCIN Data ready interrupt flag. Write 1 to this bit, the bit will clear this bit. 1: active 0: not active	RW

15.3.5 ADC Same Point Time Register (ADSAME)

The register ADSAME is used to store the interval time between repeated sampling the same point. The clock frequency of the counter is 12M/128.

ADSAME **0x10070010**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SCNT															
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

15.3.6 ADC Wait Pen Down Time Register (ADWAIT)

The register ADWAIT is used to store the interval time of wait pen down. And the register can be used as the interval time among the different point. The clock frequency of the counter is 12M/128.

ADDIFF **0x10070014**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	WCNT															
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

15.3.7 ADC Touch Screen Data Register (ADTCH)

The read-only ADTCH is corresponded to 2x32 bit FIFO, it keep the sample data for touch screen. 0~11 bits are data, 15 bit is data type. 16~27 bits are data, 31 bit is data type. When write to the register, DATA will be clear to 0.

ADTCH **0x10070018**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

	TYPE1	Reserved	TDATA1	TYPE0	Reserved	TDATA0
RST	0	0 0 0	0 0 0 0 0 0 0 0 0 0 0 0	0	0 0 0	0 0 0 0 0 0 0 0 0 0 0 0

Bits	Name	Description	RW
31	TYPE1	Type of the Touch Screen Data1. When A/D is used as Touch Screen, ADCFG.XYZ=10 TYPE1=1: $X_d \rightarrow Y_d \rightarrow Z1 \rightarrow Z2$ TYPE1=0: $X_d \rightarrow Y_d \rightarrow Z3 \rightarrow Z4$ When A/D is used as Touch Screen, ADCFG.XYZ=00 or XYZ=01, TYPE1=0.	RW
30:28	Reserved	These bits always read 0, and written are ignored.	R
27:16	TDATA1	The concert data of touch screen A/D.	RW
15	TYPE0	Type of the Touch Screen Data2. When A/D is used as Touch Screen, ADCFG.XYZ=10 TYPE0=1: $X_d \rightarrow Y_d \rightarrow Z1 \rightarrow Z2$ TYPE0=0: $X_d \rightarrow Y_d \rightarrow Z3 \rightarrow Z4$ When A/D is used as Touch Screen, ADCFG.XYZ=00 or XYZ=01, TYPE0=0.	RW
14:12	Reserved	These bits always read 0, and written are ignored.	R
11:0	TDATA0	The concert data of touch screen A/D.	RW

Note:

(1) When A/D is used as Touch Screen, EX_IN=0 and ADCFG.XYZ=00.

The format of touch screen data is as follows:

Type1	Reserved	Data1	Type0	Reserved	Data0
0	000	Y_s	0	000	X_s

(2) When A/D is used as Touch Screen, EX_IN=1 and ADCFG.XYZ=00.

The format of touch screen data is as follows:

Type1	Reserved	Data1	Type0	Reserved	Data0
0	000	Y_d	0	000	X_d

(3) When A/D is used as Touch Screen, EX_IN=0 and ADCFG.XYZ=01.

The format of touch screen data is as follows:

Type1	Reserved	Data1	Type0	Reserved	Data0
0	000	Y_s	0	000	X_s

0	000	000000000000	0	000	Z_s

Users need to read twice to get the whole data. The first time reading gets the data Y_s and X_s. The second time reading gets the data Z_s. The relation between “touch pressure” and “Z_s” are inverse ratio.

(4) When A/D is used as Touch Screen, EX_IN=1 and ADCFG.XYZ=01
The format of touch screen data is as follows:

Type1	Reserved	Data1	Type0	Reserved	Data0
0	000	Y_d	0	000	X_d
0	000	000000000000	0	000	Z_s

Users need to read twice to get the whole data. The first time reading gets the data Y_d and X_d. The second time reading gets the data Z_s. The relation between “touch pressure” and “Z_s” are inverse ratio.

(5) When A/D is used as Touch Screen, ADCFG.XYZ=11,TYPE=1
The format of touch screen data is as follows:

Type1	Reserved	Data1	Type0	Reserved	Data0
1	000	Y_d	1	000	X_d
1	000	$Z2_d$	1	000	$Z1_d$

Users need to read twice to get the whole data. The first time reading gets the data Y_d and X_d. The second time reading gets the data $Z2_d$ and $Z1_d$.

The touch pressure measurement formula is as follows: (You can use formula 1 or formula 2.)

$$R_{\text{TOUCH}} = R_{\text{X-Plate}} \bullet \frac{\text{X-Position}}{4096}\left(\frac{Z_2}{Z_1}-1\right) \qquad (1)^{*1}$$

$$R_{\text{TOUCH}} = \frac{R_{\text{X-Plate}} \bullet \text{X-Position}}{4096}\left(\frac{4096}{Z_1}-1\right) - R_{\text{Y-Plate}} \bullet \left(1-\frac{\text{Y-Position}}{4096}\right) \qquad (2)^{*1}$$

(6) When A/D is used as Touch Screen, ADCFG.XYZ=11,TYPE=0
The format of touch screen data is as follows:

Type1	Reserved	Data1	Type0	Reserved	Data0
0	000	Y_d	0	000	X_d
0	000	$Z4_d$	0	000	$Z3_d$

Users need to read twice to get the whole data. The first time reading gets the data Y_d and X_d. The second time reading gets the data $Z4_d$ and $Z3_d$.

The touch pressure measurement formula is as follows: (You can use formula 3 or formula 4.)

$$R_{\text{TOUCH}} = R_{\text{Y-Plate}} \bullet \frac{\text{Y-Position}}{4096}\left(\frac{Z_4}{Z_3} - 1\right) \qquad (3)^{*1}$$

$$R_{\text{TOUCH}} = \frac{R_{\text{Y-Plate}} \bullet \text{Y-Position}}{4096}\left(\frac{4096}{Z_3} - 1\right) - R_{\text{X-Plate}} \bullet \left(1 - \frac{\text{X-Position}}{4096}\right) \qquad (4)^{*1}$$

Note[*1]:

To determine pen or finger touch, the pressure of the touch needs to be determined. Generally, it is not necessary to have very high performance for this test; therefore, the 8-bit resolution mode is recommended (however, calculations will be shown here are in 12-bit resolution mode).

$R_{\text{X-plate}}$: Total X-axis resistor value (about 200Ω~ 600Ω)
$R_{\text{Y-plate}}$: Total Y-axis resistor value (about 200Ω~ 600Ω)
X-Position: X-axis voltage sample value
Y-Position: Y-axis voltage sample value
Z1, Z2: Z1, Z2 voltage sample value
Z3, Z4: Z3, Z4 voltage sample value

15.3.8 ADC PBAT Data Register (ADBDAT)

The read-only ADBDAT is a 16-bit register, it keep the sample data of both “PBAT mode” and “Single channel check” mode. 0~11 bits are data.

ADBDAT **0x1007001C**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Reserved				BDATA											
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Name	Description	RW
15:12	Reserved	These bits always read 0, and written are ignored.	R
11:0	BDATA	Data of A/D convert when ADCEN = 1. Data of PBAT A/D convert. When write to the register, DATA will be clear to 0.	RW

When ADCCFG.BAT_MD = 0 (full battery voltage>=2.5V), the measured voltage V_{BAT} is as follows:

$$V_{\text{BAT}} = \frac{\text{BDATA}}{4096} \bullet 7.5V * 0.986 + 0.033V$$

When ADCCFG.BAT_MD = 1 (full battery voltage<2.5V), the measured voltage V_{BAT} is as follows:

$$V_{BAT} = \frac{BDATA}{4096} \bullet 2.5V$$

It is recommended to connect a capacitance of about 0.1uF near to pin ADIN0 to have a more stable battery measurement and better ESD protection.

15.3.9 ADC SADCIN Data Register (ADSDAT)

The read-only ADSDAT is a 16-bit register, it keep the sample data. 0~11 bits are data.

ADDAT **0x10070020**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Reserved				SDATA											
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Name	Description	RW
15:12	Reserved	These bits always read 0, and written are ignored.	R
11:0	SDATA	Data of SADCIN A/D convert. When write to the register, DATA will be clear to 0.	RW

15.3.10 ADC IP DATA PIN (ADDPIN)

The read-only ADDPIN is a 16-bit fake register. The transfer data is come from SADC IP output data directly. This is used to check IP data.

ADDPIN **0x10070024**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Reserved				DATA											
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Name	Description	RW
15:12	Reserved	These bits always read 0, and written are ignored.	R
11:0	DATA	Data of transfer.	R

15.4 SAR A/D Controller Guide

The following describes steps of using SAR-ADC.

15.4.1 Single Operation (only used as a test mode to check the channel function)

(1) Set ADTCTL to 0x1f to mask all the interrupt of SADC.
(2) Set ADCFG.CMD to choose one CMD;(0000~1011)
(3) Set ADCFG.CLKDIV to set A/D clock frequency;
(4) Set ADTCTL.PDEN to 0;
(5) Set ADENA.ADEN to 1 to start A/D;
(6) When ADSTATE.DRDY to 1, you can read the sample data from ADBDAT and ADENA.ADEN will be set to 0 auto.

15.4.2 A simple Touch Screen Operation

(Pen Down → Sample some data of several points → Pen Up)

(1) Set ADTCTL to 0x1f to mask all the interrupt of SADC.
(2) Set DMA_EN to choose whether to use DMA to read the sample data out or to use CPU to read the sample data out;
(3) Set ADCFG.SPZZ, ADCFG.EX_IN and ADCFG.XYZ to choose sample mode
    1: X_s→Y_s (Single-end X→Single-end Y).
    2: X_d→Y_d (Differential X→Differential Y).
    3: X_s→Y_s→Z_s (Single-end X→Single-end Y→Single-end Z)
    4: X_d→Y_d→Z_s (Differential X→Differential Y→Single-end Z)
    5:X_d→Y_d→$Z1_d$→$Z2_d$ or X_d→Y_d→$Z3_d$→$Z4_d$ (Reference register ADCFG.SPZZ)
    (Differential X→Differential Y→Differential Z1→Differential Z2 or
      Differential X→Differential Y→Differential Z3→Differential Z4,)
(4) Set ADCFG.CLKDIV to set A/D clock frequency;
(5) Set ADWAIT to decide the wait time of pen down and the interval time between sampling different points. This time delay is necessary because when pen is put down or pen position change, there should be some time to wait the pen down signal to become stable.
(6) Set ADSAME to decide the interval time between repeated sampling the same point. User can repeat sampling one point to get the most accurate data.
(7) Set ADTCTL.PENDM to 0 to enable the pen down interrupt of touch panel;
(8) Set ADENA.TCHEN to 1 to start touch panel;
(9) When pen down interrupt is happened, you should set ADTCTL.PENDM to 1 and clear ADSTATE.PEND to close pen down interrupt. Then you should clear ADSTATE.PENDU and set ADTCTL.PENUM to 0 to enable pen up interrupt.
(10) When pen down interrupt is happened, the SAR ADC is sampling data. When ADSTATE.DTCH to 1, user must read the sample data from ADTCH. The SAR ADC will not sample the next point until the whole data of the one point are read (no matter by CPU or DMA). If ADCFG.XYZ is mode one and mode two, user only needs to read once to get the whole data. In other modes, user needs to read twice to get the whole data.
(11) Repeat 10 till pen up interrupt happened.

(12) When pen up interrupt is happened, you should set ADTCTL.PENUM to 1 and clear ADSTATE.PENU. Then you should clear ADSTATE.PENDD and set ADTCTL.PENPM to 0 to enable pen down interrupt.
(13) Wait pen down interrupt and repeat from 9.
(14) When you want to shut down the touch screen, user can set the ADENA.TCHEN to 0. If the last point is not sampled completely, user can abandon it.

15.4.3 PBAT Sample Operation

(1) Set ADCFG.CLKDIV to set A/D clock frequency;
(2) Set ADCFG.CH_MD to choose PBAT test mode channel.
(3) Set ADENA.PBATEN to 1 to enable the channel.
(4) When ADSTATE.DRDY = 1, you can read the sample data from ADPBAT. And the PBATEN will be set to 0 auto.

15.4.4 SADCIN Sample Operation

(1) Set ADCFG.CLKDIV to set A/D clock frequency;
(2) Set ADENA.SADCINEN to 1 to enable the channel.
(3) When ADSTATE. SRDY = 1, you can read the sample data from ADSDAT. And the SADCINEN will be set to 0 auto.

Note:

Touch Screen mode can be interrupt by the PBAT and SADCIN mode. And the priority is SADCIN > PBAT > TOUCH. If SADCINEN or PBATEN is set to 1 before or at the same time with TCHEN, SAR ADC will first work in SADCIN mode then in PBAT mode at last in touch screen mode. If SADCINEN and PBATEN are set to 1 after the TCHEN, the SAR ADC will work in touch screen mode first and finish sampling the same point completely then turn to the SADCIN or PBAT mode. And return to touch screen mode.

15.4.5 Use TSC to support keypad

SADC TSC function can apply to a keypad, if touch screen is not used. Suppose the keypad is a NxM matrix, where X direction has N key columns and Y direction has M key rows. Kij is used to indicate the key in ith column from left to right and jth row from bottom to top, where i=0~(N-1) and j=0~(M-1). Figure 15-1 is a 6x5 keypad circuit. The blue color is for X direction network and pink color is for Y. The networks are composed by resistors and metal line. These two networks should be connected to SADC 4 pins: XP/XN/YP/YN as illustrated in the figure. The gray circle is the key. When no key pressing, X network and Y network is open circuit. When a key is pressed, the X network and Y network is shorted under the key position.

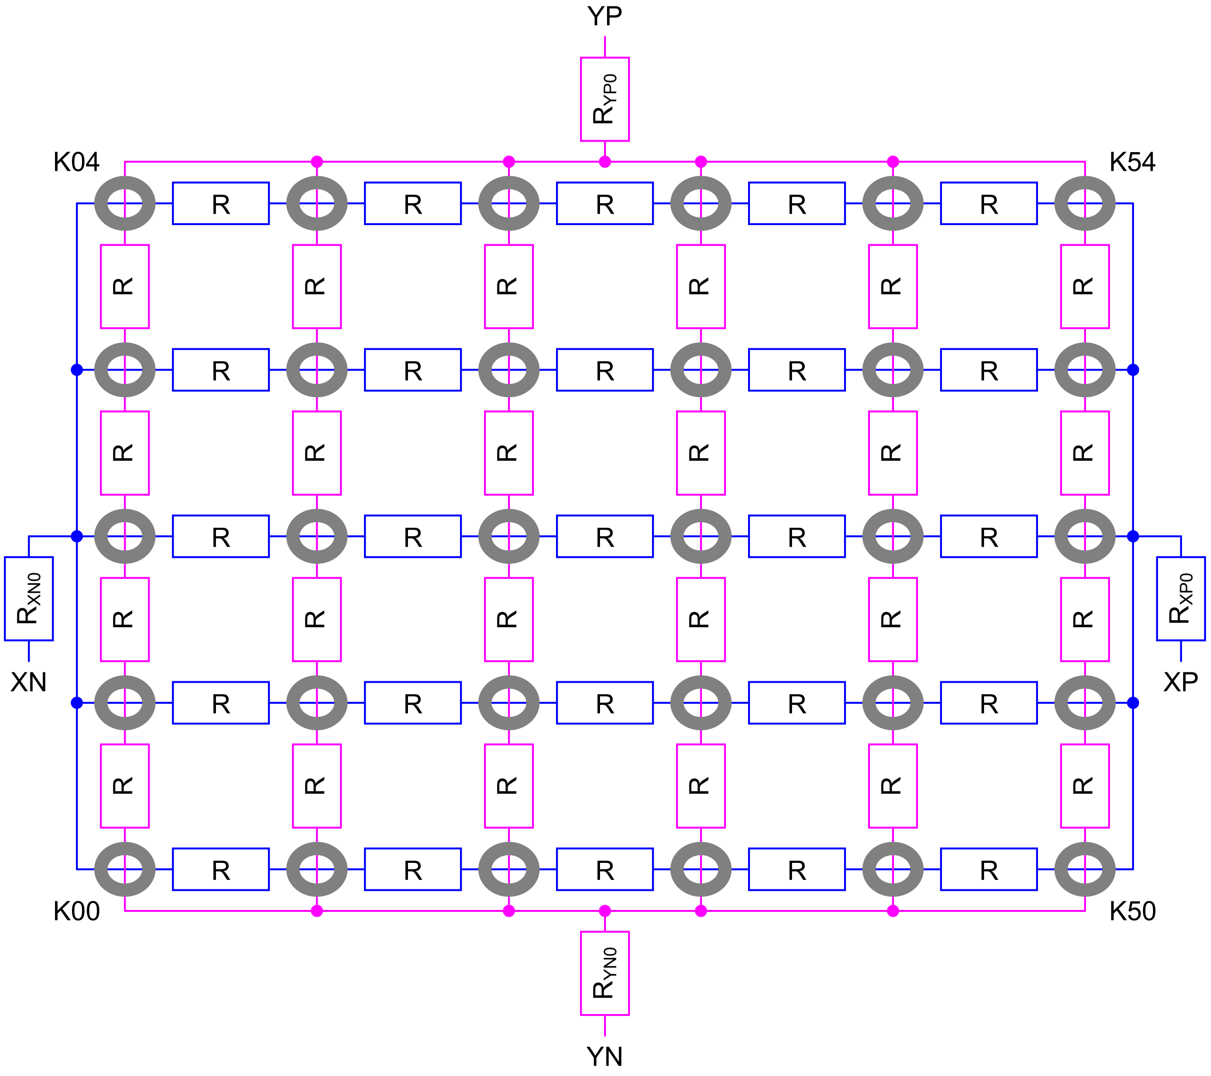

Figure 15-1 6x5 keypad circuit

When SADC is in waiting for pen-down status (C=1100), the equivalent circuit is show in Figure 15-2. When the key is not pressed, XP is open and the PEN is pulled to VDDADC, which is logic 1. When the key Kij is pressed, the circuit is: VDDADC→(10kΩ resistor)→R_{XP}→R_{YN}→VSSADC.

Figure 15-2 Wait for pen-down (C=1100) circuit

Where

$$R_{XP} = \frac{(N-1)^2 - i^2}{M \times (N-1-i) + 2i} \times R$$

$$R_{YN} = \frac{j \times (2M-2-j)}{N \times j + 2M - 2 - 2j} \times R$$

To ensure logic 0 at PEN in this case, following formula should be obeyed.

$$R_{XP} + R_{YN} + R_{XP0} + R_{YN0} \le 3k\Omega \qquad (1)$$

It is suggested the value of N and M is as close to each other as possible. For N=2~20, M=2~20 and M=(N-1, N or N+1), we found

$$R_{XP} + R_{YN} < 2.7 \times R \qquad (2)$$

After key pressing is found, the key Kij location, columns and row, should be measured by using C=0010 and C=0011 respectively. The equivalent circuits are show in Figure 15-3 and Figure 15-4, where

$$R_{X0} = \frac{N-1}{M-1} \times R$$

$$R_{Y0} = \frac{M-1}{N-1} \times R$$

$$R_{XNi} = i \times R$$

$$R_{XPi} = (N-1-i) \times R$$

$$R_{YNj} = j \times R$$

$$R_{YPj} = (M-1-j) \times R$$

Figure 15-4 Measure Y-position (C=0011) circuit

So for Kij pressing, we should get ADC converted number Ni and Nj for i and j respectively.

$$Ni = \frac{R_{XN0} + \frac{i}{M}R}{R_{XN0} + \frac{N-1}{M}R + R_{XP0}} \times 4096$$

$$Nj = \frac{R_{YN0} + \frac{j}{N}R}{R_{YN0} + \frac{M-1}{N}R + R_{YP0}} \times 4096$$

It is required the resistor between XP and XN in case of C=0010, between YP and YN in case of C=0011, must be $\geqslant 200\Omega$ and it better be $\geqslant 500\Omega$. Also consider the requirement in formula (1) and

(2) above, we suggest to put $R_{XP0} = R_{XN0} = R_{YP0} = R_{YN0}$ = 50Ω or 100Ω, put R = 500Ω ~ 1kΩ.

To use the keypad, the software should set:

```
ADENA.TCHEN = 1
ADCFG.EX_IN = 1
ADCFG.XYZ = 00
```

The operation is similar to touch screen.

16 MultiMediaCard/Secure Digital Controller

16.1 Overview

The MultiMediaCard (MMC) is a universal low cost data storage and communication media that is designed to cover a wide area of applications such as electronic toys, organizers, PDAs, smart phones, and so on. The MMC communication is base on an advanced 7 pin serial bus designed to operate in a low voltage range, at medium speed (20 Mbps).

The Secure Digital (SD) card is an evolution of MMC, with an additional 2 pins and the same form factors. It is specifically designed to meet the security, capacity, performance, and environmental requirements inherent in newly emerging audio and video consumer electronic devices. The physical form factor, pin assignment, and data transfer protocol are forward compatible with the MultiMediaCard with some additions. An SD card can be categorized as SD memory or SD I/O card, commonly known as SDIO. A memory card invokes a copyright protection mechanism that complies with the security of the SDMI standard and is faster and capable of higher memory capacity. The SDIO card provides high-speed data I/O with low-power consumption for mobile electronic devices.

Features of the MultimediaCard/Secure Digital Controller include the following:

- Fully compatible with the *MMC System Specification version 3.3*
- Fully compatible with the *SD Memory Card Specification 1.01* and *SD I/O Specification 1.0* with 1 command channel and 4 data channels
- 20-80 Mbps maximum data rate
- Built-in programmable frequency divider for MMC/SD bus
- Maskable hardware interrupt for SDIO interrupt, internal status and FIFO status
- 16-entry x 32-bit built-in data FIFO
- Password protection of cards
- Multi-SD function support including multiple I/O and combined I/O and memory
- Up to 7 I/O functions plus one memory supported on single SDIO card
- IRQ supported enable card to interrupt MMC/SD controller
- Single or multi block access to the card including erase operation
- Stream access to the card
- Supports SDIO read wait, interrupt detection during 1-bit or 4-bit access
- The maximum block length is 2048 bytes

16.3 MMC/SD Controller Signal I/O Description

The MMC and SD cards are 7- or 9- pin cards that operate as external memory storage. The pin assignment and form factor are shown in Table 16-1.

Table 16-1 MMC/SD Controller Signal Description

Form factor and pinout	Pin number	MMC card	SD card	
			1-bit mode	4-bit mode
 1 2 3 4 5 6 7 8 9 32 mm 24 mm These pins appear on the SD card only	1	Reserved	Not Used	Data Line [Bit 3]
	2	Command/Response (CMD)		
	3	Supply Voltage Ground (Vss1)		
	4	Supply Voltage (Vdd)		
	5	Clock (CLK)		
	6	Supply Voltage Ground (Vss2)		
	7	Data Line [Bit 0]		
	8	▨	Interrupt (IRQ)	Data Line [Bit 1] or Interrupt (IRQ)
	9	▨	ReadWait(RW)	Data Line [Bit 2] or ReadWait (RW)

MSC and the card communication over the CMD and DATA line is base on command and data bit streams which are initiated by a start bit and terminated by a stop bit.

- **Command**: a command is a token, which starts an operation. A command is sent from MSC either to a single card (addressed command) or to all connected cards (broadcast command). A command is transferred serially on the CMD line. Each command token is preceded by a start bit ('0') and succeeded by an end bit ('1'). The total length is 48 bits and protected by CRC bits.

Table 16-2 Command Token Format

Bit position	47	46	[45 : 40]	[39 : 8]	[7 : 1]	0
Width (bits)	1	1	6	32	7	1
Value	0	1	X	X	x	1
Description	Start bit	Transmission bit	Command index	argument	CRC7	End bit

- **Response**: a response is a token which is sent from an addressed card, or (synchronously) from all connected cards, to MSC as an answer to a previously received command. A response is transferred serially on the CMD line. Response tokens have varies coding schemes depending on their content.

- **Data:** data can be transferred from the card to MSC or vice versa. Data is transferred via the data line. Data transfers to/from the SD Memory Card are done in blocks. Data blocks always succeeded by CRC bits. Single and multiple block operations are defined. Note that the Multiple Block operation mode is better for faster write operation. A multiple block transmission is terminated when a stop command follows on the CMD line. Data transfer can be configured by the MSC to use single or multiple data lines.

Table 16-3 MMC/SD Data Token Format

Description	Start bit	Data	CRC16	End bit
Stream Data	0	X	no CRC	1
Block Data	0	X	X	1

16.4 Register Description

The MMC/SD controller is controlled by a set of registers that the application configures before every operation. The Table 16-4 lists all the MSC registers.

Table 16-4 MMC/SD Controller Registers Description

Name	RW	Reset Value	Address	Access Size
MSC_STRPCL	W	0x0000	0x10021000	16

Note: *1: Writing MSC_IREG is used to clear interrupt source and only three interrupt sources can be cleared by this way.

16.4.1 Start/stop MMC/SD clock Register (MSC_STRPCL)

MSC_STRPCL **0x10021000**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Reserved								EXIT_MULTIPLE	EXIT_TRANSFER	START_READWAIT	STOP_READWAIT	RESET	START_OP	STRPCL	
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Name	Description	RW
15:8	Reserved		R
7	EXIT_MULTIPLE	If CMD12 or CMD52 (I/O abort) is to be sent to terminate multiple block read/write in advance, set this bit to 1.	W

		0 – No effect. 1 – Exit from multiple block read/write.	
6	EXIT_TRANSFER	**Only used for SDIO suspend/resume and MMC stream read.** For SDIO, after suspend is accepted, set this bit with 1. For MMC, after the expected number of data are received, set this bit with 1. 0 – No effect. 1 – Exit from multiple block read/write after suspend is accepted, or exit from stream read.	W
5	START_READWAIT	Only used for SDIO ReadWait. Start the ReadWait cycle. 0 – No effect. 1 – Start ReadWait.	W
4	STOP_READWAIT	Only used for SDIO ReadWait. Stop the ReadWait cycle. 0 – No effect. 1 – Start ReadWait.	W
3	RESET	Resets the MMC/SD controller. 0 – No effect. 0 – Reset the MMC/SD controller.	W
2	START_OP	This bit is used to start the new operation. When starting the clock, this bit can be 1. When stopping the clock, this bit can only be 0. 0 – Do nothing. 1 – Start the new operation.	W
1:0	CLOCK_CONTROL	These bits are used to start or stop clock. 00 – Do nothing. 01 – Stop MMC/SD clock 10 – Start MMC/SD clock 11 – Reserved	W

16.4.2 MSC Status Register (MSC_STAT)

MSC_STAT **0x10021004**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Reserved																IS_RESETTING	SDIO_INT_ACTIVE	PRG_DONE	DATA_TRAN_DONE	END_CMD_RES	DATA_FIFO_AFULL	IS_READWAIT	CLK_EN	DATA_FIFO_FULL	DATA_FIFO_EMPTY	CRC_RES_ERR	CRC_READ_ERROR	CRC_WRITE_ERROR		TIME_OUT_RES	TIME_OUT_READ
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0

Bits	Name	Description	RW
31:16	Reserved		R
15	IS_RESETTING	MSC is resetting after power up or MSC_STRPCL[RESET] is written with 1 0 – Reset has been finished. 1 – Reset has not been finished.	R
14	SDIO_INT_ACTIVE	Indicates whether an interrupt is detected at the SD I/O card. A separate acknowledge command to the card is required to clear this interrupt. 0 – No interrupt detected. 1 – The interrupt from SDIO is detected.	R
13	PRG_DONE	Indicates whether card has finished programming. 0 – Card has not finished programming and is busy. 1 – Card has finished programming and is not busy.	R
12	DATA_TRAN_DONE	Indicates whether data transmission to card has completed. 0 – Data transmission to card has not completed. 1 – Data transmission to card has completed.	R
11	END_CMD_RES	End command-response sequence or command sequence. 0 – Command and response/no-response sequence has not completed. 1 – Command and response/no-response sequence has completed.	R
10	DATA_FIFO_AFULL	Indicates whether data FIFO is almost full (The number of words >= 15). For reading data from card, use this bit. 0 – Data FIFO is not full. 1 – Data FIFO is full.	R
9	IS_READWAIT	Indicates whether SDIO card has entered ReadWait State 0 – Card has not enter ReadWait. 1 – Card has enter ReadWait.	R
8	CLK_EN	Clock enabled. 0 – Clock is off. 1 – Clock is on.	R
7	DATA_FIFO_FULL	Indicates whether data FIFO is full. For reading data from card, do not use this bit, because it almost keeps to be 0. 0 – Data FIFO is not full. 1– Data FIFO is full.	R
6	DATA_FIFO_EMPTY	Indicates whether data FIFO is empty. 0 – Data FIFO is not empty. 1– Data FIFO is empty.	R

5	CRC_RES_ERR	Response CRC error. 0 – No error on the response CRC. 1– CRC error occurred on the response.	R
4	CRC_READ_ERROR	CRC read error. 0 – No error on received data. 1– CRC error occurred on received data	R
3:2	CRC_WRITE_ERROR	CRC write error. 00 – No error on transmission of data. 01 – Card observed erroneous transmission of data. 10 – No CRC status is sent back. 11 – Reserved	R
1	TIME_OUT_RES	Response time out. 0 – Card response has not timed out. 1 – Card response has time out.	R
0	TIME_OUT_READ	Read time out. 0 – Card read data has not timed out. 1 – Card read data has timed out.	R

16.4.3 MSC Clock Rate Register (MSC_CLKRT)

The MSC_CLKRT register specifies the frequency division of the MMC/SD bus clock. The software is responsible for setting this register.

MSC_CLKRT																**0x10021008**
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Reserved													CLK_RATE		
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Name	Description	RW
15:3	Reserved		R
2:0	CLK_RATE	Clock rate. 000 – CLK_SRC. 001 – 1/2 of CLK_SRC. 010 – 1/4 of CLK_SRC. 011 – 1/8 of CLK_SRC. 100 – 1/16 of CLK_SRC. 101 – 1/32 of CLK_SRC. 110 – 1/64 of CLK_SRC. 111 – 1/128 of CLK_SRC.	WR

16.4.4 MMC/SD Command and Data Control Register (MSC_CMDAT)

MSC_CMDAT **0x1002100C**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Reserved																Reserved				IO_ABORT	BUS_WIDTH		DMA_EN	INIT	BUSY	STREAM_BLOCK	WRITE_READ	DATA_EN	RESPONSE_FORMAT		
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Name	Description	RW
31:12	Reserved		R
11	IO_ABORT	Specifies the current command is used to abort data transfer. **Only used for SDIO.** 0 – Nothing. 1 – The current command is used to abort transfer.	WR
10:9	BUS_WIDTH	Specifies the width of the data bus. 00 – 1-bit. 01 – Reserved. 10 – 4-bit. 11 – Reserved.	WR
8	DMA_EN	DMA mode enables. When DMA mode is used, this bit is also a mask on RXFIFO_RD_REQ and TXFIFO_WR_REQ interrupts. 0 – Program I/O. 1 – DMA mode.	WR
7	INIT	80 initialization clocks 0 – Do not precede command sequence with 80 clocks. 1 – Precede command sequence with 80 clocks.	W
6	BUSY	Specifies whether a busy signal is expected after the current command. This bit is for no data command/response transactions only. 0 – Not expect a busy signal. 0 – Expects a busy signal. If the response is R1b, then set it.	WR
5	STREAM_BLOCK	Stream mode 0 – Data transfer of the current command sequence is not in stream mode. 1– Data transfer of the current command sequence is in	WR

		stream mode.	
4	WRITE_READ	Specifies that the data transfer of the current command is a read or write operation. 0 – Specifies that the data transfer of the current command is a read operation. 1 – Specifies that the data transfer of the current command is a write operation.	WR
3	DATA_EN	Specifies whether the current command includes a data transfer. It is also used to reset RX_FIFO and TX_FIFO. 0 – No data transfer with current command. 1 – Has data transfer with current command. It is also used to reset RX_FIFO and TX_FIFO.	WR
2:0	RESPONSE_FORMAT	These bit specify the response format for the current command. 000 – No response. 001 – Format R1 and R1b. 010 – Format R2. 011 – Format R3. 100 – Format R4. 101 – Format R5. 110 – Format R6. 111 – Reserved.	WR

16.4.5 MMC/SD Response Time Out Register (MSC_RESTO)

MSC_RESTO **0x10021010**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Reserved								RES_TO							
RST	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0

Bits	Name	Description	RW
15:8	Reserved		R
7:0	RES_TO	Specifies the number of MSC_CLK clock counts between the command and when the MMC/SD controller turns on the time-out error for the received response. The default value is 64.	WR

16.4.6 MMC/SD Read Time Out Register (MSC_RDTO)

MSC_RDTO **0x10021014**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	READ_TO															
RST	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bits	Name	Description	RW
15:0	READ_TO	Specifies the number of clocks between the command and when the MMC/SD host controller turns on the time-out error for the received data. The unit is CLK_SRC / 256.	WR

16.4.7 MMC/SD Block Length Register (MSC_BLKLEN)

MSC_BLKLEN **0x10021018**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Reserved				BLK_LEN											
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Name	Description	RW
15:12	Reserved		R
11:0	BLK_LEN	Specifies the number of bytes in a block, and is normally set to 0x200 for MMC/SD data transactions. The value Specified in the cards CSD.	WR

16.4.8 MSC/SD Number of Block Register (MSC_NOB)

MSC_NOB **0x1002101C**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	NOB															
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Name	Description	RW
15:0	NOB	Specifies the number of blocks in a data transfer. One block is a possibility.	WR

16.4.9 MMC/SD Number of Successfully-transferred Blocks Register (MSC_SNOB)

In block mode, the MSC_SNOB register records the number of successfully transferred blocks. If the last block has CRC error, this register also summaries it. It is used to query blocks for multiple block transfer.

MSC_SNOB **0x10021020**

Bit		15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
		MSC_SNOB															
RST		?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?

Bits	Name	Description	RW
15:0	MSC_SNOB	Specify the number of successfully transferred blocks for a multiple block transfer.	R

16.4.10 MMC/SD Interrupt Mask Register (MSC_IMASK)

MSC_IMASK **0x10021024**

Bit		15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
		Reserved								SDIO	TXFIFO_WR_REQ	RXFIFO_RD_REQ	Reserved		END_CMD_RES	PRG_DONE	DATA_TRAN_DONE
RST		0	0	0	0	0	0	0	0	1	1	1	1	1	1	1	1

Bits	Name	Description	RW
15:8	Reserved		R
7	SDIO	Mask the interrupt from the SD I/O card. 0 – Not masked. 1 – Masked.	WR
6	TXFIFO_WR_REQ	Mask the Transmit FIFO write request interrupt. 0 – Not masked. 1 – Masked.	WR
5	RXFIFO_RD_REQ	Mask the Receive FIFO read request interrupt. 0 – Not masked. 1 – Masked.	WR
4:3	Reserved		R
2	END_CMD_RES	Mask the End command response interrupt. 0 – Not masked. 1 – Masked.	WR
1	PRG_DONE	Mask the Programming done interrupt. 0 – Not masked. 1 – Masked.	WR
0	DATA_TRAN_DONE	Mask the Data transfer done interrupt. 0 – Not masked.	WR

		1 – Masked.	

16.4.11 MMC/SD Interrupt Register (MSC_IREG)

The MSC_IREG register shows the currently requested interrupt. The FIFO request interrupts, TXFIFO_WR_REQ, and RXFIFO_RD_REQ are masked off with the DMA_EN bit in the MSC_CMDAT register. The software is responsible for monitoring these bit in program I/O mode.

MSC_IREG **0x10021028**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Reserved								SDIO	TXFIFO_WR_REQ	RXFIFO_RD_REQ	Reserved		END_CMD_RES	PRG_DONE	DATA_TRAN_DONE
RST	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	Name	Description	RW
15:8	Reserved		R
7	SDIO	Indicates whether the interrupt from SDIO is detected. 0 – The interrupt from SDIO is not detected. 1 – The interrupt from SDIO is detected.	R
6	TXFIFO_WR_REQ	Transmit FIFO write request. Set if data FIFO becomes half empty (the number of words is < 8). 0 – No Request for data Write to MSC_TXFIFO. 1 – Request for data write to MSC_TXFIFO.	R
5	RXFIFO_RD_REQ	Receive FIFO read request. Set if data FIFO becomes half full (the number of words is >= 8) or the entries in data FIFO are the last read data. 0 – No Request for data read from MSC_RXFIFO. 1 – Request for data read from MSC_RXFIFO.	R
4:3	Reserved		R
2	END_CMD_RES	Indicates whether the command/response sequence has been finished. 0 – The command/response sequence has not been finished. 1 – The command/response sequence has bee finished. Write 1 to clear.	WR
1	PRG_DONE	Indicates whether card has finished programming. 0 – Card has not finished programming and is busy. 1 – Card has finished programming and is no longer busy. Write 1 to clear.	WR

0	DATA_TRAN_DONE	Indicates whether data transfer is done. Note that for stream read/write, only when CMD12 (STOP_TRANS) has been sent, is this bit set. 0 – Data transfer is not complete. 1 – Data transfer has completed or an error has occurred. Write 1 to clear.	WR

16.4.12 MMC/SD Command Index Register (MSC_CMD)

MSC_CMD **0x1002102C**

Bit	7	6	5	4	3	2	1	0
	Reserved		CMD_INDEX					
RST	0	0	0	0	0	0	0	0

Bits	Name	Description	RW
7:6	Reserved		R
5:0	CMD_INDEX	Specifies the command index to be executed.	WR

16.4.13 MMC/SD Command Argument Register (MSC_ARG)

MSC_ARG **0x10021030**

Bits	Name	Description	RW
31:0	ARG	Specifies the argument for the current command.	WR

16.4.14 MMC/SD Response FIFO Register (MSC_RES)

The read-only MMC/SD Response FIFO register (RES_FIFO) holds the response sent back to the MMC/SD controller after every command. The size of this FIFO is 8 x 16-bit. The RES FIFO does not contain the 7-bit CRC for the response. The Status for CRC checking and response time-out status is in the status register, MSC_STAT.

The first halt-word read from the response FIFO is the most significant halt-word of the received response.

MSC_RES **0x10021034**

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

		DATA
RST		? ? ? ? ? ? ? ? ? ? ? ? ? ? ? ?

Bits	Name	Description	RW
15:0	DATA	Contains the response to every command that is sent by the MMC/SD controller. The size of this FIFO register is 8 x 16-bit.	R

16.4.15 MMC/SD Receive Data FIFO Register (MSC_RXFIFO)

The MSC_RXFIFO is used to read the data from a card. It is read-only to the software, and is read on 32-bit boundary. The size of this FIFO is 16 x 32-bit.

MSC_RXFIFO **0x10021038**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits	Name	Description	RW
31:0	DATA	One word of write data. The size of this FIFO is 16 x 32-bit.	W

16.5 MMC/SD Functional Description

All communication between system and cards is controlled by the MSC. The MSC sends commands of two type: broadcast and addressed (point-to-point) commands.

Broadcast commands are intended for all cards, command like "Go_Idle_State", "Send_Op_Cond", "All_send_CID" and "Set_relative_Addr" are using way of broadcasting. During Broadcast mode, all cards are in open-drain mode, to avoid bus contention.

After Broadcast commands "Set_relative_Addr" issue, cards are enter standby mode, and Addressed command will be used from now on, in this mode, CMD/DAT will return to push-pull mode, to have maximum driving for maximum operation frequency.

The MMC and the SD are similar product. Besides the 4x bandwidth and the built-in encryption, they are being programmed similarly.

The MMC/SD controller (MSC) is the interface between the software and the MMC/SD bus. It is responsible for the timing and protocol between the software and the MMC/SD bus. It consists of control and status registers, a 16-bit response FIFO that is 8 entries deep, and one 32-bit receive/transmit data FIFOs that are 16 entries deep. The registers and FIFOs are accessible by the software.

MSC also enable minimal data latency by buffering data and generating and checking CRCs.

16.5.1 MSC Reset

The MMC/SD controller (MSC) can be reset by a hardware reset or software reset. All registers and FIFO controls are set to their default values after any reset.

16.5.2 MSC Card Reset

The command Go_Idle_State, CMD0 is the software reset command for MMC and SD Memory Card, and sets each card into Idle State regardless of the current card state; while in SDIO card, CMD52 is used to write IO reset in CCCR. The cards are initialized with a default relative card address (RCA=0x0000) and with a default driver stage register setting (lowest speed, highest driving current capability).

16.5.3 Voltage Validation

All cards shall be able to establish communication with the host using any operation voltage in the maximal allowed voltage range specified in this standard. However, the support minimum and maximum values for Vdd are defined in Operation Conditions register (OCR) and many not cover the whole range. Cards that store the CID and CSD data in the payload memory would be able to communicate these information only under data transfer Vdd conditions. That means if host and card have non compatible Vdd ranges, the card will not be able to complete the identification cycle, nor to send CSD data.

Therefore, a special command Send_Op_cont (CMD1 for MMC), SD_Send_Op_Cont (CMD41 for SD Memory) and IO_Send_Op_Cont (CMD5 for SDIO) are designed to provide a mechanism to identify and reject cards which do not match the Vdd range desired by the host. This is accomplished by the host sending the required Vdd voltage window as the operand of this command. Cards which can not perform data transfer in the specified range must discard themselves from further bus operations and go into Inactive State. By omitting the voltage range in the command, the host can query each card and determine the common voltage range before sending out-of-range cards into the Inactive State. This query should be used if the host is able to select a common voltage range or if a notification to the application of non usable cards in the stack is desired.

16.5.4 Card Registry

Card registry on MCC and SD card are different.

For SD card, Identification process start at clock rate Fod, while CMD line output drives are push-pull drivers instead of open-drain. After the bus is activated the host will request the cards to send their valid operation conditions. The response to ACMD41 is the operation condition register of the card. The same command shall be send to all of the new cards in the system. Incompatible cards are sent into Inactive State. The host then issue the command All_Send_CID (CMD2) to each card and get its unique card indentification (CID) number. Card that is unidentified, that is, which is in Ready State, send its CID number as the response. After the CID was sent by the card it goes into Identification State. Thereafter, the host issues Send_Relative_Addr (CMD3) asks the card to publish a new relative card address (RCA), which is shorter that CID and which will be used to address the card in the future data transfer mode. Once the RCA is received the card state changes to the Stand-by State. At this point, if the host wants that the card will have another RCA number, it may ask the card to publish a new number by sending another Send_Relative_Addr command to the card. The last published RCA is the actual RCA of the card. The host repeats the identification process, that is, the cycles with CMD2 and CMD3 for each card in the system.

In MMC, the host starts the card identification process in open-drain mode with the identification clock rate Fod. The open drain driver stages on the CMD line allow parallel card operation during card identification. After the bus is actived the host will request the cards to send their valid operation conditions (CMD1). The response to CMD1 is the ‘wired or’ operation on the condition restrictions of all cards in the system. Incompatible cards are sent into Inactive State. The host then issues the broadcast command All_Send_CID (CMD2), asking all cards for their unique card identification (CID) number. All unidentified cards, that is, those which are in Ready State, simultaneously start sending their CID numbers serially, while bit-wise monitoring their outgoing bitstream. Those cards, whose outgoing CID bits do not match the corresponding bits on the command line in any one of the bit periods stop sending their CID immediately and must wait for the next identification cycle. Since CID is unique for each card, only one card can be successfully send its full CID to the host. This card then goes into Identification State. Thereafter, the host issues Set_Relative_Addr (CMD3) to assign to this card a relative card address (RCA). Once the RCA is received the card state changes to the Stand-by

State, and the card does not react to further identification cycles, and its output switches from open-drain to push-pull. The host repeat the process, that is CM2 and CMD3, until the host receive time-out condition to recognize completion of the identification process.

16.5.5 Card Access

16.5.5.1 Block Access, Block Write and Block Read

During block write (CMD24-27) one or more blocks of data are transferred from the host to the card with a CRC appended to the end of each block by the host. A card supporting block write shall always be able to accept a block of data defined by WRITE_BL_LEN. If the CRC fails, the card shall indicate the failure on the DAT line; the transferred data will be discarded and not written, and all further transmitted blocks (in multiple block write mode) will be ignored.

Programming of the CID and CSD registers does not require a previous block length setting. The transferred data is also CRC protected. If a part of the CSD or CID register is stored in ROM, then this unchangeable part must match the corresponding part of the receive buffer. If this match fails, then the card will report an error and not change any register contents. Some cards may require long and unpredictable times to write a block of data. After receiving a block of data and completing the CRC check, the card will begin writing and hold the DAT line low if its write buffer is full and unable to accept new data from a new WRITE_BLOCK command. The host may poll the status of the card with a SEND_STATUS command (CMD13) at any time, and the card will respond with its status. The status bit READY_FOR_DATA indicates whether the card can accept new data or whether the write process is still in progress). The host may deselect the card by issuing CMD7 (to select a different card) which will displace the card into the Disconnect State and release the DAT line without interrupting the write operation. When reselecting the card, it will reactivate busy indication by pulling DAT to low if programming is still in progress and the writte buffer is unavailable.

Block read is similar to stream read, except the basic unit of data transfer is a block whose maximizes is defined in the CSD (READ_BL_LEN). If READ_BL_PARTIAL is set, smaller blocks whose starting and ending address are entirely contained within one physical block (as defined by READ_BL_LEN) may also be transmitted. Unlike stream read, a CRC is appended to the end of each block ensuring data transfer integrity. CMD17 (READ_SINGLE_BLOCK) initiates a block read and after completing the transfer, the card returns to the Transfer state. CMD18 (READ_MULTIPLE_BLOCK) starts a transfer of several consecutive blocks. Blocks will be continuously transferred until a stop command is issued. If the host uses partial blocks whose accumulated length is not block aligned and block misalignment is not allowed, the card shall detect a block misalignment at the beginning of the first mis-aligned block, set the ADDRESS_ERROR error bit in the status register, abort transmission and wait in the Data State for a stop command.l

16.5.5.2 Stream Access, Stream Write and Stream Read (MMC Only)

Stream write (CMD20) starts the data transfer from the host to the card beginning from the starting address until the host issues a stop command. Since the amount of data to be transferred is not determined in advance, CRC can not be used. If the end of the memory range is reached while sending data and no stop command has been sent by the host, all further transferred data is discarded.

There is a stream oriented data transfer controlled by READ_DAT_UNTIL_STOP (CMD11). This command instructs the card to send its payload, starting at a specified address, until the host sends a STOP_TRANSMISSION command (CMD12). The stop command has execution delay due to the serial command transmission. The data transfer stops after the end bit of the stop command. If the end of the memory range is reached while sending data and no stop command has been sent yet by the host, the contents of the further transferred payload is undefined.

16.5.5.3 Erase, Group Erase and Sector Erase (MMC Only)

It is desirable to erase many sectors simultaneously in order to enhance the data throughput. Identification of these sectors is accomplished with the TAG_* commands. Either an arbitrary set of sectors within a single erase group, or an arbitrary selection of erase groups may be erase at one time, but not both together. That is, the unit of measure for determining an erase is either a sector or an erase group. If a set of sectors must be erased, all selected sectors must lie within the same erase group. To facilitate selection, a first command with the starting address is followed by a second command with the final address, and all sectors (or groups) within this range will be selected for erase.

16.5.5.4 Wide Bus Selection/Deselection

Wide Bus (4 bit bus width) operation mode may be selected / deselected using ACMD6. The default bus width after power up or GO_IDLE (CMD0) is 1 bit bus width. ACMD6 command is valid in ‘trans state’ only. That means the bus width may be changed only after a card was selected (CMD7).

16.5.6 Protection Management

Three write protect methods are supported in the host for Cards, Card internal write protect (Card’s responsibility), Mechanical write protect switch (Host responsibility only) and Password protection card lock operation.

16.5.6.1 Card Internal Write Protection

Card data may be protected against either erase or write. The entire card may be permanently write protected by the manufacturer or content provider by setting the permanent or temporary write protect bits in the CSD. For cards which support write protection of groups of sectors by setting the WP_GRP_SIZE sectors as specified in the CSD), and the write protection may be changed by the application. The SET_WRITE_PROT command sets the write protection of the addressed write-protect group, and the CLR_WRITE_PROT command clears the write protection of the addressed write-protect group.

The SEND_WRITE_PROT command is similar to a single block read command. The card shall send a data block containing 32 write protection bits (representing 32 write protect groups starting at the specified address) followed by 16 CRC bits. The address field in the write protect commands is a group address in byte units. The card will ignore all LSB’s below the group size.

16.5.6.2 Mechanical write protect switch

A mechanical sliding tablet on the side of the card will be used by the user to indicate that a given card is write protected or not. If the sliding tablet is positioned in such a way that the window is open that means the card is write protected. If the window is close the card is not write protected.

A proper, matched, switch on the socket side will indicated to the host that the card is write protected or not. It is the responsibility of the host to protect the card. The position of the write protect switch is un-known to the internal circuitry of the card.

16.5.6.3 Password Protect

The password protection feature enables the host to lock a card while providing a password, which later will be used for unlocking the card. The password and its size is kept in an 128-bit PWD and 8-bit PWD_LEN registers, respectively. These registers are non-volatile so that a power cycle will not erase them.

Locked cards respond to (and execute) all commands in the basic command class (class 0) and “lock card” command class. Thus the host is allowed to reset, initialize, select, query for status, etc., but not to access data on the card. If the password was previously set (the value of PWD_LEN is not 0) will be locked automatically after power on. Similar to the existing CSD and CID register write commands the lock/unlock command is available in “trans_state” only. This means that it does not include an address argument and the card must be selected before using it. The card lock/unlock command has the structure and bus transaction type of a regular single block write command. The transferred data block includes all the required information of the command (password setting mode, PWD itself, card lock/unlock etc.). The following table describes the structure of the command data block.

Table 16-5 Command Data Block Structure

Byte #	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0	Rsv	Rsv	Rsv	Rsv	ERASE	LOCK_UNLOCK	CLR_PWD	SET_PWD
1	PWDS_LEN							
2	Password Data							
…								
PWDS_LEN + 1								

- **ERASE** – 1 Defines Forced Erase Operation (all other bits shall be 0) and only the command byte is sent.
- **LOCK/UNLOCK** – 1=Locks the card. 0=Unlock the card (note that it is valid to set this bit together with SET_PWD but it is not allowed to set it together with CLR_PWD).
- **CLR_PWD** – 1=Clears PWD.
- **SET_PWD** – 1=Set new password to PWD.
- **PWD_LEN** – Defines the following password length (in bytes).
- **PWD** – The password (new or currently used depending on the command).

The data block size shall be defined by the host before it send the card lock/unlock command. This will allow different password sizes.

The following paragraphs define the various lock/unlock command sequences:

- Setting the Password:
    - Select a card (CMD7), if not previously selected already
    - Define the block length (CMD16), given by the 8bit card lock/unlock mode, the 8 bits password size (in bytes), and the number of bytes of the new password. In case that a password replacement is done, then the block size shall consider that both passwords, the old and the new one, are sent with the command.
    - Send Card Lock/Unlock command with the appropriate data block size on the data line including 16-bit CRC. The data block shall indicate the mode (SET_PWD), the length (PWD_LEN) and the password itself. In case that a password replacement is done, then the length value (PWD_LEN) shall include both passwords, the old and the new one, and the PWD field shall include the old password (currently used) followed by the new password.
    - In case that the sent old password is not correct (not equal in size and content) then LOCK_UNLOCK_FAILED error bit will be set in the status register and the old password does not change. In case that PWD matches the sent old password then the given new password and its size will be saved in the PWD and PWD_LEN fields, respectively.

  Note that the password length register (PWD_LEN) indicates if a password is currently set. When it equals 0 there is no password set. If the value of PWD_LEN is not equal to zero the card will lock itself after power up. It is possible to lock the card immediately in the current power session by setting the LOCK/UNLOCK bit (while setting the password) or sending additional command for card lock.

- Reset the password:
    - Select a card (CMD7), if not previously selected already
    - Define the block length (CMD16), given by the 8-bit card lock/unlock mode, the 8-bit password size (in bytes), and the number of bytes of the currently used password.
    - Send the card lock/unlock command with the appropriate data block size on the data line including 16-bit CRC. The data block shall indicate the mode CLR_PWD, the length (PWD_LEN) and the password (PWD) itself (LOCK/UNLOCK bit is don't care). If the PWD and PWD_LEN is set to 0. If the password is not correct then the LOCK_UNLOCK_FAILED error bit will be set in the status register.

- Locking a card:
    - Select a card (CMD7), if not previously selected already
    - Define the block length (CMD16), given by the 8-bit card lock/unlock mode, the 8-bit password size (in bytes), and the number of bytes of currently used password.
    - Send the card lock/unlock command with the appropriate data block size on the data line including 16-bit CRC. The data block shall indicate the mode LOCK, the length (PWD_LEN) and the password (PWD) itself.

If the PWD content equals to the sent password then the card will be locked and the card-locked status bit will be set in the status register. If the password is not correct then LOCK_UNLOCK_FAILED error bit will be set in the status register.

Note that it is possible to set the password and to lock the card in the same sequence. In such case the host shall perform all the required steps for setting the password (as described above) including the bit LOCK set while the new password command is sent. If the password was previously set (PWD_LEN is not 0), then the card will be locked automatically after power on reset. An attempt to lock a locked card or to lock a card that does not have a password will fail and the LOCK_UNLOCK_FAILED error bit will be set in the status register.

- Unlocking the card
  - Select a card (CMD7), if not previously selected already.
  - Define the block length (CMD16), given by the 8-bit card lock/unlock mode, the 8-bit password size (in bytes), and the number of bytes of the currently used password.
  - Send the card lock/unlock command with the appropriate data block size on the data line including 16-bit CRC. The data block shall indicate the mode UNLOCK, the length (PWD_LEN) and the password (PWD) itself.

If the PWD content equals to the sent password then the card will be unlocked and the card-locked status bit will be cleared in the status register. If the password is not correct then the LOCK_UNLOCK_FAILED error bit will be set in the status register.

Note that the unlocking is done only for the current power session. As long as the PWD is not cleared the card will be locked automatically on the next power up. The only way to unlock the card is by clearing the password. An attempt to unlock an unlocked card will fail and LOCK_UNLOCK_FAILED error bit will be set in the status register.

- Forcing Erase:
  In case that the user forgot the password (the PWD content) it is possible to erase all the card data content along with the PWD content. This operation is called Forced Erase.
  - Select a card (CMD7), if not previously selected already.
  - Define the block length (CMD16) to 1 byte (8bit card lock/unlock command). Send the card lock/unlock command with the appropriate data block of one byte on the data line including 16-bit CRC. The data block shall indicate the mode ERASE (the ERASE bit shall be the only bit set).

If the ERASE bit is not the only bit in the data field then the LCOK_UNLOCK_FAILED error bit will be set in the status register and the erase request is rejected. If the command was accepted then ALL THE CARD CONTENT WILL BE ERASED including the PWD and PWD_LEN register content and the locked card will get unlocked.

An attempt to force erase on an unlocked card will fail and LOCK_UNLOCK_FAILED error bit will be set in the status register.

16.5.7 Card Status

The response format R1 contains a 32-bit field named card status. This field is intended to transmit the card's status information (which may be stored in a local status register) to the host. If not specified otherwise, the status entries are always related to the previous issued command.

Table below defines the different entries of the status. The type and clear condition fields in the table are abbreviate as follows:

Type:

E: Error bit.
S: Status bit.
R: Detected and set for the actual command response.
X: Detected and set during command execution. The host must poll the card by issuing the status command in order to read these bits.

Clear Condition:

A: According to the card current state.
B: Always related to the previous command. Reception of a valid command will clear it (with a delay of one command).
C: Clear by read.

Table 16-6 Card Status Description

Bits	Identifier	Type	Description	Clear Condition
31	OUT_OF_RAGE	E R	The commmand's argument was out of the allowed range for this card. 0 – No Error 1 – Error	C
30	ADDRESS_ERROR	E R X	A misaligned address which did not match the block length was used in the command. 0 – No Error 1 – Error	C
29	BLOCK_LEN_ERROR	E R	The transferred block length is not allowed for this, or the number of transferred bytes does not match the block length. 0 – No Error 1 – Error	C

28	ERASE_SEQ_ERROR	E R	An error in the sequence of erase commands occurred. 0 – No Error 1 – Error	C
27	ERASE_PARAM	E X	An invalid selection of sectors or groups for erase occurred. 0 – No Error 1 – Error	C
26	WP_VIOLATION	E R X	Attempt to program a write protected block. 0 – No Protected 1 – Protected	C
25	CARD_IS_LOCKED	S X	When set, signals that the card is locked by the host. 0 – Card unlocked 1 – Card locked	A
24	LOCK_UNLOCK_FAILED	E R X	Set when a sequence or password error has been detected in lock/unlock card command or if there was an attempt to access a locked card. 0 – No Error. 1 – Error.	C
23	COM_CRC_ERROR	E R	The CRC check of the previous command failed. 0 – No Error. 1 – Error.	B
22	ILLEGAL_COMMAND	E R	Command not legal for the card state. 0 – No Error. 1 – Error.	B
21	CARD_ECC_FAILED	E X	Card internal ECC was applied but failed to correct the data. 0 – normal. 1 – failure.	C
20	CC_ERROR	E R X	Internal card controller error. 0 – No Error. 1 – Error.	C
19	ERROR	E R X	A general or an unknown error occurred during the operation. 0 – No Error. 1 – Error.	C

18	UNDERRUN	E X	The card could not sustain data transfer in stream read mode. 0 – No Error. 1 – Error.	C
17	OVERRUN	E X	The card could not sustain data programming in stream write mode. 0 – No Error. 1 – Error.	C
16	CID/CSD_OVERWRITE	E R X	Can be either one of the following errors: 0 – No Error. 1 – Error.	C
15	WP_ERASE_SKIP	S X	Only partial address space was erased due to existing write protected blocks. 1 – No Protected. 1 – Protected.	C
14	CARD_ECC_DISABLED	S X	The command has been executed without using the internal ECC. 0 – enabled. 1 – disabled.	A
13	ERASE_RESET	S R	An erase sequence was cleared before executing because an out of erase sequence command was received. 0 – normal. 1 – set.	C

12:9	CURRENT_STATE	S X	The state of the card when receiving the command. If the command execution causes a state change, it will be visible to the host in the response to the next command. The four bits are interpreted as binary coded number between 0 and 15. 0 – idle 1 – ready 2 – ident 3 – stby 4 – tran 5 – data 6 – rcv 7 – prg 8 – dis (9 – 15) – rsv	B
8	READY_FOR_DATA	S X	Corresponds to buffer empty signaling on the bus. 0 – No Ready. 1 – Ready.	A
7:6	Reserved	-	-	-
5	APP_CMD	S R	The card will expect ACMD, or indication that the command has been interpreted as ACMD 0 – Disable. 1 – Enable.	C
4:0	Reserved	-	-	-

16.5.8 SD Status

The SD status contains status bits that are related to the SD card proprietary features and may be used for future application specific usage. The size of the SD status is one data block of 512bit. The content of this register is transmitted to the Host over the DAT bus along with 16-bit CRC. The SD status is sent to the host over the DAT bus if ACMD13 is sent (CMD55 followed with CMD13). ACMD13 can be sent to a card only in 'tran_state' (card is selected). SD status structure is described in below.

The same abbreviation for *type* and *clear condition* were used as for the Card Status above.

Table 16-7 SD Status Structure

Bits	Identifier	Type	Description	Clear Condition
511:510	DAT_BUS_WIDTH	S R	Shows the currently defined data	A

			bus width that was defined by SET_BUS_WIDTH command. 00 – 1 (default). 01 – Reserved. 10 – 4 bit width. 11 – Reserved.	
509	SECURED_MODE	S R	Card is in Secured Mode of operation. 0 – Not in the Mode. 10 – In the mode.	A
508:496	Reserved			
495:480	SD_CARD_TYPE	S R	All 0, is SD Memory cards.	A
479:448	SIZE_OF_PROTECTED_AREA	S R	Size of protected area.	A
447:312	Reserved			
311:0	Reserved for manufacturer			

16.5.9 SDIO

I/O access differs from memory in that the registers can be written and read individually and directly without a FAT file structure or the concept of blocks (although block access is supported). These registers allow access to the IO data, control of the IO function, and report on status or transfer I/O data to and from the host.

Each SDIO card may have from 1 to 7 functions plus one memory function built into it. A function is a self contained I/O device. I/O functions may be identical or completely different from each other. All I/O functions are organized as a collection of registers, and there is a maximum of 131,072 registers possible for each I/O function.

16.5.9.1 SDIO Interrupts

In order to allow the SDIO card to interrupt the host, and interrupt function is added to a pin on the SD interface. Pin number 8 which is used as DAT[1] when operating in the 4 bit SD mode is used to signal the card’s interrupt to the host. The use of interrupt is optional for each card or function within a card. The SDIO interrupt is “level sensitive”, that is, the interrupt line must be held active (low) until it is either recognized and acted upon by the host or de-asserted due to the end of the Interrupt Period. Once the host has serviced the interrupt, it is cleared via an IO write to the appropriate bit in the CCCR. The interrupt output of all SDIO cards is active low. This host controller provides pull-up resistors on all data lines DAT[3:0].

As Pin 8 of the card is shared between the IRQ and DAT[1] use in the 4 bit SD mode, and interrupt shall only be sent by the card and recognized by the host during a specific time. The time that a low on Pin 8 will be recognized as an interrupt is defined as the Interrupt Period.

The host here will only sample the level of Pin 8 (DAT[1]/IRQ) into the interrupt detector during the Interrupt Period. At all other times, the host will ignore the level on Pin 8. Note that the Interrupt Period is applicable for both memory and IO operations. The definition of the Interrupt Period is different for operations with single block and multiple block data transfer.

16.5.9.2 SDIO Suspend/Resume

Within a multi-function SDIO or a Combo (Mix IO and Memory) card, there are multiple devices (I/O and memory) that must share access to the SD bus. In order to allow the sharing of access to the host among multiple devices, SDIO and combo cards can implement the optional concept of suspend/resume. In a card supports suspend/resume, the host may temporarily halt a data transfer operation to one function or memory (suspend) in order to free the bus for a higher priority transfer to a different function of memory. Once this higher-priority transfer is complete, the original transfer is re-started where it left off (resume). The host controller here is supported by all IO functions except zero, and the memory of a combo card, and can suspend multiple transactions and resume them in any order desired. IO function zero does not support suspend/resume.

The procedure used to perform the Suspend/Resume operation on the SD bus is:

1. The host determines which function currently used the DAT[] line(s).
2. The host requests the lower priority or slower transaction to suspend.
3. The host checks for the transaction suspension to complete.
4. The host begins the higher priority transaction.
5. The host waits for the completion of the higher priority transaction.
6. The host restores the suspended transaction.

16.5.9.3 SDIO Read Wait

The optional Read Wait (RW) operation is defined only for the SD 1-bit and 4-bit modes. The read wait operation allows a host to signal a card that it is doing a read multiple (CMD53) operation to temporarily stall the data transfer while allowing the host to send commands to any function within the SDIO device. To determine if a card supports the Read Wait protocol, the host must test capability bits in CCCR. The timing for Read Wait is base on the Interrupt Period.

16.5.10 Clock Control

The software should guarantee that the card identification process starts in open-drain mode with the clock rate fod (0 ~ 400khz). In addition, the software should also make the card into interrupt mode with fod (only for MMC). The commands that require fod are CMD0, CMD1, CMD2, CMD3, CMD5, CMD40 and ACMD41. In data transfer mode, the MSC controller can operate card with clock rate fpp (0 ~ 25Mhz).

16.5.11 Application Specified Command Handling

The MultiMediaCard/SD system is designed to provide a standard interface for a variety applications types. In this environment it is anticipate that there will be a need for specific customers/applications features. To enable a common way of implementing these features, two types of generic commands are defined in the standard: Application Specific Command, ACMD, and General Command, GEN_CMD.

GEN_CMD, this command, when received by the card, will cause the card to interpret the following command as an application specific command, ACMD. The ACMD has the same structure as of regular MultiMediaCard standard commands and it may have the same CMD number. The card will recognize it as ACMD by the fact that it appears after APP_CMD.

The only effect of the APP_CMD is that if the command index of the, immediately, following command has an ACMD overloading, the none standard version will used. If, as an example, a card has a definition for ACMD13 but not for ACMD7 then, if received immediately after APP_CMD command, Command 13 will be interpreted as the non standard ACMD13 but, command 7 as the standard CMD7.

In order to use one of the manufacturer specific ACMD's the host will:

- Send APP_CMD. The response will have the APP_CMD bit (new status bit) set signaling to the host that ACMD is now expected.
- Send the required ACMD. The response will have the APP_CMD bit set, indicating that the accepted command was interpreted as ACMD. If a non-ACMD is sent then it will be respected by the card as normal MultiMediaCard command and the APP_CMD bit in the Card Status stays clear.

If a non valid command is sent (neither ACMD nor CMD) then it will be handled as a standard MultiMediaCard illegal command error.

The bus transaction of the GEN_CMD is the same as the single block read or write commands (CMD24 or CMD17). The difference is that the argument denotes the direction of the data transfer (rather than the address) and the data block is not a memory payload data but has a vendor specific format and meaning.

The card shall be selected ('tran_state') before sending CMD56. The data block size is the BLOCK_LEN that was defined with CMD16. The response to CMD56 will be R1b (card status + busy indication).

16.6 MMC/SD Controller Operation

16.6.1 Data FIFOs

The controller FIFOs for the response tokens, received data, and transmitted data are MSC_RES, MSC_RXFIFO, and MSC_TXFIFO, respectively. These FIFOs are accessible by the software and are described in the following paragraphs.

16.6.1.1 Response FIFO (MSC_RES)

The response FIFO, MSC_RES, contains the response received from an MMC/SD card after a command is sent from the controller. MSC_RES is a read-only, 16-bit, and 8-entry deep FIFO.

The FIFO will hold all possible response lengths. Responses that are only one byte long are located on the LSB of the 16-bit entry in the FIFO. The first half-word read from the response FIFO is the most significant half-word of the received response. For example, if the response format is R1, then the response read from RES_FIFO is bit [47:32], bit[31:16], bit[15:0] and in the third half-word only the low 8-bit is effective response [15:8] and the high 8-bit is ignored. If the response format is R2, then the response read from MSC_RES is bit [135:8] and needs reading 8 times.

The FIFO does not contain the response CRC. The status of the CRC check is in the status register, MSC_STAT.

16.6.1.2 Receive/Transmit Data FIFO (MSC_RXFIFO/MSC_TXFIFO)

The receive data FIFO and transmit data FIFO share one 16-entry x 32-bit FIFO, because at one time data are only received or are only transmitted. If it is used to receive data, it is called MSC_RXFIFO and read-only. If it is used to transmit data, it is called MSC_TXFIFO and write-only.

Data FIFO and its controls are cleared to a starting state after a system reset or at the beginning of the operations which include data transfer (MSC_CMDAT[DATA_EN] == 1).

If at any time MSC_RXFIFO becomes full and the data transmission is not complete, the controller turns the MSC_CLK off to prevent any overflows. When the clock is off, data transmission from the card stops until the clock is turned back on. After MSC_RXFIFO is not full, the controller turns the clock on to continue data transmission. The full status of the FIFO is registered in the MSC_STAT [DATA_FIFO_FULL] bit.

If at any time MSC_TXFIFO becomes empty and the data transmission is not complete, the controller turns the MSC_CLK off to prevent any underrun. When the clock is off, data transmission to the card stops until the clock is turned back on. When MSC_TXFIFO is no longer empty, the controller automatically restarts the clock. The empty status of the FIFO is registered in the MSC_STAT [DATA_FIFO_EMPTY] bit.

The FIFO is readable on word (32-bit) boundaries. The max read/written number is 16 words. The controller can correctly process big-endian an little-endian data.

Because at the beginning of the operation which include data transfer (MSC_CMDAT [DATA_EN] == 1), Data FIFO and its controls are cleared, software should guarantee data in FIFO have been read/written before beginning a new command.

16.6.2 DMA and Program I/O

Software may communicate to the MMC controller via the DMA or program I/O.

To access MSC_RXFIFO/MSC_TXFIFO with the DMA, the software must program the DMA to read or write the FIFO with source port width 32-bit, destination port width 32-bit, transfer data size 32-byte, transfer mode single. For example, to write 64 bytes of data to the MSC_TXFIFO, the software must program the DMA as follows:

```
DMA_DCTRn = 2                  // Write 2 32-bytes (64 bytes)
DMA_DCCRn[SWDH] = 0            // source port width is 32-bit
DMA_DCCRn[DWDH] = 0            // destination port width is 32-bit
DMA_DCCRn[DS] = 4              // transfer data size is 32-byte
DMA_DCCRn[TM] = 4              // transfer mode is single
DMA_DCCRn[RDIL] = 0            // request detection interval length is 0
```

The number of 32-bytes should be calculated from the number of transferred bytes as follows:

The number of words = (The number of bytes + 31) / 32

If the number of transferred bytes is not the multiple of 4, the controller can correctly process endian.

The DMA trigger level is 8 words, that is to say, the DMA read trigger is when data words in MSC_RXFIFO is >= 8 and the DMA write trigger is when data words in MSC_TXFIFO is < 8. Software can also configure DMA registers based on requirements, but the above 32-byte transfer data size is most efficient.

With program I/O, the software waits for the MSC_IREG [RXFIFO_RD_REQ] or MSC_IREG [TXFIFO_WR_REQ] interrupts before reading or writing the respective FIFO.

Note:

1. The MSC_CMDAT [DMA_EN] bit must be set to a 1 to enable communication with the DMA and it must be set to a 0 to enable program I/O.
2. DMA can be enabled only after MSC_CMDAT is written, because MSC_CMDAT [DATA_EN] is used to reset TX/RXFIFO.

16.6.3 Start and Stop clock

The software stops the clock as follows:

1. Write MSC_STRPCL with 0x01 to stop the MMC/SD bus clock.
2. Wait until MSC_STAT[CLK_EN] becomes zero.

To start the clock the software writes MSC_STRPCL with 0x02.

16.6.4 Software Reset

Reset includes the MSC reset and the card reset.

The MSC reset is through MSC_STRPCL [RESET] bit.

The card reset is to make the card into idle state. CMD0 (GO_IDLE_STATE) sets the MMC and SD memory cards into idle state. CMD52 (IO_RW_DIRECT, with argument 0x88000C08) reset the SD I/O card. The MMC/SD card are initialized with a default relative card address (RCA = 0x0001 for MMC and RCA = 0x0000 for SD) and with a default driver stage register setting (lowest speed, highest driving current capability).

The following registers must be set before the clock is started:

1. STOP THE CLOCK.
2. Set MSC_STRPCL register to 0x08 to reset MSC.
3. Wait while MSC_STAT [IS_RESETTING] is 1.
4. Set MSC_CMD with CMD0.
5. Update the MSC_CMDAT register as follows:
   a) Write 0x0000 to MSC_CMDAT [RESPONSE_FORMAT]
   b) Clear the MSC_CMDAT [DATA_EN] bit.
   c) Clear the MSC_CMDAT [BUSY] bit.
   d) Clear the MSC_CMDAT [INIT] bit.
6. Start the clock.
7. Start the operation (write MSC_STRPCL with 0x04)
8. Wait for the END_CMD_RES interrupt.

9. Set MSC_CMD with CMD52.
10. Set MSC_ARG with 0x88000C08
11. Update the MSC_CMDAT register as follows:
    a) Write 0x005 to MSC_CMDAT [RESPONSE_FORMAT]
    b) Clear the MSC_CMDAT [DATA_EN] bit.
    c) Clear the MSC_CMDAT [BUSY] bit.
    d) Clear the MSC_CMDAT [INIT] bit.
12. Start the operation.
13. Wait for the END_CMD_RES interrupt.

16.6.5 Voltage Validation and Card Registry

At most 10 MMC and 1 SD (either SDMEM or SDIO) can be inserted MMC/SD bus at the same time, and their voltage validation and card registry steps are different, so the software should be programmed as follows:

1. CHECK WHETHER SDIO CARD IS INSERTED.
2. Check whether SDMEM card is inserted.
3. Check whether MMC cards are inserted.

16.6.5.1 Check SDIO

The commands are sent as follows:

1. (Optional) Send CMD52 (IO_RW_DIRECT) with argument 0x88000C08 to reset SDIO card.
2. Send CMD5 (IO_SEND_OP_CMD) to validate voltage.
3. If the response is correct and the number of IO functions > 0, then continue, else go to check SDMEM.
4. If C-bit in the response is ready (the initialization has finished), go to 6.
5. Send CMD5 (IO_SEND_OP_CMD) to validate voltage, then go to 4.
6. If memory-present-bit in the response is true, then it is a combo card (SDIO + Memory), else it is only a SDIO card.
7. If it is a combo card, go to check SDMEM to initialize the memory part.
8. Send CMD3 (SET_RELATIVE_ADDR) to let the card publish a RCA. The RCA is returned from the response.
9. If do not accept the new RCA, go to 8, else record the new RCA.
10. Go to check MMC, because we can assure that there is no SDMEM card.

16.6.5.2 Check SDMEM

If there is no SDIO card or there is a combo card, continue to check SDMEM.

The commands are sent as follows:

1. (Optional) Send CMD0 (GO_IDLE_STATE) to reset MMC and SDMEM card. This command has no response.
2. Send CMD55. Here the default RCA 0x0000 is used for CMD55.
3. If the response is correct (CMD55 has response), then continue, else go to check MMC.
4. Send ACMD41 (SD_SEND_OP_CMD) to validate voltage (the general OCR value is 0x00FF8000).
5. If the initialization has finished, go to 7. (The response is the OCR register and it includes a status information bit (bit [31]). This status bit is set if the card power up procedure has been finished. As long as the card is busy, the corresponding bit[31] is set to LOW.)
6. Send CMD55 and ACMD41 to validate voltage, and then go to 5.
7. Send CMD2 (ALL_SEND_CID) to get the card CID.
8. Send CMD3 (SET_RELATIVE_ADDR) to let card publish a RCA. The RCA is returned from the response.
9. If do not accept the new RCA, go to 8, else record the new RCA.
10. Go to check MMC.

16.6.5.3 Check MMC

Because there may be several MMC card, so some steps (5 ~ 8) should be repeated several times.

The commands are sent as follows:

1. Send CMD1 (SEND_OP_CMD) to validate voltage (the general OCR value is 0x00FF88000).
2. If the response is correct, then continue, else goto 9.

3. If the initialization has finished, go to 5. (The response is the OCR register and it includes a status information bit (bit [31]). This status bit is set if the card power up procedure has been finished. As long as the card is busy, the corresponding bit[31] is set to LOW.)
4. Send CMD1 (SEND_OP_CMD) to validate voltage, and then go to 3.
5. Send CMD2 (ALL_SEND_CID) to get the card CID.
6. If the response timeout occurs, goto 9.
7. Send CMD3 (SET_RELATIVE_ADDR) to assign the card a RCA.
8. If there are other MMC cards, then go to 5.
9. Finish.

16.6.6 Single Data Block Write

In a single block write command, the following registers must be set before the operation is started:

1. Set MSC_NOB register to 0x0001.
2. Set MSC_BLKLEN to the number of bytes per block.
3. Update the MSC_CMDAT register as follows:
   a) Write 0x001 to MSC_CMDAT [RESPONSE_FORMAT]
   b) Write 0x2 to MSC_CMDAT [BUS_WIDTH] if the card is SD, else clear it.
   c) Set the MSC_CMDAT [DATA_EN] bit.
   d) Set the MSC_CMDAT [WRITE_READ] bit.
   e) Clear the MSC_CMDAT [STREAM_BLOCK] bit.
   f) Clear the MSC_CMDAT [BUSY] bit.
   g) Clear the MSC_CMDAT [INIT] bit.
4. Start the operation.
5. Write MSC_IMASK with some value to unmask the expected interrupts.

Then the software must perform the following steps:

1. Wait for the MSC_IREG [END_CMD_RES] interrupt.
2. Wait for the MSC_IREG [DATA_TRAN_DONE] interrupt.
   At the same time write data to the MSC_TXFIFO and continue until all of the data have been written to the FIFO.
3. Wait for MSC_IREG [PROG_DONE] interrupt. This interrupt indicates that the card has finished programming. Certainly software may start another command sequence on a different card.
4. Read the MSC_STAT register to verify the status of the transaction (i.e. CRC error status).

To address a different card, the software sends a select command to that card by sending a basic no data command and response transaction. To address the same card, the software must wait for MSC_IREG [PROG_DONE] interrupt. This ensures that the card is not in the busy state.

In addition, CMD26 (PROGRAM_CID), CMD27 (PROGRAM_CSD), CMD42 (LOCK/UNLOCK), CMD56 (GEN_CMD: write) and CMD53 (single_block_write) operations are similar to single block write.

16.6.7 Single Block Read

In a single block read command, the following registers must be set before the operation is started:

1. SET MSC_NOB REGISTER TO 0X0001.
2. Set MSC_BLKLEN register to the number of bytes per block.
3. Update the following bits in the MSC_CMDAT register:
    a) Write 0x001 to MSC_CMDAT [RESPONSE_FORMAT].
    b) Write 0x2 to MSC_CMDAT [BUS_WIDTH] if the card is SD, else clear it.
    c) Set the MSC_CMDAT [DATA_EN] bit.
    d) Clear the MSC_CMDAT [WRITE_READ] bit.
    e) Clear the MSC_CMDAT [STREAM_BLOCK] bit.
    f) Clear the MSC_CMDAT [BUSY] bit.
    g) Clear the MSC_CMDAT [INIT] bit.
4. Start the operation.
5. Write MSC_IMASK with some value to unmask the expected interrupts.

Then the software must perform the following steps:

1. Wait for the MSC_IREG [END_CMD_RES] interrupt.
2. Wait for the MSC_IREG [DATA_TRAN_DONE] interrupt.
   At the same time read data from the MSC_RXFIFO as data becomes available in the FIFO, and continue reading until all data is read from the FIFO.
3. Read the MSC_STAT register to verify the status of the transaction (i.e. CRC error status).

In addition, CMD30 (SEND_WRITE_PROT), ACMD13 (SD_STATUS), CMD56 (GEN_CMD-read), ACMD51 (SEND_SCR) and CMD53 (single_block_read) are similar to single block read.

16.6.8 Multiple Block Write

The multiple block write mode is similar to the single block write mode, except that multiple blocks of data are transferred. Each block is the same length. All the registers are set as they are for the single block write, except that the MSC_NOB register is set to the number of blocks to be written.

The multiple block write mode also requires a stop transmission command, CMD12, after the data is transferred to the card. After the MSC_IREG [DATA_TRAN_DONE] interrupt occurs, the software must program the controller register to send a stop data transmission command.

If multiple block write with pre-defined block count (refer to MMC spec v-3.3) is used, CMD12 should not be sent.

For SDIO card, CMD53 (multiple_block_write) is also similar, but when IO abort (CMD52) is sent, MSC_CMDAT [IO_ABORT] should be 1.

Table 16-8 How to stop multiple block write

Operation	Stop condition	Software processing
Open-ended or SDIO infinite	After write MSC_NOB blocks	1. Wait for DATA_TARN_DONE interrupt 2. Send CMD12 or CMD52 (IO abort)

		3. Wait for END_CMD_RES and PRG_DONE interrupt
Open-ended or SDIO infinite	Stop writing in advance (not write MSC_NOB blocks)	1. Set MSC_STRPCL [EXIT_MULTIPLE] 2. Wait for DATA_TRAN_DONE interrupt 3. Send CMD12 or CMD52 (IO abort) 4. Wait for END_CMD_RES and PRG_DONE interrupt.
Predefined block or SDIO finite	After writing MSC_NOB blocks	1. Wait for DATA_TRAN_DONE interrupt
Predefined block or SDIO finite	Stop writing in advance (not write MSC_NOB blocks)	1. Set MSC_STRPCL [EXIT_MULTIPLE] 2. Wait for DATA_TRAN_DONE interrupt 3. Send CMD12 or CMD52 (IO abort) 4. Wait for END_CMD_RES and PRG_DONE interrupt

16.6.9 Multiple Block Read

The multiple blocks read mode is similar to the single block read mode, except that multiple blocks of data are transferred. Each block is the same length. All the registers are set as they are for the single block read, except that the MSC_NOB register is set to the number of blocks to be read.

The multiple blocks read mode requires a stop transmission command, CMD12, after the data from the card is received. After the MSC_IREG [DATA_TRAN_DONE] interrupt has occurred, the software must program the controller registers to send a stop data transmission command.

If multiple block read with pre-defined block count (refer to MMC spec v-3.3) is used, CMD12 should not be sent.

For SDIO card, CMD53 (multiple_block_read) is also similar, but when IO abort (CMD52) is sent, MSC_CMDAT [IO_ABORT] should be 1.

Table 16-9 How to stop multiple block read

Operation	Stop condition	Software processing
Open-ended or SDIO infinite	After reading MSC_NOB blocks	1. Wait for DATA_TRAN_DONE interrupt 2. Send CMD12 or CMD52 (IO abort) 3. Wait for END_CMD_RES interrupt
Open-ended or SDIO infinite	Stop reading in advance (not write MSC_NOB blocks)	1. Set MSC_STRPCL [EXIT_MULTIPLE] 2. Wait for DATA_TRAN_DONE interrupt 3. Send CMD12 or CMD52 (IO abort) 4. Wait for END_CMD_RES interrupt
Predefined block or SDIO finite	After reading MSC_NOB blocks	1. Wait for DATA_TRAN_DONE interrupt
Predefined block or SDIO finite	Stop reading in advance (not write MSC_NOB blocks)	1. Set MSC_STRPCL [EXIT_MULTIPLE] 2. Wait for DATA_TRAN_DONE interrupt

		3. Send CMD12 or CMD52 (IO abort) 4. Wait for END_CMD_RES interrupt

16.6.10 Stream Write (MMC)

In a stream write command, the following registers must be set before the operation is started:

1. UPDATE MSC_CMDAT REGISTER AS FOLLOWS:
   a) Write 0x001 to the MSC_CMDAT [RESPONSE_FORMAT].
   b) Clear the MSC_CMDAT [BUS_WIDTH] because only MMC support stream write
   c) Set the MSC_CMDAT [DATA_EN] bit.
   d) Set the MSC_CMDAT [WRITE_READ] bit.
   e) Set the MSC_CMDAT [STREAM_BLOCK] bit.
   f) Clear the MSC_CMDAT [BUSY] bit.
   g) Clear the MSC_CMDAT [INIT] bit.
2. Start the operation.
3. Write MSC_IMASK with some value to unmask the expected interrupts.

Then the software must perform the following steps:

1. WAIT FOR THE MSC_IREG [END_CMD_RES] INTERRUPT.
2. Write data to the MSC_TXFIFO and continue until all of the data is written to the Data FIFO.
3. Stop clock. Wait until MSC_STAT[CLK_EN] becomes 0. The clock must be stopped.
4. Set the command registers for a stop transaction command (CMD12) and other registers.
5. Start the clock and start the operation.
6. Wait for the MSC_IREG [END_CMD_ERS] interrupt.
7. Wait for the MSC_IREG [DATA_TRAN_DONE] interrupt.
8. Wait for the MSC_IREG [PRG_DONE] interrupt. This interrupt indicates that the card has finished programming. Certainly software may start another command sequence on a different card.
9. Read the MSC_STAT register to verify the status of the transaction.

To address a different card, the software must send a select command to that card by sending a basic no data command and response transaction. To address the same card, the software must wait for MSC_IREG [PRG_DONE] interrupt. This ensures that the card is not in the busy state.

If partial blocks are allowed (if CSD parameter WRITE_BL_PARTIAL is set) the data stream can start and stop at any address within the card address space, otherwise it shall start and stop only at block boundaries. If WRITE_BL_PARTIAL is not set, 16 more stuff bytes need to be written after the useful written data, otherwise only write the useful written data.

16.6.11 Stream Read (MMC)

In a stream read command, the following registers must be set before the operation is turned on:

1. UPDATE THE MSC_CMDAT REGISTER AS FOLLOWS:
   a) Write 0x01 to the MSC_CMDAT [RESPONSE_FORMAT]
   b) Clear the MSC_CMDAT [BUS_WIDTH] because only MMC support stream read.
   c) Clear the MSC_CMDAT [WRITE_READ] bit.

   d) Set the MSC_CMDAT [STREAM_BLOCK] bit.
   e) Clear the MSC_CMDAT [BUSY] bit.
   f) Clear the MSC_CMDAT [INIT] bit.
2. Start the operation.
3. Write MSC_IMASK with some value to unmask the expected interrupts.

Then the software must perform the following steps:

1. WAIT FOR THE MSC_IREG [END_CMD_RES] INTERRUPT.
2. Read data from the MSC_RXFIFO and continue until all of the expected data has been read from the FIFO.
3. Write MSC_STRPCL [EXIT_TRANSER] with 1. If MSC_STAT[DATA_FIFO_FULL] is 1, then read MSC_RXFIFO to make it not full. Because if data FIFO is full, MSC_CLK is stopped. Here, the data FIFO contains useless data.
4. Set the command registers for a stop transaction command (CMD12) and send it. There is no need to stop the clock.
5. Wait for the MSC_IREG [END_CMD_RES]
6. Wait for the MSC_IREG [DATA_TRAN_DONE] interrupt.
7. Read the MSC_STAT register to verify the status of the transaction.

16.6.12 Erase, Select/Deselect and Stop

For CMD7 (SELECT/DESELECT_CARD), CMD12 (STOP_TRANSMISSION) and CMD38 (ERASE), the following registers must be set before the operation is started:

1. UPDATE THE MSC_CMDAT REGISTER AS FOLLOWS:
   a) Write 0x01 to the MSC_CMDAT [RESPONSE_FORMAT]
   b) Clear the MSC_CMDAT [DATA_EN] bit.
   c) Clear the MSC_CMDAT [WRITE_READ] bit.
   d) Clear the MSC_CMDAT [STREAM_BLOCK] bit.
   e) Set the MSC_CMDAT [BUSY] bit.
   f) Clear the MSC_CMDAT [INIT] bit.
2. Start the operation.
3. Write MSC_IMASK with some value to unmask the expected interrupts.

Then the software must perform the following steps:

1. WAIT FOR THE MSC_IREG [END_CMD_RES] INTERRUPT.
2. Wait for the MSC_IREG [PRG_DONE] interrupt. If CMD12 is sent to terminate data read operation, then there is no need to wait for MSC_IREG [PRG_DONE] interrupt. This interrupt indicates that the card has finished programming. Certainly software may start another command sequence on a different card.

16.6.13 SDIO Suspend/Resume

The actual suspend/resume steps are as follows:

1. DURING DATA TRANSFER, SEND CMD52 TO REQUIRE SUSPEND. BR AND RAW FLAG SHOULD BE 1.
2. If BS flag in the response is 0, then suspend has been accepted and goto 4

3. Send CMD52 to query card status. R flag should be 1. Go to 2.
4. Write MSC_STRPCL [EXIT_TRANSFER] with 1.
5. Wait for the MSC_IREG [DATA_TRAN_DONE] interrupt.
6. Read MSC_NOB, MSC_SNOB and etc, save them into variables.
7. Set registers for high priority transfer and start it.
8. Wait until high priority transfer is finished.
9. Restore registers from variables, but MSC_NOB should be (MSC_NOB – MSC_SNOB).
10. Send CMD52 to require resume. FSx should be resumed function number.

16.6.14 SDIO ReadWait

The actual ReadWait steps are as follows

1. During multiple block read, read MSC_SNOB. If MSC_SNOB is nearby or equal to MSC_NOB, no need to use ReadWait.
2. Write MSC_STRPCL [START_READWAIT] with 1.
3. Wait until MSC_STAT [IS_READWAIT] becomes 1.
4. Send CMD52 to query card status.
5. Write MSC_STRPCL [STOP_READWAIT] with 1.

16.6.15 Operation and Interrupt

The software can use polling-status method to operate the MMC/SD card, but this is not the proposed method, because its performance is very low. The proposed method is to use interrupt. Generally there are fixed necessary steps to finish each command. The steps are as follows.

1. (Optional) Stop clock. Poll CLK_EN.
2. Fill the registers (MSC_CMD, MSC_CMDAT, MSC_ARG, MSC_CLKRT, and etc).
3. (Optional) Start clock.
4. Start the operation. Wait for the MSC_IREG [END_CMD_RES] interrupt.
5. Wait for the MSC_IREG [DATA_TRAN_DONE] interrupt.
6. Send STOP_TRANS (CMD12) or I/O abort (CMD52). Wait for the MSC_IREG [END_CMD_ERS] interrupt.
7. Wait for the MSC_IREG [DATA_TRAN_DONE] interrupt
8. Wait for the MSC_IREG [PRG_DONE] interrupt.

Table 16-10 The mapping between Commands and Steps

ACMD42	SET_CLR_CARD_DETECT	Y	Y	Y	Y					
ACMD51	SEND_SCR	Y	Y	Y	Y	Y				

Note: For stream read/write, STOP_CMD is sent after finishing data transfer. For write, STOP_CMD is with the last six bytes. For read, STOP_CMD is sent after receiving data and card sends some data which MSC ignores.

17 I2C Bus Interface

17.1 Overview

The I2C bus was created by the Phillips Corporation and is a serial bus with a two-pin interface. The SDA data pin is used for input and output functions and the SCL clock pin is used to control and reference the I2C bus. The I2C unit allows the processor to serve as a master and slave device that resides on the I2C bus. The I2C unit enables the processor to communicate with I2C peripherals and microcontrollers for system management functions. The I2C bus requires a minimum amount of hardware to relay status and reliability information concerning the processor subsystem to an external device. The I2C unit is a peripheral device that resides on the processor internal bus. Data is transmitted to and received from the I2C bus via a buffered interface. Control and status information is relayed through a set of memory-mapped registers. Refer to ***The I2C-Bus Specification*** for complete details on I2C bus operation.

The I2C has the following features:

- Supports only single master mode.
- Supports I2C standard-mode and F/S-mode up to 400 kHz.
- I2C receiver and transmitter are double-buffered.
- Supports burst reading or writing of data.
- Supports random writing access of data.
- Supports general call address and START byte format after START condition.
- Independent, programmable serial clock generator.
- Supports slave coping with fast master during data transfers by holding the SCL line on a bit level.
- The number of devices that you can connect to the same I2C-bus is limited only by the maximum bus capacitance of 400pF.

Bits	Name	Description	RW
15:01	GR	Sets the frequency of serial clock. The serial clocks frequency is calculated as follows: [Value of I2CGR] = [Frequency of Device_clock] / (16 * [SCL clock rate]) – 1	RW

Note: To make the I2C operate normally, frequency of PCLK (APB-bus clock) should not lower than transfer 2 * [byte rate].

17.4 I^{2}C-Bus Protocol

17.4.1 Bit Transfer

Due to the variety of different technology devices (CMOS, NMOS, bipolar) which can be connected to the I^{2}C-bus, the levels of the logical '0' (LOW) and '1' (HIGH) are not fixed and depend on the associated level of VDD. One clock pulse is generated for each data bit transferred.

17.4.2 Data Validity

The data on the SDA line must be stable during the HIGH period of the clock. The HIGH or LOW states of the data line can only change when the clock signal on the SCL line is LOW.

17.4.3 START and STOP Conditions

A HIGH to LOW transition on the SDA line while SCL is HIGH indicates a START condition. A LOW to HIGH transition on the SDA line while SCL is HIGH defines a STOP condition.

17.4.4 Byte Format

1. Every byte put on the SDA line must be 8-bits width
2. The number of bytes that can be transmitted/received per transfer is unrestricted.
3. Each byte has to be followed by an acknowledge (ack/nack) bit.
4. Data is transferred with the most significant bit (MSB) first.
5. Data transfer with an acknowledge signal (acknowledge or not-acknowledge) is obligatory.
6. The acknowledge_ related clock pulse is generated by the master.
7. The transmitter releases the SDA line (HIGH) during the acknowledge clock pulse. The receiver must pull down the SDA line during the acknowledge clock pulse so that it remains stable LOW during the HIGH period of this clock pulse.
8. Slave can hold the SCL line LOW during the SCL in LOW level at any bit to force the master to proceed a lower speed of transfer.

Notes:

1. Sr means repeated START condition. P means STOP condition.

2. In Fig (a), if the master does not generate Sr or P, the next data byte follows the ack.
3. In Fig (b), nack is received, the master generates Sr or P and the transfer terminates.

17.4.5 Data Transfer Format

17.4.5.1 First Byte

The first byte is a term indicates the address byte after START condition.

1) Normal 7-bit Address:

After the START condition, the addressing procedure for the I^2C-bus is such that the first byte usually determines which slave will been selected by the master.

The first seven bits of the first byte make up the slave address. The eighth bit is the LSB (least significant bit). It determines the direction of the message. A ‘zero’ in the least significant position of the first byte means that the master will write information to a selected slave. A ‘one’ in this position means that the master will read information from the slave.

When an address is sent, each device in a system compares the first seven bits after the START condition with its address. If they match, the device considers itself addressed by the master as a slave-receiver or slave-transmitter, depending on the R/W bit.

A slave address can be made-up of a fixed and a programmable part. Since it’s likely that there will be several identical devices in a system, the programmable part of the slave address enables the maximum possible number of such devices to be connected to the I^2C-bus. The number of programmable address bits of a device depends on the number of pins available. For example, if a device has 4 fixed and 3 programmable address bits, a total of 8 identical devices can be connected to the same bus.

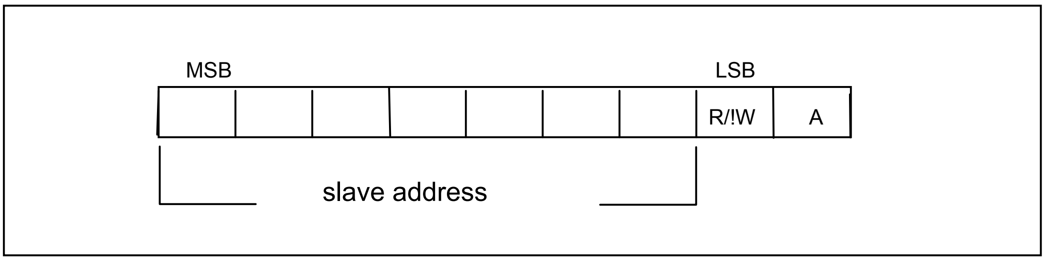

Figure 17-3 Normal 7 Bit Address after START Condition

2) General Call Address:

Address byte with all bits are “0” is defined as “general call address”. When this address is used, all devices should, in theory, respond with an acknowledge. However, if a device doesn’t need any of the data supplied within the general call structure, it can ignore this address by not issuing an acknowledgment. If a device does require data from a general call address, it will acknowledge this address and behave as a slave- receiver. The second and following bytes will be acknowledged by every slave-receiver capable of handling this data. A slave that cannot process one of these bytes must ignore it by not-acknowledging.

The second byte of the general call address then defines the action to be taken.

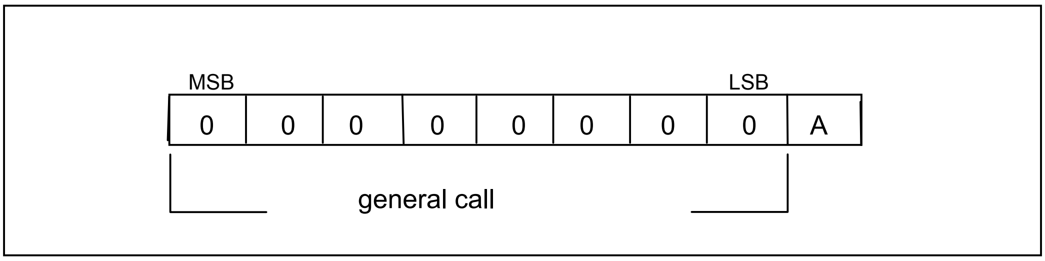

Figure 17-4 General Call Address after START Condition

3) START Byte Address:

START Byte:

After the START condition S has been transmitted by the master, data transfer can be preceded by a start procedure which is much longer than normal. The start procedure consists of:

- A START condition (S)
- A START byte (00000001)
- An acknowledge clock pulse (ACK)*
- A repeated START condition (Sr)

Note: An acknowledge-related clock pulse is generated after the START byte. This is present only to conform to the byte handling format used on the bus. No device is allowed to acknowledge the START byte.

When the START byte (00000001) is transmitted, another microcontroller (the slave) can therefore sample the SDA line at a low sampling rate (also determined by the I2CGR) until one of the seven zeros in the START byte is detected. After detection of this LOW level on the SDA line, the microcontroller can switch to a higher sampling rate to find the repeated START condition Sr which is then used for synchronization.

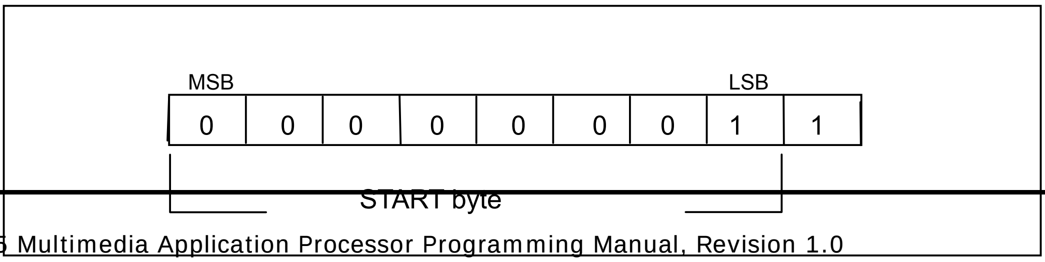

Figure 17-5 START Byte after START Condition

17.4.5.2 Transfer Format

A data transfer is always terminated by a STOP condition (P) generated by the master. However, if a master still wishes to communicate on the bus, it can generate a repeated START condition (Sr) and address another slave without first generating a STOP condition. Various combinations of read/write formats are then possible within such a transfer.

Possible data transfer formats are:

- Master-transmitter transmits to slave-receiver. The transfer direction is not changed.
- Master reads slave immediately after first byte. At the moment of the first acknowledge, the master-transmitter becomes a master- receiver and the slave-receiver becomes a slave-transmitter.
- This first acknowledge is still generated by the slave. The STOP condition is generated by the master, which has previously sent a not-acknowledge.

Notes:

1. Combined formats can be used, for example, to control a serial memory. During the first data byte, the internal memory location has to be written. After the START condition and slave address is repeated, data can be transferred.
2. All decisions on auto-increment or decrement of previously accessed memory locations etc. are taken by the designer of the device.
3. Each byte is followed by an acknowledgment bit as indicated by the 'A 'or '!A ' blocks in the sequence.

18 UART Interface

This chapter describes the universal asynchronous receiver/transmitter (UART) serial ports. There are two UARTs: All UARTs use the same programming model. Each of the serial ports can operate in interrupt based mode or DMA-based mode.

The Universal asynchronous receiver/transmitter (UART) is compatible with the 16550 industry standard and can be used as slow infrared asynchronous interface that conforms to the Infrared Data Association (IrDA) serial infrared specification 1.1.

18.1 Overview

- Full-duplex operation
- 5-, 6-, 7- or 8-bit characters with optional no parity or even or odd parity and with 1, 1½, or 2 stop bits
- 16x8bit transmit FIFO and 16x11bit receive FIFO
- Independently controlled transmit, receive (data ready or timeout), line status interrupts
- Baud rate generation allows up to 230.4Kbps
- Internal diagnostic capability Loopback control and break, parity, overrun and framing-error is provided
- Separate DMA requests for transmit and receive data services in FIFO mode
- Modem Control Functions are provided
- Slow infrared asynchronous interface that conforms to IrDA specification

18.2 Pin Description

Table 18-1 UART Pins Description

Name	Type	Description
RxD	Input	Receive data input
TxD	Output	Transmit data output
CTS_	Input	Clear to Send — Modem Transmission enabled
RTS_	Output	Request to Send — UART Transmission request

18.3 Register Description

All UART register 32-bit access address is physical address. When ULCR.DLAB is 0, URBR, UTHR and UIER can be accessed; When ULCR.DLAB is 1, UDLLR and UDLHR can be accessed.

18.3.1 UART Receive Buffer Register (URBR)

The read-only URBR is corresponded to one level 11bit buffer in non-FIFO mode and a 16x11bit FIFO that holds the character(s) received by the UART. Bits in URBR are right-justified when being configured to use fewer than eight bits, and the rest of most significant data bits are zeroed and the most significant three bits of each buffer are the status for the character in the buffer. If ULSR.DRY is 0, don't read URBR, otherwise wrong operation may occur.

URBR0, URBR1, URBR2, URBR3

0x10030000, 0x10031000,
0x10032000, 0x10033000 (DLAB = 0)

18.3.3 UART Divisor Latch Low/High Register (UDLLR / UDLHR)

UART Divisor Latch registers, UDLLR/UDLHR together compose the divisor for the programmable baud rate generator that can take the 3.6864-MHz fixed-input clock and divide it by 1 to (2^{16} – 1). UDLHR/UDLLR stores the high/low 8-bit of the divisor respectively. Load these divisor latches during initialization to ensure that the baud rate generator operates properly. If both Divisor Latch registers are 0, the 16X clock stops. The maximum baud rate is 230.4kbps.

The relationship of baud rate and the value of Divisor is shown by the formula:

Baud Rate = 3.6864 Mhz / (16 * **Divisor**)

UDLLR0, UDLLR1, UDLLR2, UDLLR3

0x10030000, 0x10031000,
0x10032000, 0x10033000 (DLAB = 1)

18.3.4 UART Interrupt Enable Register (UIER)

The UART Interrupt Enable Register (UIER) contains the interrupt enable bits for the five types of interrupts (receive data ready, timeout, line status, and transmit data request, and modem status) that set a value in UIIR.

UIER0, UIER1, UIER2, UIER3

0x10030004, 0x100301004,
0x10032004, 0x10033004 (DLAB = 0)

	RDTR		Reserved	UME	DME	TFRT	RFRT	FME
RST	0	0	0	0	0	0	0	0

Bits	Name	Description	RW
7:6	RDTR	**Receive Buffer Data Number Trigger** These bits are used to select the trigger level for the receive data ready	W

		interrupt in FIFO mode. 0b00 = 1 0b01 = 4 0b10 = 8 0b11 = 15	
5	Reserved	Always read 0, write is ignored	R
4	UME	**UART Module Enable** 0 = Disable UART 1 = Enable UART	W
3	DME	**DMA Mode Enable** 0 = Disable DMA mode 1 = Enable DMA mode	W
2	TFRT	**Transmit Holding Register Reset** 0 = Not reset 1 = Reset transmit FIFO	W
1	RFRT	**Receive Buffer Reset** 0 = Not reset 1 = Reset receive FIFO	W
0	FME	**FIFO Mode Enable** Set this bit before the trigger levels. 0 = non-FIFO mode 1 = FIFO mode	W

18.3.7 UART Line Control Register (ULCR)

The ULCR defines the format for UART data transmission.

ULCR0. ULCR1, ULCR2, ULCR3

0x1003000C, 0x1003100C
0x1003200C, 0x1003300C

Bit	7	6	5	4	3	2	1	0
	DLAB	SBK	STPAR	PARM	PARE	SBLS	WLS	
RST	0	0	0	0	0	0	0	0

Bits	Name	Description	RW
7	DLAB	**Divisor Latch Access Bit** 0 = Enable to access URBR, UTHR or UIER 1 = Enable to access UDLLR or UDLHR	W
6	SBK	**Set Break** Causes a break condition (at least one 0x00 data) to be transmitted to the	W

		receiving UART. Acts only on the TXD pin and has no effect on the transmit logic. 0 = No effect on TXD output 1 = Forces TXD output to 0	
5	STPAR	**Sticky Parity** Setting this bit forces parity location to be opposite of PARM bit when PARE is 1 (it is ignored when PARE is 0). 0 = Disable Sticky parity 1 = Enable Sticky parity (opposite o f PARM bit)	W
4	PARM	**Parity Odd/Even Mode Select** If PARE = 0, PARM is ignored 0 = Odd parity 1 = Even parity	W
3	PARE	**Parity Enable** Enables a parity bit to be generated on transmission or checked on reception. 0 = No parity 1 = Parity	W
2	SBLS	**Stop Bit Length Select** Specifies the number of stop bits transmitted and received in each character. When receiving, the receiver checks only the first stop bit. 0 = 1 stop bit 1 = 2 stop bits, except for 5-bit character then 1-1/2 bits	W
1:0	WLS	**Word Length Select** 0b00 = 5-bit character 0b01 = 6-bit character 0b10 = 7-bit character 0b11 = 8-bit character	W

18.3.8 UART Line Status Register (ULSR)

The read-only ULSR indicates status information during the data transfer. Receive error information in ULSR[4:1] remains set until software reads ULSR and it must be read before the error character is read.

ULSR0, ULSR1, ULSR2, ULSR3 **0x10030014, 0x10031014, 0x10032014, 0x10033014**

Bit	7	6	5	4	3	2	1	0
	FIFOE	TEMP	TDRQ	BI	FMER	PARER	OVER	DRY
RST	0	1	1	0	0	0	0	0

Bits	Name	Description	RW
7	FIFOE	**FIFO Error Status (FIFO mode only)** FIFOE is set when there is at least one kind of receive error (parity, frame, overrun, break) for any of the characters in receive buffer. FIFOE is reset when all error characters are read out of the buffer. During DMA transfer, the error interrupt generates when FIFOE is 1, and no receive DMA request generates even when data in receive buffer reaches the trigger threshold until all the error characters are read out. In non-DMA mode, FIFOE set does not generate error interrupt. 0 = No error data in receive buffer or non-FIFO mode 1 = One or more error character in receive buffer	R
6	TEMP	**Transmit Holding Register Empty** Set when both UTHR and shift register are empty. It is cleared when either the UTHR or the shift register contains a data character. 0 = There is data in the transmit shifter and UTHR 1 = All the data in the transmit shifter and UTHR has been shifted out	R
5	TDRQ	**Transmit Data Request** Set when UTHR has half or more empty location (FIFO mode) or empty (non-FIFO mode). When both UIER.TDRIE and TDRQ are 1, transmit data request interrupt generates or during DMA transfer, DMA request to the DMA controller generates when UIER.TDRIE is 0 and TDRQ is 1. 0 = There is one (non-FIFO mode) or more than half data (FIFO mode) in UTHR 1 = None data (non-FIFO mode) or half or less than half data (FIFO mode) in UTHR	R
4	BI	**Break Interrupt** BI is set when the received data input is held low for longer than a full-word transmission time (the total time of start bit + data bits + parity bit + stop bits). BI is cleared when the processor reads the ULSR. In FIFO mode, only one character equal to 0x00 is loaded into the FIFO regardless of the length of the break condition. BI shows the break condition for the character at the front of the FIFO, not the most recently received character. 0 = No break signal has been received 1 = Break signal received	R
3	FMER	**Framing Error** Set when the bit following the last data bit or parity bit is detected to be 0. If the ULCR had been set for two or one and half stop bits, the other stop	R

		bits are not checked except the first one. In FIFO mode, FMER shows a framing error for the character at the front of the receive buffer, not for the most recently received character. Cleared when the processor reads the ULSR. 0 = No framing error 1 = Invalid stop bit has been detected	
2	PARER	**Parity Error** Indicates that the received data character does not have the correct even or odd parity, as selected by the even parity select bit. PARER is set upon detection if a parity error and is cleared when the processor reads the ULSR. In FIFO mode, PARER shows a parity error for the character at the front of the FIFO, not the most recently received character. 0 = No parity error 1 = Parity error has occurred	R
1	OVER	**Overrun Error** Set when both receive buffer and shifter are full and new data is received which will be lost. Cleared when the processor reads the ULSR. 0 = No data has been lost 1 = Receive data has been lost	R
0	DRY	**Data Ready** Set when a complete incoming character has been received into the Receive Buffer registers. DRY is cleared when the receive buffer is read (non-FIFO mode) or when the buffer is empty or when the buffer is reset by setting UFCR.RFRT to 1. 0 = No data has been received 1 = Data is available in URBR	R

18.3.9 UART Modem Control Register (UMCR)

The UMCR uses the modem control pins RTS_ and CTS_ to control the interface with a modem or data set. UMCR also controls the loopback mode. Loopback mode must be enabled before the UART is enabled.

UMCR0, UMCR1, UMCR2, UMCR3 **0x10030010, 0x10031010, 0x10032010, 0x10033010**

Bit	7	6	5	4	3	2	1	0
	MDCE	Reserved		LOOP	Reserved	Reserved	RTS	Reserved
RST	0	0	0	0	0	0	0	0

Bits	Name	Description	RW

7	MDCE	**Modem Control Enable** 0 = Modem function is disabled 1 = Modem function is enabled	W
6:5	Reserved	Always read 0, write is ignored	R
4	LOOP	**Loop Back** This bit is used for diagnostic testing of the UART. When LOOP is 1, TXD output pin is set to a logic 1 state, RXD is disconnected from the pin, and the output of the transmitter shifter register is looped back into the receiver shift register input internally, similar to CTS_ and RTS_ pins and the RTS bit of the UMCR is connected to CTS bit of UMSR respectively. Loopback mode must be selected before the UART is enabled. 0 = Normal operation mode 1 = Loopback-mode UART operation	W
3	Reserved	Always read 0, write is ignored	R
2	Reserved	Always read 0, write is ignored	R
1	RTS	**Request To Send** This bit can control the RTS_ output state. 0 = RTS_ force to high 1 = RTS_ force to low	W
0	Reserved	Always read 0, write is ignored	R

18.3.10 UART Modem Status Register (UMSR)

The read-only UMSR provides the current state of the control lines from the modem to the processor. They are cleared when the processor reads UMSR.

UMSR0, UMSR1, UMSR2, UMSR3 **0x10030018, 0x10031018, 0x10032018, 0x10033018**

Bit	7	6	5	4	3	2	1	0
	Reserved			CTS	Reserved			CCTS
RST	0	0	0	0	0	0	0	0

Bits	Name	Description	RW
7	Reserved	Always read 0, write is ignored	R
6	Reserved	Always read 0, write is ignored	R
5	Reserved	Always read 0, write is ignored	R
4	CTS	**Status of Clear To Send** When MDCE bit is 1, this bit is the complement of CTS_ input. If Loop bit of UMCR is 1, this bit is equivalent to RTS bit of UMCR.	R

		0 = CTS_ pin is 1 1 = CTS_ pin is 0	
3	Reserved	Always read 0, write is ignored	R
2	Reserved	Always read 0, write is ignored	R
1	Reserved	Always read 0, write is ignored	R
0	CCTS	**Change status of CTS_** When MDCE bit is 1, this bit indicates the state change on CTS_ pin. 0 = No state change on CTS_ pin since last read of UMSR 1 = A change occurs on the state of CTS_ pin	R

18.3.11 UART Scratchpad Register

This Scratchpad register is used as a scratch register for the programmer and has no effect on the UART.

USPR **0x1003001C**

Bit	7	6	5	4	3	2	1	0
	Scratch Data							
RST	?	?	?	?	?	?	?	?

18.3.12 Infrared Selection Register (ISR)

The ISR is used to configure the slow-infrared (SIR) interface that is provided in each UART to support two-way wireless communication using infrared transmission that conforms to the IrDA serial infrared specification 1.1. The maximum frequency is up to 115.2kbps.

ISR **0x10030020**

Bit	7	6	5	4	3	2	1	0
	Reserved			RDPL	TDPL	XMODE	RCVEIR	XMITIR
RST	0	0	0	0	0	0	0	0

Bits	Name	Description	RW
7:5	Reserved	Always read 0, write is ignored	R
4	RDPL	**Receive Data Polarity** 0 = Slow-infrared (SIR) interface decoder takes positive pulses as zeros. 1 = SIR decoder takes negative pulses as zeros.	W

3	TDPL	**Transmit Data Polarity** 0 = SIR encoder generates a positive pulse for a data bit of zero. 1 = SIR encoder generates a negative pulse for a data bit of zero.	W
2	XMODE	**Transmit Pulse Width Mode** Set when the transmit encoder needs to generate 1.6us pulses (that are 3/16 of a bit-time at 115.2 kbps). Cleared when the transmit encoder needs to generate 3/16 of a bit-time wide according to current baud rate. 0 = Transmit pulse width is 3/16 of a bit-time wide. 1 = Transmit pulse width is 1.6 us.	W
1	RCVEIR	**Receiver SIR Enable** This bit is used to select the signal from the RXD pin is processed by the IrDA decoder before it is fed to the UART (RCVEIR = 1) or bypass IrDA decoder and is fed directly to the UART (RCVEIR = 0). 0 = Receiver is in UART mode. 1 = Receiver is in SIR mode.	W
0	XMITIR	**Transmitter SIR Enable** This bit is used to select TXD output pin is processed by the IrDA encoder before it is fed to the device pin (XMITIR = 1) or bypass IrDA encoder and is fed directly to the device pin (XMITIR = 0). Note: disable infrared LED before XMITIR is set, otherwise a false start bit may occur. 0 = Transmitter is in UART mode. 1 = Transmitter is in SIR mode.	W

18.3.13 Uart M Register (UMR)

UMSR0, UMSR1, UMSR2, UMSR3 **0x10030024, 0x10031024, 0x10032024, 0x10033024**

Bit	7	6	5	4	3	2	1	0
	▨	▨	▨		▨	▨	▨	
RST	0	0	0	0	0	0	0	0

M is the value of UMR register.

It will take UART at least M cycles for transmitter to transmit one bit and receiver to receive one bit ,

It will take UART at most M+1 cycles for transmitter to transmit one bit and receiver to receive one bit,

18.3.14 Uart Add Cycle Register(UACR)

UMSR0, UMSR1, UMSR2, UMSR3

Bit	12	11	10	9	8	7	6	5	3	2	1
RST						0	0	0	0	0	0

If Nth bit of the register is 1 ,It will take Uart M+1 cycles to transmit or receive the bit of date for transmit or receive.

If the register is 12'h0 ,UART will receive or transmit a bit by M cycle .

If the register is 12'hfff ,UART will receive or transmit a bit by M+1 cycle .

For the detail to see 1.4.8For any frequency clock to use the Uart

18.4 Operation

The following sections describe the UART operations that include flow of configuration, data transmission, data reception, and Infra-red mode.

18.4.1 UART Configuration

Before UART starts to transfer data or changing transfer format, configuration must be done to define the transfer format. The sample flow is as the following:

In FIFO mode, set FME bit of UFCR to 1, reset receive and transmit FIFO, then initialize the UART as described below.

1. Clear UFCR.UME to 0
2. Set value in UDLL/UDHR to generate the baud rate clock
3. Set data format in ULCR
4. If it is in FIFO MODE, set FME bit and other FIFO control in UFCR, reset receive and transmit FIFO, otherwise skip item 4
5. Set each interrupt enable bit in UIER in interrupt-based transfer or set UFCR.DME in DMA-based transfer (DMA transfer is FIFO mode only), then set UFCR.UME

18.4.2 Data Transmission

After configuration, UART is ready for data transfer. For data transmission, refer to the following procedure:

1. Read ULSR.TDRQ (interrupt disable) or wait for transmit data request interrupt (interrupt enable), if TDRQ = 1 or transmit data request interrupt generates, that means there is enough empty location in UTHR for new data
2. If ULSR.TDRQ is 1 or get the transmit data request interrupt, write transmit data to UTHR to start transmission
3. Do item 1 and item 2 if there are more data waiting for transmit
4. After all necessary data are written to UTHR, wait ULSR.TEMP = 1, that means all data completely transmitted
5. If it is necessary to send break, set ULCR.SBK and at least wait for 1-bit interval time to send a valid break, then clear ULCR.SBK
6. Clear UME bit to finish UART transmission

18.4.3 Data Reception

After configuration, UART is ready for data transfer. For data reception, refer to the following sample procedure:

1. Read ULSR.DRY (interrupt disable) or wait for receive data request interrupt (interrupt enable), if ULSR.DRY =1 or receive data request interrupt generates, that means URBR has one data (non-FIFO mode) or data in URBR reaches the trigger value (FIFO mode)
2. If ULSR.DRY = 1 or receive data request interrupt generates, then read ULSR.FIFOE or see if there is error interrupt, if FIFOE = 1, it means received data has receive error, then go to error handler, other wise go to item 3
3. Read one received data in URBR (non-FIFO mode) or data equal to trigger value in URBR (FIFO mode)
4. Check whether all data received: check whether ULSR.DRY = 0, in FIFO mode and interrupt is enabled, timeout interrupt may generate, when timeout interrupt generates, read URBR till ULSR.DRY = 0
5. Clear UFCR.UME to end data reception when all data are received and ULSR.DRY = 0

18.4.4 Receive Error Handling

A sample error handling flow is as the following:

1. If ULSR.FIFOE = 1, it means there is receive error in received data, then check what error it is
2. If ULSR.OVER = 1, go to OVER error handling
3. If ULSR.BI = 1, go to Break handling
4. If ULSR.FMER = 1, go to Frame error handling
5. If PARER = 1, go to PARER error handling

18.4.5 Modem Transfer

When UMCR.MDCE = 1, modem control is enabled. Transfer flow can be stopped and restarted by software through RTS_ and CTS_ pin. When UART transmitter detects low level on CTS_ pin, it stops transmission and TxD pin goes to mark state after finishing transmitting the current character until it detects CTS_ pin goes back to high level. RTS_ pin is output to receiving UART and its state can be controlled by setting UMCR.RTS bit, that is, setting UMCR.RTS to 1, RTS_ pin is low level output that means UART is ready to receive data, on the contrary, it means UART currently can’t receive more data.

18.4.6 DMA Transfer

UART can operate in DMA-based (UFCR.DME = 1, FIFO mode only), that is, dma request initiated by UART takes the place of interrupt request and transmission/reception is carried out using DMA instead of CPU. Be sure that software guarantee to disable transmit and receive interrupt except timeout and error interrupts.

During DMA transfer, if an interrupt occurs, software must first read the ULSR to see if an error interrupt exists, then check the UIIR for the source of the interrupt and if DMA channel is already halt because of the error indicator from UART, then disable DMA channel and read out all the error data from receive FIFO. Software re-set and re-enable DMA and data transfer by DMA will re-start.

18.4.7 Slow IrDA Asynchronous Interface

Each UART supports slow infra-red (SIR) transmission and reception by setting ISR.XMITIR and ISR.RCVEIR to 1 (make sure the two bits are not set to 1 at the same time because SIR can’t operate full-duplex). According to the IrDA 1.1, data rate is limited at a maximum value of 115.2Kbps.

In SIR transmit mode, the transmit pulse comes out at a rate of 3/16 (when the transmit data bit is zero); in SIR receive mode, the receiver must detect the 3/16 pulsed period to recognize a zero value (an active high or low pulse is demodulation to 0, and no pulse is demodulation to 1).

Compared to normal UART, there are some limitations to SIR, that is, each character is fixed to 8-bit data width, no parity and 1 stop bit and modem function is ignored. The IrDA 1.1 specifies a minimum 10ms latency after an optical node ceases transmitting before its receiver recovers its receiving function and software must guarantee this delay.

In the IrDA 1.1 specification, communication must start up at the rate of 9600bps, but then allows the link to negotiate higher (or lower) data rates if supported by both ends. However, the communication rate will not automatically change. Change, if necessary, is performed by software.

18.4.8 For any frequency clock to use the Uart

Note: if you don't set M register and UACR the uart work at normal mode with the specified frequencies. To use other frequency you should to set Mregister and UACR to right value .

1.The Improving

Following changes are made

- One bit is composed by M CLK_{BR} cycles, which can be 4~1024
- Some extra CLK_{BR} cycles can be inserted in some bits in one frame, so that like M has fraction.

For instance:

$CLK_{BR} = CLK_{DEV} / N$ N = 1, 2, …
$CLK_{BR} = CLK_{DEV} = 4MHz$
Band rate = 460800

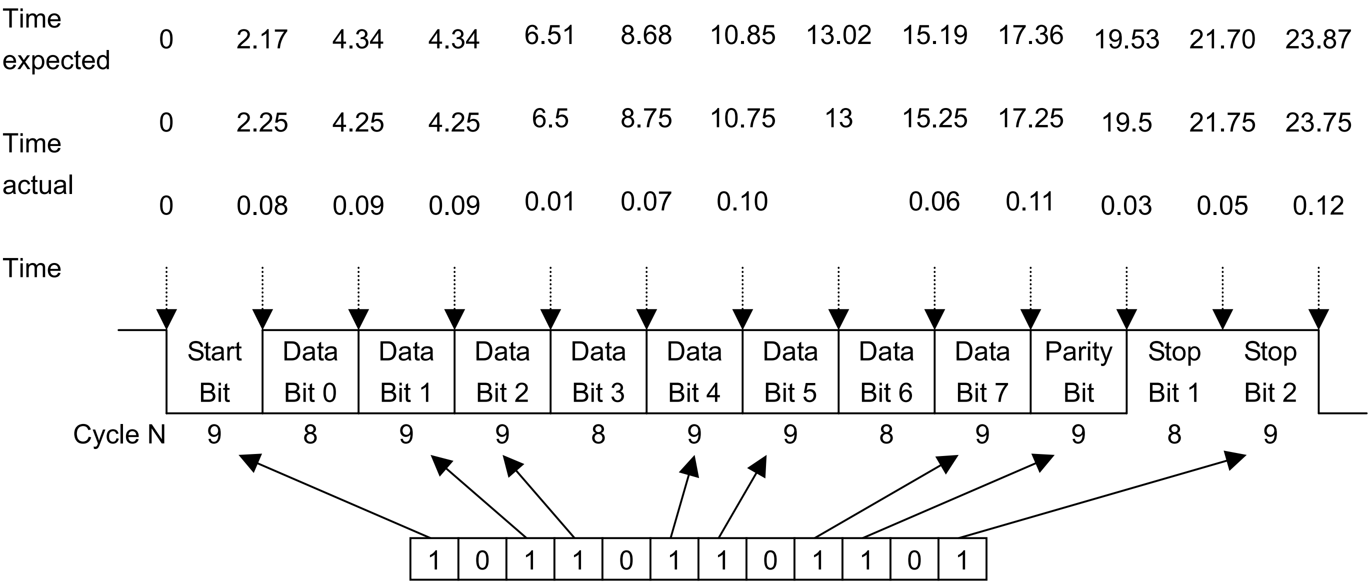
In accurate

$M_a = 8.681$

We take

M = 8, with 8 extra cycles in every frame

A 12-bit register is used to indicate where to insert the extra cycles



Time expected
0 2.17 4.34 4.34 6.51 8.68 10.85 13.02 15.19 17.36 19.53 21.70 23.87
Time actual
0 2.25 4.25 4.25 6.5 8.75 10.75 13 15.25 17.25 19.5 21.75 23.75
0 0.08 0.09 0.09 0.01 0.07 0.10 0.06 0.11 0.03 0.05 0.12
Time
Start Bit
Data Bit 0
Data Bit 1
Data Bit 2
Data Bit 3
Data Bit 4
Data Bit 5
Data Bit 6
Data Bit 7
Parity Bit
Stop Bit 1
Stop Bit 2
Cycle N
9 8 9 9 8 9 9 8 9 9 8 9
1 0 1 1 0 1 1 0 1 1 0 1

For transmission, in theory, the biggest error is half of CLK_{BR} cycle, which is 0.125us here.

2 To set UMR register

$CLK_{BR} = CLK_{DEV} / N$

$M_a = CLK_{BR}/\text{band rate}$

M is modem of M_a。

Write M to Mregister.

Considering the power and the robust quality, for M form 6 to 32 is you better select by set the UDLR.

The max error

$$\frac{0.5 / CLK_{BR}}{M_a / CLK_{BR}} = 0.5/M_a < 0.5/M$$

M	4	8	16	32	64
error/W_{bit}	12.5%	6.25%	3.125%	1.56%	0.78%

Table 1

3. To set UACR value

for each bit of it means:

0 :means not to add additional cycle to the the bit that uart is prepare to transmit or receive , in another word ,you will to use M cycles to transmit or receive the bit .

1 :means to add additional cycle to the the bit that uart is prepare to transmit or receive,in another word, you will to use M+1 cycles to transmit or receive the bit .

To set UACR value you must ensure that the max error of each bit should be less than $0.5P_{BR}$.

For example：M_a-M =0.15 ; M+1-M_a=0.85;

Write UMR 8

Write UMR 408

cycle/bit	：	M，	M，	M，	M+1，	M，	M，	M，	M，	M，	M，	M+1，	M
UACR	：	0	0	0	1	0	0	0	0	0	0	1	0

19 Image Process Unit

19.1 Overview

IPU (Image process unit) contains Resize and CSC (color space conversion), which is used for image post processing.

19.2 Features

- Input data: from external memory
- Input format: YUV /YCbCr (4:2:0, 4:2:2, 4:4:4, 4:1:1)
- Output format: RGB (565, 555, 888)
- Minimum input image size: 33x33
- Maximum input image size: 2047x2047
- Image resizing:
- ■ Up scaling ratios up to 1:2 in fractional steps
- ■ Down scaling ratios up to 20:1 in fractional steps

19.4 Data flow

19.4.1 Input Data

Y, U, V (or Y, Cb, Cr; following chapters use YUV for convenience) data would be load from external memory by DMA respectively.

19.4.2 Output Data

The data format after CSC is RGB (565, 555, 888), and the data would be stored back to the external memory by DMA.

19.4.3 Resize Coefficients LUT

The resize coefficients look up tables are preset by software according to specific format (see later chapter for detail). There are 2 tables support independent horizontal and vertical scaling. Each table has 20 entries that can accommodate up to 20 coefficients.

19.5 Register definition

19.5.1 IPU Control Register

IPU_CONTROL **0x0**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																							V_SCALE	H_SCALE					IPU_RST	FM_IRQ_EN	RSZ_EN	IPU_EN
RST	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	0	0	0	0

Bits	Name	Description	R/W
31:10	Reserved	Writing has no effect, read as zero.	R
9	V_SCALE	Vertical direction scale flag. 0: down scaling; 1: up scaling	RW
8	H_SCALE	Horizontal direction scale flag. 0: down scaling; 1: up scaling	RW
7:4	Reserved	Writing has no effect, read as zero.	R
3	IPU_RST	Reset IPU. Writing 1: reset IPU; 0: no effect. Read as zero	W
2	FM_IRQ_EN	Frame process finish interrupt enable. 1: enable; 0: disable	RW
1	RSZ_EN	Resize enable. 1: enable; 0: disable	RW
0	IPU_EN	IPU enable. 1: enable; 0: disable Once IPU is enabled, IPU keeps working until the flag OUT_END in the status register IPU_STATUS is set value 1.	RW

NOTES:

Setting value 1 to IPU_RST will reset all software visible IPU registers immediately. It is not recommended that stopping IPU abruptly by clearing IPU_EN when IPU is running (IPU_EN=1, OUT_END=0), or writing value 1 to IPU_RST when DMA (in or out) is working (IPU_EN=1, OUT_END=0), otherwise, the result is unpredictable.

19.5.2 IPU Status Register

IPU_STATUS **0x4**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																																OUT_END
RST	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	0

Bits	Name	Description	R/W
31:1	Reserved	Writing has no effect, read as zero.	R
0	OUT_END	Output DMA termination flag. 1: finished; 0: not finished HW can only set 1 to it, while SW can only clear it to 0	R/W

NOTES:

If IPU_CONTROL.FM_IRQ_EN has been set 1, once OUT_END is set value 1 which denotes a frame's post process done, an low level active interrupt request will be issued until corresponding software handler clear OUT_END to value 0.

19.5.3 Data Format Register

D_FMT **0x8**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Note: R = C0*(Y – X0) + C1*(Cr-128) G = C0*(Y – X0) – C2*(Cb-128) – C3*(Cr-128) B = C0*(Y – X0) + C4*(Cb-128)			

19.5.19 Horizontal Resize Coefficients Look Up Table Register group

HRSZ_COEF_LUT **0x48 ~ 0x94**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
																							W_COEF								IN_EN	OUT_EN
RST	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?	?

Bits	Name	Description	R/W
31:13	Reserved	Writing has no effect, read as zero.	R

9:2	W_COEF	Weighting coefficients, 8 bits length, that is to say the precision is 1/128.
		For up-scaling,
		W_k = 1 – (k*n/m – [k*n/m]), k = 0, 1, … m-1.
		For down-scaling,
		for (t=0, k=0; k < n; k++) {
		If ([(t*n+1)/m] – k >=1) { W_k = 0;}
		else if ((t*n+1)/m – k == 0) { W_k = 1; t++;}
		else { W_k = 1 – ((t*n+1)/m – [t*n/m]); t++;}
		}
		W_COEF $_k$ = [128 * W_k]
		Here n stands for original pixel points, m stands for pixel points after resize. For example down-scaling 5:3, n = 5, m = 3.
			RW

		Moreover, m and n are prime, that is, for example 8:2 should be converted to 4:1. When IPU_CONTROL.RSZ_EN set as 1 and m:n = 1:1, all coefficients should be calculated as up-scale case.	

1	IN_EN	Flag for whether new pixel would be used.
		IN_EN = 0, no new pixel
		IN_EN = 1, one new pixel
		In down scale case, IN_EN always equals 1.
		In up scale case,
		For (i=0, k=0; k < m; k++) {
		If(i<= k*n/m) { IN_EN $_k$ = 1; i++;}
		else { IN_EN $_k$ =0;}
		}
			RW

0	OUT_EN	Flag for whether current interpolation would be output.
		OUT_EN = 0, current interpolation would not be output
		OUT_EN = 1, current interpolation would be output
		In up scale case, OUT_EN always equals 1.
		In down scale case,
		For (t=0, k=0; k < n; k++) {
		If([(t*n+1)/m] – k >=1)
		OUT_EN $_k$ = 0;
		else {OUT_EN $_k$ =1; t++;}
		}
			RW

NOTES:

The coefficient number equals to max (m, n). HLUT (horizontal look up table) and VLUT (vertical look up table) are independent, so the two tables may have different coefficient number. Therefore,

RSZ_COEF_INDEX.VIDX = The coefficient number of VLUT – 1

RSZ_COEF_INDEX.HIDX = The coefficient number of HLUT – 1

Moreover, when m=1 for down-scaling, discard above formula and use following rules:

1. W_COEF_0 = 64 (W_0 = 0.5), and $W\_COEF_{1 \sim n-1}$ = 0
2. IN_EN always equals 1
3. OUT_EN_0 = 1, and $OUT\_EN_{1 \sim n-1}$ = 0

Following are two examples of setting LUT

Resize coefficients for 7:3

W	W_COEF	IN_EN	OUT_EN	Pixel1	Pixel2	OUT
2/3	85	1	1	P [0]	P [1]	P [0] * 2/3 + P [1] * 1/3
0	0	1	0	P [1]	P [2]	No new pixel out
1/3	42	1	1	P [2]	P [3]	P [2] * 1/3 + P [3] * 2/3
0	0	1	0	P [3]	P [4]	No new pixel out
0	0	1	0	P [4]	P [5]	No new pixel out
1	128	1	1	P [5]	P [6]	P [5] * 1 + P [6] * 0
0	0	1	0	P [6]	P [7]	No new pixel out

Resize coefficients for 3:5

W	W_COEF	IN_EN	OUT_EN	Pixel1	Pixel2	OUT
1	128	1	1	P [0]	P [1]	P [0] * 1 + P [1] * 0
2/5	51	0	1	P [0]	P [1]	P [0] * 2/5 + P [1] * 3/5
4/5	102	1	1	P [1]	P [2]	P [1] * 4/5 + P [2] * 1/5
1/5	25	0	1	P [1]	P [2]	P [1] * 1/5 + P [2] * 4/5
3/5	76	1	1	P [2]	P [3]	P [2] * 3/5 + P [3] * 2/5

19.6 Calculation for Resized width and height

For software, to preset correct value for register OUT_GS, please refer to following formula.

Set IW stand for original input frame width, IH stand for original input frame height, OW stand for new frame width after resize, OH stand for new frame height after resize.

In Up-scale case (n < m):

If [(IW - 1) * (m/n)] * (n/m) ==(IW-1) then
    OW = [(IW - 1) * (m/n)] + 1;
Else OW = [(IW - 1) * (m/n)] + 2;
If [(IH - 1) * (m/n)] * (n/m) == (IH-1) then
    OH = [(IH - 1) * (m/n)] + 1;
Else OH = [(IH - 1) * (m/n)] + 2;

In Down-scale case (n>m):

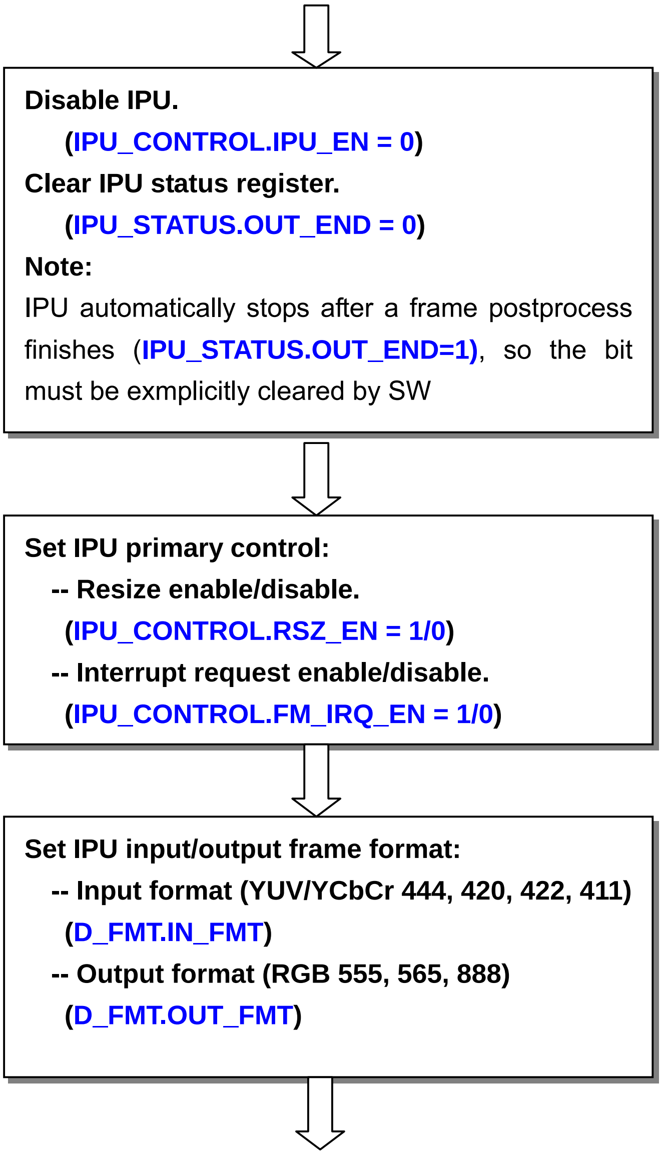
If [(IW - 1) * (m/n)] * (n/m) ==(IW-1) then
    OW = [(IW - 1) * (m/n)];
Else OW = [(IW - 1) * (m/n)] + 1;
If [(IH - 1) * (m/n)] * (n/m) ==(IH-1) then
    OH = [(IH - 1) * (m/n)];
Else OH = [(IH - 1) * (m/n)] + 1;

For example:

A 36x46 frame with the horizontal resize ratio of 4:5 (up-scale) and vertical resize ratio of 7:6 (down-scale), by the expressions above we get its new size after resize from the following process.

For Width: [(36 - 1) * (5/4)] * (4/5) = 34.4 ≠ (36-1)
    So OW = [(36 - 1) * (5/4)] + 2 = 45
For Height: [(46 - 1) * (6/7)] * (7/6) = 44.33 ≠ (46 - 1)
    So OH = [(46 - 1) * (6/7)] + 1 = 39

19.7 IPU Initialization Flow



Disable IPU.

(IPU_CONTROL.IPU_EN = 0)

Clear IPU status register.

(IPU_STATUS.OUT_END = 0)

Note:

IPU automatically stops after a frame postprocess finishes (**IPU_STATUS.OUT_END=1)**, so the bit must be exmplicitly cleared by SW

Set IPU primary control:

- **Resize enable/disable.** (IPU_CONTROL.RSZ_EN = 1/0)
- **Interrupt request enable/disable.** (IPU_CONTROL.FM_IRQ_EN = 1/0)

Set IPU input/output frame format:

- **Input format (YUV/YCbCr 444, 420, 422, 411)** (D_FMT.IN_FMT)
- **Output format (RGB 555, 565, 888)** (D_FMT.OUT_FMT)

Set input frame size:

- **-- Input frame width (Eg: 288x188 frame)** **(IN_FM_GS.IN_FM_W = 288)**
- **-- Input frame height (Eg: 288x188 frame)** **(IN_FM_GS.IN_FM_H = 188)**
- **-- Y frame stride (Y_STRIDE.Y_S)**
- **-- U frame stride (UV_STRIDE.U_S)**
- **-- V frame stride (UV_STRIDE.V_S)**

Note: Frame width/height value should be restricted according to frame format (ensure it is a legal size). In the case of 411 the value should be multiple of 4. In the case of 420/422 the value should be multiple of 2. In the case of 444 the value can be any integer in the legal range (33 ~ 2047). Moreover, the stride value should be set to ensure frames' every line start address are word aligned.

Set input/output data start address:

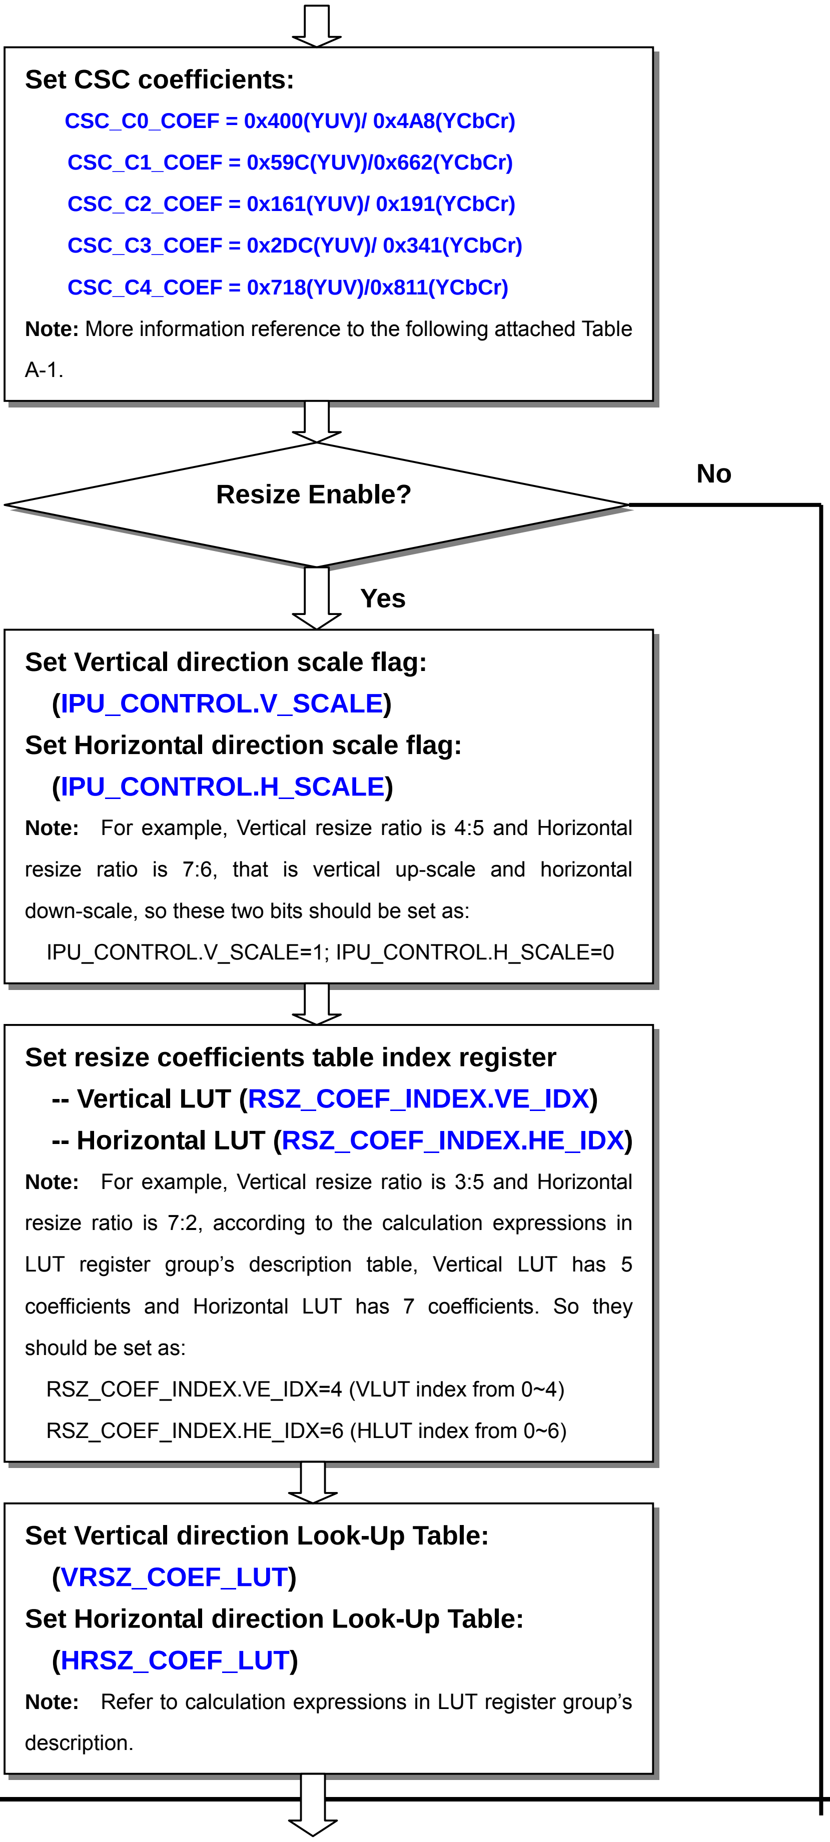
- **-- Y frame start address (Y_ADDR.Y_ADDR)**
- **-- U frame start address (U_ADDR.U_ADDR)**
- **-- V frame start address (V_ADDR.V_ADDR)**
- **-- Output frame start address** **(OUT_ADDR.OUT_ADDR)**

Note: Y/U/V frame start address must be word aligned. Output frame start address can be half-word or word aligned except RGB888 format, which should be word aligned.

Set output frame size:

- **-- Output frame width** **(OUT_GS.OUT_FM_W)**
- **-- Output frame height** **(OUT_GS.OUT_FM_H)**
- **-- Output frame stride** **(OUT_STRIDE.OUT_S)**

Note: Since the unit is byte, the exact values filled in are the pixel numbers left shifted by 1 or 2 according to output format. For example: RGB888, each pixel takes 4 bytes, so the width value is pixel numbers * 4. Hence, a RGB888 format output frame with size of 120x80 and stride of 124, their value should be filled as: OUT_GS.OUT_FM_W=120<<2;
OUT_GS.OUT_FM_H=80;OUT_STRIDE.OUT_S=124<<2



Set CSC coefficients:

CSC_C0_COEF = 0x400(YUV)/ 0x4A8(YCbCr)
CSC_C1_COEF = 0x59C(YUV)/0x662(YCbCr)
CSC_C2_COEF = 0x161(YUV)/ 0x191(YCbCr)
CSC_C3_COEF = 0x2DC(YUV)/ 0x341(YCbCr)
CSC_C4_COEF = 0x718(YUV)/0x811(YCbCr)

Note: More information reference to the following attached Table A-1.

Set Vertical direction scale flag:
(IPU_CONTROL.V_SCALE)
Set Horizontal direction scale flag:
(IPU_CONTROL.H_SCALE)

Note: For example, Vertical resize ratio is 4:5 and Horizontal resize ratio is 7:6, that is vertical up-scale and horizontal down-scale, so these two bits should be set as:

IPU_CONTROL.V_SCALE=1; IPU_CONTROL.H_SCALE=0

Set resize coefficients table index register
-- Vertical LUT (RSZ_COEF_INDEX.VE_IDX)
-- Horizontal LUT (RSZ_COEF_INDEX.HE_IDX)

Note: For example, Vertical resize ratio is 3:5 and Horizontal resize ratio is 7:2, according to the calculation expressions in LUT register group's description table, Vertical LUT has 5 coefficients and Horizontal LUT has 7 coefficients. So they should be set as:

RSZ_COEF_INDEX.VE_IDX=4 (VLUT index from 0~4)
RSZ_COEF_INDEX.HE_IDX=6 (HLUT index from 0~6)

Set Vertical direction Look-Up Table:
(VRSZ_COEF_LUT)
Set Horizontal direction Look-Up Table:
(HRSZ_COEF_LUT)

Note: Refer to calculation expressions in LUT register group's description.

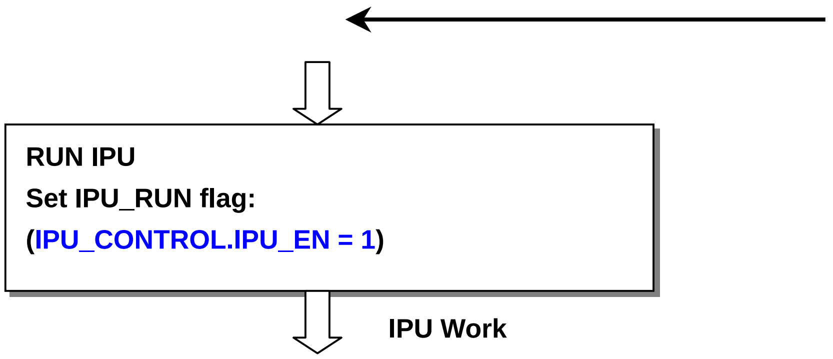


Table A-1. YUV/YCbCr to RGB CSC Equations

Input data	Matrix	CSC_COEF register values
YUV	R = C0*(Y – X0) + C1*(V-128) G = C0*(Y – X0) – C2*(U-128) – C3*(V-128) B = C0*(Y – X0) + C4*(U-128) X0: 0 C0: 1 C1: 1.4026 C2: 0.3444 C3: 0.7144 C4: 1.7730	CSC_C0_COEF = 0x400 CSC_C1_COEF= 0x59C CSC_C2_COEF = 0x161 CSC_C3_COEF = 0x2DC CSC_C4_COEF = 0x718
YCbCr	R = C0*(Y – X0) + C1*(Cr-128) G = C0*(Y – X0) – C2*(Cb-128) – C3*(Cr-128) B = C0*(Y – X0) + C4*(Cb-128) X0: 16 C0: 1.164 C1: 1.596 C2: 0.391 C3: 0.813 C4: 2.018	CSC_C0_COEF = 0x4A8 CSC_C1_COEF = 0x662 CSC_C2_COEF = 0x191 CSC_C3_COEF = 0x341 CSC_C4_COEF = 0x811

Table A-2. Output data package format

Format	Package
RGB888	Bit-31 24 23 16 15 8 7 0  EMPTY R7 R0 G7 G0 B7 B0
RGB555	15 14 10 9 5 4 0  Empty R7 R3 G7 G3 B7 B3
RGB565	15 11 10 5 4 0  R7 R3 G7 G2 B7 B3

Note:

All R/G/B data are little-endian type; all the empty bits in the above figure are filled with 0.

Figure A-1 Source Data storing format in external memory.

Example: YUV420 118x80 frame

	Bit-31			Bit-0	
	...				
Y Frame	Y (3,0)	Y (2,0)	Y (1,0)	Y (0,0)	Y Frame start Address, Line 0 start
	Y (7,0)	Y (6,0)	Y (5,0)	Y (4,0)	
	...				Y Frame Line 0, other entries of memory
	Data out of frame		Y (117,0)	Y (116,0)	Y Line 0 end -- Y (117,0), from here to Line 0 start stands for frame width
	...				
	Y (3,1)	Y (2,1)	Y (1,1)	Y (0,1)	Y Frame Line 1 start, from Line 0 start to here stands for the Y stride value
	...				
	...		Y (117,79)	Y (116,79)	Y Frame end -- Y (117,79)
	...				
U Frame	U (3,0)	U (2,0)	U (1,0)	U (0,0)	U Frame start Address, Line 0 start
	...				
	Out data	U (58,0)	U (57,0)	U (56,0)	U Frame Line 0 end -- U (58,0)
	...				
	Out data	U (58,39)	U (57,39)	U (56,39)	U Frame end -- U (58,39)
	...				
V Frame	V (3,0)	V (2,0)	V (1,0)	V (0,0)	V Frame start Address, Line 0 start
	...				
	Out data	V (58,39)	V (57,39)	V (56,39)	V Frame end -- V (58,39)
	...				

Note:
1. Every line's start address should be word aligned.
2. All pixel data should be stored as little-endian format.
3. Destination data (RGB) storing format in external memory is similar with above figure, but RGB555 and RGB565 frame's every line start address can be half-word aligned (RGB888 frame still need word aligned).

20 Jz4725 Boot ROM Specification

The Jz4725 contains an internal 8KB boot ROM. The CPU boots from the boot ROM after reset.

20.1 Boot Select

The boot sequence of the Jz4725 is controlled by boot_sel[1:0]. The configuration of boot_sel[1:0] is showed as below:

Table 20-1 Boot Configuration of Jz4725

boot_sel[1:0]	
00	Not used
01	Boot from USB device
10	Boot from 512 page size NAND flash at CS1
11	Boot from 2048 page size NAND flash at CS1

20.2 Boot Sequence

After reset, the boot program on the internal boot ROM executes as bellows:

1. Read boot_sel[1:0] and branch to proper programs according to it.
2. If it is boot from USB (“01”), connect USB cable to PC host, receive a block of data from USB and store it in internal SRAM. Then branch to this area in SRAM.
3. If it is boot from NAND flash (“10”, or “11”), set proper NAND flash page size, read first byte from the NAND to know if it is 8 or 16 bits width, page cycle is 2 or 3 cycles. Set EMC according to it and read up to 8KB from NAND to internal SRAM. Then branch to SRAM at 4 bytes offset.

Note: The Jz4725 internal SRAM is 16KB, its address is from 0x80000000 to 0x80004000.

20.3 NAND Boot Specification

If CPU boots from NAND flash (CS1), the boot program will read the first byte from NAND flash to know if it is 8 or 16 bits width, page cycle is 2 or 3 cycles. If bit[7:4] of the first byte is zero, it is a 16-bit flash, else it is a 8-bit flash. If bit[3:0] of the first byte is zero, it is 2 page cycles, else it is 3 page cycles. The boot ROM will configure EMC and GPIO pins according to the first byte data, then continue to load up to 8KB from NAND to internal SRAM and branch to internal SRAM at 4 bytes offset.

The boot program can load two areas of data from NAND flash to internal SRAM, one is the normal area up to 8KB starting from NAND flash address 0, the other is the backup area up to 8KB starting from NAND flash address 0x2000. After reset, the boot program will first read the normal area data from NAND flash using hardware Reed-Solomon ECC. If no ECC error is detected or ECC error is correctable, the boot program then branches to internal SRAM at 4 bytes offset. If it detects an uncorrectable ECC error, it will continue to read the backup area of data from NAND flash using hardware Reed-Solomon ECC. If no ECC error is detected or ECC error is correctable, the boot program will then branch to internal SRAM at 4 bytes offset. If it detects an uncorrectable ECC error again, it will continue to start booting from NOR flash at CS4.

Every time the boot program starts reading a page, it first checks if the page contains valid data. If the page contains valid data, it will read the page to internal SRAM. If the page data is not valid, the boot program knows that it has finished reading all the data and then branches to internal SRAM at 4 bytes offset. The boot program will decide the page valid flag according to the 3rd, 4th, 5th byte of the spare area of each page. If one of the three bytes is zero, the boot program knows that this page data is valid, else this page data is not valid.

The boot program enables hardware RS ECC when reading NAND flash data. When a 512-byte data is read, it will check the calculated ECC with stored ECC. The calculated and stored ECC are both 9 bytes per 512-byte data. And the 9-byte stored ECC is starting from the 7th byte of the spare area of each page.

The NAND boot specification is showed as below:

Table 20-2 NAND First Data Byte Definition

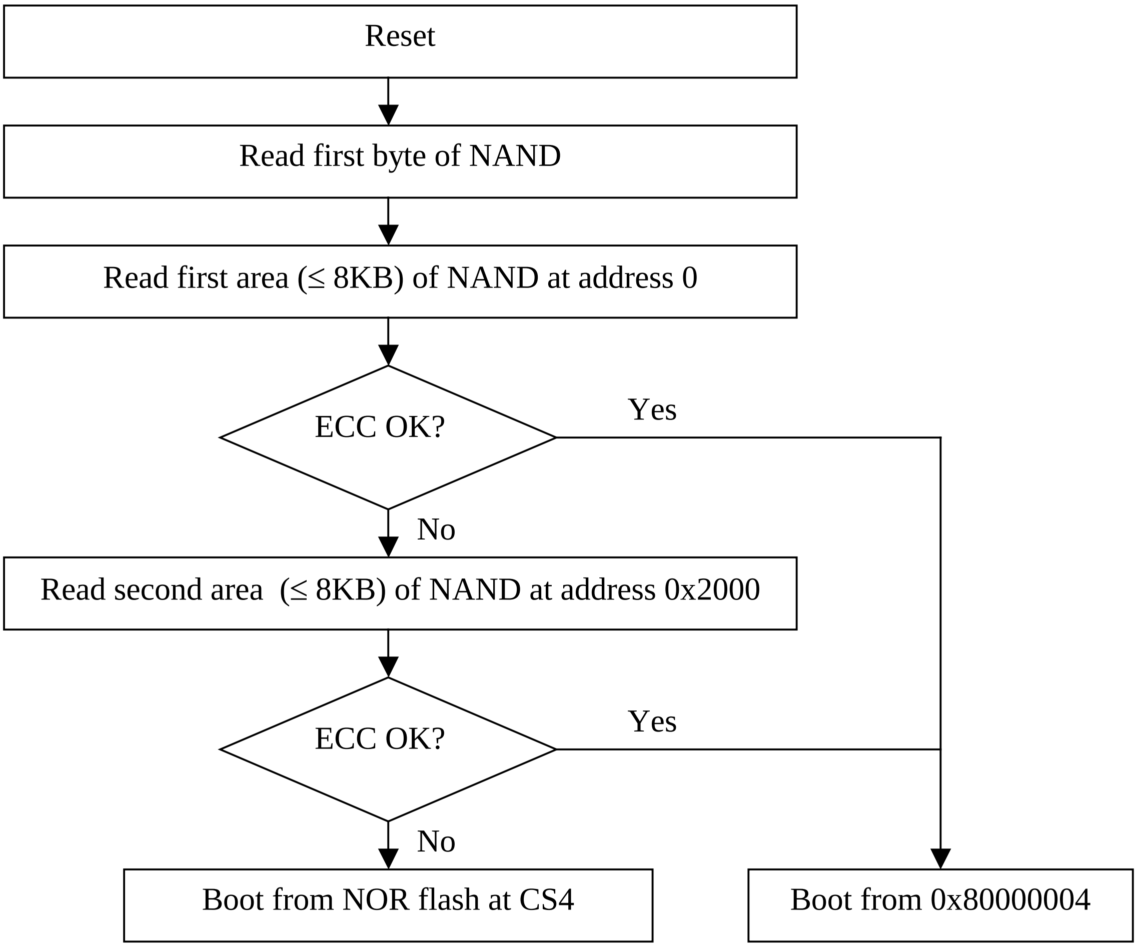
First Byte of NAND	Data Bus Width of Flash
0xff	3 page cycles, 8-bit
0xf0	2 page cycles, 8-bit
0x0f	3 page cycles, 16-bit
0x00	2 page cycles, 16-bit

Table 20-3 NAND Spare Area Definition

Spare Area Offset	Description
0 – 1	Reserved
2 – 4	Page is valid if one of the three bytes is zero
5	Reserved
6 - 14	Stored 9-byte ECC of data0 – data511
15 - 23	Stored 9-byte ECC of data512 – data1023 (2KB page NAND only)
24 – 32	Stored 9-byte ECC of data1024 – data1535 (2KB page NAND only)

33 - 41	Stored 9-byte ECC of data1536 – data2047 (2KB page NAND only)

The procedure of the Jz4725 NAND boot is showed as below:



Reset
Read first byte of NAND
Read first area (≤ 8KB) of NAND at address 0
ECC OK?
Yes
No
Read second area (≤ 8KB) of NAND at address 0x2000
ECC OK?
Yes
No
Boot from NOR flash at CS4
Boot from 0x80000004

Table 20-4 Jz4725 NAND Boot Sequence

20.4 USB Boot Specification

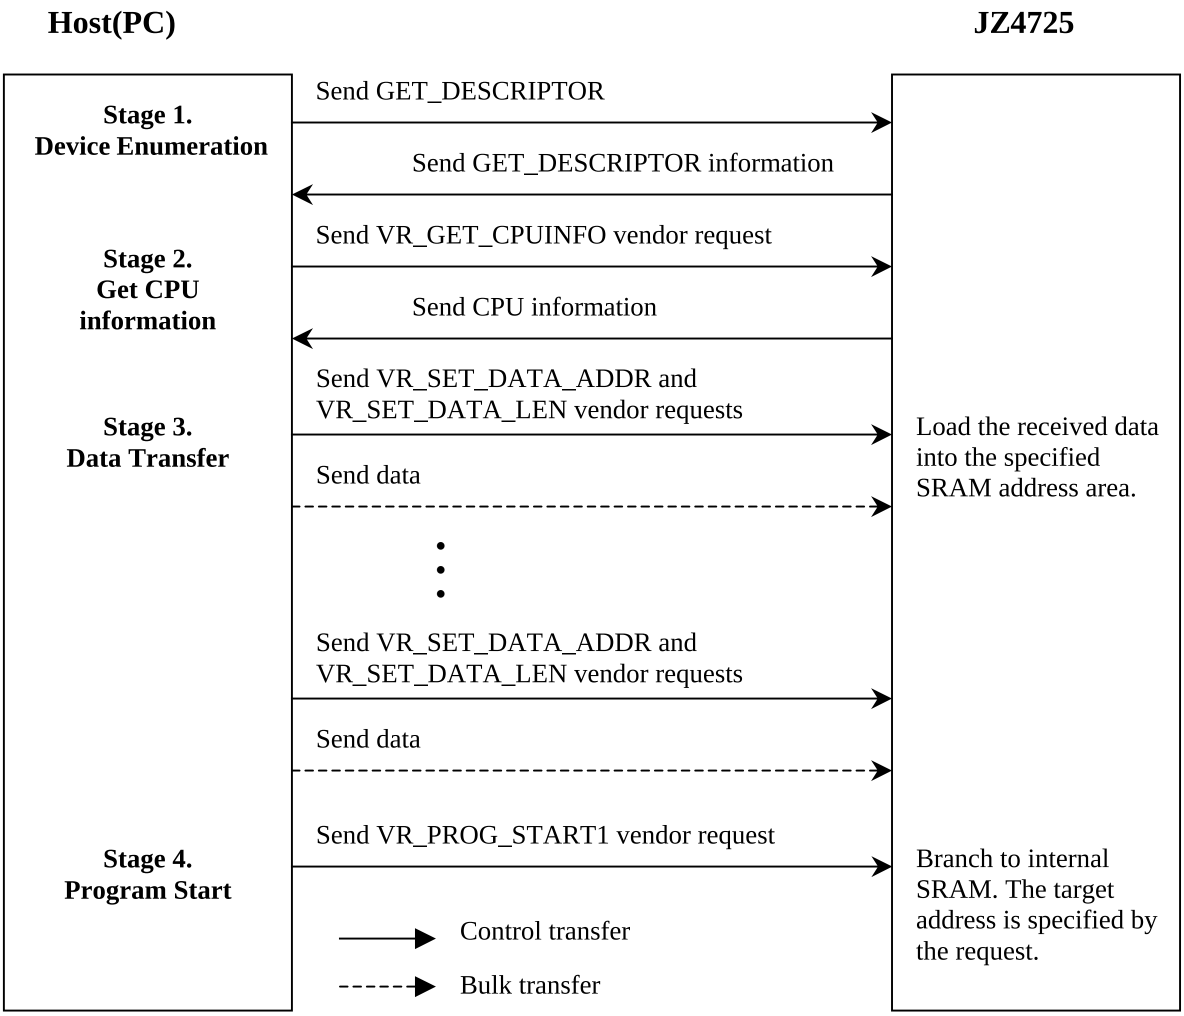
When boot_sel[1:0] is selected from USB boot, the internal boot ROM downloads user program from the USB port to internal SRAM and branches to the internal SRAM to execute the program.

The boot program supports both high-speed (480MHz) and full-speed (12MHz) transfer modes. The boot program uses the following two transfer types.

Table 20-5 Transfer Types Used by the Boot Program

Transfer Type	Description
Control Transfer	Used for transmitting standard requests and vendor requests.
Bulk Transfer	Used for responding to vendor requests and transmitting a user program.

The following figure shows an overview of the USB communication flow.



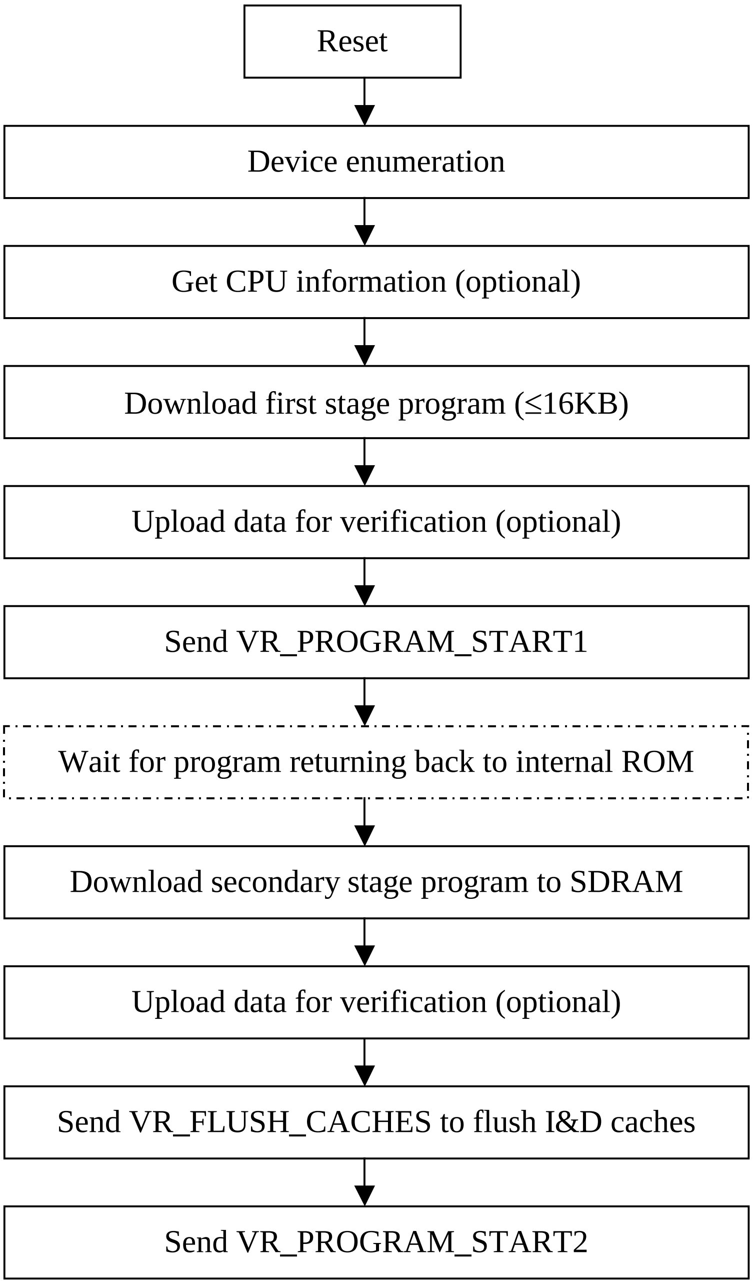
Host(PC)
JZ4725
Stage 1.
Device Enumeration
Stage 2.
Get CPU information
Stage 3.
Data Transfer
Stage 4.
Program Start
Send GET_DESCRIPTOR
Send GET_DESCRIPTOR information
Send VR_GET_CPUINFO vendor request
Send CPU information
Send VR_SET_DATA_ADDR and VR_SET_DATA_LEN vendor requests
Send data
Send VR_SET_DATA_ADDR and VR_SET_DATA_LEN vendor requests
Send data
Send VR_PROG_START1 vendor request
Load the received data into the specified SRAM address area.
Branch to internal SRAM. The target address is specified by the request.
Control transfer
Bulk transfer

Figure 20-1 USB Communication Flow

The vendor ID and product ID for the USB boot device are 0x601A and 0x4740 respectively. The Configuration for USB is for Control Endpoint 0 with Max Packet Size equals 64 bytes, Bulk IN at Endpoint 1 with Max Packet Size equals 512 bytes in high-speed and 64 bytes in full-speed, Bulk OUT at Endpoint 1 with Max Packet Size equals 512 bytes in high-speed and 64 bytes in full-speed.

The USB boot program provides six vendor requests through control endpoint for user to download/upload data to/from device, and to branch to a target address to execute user program. The six vendor requests are VR_GET_CPU_INFO (0x00), VR_SET_DATA_ADDRESS (0x01), VR_SET_DATA_LENGTH (0x02), VR_FLUSH_CACHES (0x03), VR_PROGRAM_START1 (0x04) and VR_PROGRAM_START2 (0x05). User program is transferred through Bulk IN or Bulk OUT endpoint.

When Jz4725 is reset with boot_sel[1:0] equals 01b, the internal boot ROM will switch to USB boot mode and wait for USB requests from host. After connecting the USB device port to host, host will recognise the connection of a USB device, and start device enumeration. After finishing the device enumeration, user can send VR_GET_CPU_INFO (0x00) to query the device CPU information. If user wants to download/upload a program to/from device, two vendor requests VR_SET_DATA_ADDRESS (0x01) and VR_SET_DATA_LENGTH (0x02) should be sent first to tell the device the address and length in byte of the subsequent transferring data. Then data can be transferred through bulk-out/bulk-in endpoint. After this first stage program has been transferred to device, user can send vendor request VR_PROGRAM_START1 (0x04) to let the CPU to execute the program. This first stage program must not greater than 16KB and is normally used to init GPIO and SDRAM of the target board. At the end of the first stage program, it can return back to the internal boot ROM by jumping to ra ($31) register. Thus user can download a new program to the SDRAM of the target board like the first stage, and send vendor request VR_FLUSH_CACHES (0x03) and VR_PROGRAM_START2 (0x05) to let the CPU to execute the new program. Next figure is the typical procedure of USB boot.



Reset
Device enumeration
Get CPU information (optional)
Download first stage program (≤16KB)
Upload data for verification (optional)
Send VR_PROGRAM_START1
Wait for program returning back to internal ROM
Download secondary stage program to SDRAM
Upload data for verification (optional)
Send VR_FLUSH_CACHES to flush I&D caches
Send VR_PROGRAM_START2

Figure 20-2 Typical Procedure of USB Boot

Following tables list all the vendor requests that USB boot program supports:

Table 20-6 Vendor Request 0 Setup Command Data Structure

Offset	Field	Size	Value	Description
0	bmRequestType	1	40H	D7 0: Host to Device D6-D5 2: Vendor D4-D0 0: Device
1	bRequest	1	00H	VR_GET_CPU_INFO: get CPU information
2	wValue	2	0000H	Not in used
4	wIndex	2	0000H	Not in used
6	wLength	2	0008H	8 bytes

Table 20-7 Vendor Request 1 Setup Command Data Structure

Offset	Field	Size	Value	Description
0	bmRequestType	1	40H	D7 0: Host to Device D6-D5 2: Vendor D4-D0 0: Device
1	bRequest	1	01H	VR_SET_DATA_ADDRESS: set address for next bulk-in/bulk-out transfer
2	wValue	2	xxxxH	MSB (bit[31:16]) of the data address
4	wIndex	2	xxxxH	LSB (bit[15:0]) of the data address
6	wLength	2	0000H	Not in used

Table 20-8 Vendor Request 2 Setup Command Data Structure

Offset	Field	Size	Value	Description
0	bmRequestType	1	40H	D7 0: Host to Device D6-D5 2: Vendor D4-D0 0: Device
1	bRequest	1	02H	VR_SET_DATA_LENGTH: set length in byte for next bulk-in/bulk-out transfer
2	wValue	2	xxxxH	MSB (bit[31:16]) of the data length
4	wIndex	2	xxxxH	LSB (bit[15:0]) of the data length
6	wLength	2	0000H	Not in used

Table 20-9 Vendor Request 3 Setup Command Data Structure

Offset	Field	Size	Value	Description
0	bmRequestType	1	40H	D7 0: Host to Device D6-D5 2: Vendor D4-D0 0: Device

1	bRequest	1	03H	VR_FLUSH_CACHES: flush I-Cache and D-Cache
2	wValue	2	0000H	Not in used
4	wIndex	2	0000H	Not in used
6	wLength	2	0000H	Not in used

Table 20-10 Vendor Request 4 Setup Command Data Structure

Offset	Field	Size	Value	Description
0	bmRequestType	1	40H	D7 0: Host to Device D6-D5 2: Vendor D4-D0 0: Device
1	bRequest	1	04H	VR_PROGRAM_START1: transfer data from D-Cache to I-Cache and branch to address in I-Cache. Note: After downloading program from host to device for the first time, you can only use this request to start the program. Since the USB boot program will download data to D-Cache after reset. This request will transfer data from D-Cache to I-Cache and execute the program in I-Cache.
2	wValue	2	xxxxH	MSB (bit[31:16]) of the program entry point
4	wIndex	2	xxxxH	LSB (bit[15:0]) of the program entry point
6	wLength	2	0000H	Not in used

Table 20-11 Vendor Request 5 Setup Command Data Structure

Offset	Field	Size	Value	Description
0	bmRequestType	1	40H	D7 0: Host to Device D6-D5 2: Vendor D4-D0 0: Device
1	bRequest	1	05H	VR_PROGRAM_START2: branch to target address directly
2	wValue	2	xxxxH	MSB (bit[31:16]) of the program entry point
4	WIndex	2	xxxxH	LSB (bit[15:0]) of the program entry point
6	WLength	2	0000H	Not in used
