

KSZ8895MLU

Integrated 5-Port 10/100 Managed Switch

General Description

The KSZ8895MLU is a highly-integrated Layer 2-managed 5-port switch with an optimized design and plentiful features. It is designed for cost-sensitive 10/100Mbps 5-port switch systems with on-chip termination, lowest power consumption and internal core power controller. These features will save more system cost. It has 1.4Gbps high-performance memory bandwidth, shared memory based switch fabric with full non-blocking configuration. It also provides an extensive feature set such as power management, programmable rate limit and priority ratio, tag/port-based VLAN, packets filtering, quality of service (QoS) four-queues prioritization, management interface, and MIB counters. Port 5 is a MAC 5 MII interface with PHY mode. The SW5-MII interface can be connected to a processor with a MAC MII interface.

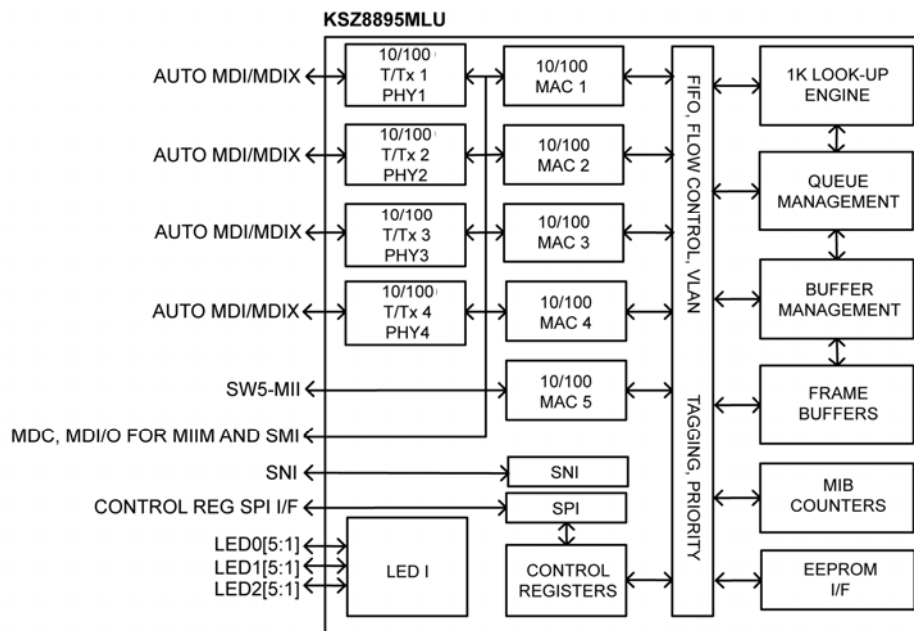

The KSZ8895MLU provides multiple CPU control/data interfaces to effectively address both current and emerging fast Ethernet applications.

The KSZ8895MLU consists of 10/100 PHYs with patented and enhanced mixed-signal technology, media access control (MAC) units, a high-speed non-blocking switch fabric, a dedicated address lookup engine, and an on-chip frame buffer memory. The KSZ8895MLU contains five MACs and four integrated PHYs. All PHYs support 10/100Base-T/TX.

All registers of MACs and PHYs units can be managed by the SPI interface or the SMI interface. MIIM registers of the PHYs can be accessed through the MDC/MDIO interface. EEPROM can set all control registers for the unmanaged mode.

Datasheets and support documentation can be found on Micrel's web site at: www.micrel.com.

Functional Diagram

Features

Advanced Switch Features

- IEEE 802.1q VLAN support for up to 128 VLAN groups (full-range 4096 of VLAN IDs).
- Static MAC table supports up to 32 entries.
- VLAN ID tag/untag options, per port basis.
- IEEE 802.1p/q tag insertion or removal on a per port basis based on ingress port (egress).
- Programmable rate limiting at the ingress and egress on a per port basis.
- Jitter-free per packet based rate-limiting support.
- Broadcast storm protection with percentage control (global and per port basis).
- IEEE 802.1d rapid spanning tree protocol RSTP support.
- Tail tag mode (1byte added before FCS) support at Port 5 to inform the processor which ingress port receives the packet.
- 1.4Gbps high-performance memory bandwidth and shared memory-based switch fabric with fully non-blocking configuration.
- MII with MAC 5 on Port 5, SW5-MII for MAC 5 MII interface.
- Enable/Disable option for huge frame size up to 2000 bytes per frame.
- IGMP v1/v2 snooping (Ipv4) support for multicast packet filtering.
- IPv4/IPv6 QoS support.
- Support unknown unicast/multicast address and unknown VID packet filtering.
- Self-address filtering.

Comprehensive Configuration Register Access

- Serial management interface (MDC/MDIO) to all PHYs registers and SMI interface (MDC/MDIO) to all registers.
- High-speed SPI (up to 25MHz) and I²C master Interface to all internal registers.
- I/O pins strapping and EEPROM to program selective registers in unmanaged switch mode.
- Control registers configurable on the fly (port-priority, 802.1p/d/q, AN...).

QoS/CoS Packet Prioritization Support

- Per port, 802.1p and DiffServ-based.
- 1/2/4-queue QoS prioritization selection.
- Programmable weighted fair queuing for ratio control.
- Re-mapping of 802.1p priority field per port basis.

Integrated 5-Port 10/100 Ethernet Switch

- New generation switch with five MACs and five PHYs fully compliant with IEEE 802.3u standard.
- Non-blocking switch fabric assures fast packet delivery by utilizing a 1K MAC address lookup table and a store-and-forward architecture.
- On-chip 64Kbyte memory for frame buffering (not shared with 1K unicast address table).
- Full duplex IEEE 802.3x flow control (PAUSE) with force mode option.

- Half-duplex back pressure flow control.
- HP Auto MDI/MDI-X and IEEE Auto crossover support.
- Port 5 MAC5 SW5-MII interface supports PHY mode and MAC mode.
- 7-wire serial network interface (SNI) support for legacy MAC.
- Per port LED Indicators for link, activity, and 10/100 speed.
- Register port status support for link, activity, full/half duplex and 10/100 speed.
- On-chip terminations and internal biasing technology for cost down and lowest power consumption.

Switch Monitoring Features

- Port mirroring/monitoring/sniffing: ingress and/or egress traffic to any port or MII.
- MIB counters for fully-compliant statistics gathering 34 MIB counters per port.
- Loop-back support for MAC, PHY, and remote diagnostic of failure.
- Interrupt for the link change on any ports.

Low Power Dissipation

- Full-chip hardware power-down.
- Full-chip software power-down/per port software power down.
- Energy-detect mode support < 100mW full-chip power consumption when all ports have no activity.
- Very-low, full-chip power consumption (<0.5W), without extra power consumption on transformers.
- Dynamic clock-tree shutdown feature.
- Voltages: Single 3.3V supply with 3.3V VDDIO and Internal 1.2V LDO controller enabled or external 1.2V LDO solution:
 - Analog VDDAT 3.3V only
 - VDDIO support 3.3V, 2.5V and 1.8V
 - Low 1.2V core power
- 0.13um CMOS technology.
- Industrial Temperature Range: -40°C to +85°C.
- Available in 128-pin LQFP, lead-free package.

Applications

- VoIP phone
- Set-top/game box
- Automotive
- Industrial control
- IPTV POF
- SOHO residential gateway
- Broadband gateway/firewall/VPN
- Integrated DSL/cable modem
- Wireless LAN access point + gateway
- Standalone 10/100 switch

Pin Configuration

Pin Description

Pin Number	Pin Name	Type ⁽¹⁾	Port	Pin Function ⁽²⁾
1	MDI-XDIS	LPD	1 – 5	Disable auto MDI/MDI-X. PD (default) = normal operation. PU = disable auto MDI/MDI-X on all ports.
2	GNDA	GND		Analog ground.
3	VDDAR	P		1.2V analog V _{DD} .
4	RXP1	I	1	Physical receive signal + (differential).
5	RXM1	I	1	Physical receive signal – (differential).
6	GNDA	GND		Analog ground.
7	TXP1	O	1	Physical transmit signal + (differential).
8	TXM1	O	1	Physical transmit signal – (differential).
9	VDDAT	P		3.3V analog V _{DD} .
10	RXP2	I	2	Physical receive signal + (differential).
11	RXM2	I	2	Physical receive signal – (differential).
12	GNDA	GND		Analog ground.
13	TXP2	O	2	Physical transmit signal + (differential).
14	TXM2	O	2	Physical transmit signal – (differential).
15	VDDAR	P		1.2V analog V _{DD} .
16	GNDA	GND		Analog ground.
17	ISSET			Set physical transmit output current. Pull-down with a 12.4kΩ1% resistor.
18	VDDAT	P		3.3V analog V _{DD} .
19	RXP3	I	3	Physical receive signal + (differential).
20	RXM3	I	3	Physical receive signal - (differential).
21	GNDA	GND		Analog ground.
22	TXP3	O	3	Physical transmit signal + (differential).
23	TXM3	O	3	Physical transmit signal – (differential).
24	VDDAT	P		3.3V analog V _{DD} .
25	RXP4	I	4	Physical receive signal + (differential).

Notes:

- P = Power supply.
 I = Input.
 O = Output.
 I/O = Bidirectional.
 GND = Ground.
 IPU = Input w/internal pull-up.
 IPD = Input w/internal pull-down.
 IPD/O = Input w/internal pull-down during reset, output pin otherwise.
 IPU/O = Input w/internal pull-up during reset, output pin otherwise.
 NC = No connect.
- PU = Strap pin pull-up.
 PD = Strap pull-down.
 OTRI = Output tristated.

Pin Description (Continued)

Pin Number	Pin Name	Type ⁽¹⁾	Port	Pin Function ⁽²⁾
26	RXM4	I	4	Physical receive signal - (differential).
27	GNDA	GND		Analog ground.
28	TXP4	O	4	Physical transmit signal + (differential).
29	TXM4	O	4	Physical transmit signal – (differential).
30	GNDA	GND		Analog ground.
31	VDDAR	P		1.2V analog V _{DD} .
32	RXP5	I	5	Reserved for MLU. No connect.
33	RXM5	I	5	Reserved for MLU. No connect.
34	GNDA	GND		Analog ground.
35	TXP5	O	5	Reserved for MLU. No connect.
36	TXM5	O	5	Reserved for MLU. No connect.
37	VDDAT	P		3.3V analog V _{DD} .
38	NC	NC		No connect.
39	NC	NC		No connect.
40	NC	NC		No connect.
41	NC	NC		No connect.
42	NC	NC		No connect.
43	NC	NC		No connect.
44	NC	NC		No connect.
45	NC	NC		No connect.
46	NC	NC		No connect.
47	PWRDN_N	IPU		Full-chip power down. Active low.
48	INTR_N	OPU		Interrupt. This pin is Open-Drain output pin.
49	GNDD	GND		Digital ground.
50	VDDC	P		1.2V digital core V _{DD} .
51	PMTXEN	IPD	5	Reserved for MLU. No connect.
52	PMTXD3	IPD	5	Reserved for MLU. No connect.
53	PMTXD2	IPD	5	Reserved for MLU. No connect.
54	PMTXD1	IPD	5	Reserved for MLU. No connect.
55	PMTXD0	IPD	5	Reserved for MLU. No connect.
56	PMTXER	IPD	5	Reserved for MLU. No connect.
57	PMTXC	I/O	5	Reserved for MLU. No connect.
58	GNDD	GND		Digital ground.
59	VDDIO	P		3.3V, 2.5V or 1.8V digital V _{DD} for digital I/O circuitry.
60	PMRXC	I/O	5	Reserved for MLU. No connect.
61	PMRXDV	IPD/O	5	Reserved for MLU. No connect.
62	PMRXD3	IPD/O	5	Reserved for MLU. Strap option: PD (default) = enable flow control. PU = disable flow control.

Pin Description (Continued)

Pin Number	Pin Name	Type ⁽¹⁾	Port	Pin Function ⁽²⁾
63	PMRXD2	IPD/O	5	Reserved for MLU. Strap option: PD (default) = disable back pressure. PU = enable back pressure.
64	PMRXD1	IPD/O	5	Reserved for MLU. Strap option: PD (default) = drop excessive collision packets. PU = does not drop excessive collision packets.
65	PMRXD0	IPD/O	5	Reserved for MLU. Strap option: PD (default) = disable aggressive back-off algorithm in half-duplex mode. PU = enable for performance enhancement.
66	PMRXER	IPD/O	5	Reserved for MLU. Strap option: PD (default) = 1522/1518 bytes; PU = packet size up to 1536 bytes.
67	PCRS	IPD/O	5	Reserved for MLU. Strap option for port 4 only. PD (default) = force half-duplex if auto-negotiation is disabled or fails. PU = force full-duplex if auto negotiation is disabled or fails. Refer to Register 76.
68	PCOL	IPD/O	5	Reserved for MLU. Strap option for port 4 only. PD (default) = no force flow control, normal operation. PU = force flow control. Refer to Register 66.
69	SMTXEN	IPD		Port 5 Switch MII transmit enable.
70	SMTXD3	IPD		Port 5 Switch MII transmit bit 3.
71	SMTXD2	IPD		Port 5 Switch MII transmit bit 2.
72	SMTXD1	IPD		Port 5 Switch MII transmit bit 1.
73	SMTXD0	IPD		Port 5 Switch MII transmit bit 0.
74	SMTXER	IPD		Port 5 Switch MII transmit error.
75	SMTXC	I/O		Port 5 Switch MII transmit clock: Input: SW5-MII MAC mode. Output: SW5-MII PHY modes.
76	GNDD	GND		Digital ground.
77	VDDIO	P		3.3V, 2.5V or 1.8V digital V _{DD} for digital I/O circuitry.
78	SMRXC	I/O		Port 5 Switch MII receive clock: Input: SW5-MII MAC mode. Output: SW5-MII PHY mode.
79	SMRXDV	IPD/O		Switch MII receive data valid.
80	SMRXD3	IPD/O		Port 5 Switch MII receive bit 3. Strap option: PD (default) = Disable Switch SW5-MII full-duplex flow control PU = Enable Switch SW5-MII full-duplex flow control.

Pin Description (Continued)

Pin Number	Pin Name	Type ⁽¹⁾	Port	Pin Function ⁽²⁾		
81	SMRXD2	IPD/O		Port 5 Switch MII receive bit 2. Strap option: PD (default) = Switch SW5-MII in full-duplex mode; PU = Switch SW5-MII in half-duplex mode.		
82	SMRXD1	IPD/O		Port 5 Switch MII receive bit 1. Strap option: PD (default) =Port 5 Switch SW5-MII in 100Mbps mode; SW5-TMII in 200Mbps mode. PU = Switch SW5-MII in 10Mbps mode.		
83	SMRXD0	IPD/O		Port 5 Switch MII receive bit 0. Strap option: LED mode PD (default) = mode 0; PU = mode 1. See “Register 11.” Mode 0, link at 100/Full LEDx[2,1,0]=0,0,0 100/Half LEDx[2,1,0]=0,1,0 10/Full LEDx[2,1,0]=0,0,1 10/Half LEDx[2,1,0]=0,1,1 Mode 1, link at 100/Full LEDx[2,1,0]=0,1,0 100/Half LEDx[2,1,0]=0,1,1 10/Full LEDx[2,1,0]=1,0,0 10/Half LEDx[2,1,0]=1,0,1		
					Mode 0	Mode 1
				LEDX_2	Lnk/Act	100Lnk/Act
				LEDX_1	FullD/Col	10Lnk/Act
				LEDX_0	Speed	Full duplex
84	SCOL	IPD/O		Port 5 Switch MII collision detect: Input: SW5-MII MAC modes. Output: SW5-MII PHY modes.		
85	SCRS	IPD/O		Port 5 Switch MII modes carrier sense: Input: SW5-MII MAC modes. Output: SW5-MII PHY modes.		
86	SCONF1	IPD		Pin 91,86,87 are dual MII configuration pins for the Port5 MAC5 MII. SW5-MII supports both MAC mode and PHY modes.		
				Pin#: (91, 86, 87)	Port5 Switch MAC5 SW5- MII	
				000	Disable, Otri	
				001	PHY Mode MII	
				010	MAC Mode MII	
				011	PHY Mode SNI	
				100	Disable (Default)	
				101	PHY Mode MII	
				110	MAC Mode MII	
111	PHY Mode SNI					
87	SCONF0	IPD		Dual MII configuration pin. See pin 86 descriptions.		
88	GNDD	GND		Digital ground.		
89	VDDC	P		1.2V digital core V _{DD} .		
90	LED5-2	IPU/O	5	Reserved for MLU Strap option: aging setup. See “Aging” section. PU (default) = aging enable PD = aging disable.		

Pin Description (Continued)

Pin Number	Pin Name	Type ⁽¹⁾	Port	Pin Function ⁽²⁾
91	LED5-1	IPU/O	5	Reserved for MLU Strap option: PU (default): enable PHY[5] MII I/F. PD: tristate and disable all PHY[5] MII output. (Design should pull this pin down as default for MLU.
92	LED5-0	IPU/O	5	Reserved for MLU Strap option for port 4 only. PU (default) = Enable auto-negotiation. PD = Disable auto-negotiation. Strap to register76 bit[7].
93	LED4-2	IPU/O	4	LED indicator 2.
94	LED4-1	IPU/O	4	LED indicator 1.
95	LED4-0	IPU/O	4	LED indicator 0. Strap option: PU (default) = Normal mode. PD = Energy Detection mode (EDPD mode). Strap to register 14 bits[4:3]
96	LED3-2	IPU/O	3	LED indicator 2.
97	LED3-1	IPU/O	3	LED indicator 1.
98	LED3-0	IPU/O	3	LED indicator 0. Strap option: PU (default) = Select I/O drive strength (8mA); PD = Select I/O drive strength (12mA). Strap to register132 bit[7-6].
99	GNDD	GND		Digital ground.
100	VDDIO	P		3.3V, 2.5V or 1.8V digital V _{DD} for digital I/O circuitry.
101	LED2-2	IPU/O	2	LED indicator 2.
102	LED2-1	IPU/O	2	LED indicator 1. Strap option: for port 3 only. PU (default) = Enable auto-negotiation. PD = Disable auto-negotiation. Strap to register60 bit[7].
103	LED2-0	IPU/O	2	LED indicator 0.
104	LED1-2	IPU/O	1	LED indicator 2.
105	LED1-1	IPU/O	1	LED indicator 1. Strap option: for port 3 only. PU (default) = no force flow control, normal operation. PD = force flow control. Strap to register60 bit[4].
106	LED1-0	IPU/O	1	LED indicator 0. Strap option for port 3 only. PU (default) = force half-duplex if auto-negotiation is disabled or fails. PD = force full-duplex if auto negotiation is disabled or fails. Strap to register60 bit[5].
107	MDC	IPU	All	Switch MII management data clock. Or SMI interface clock.
108	MDIO	I/O	All	Switch MII management data I/O. Or SMI interface data I/O. Features internal pull down to define pin state when not driven. Need an external pull-up when driven.
109	SPIQ	OTRI	All	SPI serial data output in SPI slave mode.
110	SPIC/SCL	I/O	All	SPI slave mode: clock input (1) Input clock up to 25MHz in SPI slave mode, (2) output clock at 61kHz in I ² C master mode. See "Pin 113."

Pin Description (Continued)

Pin Number	Pin Name	Type ⁽¹⁾	Port	Pin Function ⁽²⁾	
111	SSPID/SDA	I/O	All	SPI slave mode: serial data input. (1) Serial data input in SPI slave mode; (2) Serial data input/output in I ² C master mode. See “Pin 113.”	
112	SPIS_N	IPU	All	SPI slave mode: chip select (active low). (1) SPI data transfer start in SPI slave mode. When SPIS_N is high, the KSZ8895MLU is deselected and SPIQ is held in high impedance state, a high-to-low transition to initiate the SPI data transfer. (2) not used in I ² C master mode.	
113	PS1	IPD		Serial bus configuration pin. For this case, if the EEPROM is not present, the KSZ8895MLU will start itself with the PS[1.0] = 00 default register values.	
				Pin Configuration	Serial Bus Configuration
				PS[1.0]=00	I ² C Master Mode for EEPROM
				PS[1.0]=01	SMI Interface Mode
				PS[1.0]=10	SPI Slave Mode for CPU Interface
				PS[1.0]=11	Factory Test Mode (BIST)
114	PS0	IPD		Serial bus configuration pin. See “Pin 113.”	
115	RST_N	IPU		Reset the KSZ8895MLU device. Active low.	
116	GNDD	GND		Digital ground.	
117	VDDC	P		1.2V digital core V _{DD} .	
118	TESTEN	IPD		NC for normal operation. Factory test pin.	
119	SCANEN	IPD		NC for normal operation. Factory test pin.	
120	NC	NC		No connect.	
121	X1	I		25MHz crystal clock connection/or 3.3V Oscillator input. Crystal/Oscillator should be ±50ppm tolerance.	
122	X2	O		25MHz crystal clock connection.	
123	NC	NC		No connect.	
124	NC	NC		No connect.	
125	LDO_O	P		When pin126 is pull-up, the Internal 1.2V LDO controller is enabled and creates 1.2V output with using an external FET. When pin126 is pull-down (default), the pin 125 is tristated.	
126	IN_PWR_SEL	IPD		Pull-up to enable LDO_O of pin 125. Pull-down to disable LDO_0.	
127	GNDA	GND		Analog ground.	
128	TEST2	NC		NC for normal operation. Factory test pin.	

Pin for Strap-In Options

The KSZ8895MLU can function as a managed switch or unmanaged switch. If no EEPROM or micro-controller exists, the KSZ8895MLU will operate from its default setting. The strap-in option pins can be configured by external pull-up/down resistors and take the effect after power-down reset or warm reset, the functions are described in the following tables.

Pin Number	Pin Name	PU/PD ⁽¹⁾	Description ⁽¹⁾
1	MDI-XDIS	IPD	Disable auto MDI/MDI-X. PD = (default) = normal operation PU = disable auto MDI/MDI-X on all ports.
62	PMRXD3	IPD/O	Strap option: PD (default) = enable flow control; PU = disable flow control.
63	PMRXD2	IPD/O	Strap option: PD (default) = disable back pressure; PU = enable back pressure.

Introduction

The KSZ8895MLU contains four 10/100 physical layer transceivers and five media access control (MAC) units with an integrated Layer 2 managed switch. The device runs in two modes. The first mode is as a 4-port integrated switch. The second is as a 4-port switch with the fifth MAC. In this mode, access to the fifth MAC is provided through a media independent interface (MII).

The KSZ8895MLU has the flexibility to reside in a managed or unmanaged design. In a managed design, a host processor has complete control of the KSZ8895MLU via the SPI bus, or via the MDC/MDIO interface with SMI mode. An unmanaged design is achieved through I/O strapping or EEPROM programming at system reset time.

On the media side, the KSZ8895MLU supports IEEE 802.3 10BASE-T, 100BASE-TX on all ports with Auto MDI/MDIX. The KSZ8895MLU can be used as fully-managed 4-port stand alone switch or hook up to microprocessor by its SW-MII interface for an application solution.

Physical signal transmission and reception are enhanced through the use of patented analog circuitry that makes the design more efficient and allows for lower power consumption and smaller chip die size.

There are a number of major enhancements from the KS8995MA to the KSZ8895MLU. These include: more host interface options, four queues prioritization, tag as well as port based VLAN, rapid spanning tree support, IGMP snooping support, port mirroring support and more flexible rate limiting and filtering functionality.

Physical Layer Transceiver

100BASE-TX Transmit

The 100BASE-TX transmit function performs parallel-to-serial conversion, 4B/5B coding, scrambling, NRZ-to-NRZI conversion, MLT3 encoding and transmission. The circuit starts with a parallel-to-serial conversion, which converts the MII data from the MAC into a 125MHz serial bit stream. The data and control stream is then converted into 4B/5B coding followed by a scrambler. The serialized data is further converted from NRZ-to-NRZI format, and then transmitted in MLT3 current output. The output current is set by an external 1% 12.4k Ω resistor for the 1:1 transformer ratio. It has a typical rise/fall time of 4ns and complies with the ANSI TP-PMD standard regarding amplitude balance, overshoot, and timing jitter. The wave-shaped 10BASE-T output is also incorporated into the 100BASE-TX transmitter.

100BASE-TX Receive

The 100BASE-TX receiver function performs adaptive equalization, DC restoration, MLT3-to-NRZI conversion, data and clock recovery, NRZI-to-NRZ conversion, de-scrambling, 4B/5B decoding, and serial-to-parallel conversion. The receiving side starts with the equalization filter to compensate for inter-symbol interference (ISI) over the twisted pair cable. Since the amplitude loss and phase distortion is a function of the length of the cable, the equalizer has to adjust its characteristics to optimize the performance. In this design, the variable equalizer will make an initial estimation based on comparisons of incoming signal strength against some known cable characteristics, then tunes itself for optimization. This is an ongoing process and can self-adjust against environmental changes such as temperature variations.

The equalized signal then goes through a DC restoration and data conversion block. The DC restoration circuit is used to compensate for the effect of baseline wander and improve the dynamic range. The differential data conversion circuit converts the MLT3 format back to NRZI. The slicing threshold is also adaptive.

The clock recovery circuit extracts the 125MHz clock from the edges of the NRZI signal. This recovered clock is then used to convert the NRZI signal into the NRZ format. The signal is then sent through the de-scrambler followed by the 4B/5B decoder. Finally, the NRZ serial data is converted to the MII format and provided as the input data to the MAC.

PLL Clock Synthesizer

The KSZ8895MLU generates 125MHz, 83MHz, 41MHz, 25MHz and 10MHz clocks for system timing. Internal clocks are generated from an external 25MHz crystal or oscillator.

Scrambler/De-Scrambler (100BASE-TX Only)

The purpose of the scrambler is to spread the power spectrum of the signal in order to reduce EMI and baseline wander. The data is scrambled through the use of an 11-bit wide linear feedback shift register (LFSR). This can generate a 2047-bit non-repetitive sequence. The receiver will then de-scramble the incoming data stream with the same sequence at the transmitter.

10BASE-T Transmit

The output 10BASE-T driver is incorporated into the 100BASE-T driver to allow transmission with the same magnetics. They are internally wave-shaped and pre-emphasized into outputs with typical 2.3V amplitude. The harmonic contents are at least 27dB below the fundamental when driven by an all-ones Manchester-encoded signal.

10BASE-T Receive

On the receive side, input buffer and level detecting squelch circuits are employed. A differential input receiver circuit and a PLL perform the decoding function. The Manchester-encoded data stream is separated into clock signal and NRZ data. A squelch circuit rejects signals with levels less than 400mV or with short pulse widths in order to prevent noises at the RXP or RXM input from falsely triggering the decoder. When the input exceeds the squelch limit, the PLL locks onto the incoming signal and the KSZ8895MLU decodes a data frame. The receiver clock is maintained active during idle periods in between data reception.

MDI/MDI-X Auto Crossover

To eliminate the need for crossover cables between similar devices, the KSZ8895MLU supports HP Auto MDI/MDI-X and IEEE 802.3u standard MDI/MDI-X auto crossover. HP Auto MDI/MDI-X is the default.

The auto-sense function detects remote transmit and receive pairs and correctly assigns transmit and receive pairs for the KSZ8895MLU device. This feature is extremely useful when end users are unaware of cable types, and also, saves on an additional uplink configuration connection. The auto-crossover feature can be disabled through the port control registers, or MIIM PHY registers. The IEEE 802.3u standard MDI and MDI-X definitions are highlighted in Table 1:

MDI		MDI-X	
RJ-45 Pins	Signals	RJ-45 Pins	Signals
1	TD+	1	RD+
2	TD-	2	RD-
3	RD+	3	TD+
6	RD-	6	TD-

Table 1. MDI/MDI-X Pin Definitions

Straight Cable

A straight cable connects an MDI device to an MDI-X device, or an MDI-X device to an MDI device. Figure 1 depicts a typical straight cable connection between a NIC card (MDI) and a switch, or hub (MDI-X).

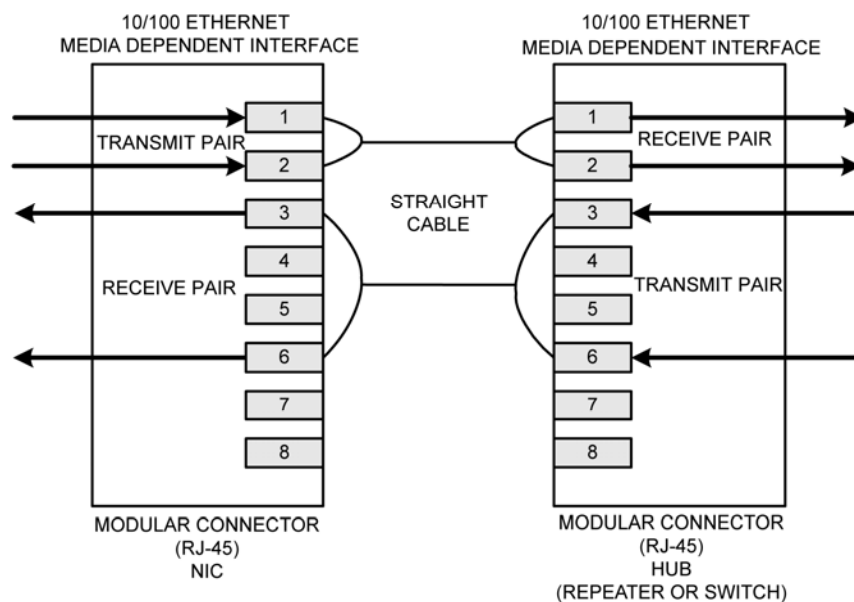

Figure 1. Typical Straight Cable Connection

Crossover Cable

A crossover cable connects an MDI device to another MDI device, or an MDI-X device to another MDI-X device. Figure 2 shows a typical crossover cable connection between two switches or hubs (two MDI-X devices).

Figure 2. Typical Crossover Cable Connection

Auto-Negotiation

The KSZ8895MLU conforms to the auto-negotiation protocol as described by the 802.3 committee. Auto-negotiation allows unshielded twisted pair (UTP) link partners to select the highest common mode of operation. Link partners advertise their capabilities to each other, and then compare their own capabilities with those they received from their link partners. The highest speed and duplex setting that is common to the two link partners is selected as the mode of operation.

The following list shows the speed and duplex operation mode from highest to lowest.

- Highest: 100Base-TX, full-duplex
- High: 100Base-TX, half-duplex
- Low: 10Base-T, full-duplex
- Lowest: 10Base-T, half-duplex

If auto-negotiation is not supported or the KSZ8895MLU link partner is forced to bypass auto-negotiation, the KSZ8895MLU sets its operating mode by observing the signal at its receiver. This is known as parallel detection, and allows the KSZ8895MLU to establish link by listening for a fixed signal protocol in the absence of auto-negotiation advertisement protocol. The auto-negotiation link-up process is shown in Figure 3.

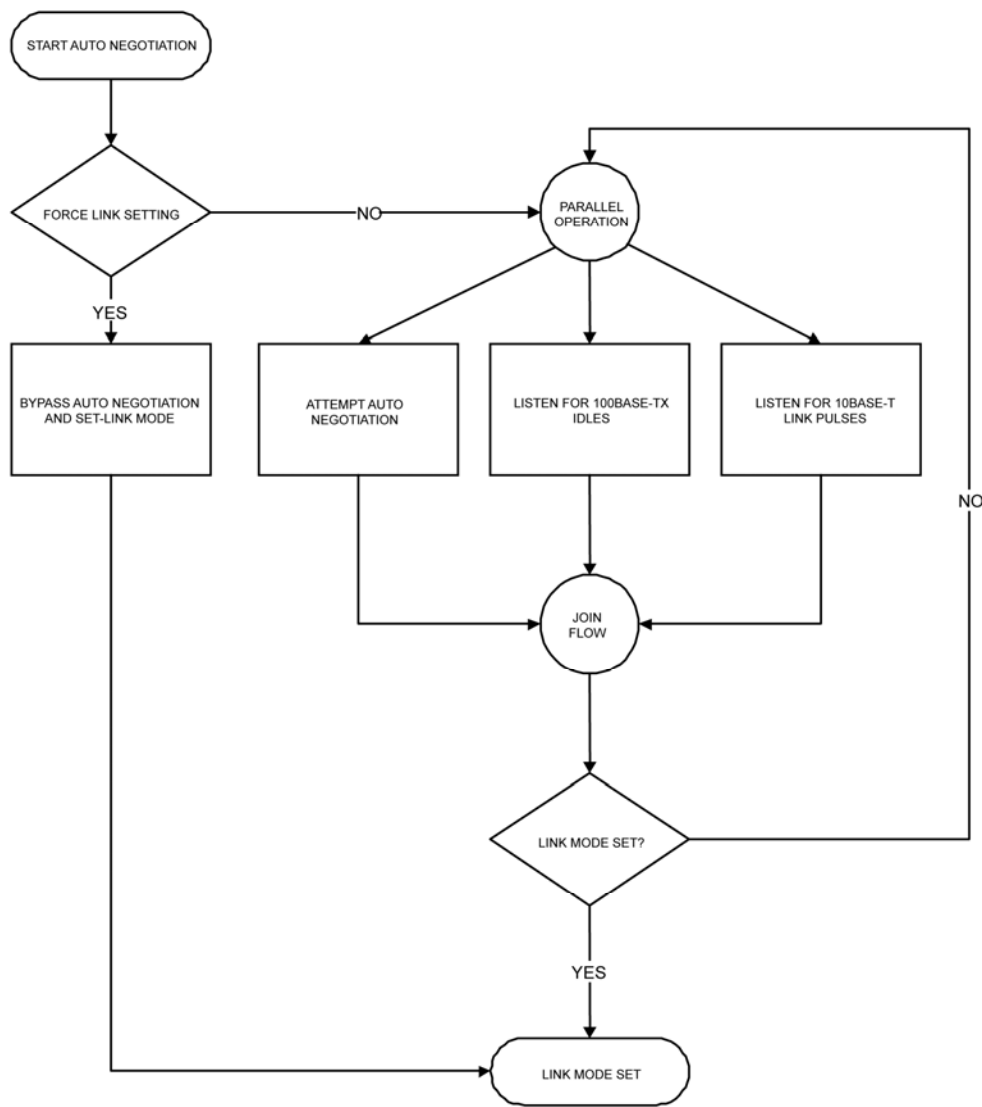

Figure 3. Auto-Negotiation

On-Chip Termination Resistors

The KSZ8895MLU reduces board cost and simplifies board layout by using on-chip termination resistors for all ports and the RX/TX differential pairs without the external termination resistors. The solution of the on chip termination and internal biasing will save about 50% power consumption compare with using external biasing and termination resistors, and the transformer will not consume power any more.

Internal 1.2V LDO Controller

The KSZ8895MLU reduces board cost and simplifies board layout by integrating an internal 1.2V LDO controller to drive a low cost MOSFET to supply the 1.2V core power voltage for a single 3.3V power supply solution.

Power Management

The KSZ8895MLU supports a full-chip hardware power-down mode. When PWRDN Pin 47 (Pin PWRDN =0) is activated low, the entire chip is powered down. If this pin is de-asserted, the chip will be internally reset.

The KSZ8895MLU can also use multiple power level of 3.3V, 2.5V or 1.8V for VDDIO to support different I/O voltage.

The KSZ8895MLU supports enhanced power management feature in low power state with energy detection to ensure low-power dissipation during device idle periods. There are five operation modes under the power management function which is controlled by the register 14 bit [4:3] and the port register control 13 bit 3 as shown below:

- Register 14 bit [4:3] = 00 normal operation mode
- Register 14 bit [4:3] = 01 energy detect mode
- Register 14 bit [4:3] = 10 soft power down mode
- Register 14 bit [4:3] = 11 power saving mode
- Port register 29, 45, 61, 77, 93 Control 13 bit 3 =1 are for the port based power-down mode

Table 2 indicates all internal function blocks status under four different power management operation modes.

KSZ8895MLU Function Blocks	Power Management Operation Modes			
	Normal Mode	Power-Saving Mode	Energy Detect Mode	Soft Power-Down Mode
Internal PLL Clock	Enabled	Enabled	Disabled	Disabled
Tx/Rx PHY	Enabled	<i>Rx unused block disabled</i>	Energy detect at Rx	Disabled
MAC	Enabled	Enabled	Disabled	Disabled
Host Interface	Enabled	Enabled	Disabled	Disabled

Table 2. Internal Function Block Status

Normal Operation Mode

This is the default setting bit [4:3] =00 in register 14 after the chip power-up or hardware reset. When KSZ8895MLU is in this normal operation mode, all PLL clocks are running, PHY and MAC are on and the host interface is ready for CPU read or write.

During the normal operation mode, the host CPU can set the bit [4:3] in register 14 to transit the current normal operation mode to any one of the other three power management operation modes.

Energy Detect Mode

The energy detect mode provides a mechanism to save more power than in the normal operation mode when the KSZ8895MLU is not connected to an active link partner. In this mode, the device will save more power based on the regular less power consumption. If the cable is not plugged, the KSZ8895MLU can automatically enter to a low power state, otherwise known as the energy detect mode. In this mode, KSZ8895MLU will keep transmitting 120ns width pulses at 1 pulse/s rate. Once activity resumes due to plugging a cable or attempting by the far end to establish link, the KSZ8895MLU can automatically power up to normal power state in energy detect mode.

Energy detect mode consists of two states, normal power state and low power state. While in low power state, the KSZ8895MLU reduces power consumption by disabling all circuitry except the energy detect circuitry of the receiver. The energy detect mode is entered by setting bit [4:3] =01 in register 14. When the KSZ8895MLU is in this mode, it will monitor the cable energy. If there is no energy on the cable for a time longer than pre-configured value at bit [7:0] Go-Sleep time in register 15, KSZ8895MLU will go into a low power state. When KSZ8895MLU is in low power state, it will keep monitoring the cable energy. Once the energy is detected from the cable, KSZ8895MLU will enter normal power state. When KSZ8895MLU is at normal power state, it is able to transmit or receive packet from the cable.

Soft Power-Down Mode

The soft power-down mode is entered by setting bit [4:3] = 10 in register 14. When KSZ8895MLU is in this mode, all PLL clocks are disabled, also all of PHYs and the MACs are off. Any dummy host access will wake-up this device from current soft power-down mode to normal operation mode and internal reset will be issued to make all internal registers go to the default values.

Power-Saving Mode

The power saving mode is entered when auto-negotiation mode is enabled, cable is disconnected, and by setting bit [4:3] = 11 in register 14. When KSZ8895MLU is in this mode, all PLL clocks are enabled, MAC is on, all internal registers value will not change, and host interface is ready for CPU read or write. In this mode, it mainly controls the PHY transceiver on or off based on line status to achieve power saving. The PHY remains transmitting and only turns off the unused receiver block. Once activity resumes due to plugging a cable or attempting by the far end to establish link, the KSZ8895MLU can automatically enabled the PHY power up to normal power state from power saving mode.

During this power-saving mode, the host CPU can set bit [4:3] in register 14 to transit the current power saving mode to any one of the other three power management operation modes.

Port-Based Power-Down Mode

In addition, the KSZ8895MLU features a per-port power down mode. To save power, a PHY port that is not in use can be powered down via the port registers control 13 bit3, or MIIM PHY registers 0 bit11.

Switch Core**Address Look-Up**

The internal look-up table stores MAC addresses and their associated information. It contains a 1K unicast address table plus switching information. The KSZ8895MLU is guaranteed to learn 1K addresses and distinguishes itself from a hash-based look-up table, which depending on the operating environment and probabilities, may not guarantee the absolute number of addresses it can learn.

Learning

The internal look-up engine updates its table with a new entry if the following conditions are met:

- The received packet's source address (SA) does not exist in the look-up table.
- The received packet is good; the packet has no receiving errors and is of legal length.

The look-up engine inserts the qualified SA into the table, along with the port number and time stamp. If the table is full, the last entry of the table is deleted first to make room for the new entry.

Migration

The internal look-up engine also monitors whether a station is moved. If this occurs, it updates the table accordingly. Migration happens when the following conditions are met:

- The received packet's SA is in the table but the associated source port information is different.
- The received packet is good; the packet has no receiving errors and is of legal length.

The look-up engine will update the existing record in the table with the new source port information.

Aging

The look-up engine will update the time stamp information of a record whenever the corresponding SA appears. The time stamp is used in the aging process. If a record is not updated for a period of time, the look-up engine will remove the record from the table. The look-up engine constantly performs the aging process and will continuously remove aging records. The aging period is 300 ± 75 seconds. This feature can be enabled or disabled through Register 3 or by external pull-up or pull-down resistors on LED[5][2]. See "Register 3" section.

Forwarding

The KSZ8895MLU will forward packets using an algorithm that is depicted in the following flowcharts. Figure 6 shows stage one of the forwarding algorithm where the search engine looks up the VLAN ID, static table, and dynamic table for the destination address, and comes up with “port to forward 1” (PTF1). PTF1 is then further modified by the spanning tree, IGMP snooping, port mirroring, and port VLAN processes to come up with “port to forward 2” (PTF2), as shown in Figure 7. This is where the packet will be sent.

KSZ8895MLU Will Not Forward the Following Packets:

- Error packets. These include framing errors, FCS errors, alignment errors, and illegal size packet errors.
- 802.3x pause frames. The KSZ8895MLU will intercept these packets and perform the appropriate actions.
- “Local” packets. Based on destination address (DA) look-up. If the destination port from the look-up table matches the port where the packet was from, the packet is defined as “local.”

Switching Engine

The KSZ8895MLU features a high-performance switching engine to move data to and from the MAC's, packet buffers. It operates in store and forward mode, while the efficient switching mechanism reduces overall latency. The KSZ8895MLU has a 64kB internal frame buffer. This resource is shared between all five ports. There are a total of 512 buffers available. Each buffer is sized at 128B.

Media Access Controller (MAC) Operation

The KSZ8895MLU strictly abides by IEEE 802.3 standards to maximize compatibility.

Inter-Packet Gap (IPG)

If a frame is successfully transmitted, the 96-bit time IPG is measured between the two consecutive MTXEN. If the current packet is experiencing collision, the 96-bit time IPG is measured from MCRS and the next MTXEN.

Backoff Algorithm

The KSZ8895MLU implements the IEEE Std. 802.3 binary exponential back-off algorithm, and optional “aggressive mode” back off. After 16 collisions, the packet will be optionally dropped depending on the chip configuration in Register 3. See “Register 3.”

Late Collision

If a transmit packet experiences collisions after 512-bit times of the transmission, the packet will be dropped.

Illegal Frames

The KSZ8895MLU discards frames less than 64 bytes and can be programmed to accept frames up to 1536 bytes in Register 4. For special applications, the KSZ8895MLU can also be programmed to accept frames up to 1916 bytes in Register 4. Since the KSZ8895MLU supports VLAN tags, the maximum sizing is adjusted when these tags are present.

Flow Control

The KSZ8895MLU supports standard 802.3x flow control frames on both transmit and receive sides.

On the receive side, if the KSZ8895MLU receives a pause control frame, the KSZ8895MLU will not transmit the next normal frame until the timer, specified in the pause control frame, expires. If another pause frame is received before the current timer expires, the timer will be updated with the new value in the second pause frame. During this period (being flow controlled), only flow control packets from the KSZ8895MLU will be transmitted.

On the transmit side, the KSZ8895MLU has intelligent and efficient ways to determine when to invoke flow control. The flow control is based on availability of the system resources, including available buffers, available transmit queues and available receive queues.

The KSZ8895MLU flow controls a port that has just received a packet if the destination port resource is busy. The KSZ8895MLU issues a flow control frame (XOFF), containing the maximum pause time defined in IEEE standard 802.3x. Once the resource is freed up, the KSZ8895MLU sends out the other flow control frame (XON) with zero pause time to turn off the flow control (turn on transmission to the port). A hysteresis feature is also provided to prevent over-activation and deactivation of the flow control mechanism.

The KSZ8895MLU flow controls all ports if the receive queue becomes full.

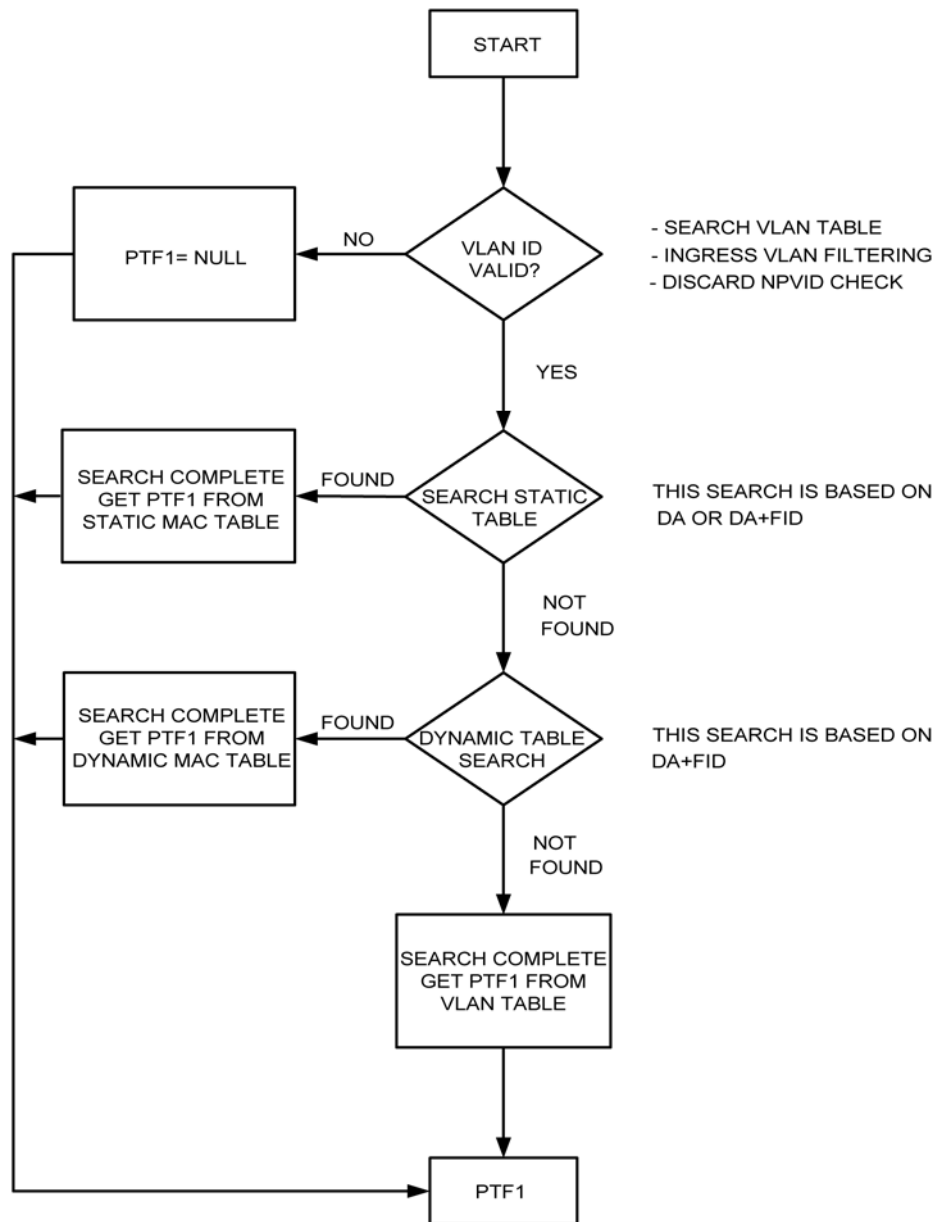

Figure 4. Destination Address Look-Up Flow Chart (Stage 1)

Figure 5. Destination Address Resolution Flow Chart (Stage 2)

The KSZ8895MLU will not forward the following packets:

1. Error packets
 - These include framing errors, Frame Check Sequence (FCS) errors, alignment errors, and illegal size packet errors.
2. IEEE802.3x PAUSE frames
 - KSZ8895MLU intercepts these packets and performs full duplex flow control accordingly.
3. "Local" packets
 - Based on destination address (DA) lookup, if the destination port from the lookup table matches the port from which the packet originated, the packet is defined as "local."

Half-Duplex Back Pressure

The KSZ8895MLU also provides a half-duplex back pressure option (note: this is not in IEEE 802.3 standards). The activation and deactivation conditions are the same as the ones given for full-duplex mode. If back pressure is required, the KSZ8895MLU sends preambles to defer the other station's transmission (carrier sense deference). To avoid jabber and excessive deference as defined in IEEE 802.3 standard, after a certain period of time, the KSZ8895MLU discontinues carrier sense but raises it quickly after it drops packets to inhibit other transmissions. This short silent time (no carrier sense) is to prevent other stations from sending out packets and keeps other stations in a carrier sense deferred state. If the port has packets to send during a back pressure situation, the carrier-sense-type back pressure is interrupted and those packets are transmitted instead. If there are no more packets to send, carrier-sense-type back pressure becomes active again until switch resources are free. If a collision occurs, the binary exponential backoff algorithm is skipped and carrier sense is generated immediately, reducing the chance of further colliding and maintaining carrier sense to prevent reception of packets. To ensure no packet loss in 10BASE-T or 100BASE-TX half-duplex modes, the user must enable the following:

- Aggressive backoff (Register 3, bit 0)
- No excessive collision drop (Register 4, bit 3)
- Back pressure (Register 4, bit 5)

These bits are not set as the default because this is not the IEEE standard.

Broadcast Storm Protection

The KSZ8895MLU has an intelligent option to protect the switch system from receiving too many broadcast packets. Broadcast packets are normally forwarded to all ports except the source port and thus use too many switch resources (bandwidth and available space in transmit queues). The KSZ8895MLU has the option to include "multicast packets" for storm control. The broadcast storm rate parameters are programmed globally and can be enabled or disabled on a per port basis. The rate is based on a 50ms interval for 100BT and a 500ms interval for 10BT. At the beginning of each interval, the counter is cleared to zero and the rate-limit mechanism starts to count the number of bytes during the interval. The rate definition is described in Registers 6 and 7. The default setting for Registers 6 and 7 is 0x4A (74 decimal). This is equal to a rate of 1%, calculated as follows:

$$148,800 \text{ frames/sec} \times 50\text{ms/interval} \times 1\% = 74 \text{ frames/interval (approx.)} = 0x4A$$

MII Interface Operation

The media independent interface (MII) is specified by the IEEE 802.3 committee and provides a common interface between physical layer and MAC layer devices. The KSZ8895MLU provides such interfaces on port 5. The SW5-MII interface is used to connect to the fifth MAC. The MII interfaces contains two distinct groups of signals, one for transmission and the other for receiving.

Port 5 MAC 5 SW5-MII Interface

Table 3 shows two connection manners:

1. The first is an external MAC connects to SW5-MII PHY mode.
2. The second is an external PHY connects to SW5-MII MAC mode.

Please see the pins [91, 86, and 87] description for detail configuration for the MAC mode and PHY mode, SW5-MII works with 25MHz and 2.5MHz clock for 100Base-TX and 10Base-T.

KSZ8895MLU PHY Mode Connection			Description	KSZ8895MLU MAC Mode Connection		
External MAC	KSZ8895MLU SW5-MII Signals	Type		External PHY	KSZ8895MLU SW5-MII Signals	Type

Table 3. Switch MAC 5 MII/Turbo MII Signals

The switch MII interface operates in either MAC mode or PHY mode for KSZ8895MLU. These interfaces are nibble-wide data interfaces and therefore run at 1/4 the network bit rate (not encoded). Additional signals on the transmit side indicate when data is valid or when an error occurs during transmission. Likewise, the receive side has indicators that convey when the data is valid and without physical layer errors. For half-duplex operation there is a signal that indicates a collision has occurred during transmission.

Note that the signal MRXER is not provided on the MII-SW interface for PHY mode operation and the signal MTXER is not provided on the MII-SW interface for MAC mode operation. Normally MRXER would indicate a receive error coming from the physical layer device. MTXER would indicate a transmit error from the MAC device. These signals are not appropriate for this configuration. For PHY mode operation, if the device interfacing with the KSZ8895MLU has an MRXER pin, it should be tied low. For MAC mode operation, if the device interfacing with the KSZ8895MLU has an MTXER pin, it should be tied low.

SNI Interface Operation

The serial network interface (SNI) is compatible with some controllers used for network layer protocol processing. This interface can be directly connected to these types of devices. The signals are divided into two groups, one for transmission and the other for reception. The signals involved are described in Table 4.

SNI Signal	Description	KSZ8895MLU Signal
TXEN	Transmit Enable	SMTXEN
TXD	Serial Transmit Data	SMTXD[0]
TXC	Transmit Clock	SMTXC
COL	Collision Detection	SCOL
CRS	Carrier Sense	SMRXDV
RXD	Serial Receive Data	SMRXD[0]
RXC	Receive Clock	SMRXC

Table 4. SNI Signals

This interface is a bit-wide data interface and therefore runs at the network bit rate (not encoded). An additional signal on the transmit side indicates when data is valid. Likewise, the receive side has an indicator that conveys when the data is valid.

For half-duplex operation there is a signal that indicates a collision has occurred during transmission.

Advanced Functionality

QoS Priority Support

The KSZ8895MLU provides Quality of Service (QoS) for applications such as VoIP and video conferencing. The KSZ8895MLU offer 1/2/4 priority queues option per port by setting the port registers xxx control 9 bit1 and the port registers xxx control 0 bit0, the 1/2/4 queues split as follows,

[Port registers xxx control 9 bit1, control 0 bit0]=00 single output queue as default.

[Port registers xxx control 9 bit1, control 0 bit0]=01 egress port can be split into two priority transmit queues.

[Port registers xxx control 9 bit1, control 0 bit0]=10 egress port can be split into four priority transmit queues.

The four priority transmit queues is a new feature in the KSZ8895MLU. The queue 3 is the highest priority queue and Queue 0 is the lowest priority queue. The port registers xxx control 7 bit1 and the port registers xxx control 0 bit0 are used to enable split transmit queues for ports 1, 2, 3, 4 and 5, respectively. If a port's transmit queue is not split, high priority and low priority packets have equal priority in the transmit queue.

There is an additional option to either always deliver high priority packets first or use programmable weighted fair queuing for the four priority queues scale by the port registers control 10, 11, 12 and 13 (default value are 8, 4, 2, 1 by their bit[6:0]).

Register 130 bit[7:6] Prio_2Q[1:0] is used when the 2 Queue configuration is selected, these bits are used to map the 2-bit result of IEEE 802.1p from the registers 128, 129 or TOS/DiffServ mapping from registers 144-159 (for 4 Queues) into two queues mode with priority high or low.

Please see the descriptions of the register 130 bits [7:6] for detail.

Port-Based Priority

With port-based priority, each ingress port is individually classified as a priority 0-3 receiving port. All packets received at the priority 3 receiving port are marked as high priority and are sent to the high-priority transmit queue if the corresponding transmit queue is split. The Port Registers Control 0 Bits [4:3] is used to enable port-based priority for ports 1, 2, 3, 4 and 5, respectively.

802.1p-Based Priority

For 802.1p-based priority, the KSZ8895MLU examines the ingress (incoming) packets to determine whether they are tagged. If tagged, the 3-bit priority field in the VLAN tag is retrieved and compared against the "priority mapping" value, as specified by the registers 128 and 129, both register 128/129 can map 3-bit priority field of 0-7 value to 2-bit result of 0-3 priority levels. The "priority mapping" value is programmable.

The following figure illustrates how the 802.1p priority field is embedded in the 802.1Q VLAN tag.

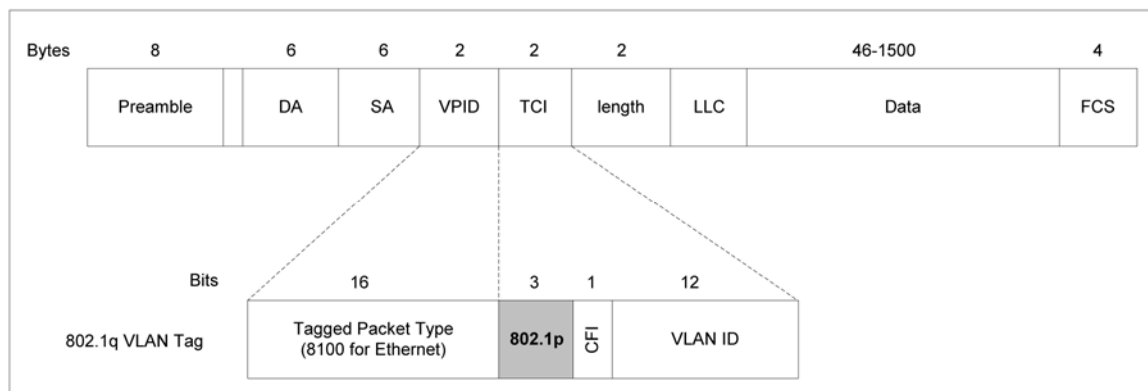

Figure 6. 802.1p Priority Field Format

802.1p-based priority is enabled by bit [5] of the port registers control 0 for ports 1, 2, 3, 4 and 5, respectively.

The KSZ8895MLU provides the option to insert or remove the priority tagged frame's header at each individual egress port. This header, consisting of the 2 bytes VLAN Protocol ID (VPID) and the 2-byte Tag Control Information field (TCI), is also referred to as the IEEE 802.1Q VLAN tag.

Tag Insertion is enabled by bit [2] of the port registers control 0 and the port register control 8 to select which source port (ingress port) PVID can be inserted on the egress port for ports 1, 2, 3, 4 and 5, respectively. At the egress port, untagged packets are tagged with the ingress port's default tag. The default tags are programmed in the port registers control 3 and control 4 for ports 1, 2, 3, 4 and 5, respectively. The KSZ8895MLU will not add tags to already tagged packets.

Tag Removal is enabled by bit [1] of the port registers control 0 for ports 1, 2, 3, 4 and 5, respectively. At the egress port, tagged packets will have their 802.1Q VLAN Tags removed. The KSZ8895MLU will not modify untagged packets.

The CRC is recalculated for both tag insertion and tag removal.

802.1p Priority Field Re-mapping is a QoS feature that allows the KSZ8895MLU to set the "User Priority Ceiling" at any ingress port by the port register control 2 bit 7. If the ingress packet's priority field has a higher priority value than the default tag's priority field of the ingress port, the packet's priority field is replaced with the default tag's priority field.

DiffServ-Based Priority

DiffServ-based priority uses the ToS registers (registers 144 to 159) in the Advanced Control Registers section. The ToS priority control registers implement a fully decoded, 128-bit Differentiated Services Code Point (DSCP) register to determine packet priority from the 6-bit ToS field in the IP header. When the most significant 6 bits of the ToS field are fully decoded, the resultant of the 64 possibilities of DSCP decoded is compared with the corresponding bits in the DSCP register to determine priority.

Spanning Tree Support

Port 5 is the designated port for spanning tree support.

The other ports (port 1 – port 4) can be configured in one of the five spanning tree states via "transmit enable," "receive enable," and "learning disable" register settings in Registers 18, 34, 50, and 66 for ports 1, 2, 3, and 4, respectively. The following description shows the port setting and software actions taken for each of the five spanning tree states.

Disable state: the port should not forward or receive any packets. Learning is disabled.

Port setting: "transmit enable = 0, receive enable = 0, learning disable = 1."

Software action: the processor should not send any packets to the port. The switch may still send specific packets to the processor (packets that match some entries in the static table with "overriding bit" set) and the processor should discard those packets.

Note: Processor is connected to port 5 via MII interface. Address learning is disabled on the port in this state.

Blocking state: only packets to the processor are forwarded. Learning is disabled.

Port setting: "transmit enable = 0, receive enable = 0, learning disable = 1"

Software action: the processor should not send any packets to the port(s) in this state. The processor should program the "Static MAC table" with the entries that it needs to receive (e.g., BPDU packets). The "overriding" bit should also be set so that the switch will forward those specific packets to the processor. Address learning is disabled on the port in this state.

Listening state: only packets to and from the processor are forwarded. Learning is disabled.

Port setting: "transmit enable = 0, receive enable = 0, learning disable = 1.

"Software action: The processor should program the static MAC table with the entries that it needs to receive (e.g., BPDU packets). The "overriding" bit should be set so that the switch will forward those specific packets to the processor. The processor may send packets to the port(s) in this state, see "Tail Tagging Mode" section for details. Address learning is disabled on the port in this state.

Learning state: only packets to and from the processor are forwarded. Learning is enabled.

Port setting: "transmit enable = 0, receive enable = 0, learning disable = 0."

Software action: The processor should program the static MAC table with the entries that it needs to receive (e.g., BPDU packets). The "overriding" bit should be set so that the switch will forward those specific packets to the processor. The processor may send packets to the port(s) in this state, see "Tail Tagging Mode" section for details. Address learning is enabled on the port in this state.

Forwarding state: Packets are forwarded and received normally. Learning is enabled.

Port setting: "transmit enable = 1, receive enable = 1, learning disable = 0."

Software action: The processor should program the static MAC table with the entries that it needs to receive (e.g., BPDU packets). The “overriding” bit should be set so that the switch will forward those specific packets to the processor. The processor may send packets to the port(s) in this state, see “Tail Tagging Mode” section for details. Address learning is enabled on the port in this state.

Rapid Spanning Tree Support

There are three operational states of the Discarding, Learning, and Forwarding assigned to each port for RSTP:

Discarding ports do not participate in the active topology and do not learn MAC addresses.

Discarding state: the state includes three states of the disable, blocking and listening of STP.

Port setting: “transmit enable = 0, receive enable = 0, learning disable = 1.”

Software action: the processor should not send any packets to the port. The switch may still send specific packets to the processor (packets that match some entries in the static table with “overriding bit” set) and the processor should discard those packets. When disable the port’s learning capability (learning disable=’1’), set the register 1 bit5 and bi4 will flush rapidly with the port related entries in the dynamic MAC table and static MAC table.

Note: Processor is connected to port 5 via MII interface. Address learning is disabled on the port in this state.

Ports in Learning states learn MAC addresses, but do not forward user traffic.

Learning state: only packets to and from the processor are forwarded. Learning is enabled.

Port setting: “transmit enable = 0, receive enable = 0, learning disable = 0.”

Software action: The processor should program the static MAC table with the entries that it needs to receive (e.g., BPDU packets). The “overriding” bit should be set so that the switch will forward those specific packets to the processor. The processor may send packets to the port(s) in this state, see “Tail Tagging Mode” section for details. Address learning is enabled on the port in this state.

Ports in Forwarding states fully participate in both data forwarding and MAC learning.

Forwarding state: packets are forwarded and received normally. Learning is enabled.

Port setting: “transmit enable = 1, receive enable = 1, learning disable = 0.”

Software action: The processor should program the static MAC table with the entries that it needs to receive (e.g., BPDU packets). The “overriding” bit should be set so that the switch will forward those specific packets to the processor. The processor may send packets to the port(s) in this state, see “Tail Tagging Mode” section for details. Address learning is enabled on the port in this state.

RSTP uses only one type of BPDU called RSTP BPDUs. They are similar to STP Configuration BPDUs with the exception of a type field set to “version 2” for RSTP and “version 0” for STP, and a flag field carrying additional information.

Tail Tagging Mode

The Tail Tag is only seen and used by the port 5 interface, which should be connected to a processor by SW5-MII interface. The one byte tail tagging is used to indicate the source/destination port in port 5. Only bit [3-0] are used for the destination in the tail tagging byte. Other bits are not used. The Tail Tag feature is enabled by setting register 12.

Figure 7. Tail Tag Frame Format

Ingress to Port 5 (Host → KSZ8895MLU)	
Bit [3:0]	Destination
0,0,0,0	Normal (Address Look up for destination)
0,0,0,1	Port 1 (direct forward to port1)
0,0,1,0	Port 2 (direct forward to port2)
0,1,0,0	Port 3 (direct forward to port3)
1,0,0,0	Port 4 (direct forward to port4)
1,1,1,1	Port 1, 2,3 and 4 (direct forward to port 1,2,3,4,)
Bit [7:4]	
0,0,0,0	Queue 0 is used at destination port
0,0,0,1	Queue 1 is used at destination port
0,0,1,0	Queue 2 is used at destination port
0,0,1,1	Queue 3 is used at destination port
x, 1,x,x	Whatever send packets to specified port in bit[3:0]
1, x,x,x	Bit[6:0] will be ignored
Egress from Port 5 (KSZ8895MLU → Host)	
Bit [1:0]	Source
0,0	Port 1 (packets from port 1)
0,1	Port 2 (packets from port 2)
1,0	Port 3 (packets from port 3)
1,1	Port 4 (packets from port 4)

Table 5. Tail Tag Rules

IGMP Support

For Internet Group Management Protocol (IGMP) support in layer 2, the KSZ8895MLU provides two components:

IGMP Snooping

The KSZ8895MLU traps IGMP packets and forwards them only to the processor (port 5 SW5-MII). The IGMP packets are identified as IP packets (either Ethernet IP packets, or IEEE 802.3 SNAP IP packets) with IP version = 0x4 and protocol version number = 0x2.

Multicast Address Insertion in the Static MAC Table

Once the multicast address is programmed in the Static MAC Table, the multicast session is trimmed to the subscribed ports, instead of broadcasting to all ports.

To enable IGMP support, set register 5 bit [6] to '1'. Also, "Tail tag mode" needs to be enabled, so that the processor knows which port the IGMP packet was received on. Enable "Tail tag mode" by setting Register 12 bit 0.

Port Mirroring Support

KSZ8895MLU supports “port mirror” comprehensively as:

- **“Receive Only” Mirror on a Port**

All the packets received on the port will be mirrored on the sniffer port. For example, port 1 is programmed to be “rx sniff,” and port 5 is programmed to be the “sniffer port.” A packet, received on port 1, is destined to port 4 after the internal look-up. The KSZ8895MLU will forward the packet to both port 4 and port 5. KSZ8895MLU can optionally forward even “bad” received packets to port 5.

- **“Transmit Only” Mirror on a Port**

All the packets transmitted on the port will be mirrored on the sniffer port. For example, port 1 is programmed to be “tx sniff,” and port 5 is programmed to be the “sniffer port.” A packet, received on any of the ports, is destined to port 1 after the internal look-up. The KSZ8895MLU will forward the packet to both ports 1 and 5.

- **“Receive and Transmit” Mirror on Two Ports**

All the packets received on port A AND transmitted on port B will be mirrored on the sniffer port. To turn on the “AND” feature, set Register 5 bit 0 to 1. For example, port 1 is programmed to be “rx sniff,” port 2 is programmed to be “transmit sniff,” and port 5 is programmed to be the “sniffer port.” A packet, received on port 1, is destined to port 4 after the internal look-up. The KSZ8895MLU will forward the packet to port 4 only, since it does not meet the “AND” condition. A packet, received on port 1, is destined to port 2 after the internal look-up. The KSZ8895MLU will forward the packet to both port 2 and port 5.

Multiple ports can be selected to be “rx sniffed” or “tx sniffed.” And any port can be selected to be the “sniffer port.” All these per port features can be selected through Register 17.

VLAN Support

KSZ8895MLU supports 128 active VLANs and 4096 possible VIDs specified in IEEE 802.1q. KSZ8895MLU provides a 128-entry VLAN table, which correspond to 4096 possible VIDs and converts to FID (7 bits) for address look-up max 128 active VLANs. If a non-tagged or null-VID-tagged packet is received, the ingress port VID is used for look-up when 802.1q is enabled by the global register 5 control 3 bit 7. In the VLAN mode, the look-up process starts from VLAN table look-up to determine whether the VID is valid. If the VID is not valid, the packet will be dropped and its address will not be learned. If the VID is valid, FID is retrieved for further look-up by the static MAC table or dynamic MAC table. FID+DA is used to determine the destination port. The followed table describes the difference actions at different situations of DA and FID+DA in the static MAC table and dynamic MAC table after the VLAN table finish a look-up action. FID+SA is used for learning purposes. The followed table also describes how to learning in the dynamic MAC table when VLAN table has done a look-up and the static MAC table without a valid entry.

DA Found in Static MAC Table	Use FID Flag?	FID Match?	DA+FID Found in Dynamic MAC Table	Action
No	Don't care	Don't care	No	Broadcast to the membership ports defined in the VLAN table bit [11:7].
No	Don't care	Don't care	Yes	Send to the destination port defined in the dynamic MAC table bit [57:55].
Yes	0	Don't care	Don't care	Send to the destination port(s) defined in the static MAC table bit [52:48].
Yes	1	No	No	Broadcast to the membership ports defined in the VLAN table bit [11:7].
Yes	1	No	Yes	Send to the destination port defined in the dynamic MAC table bit [57:55].
Yes	1	Yes	Don't care	Send to the destination port(s) defined in the static MAC table bit [52:48].

Table 6. FID+DA Look-Up in the VLAN Mode

SA+FID Found in Dynamic MAC Table	Action
No	The SA+FID will be learned into the dynamic table.
Yes	Time stamp will be updated.

Table 7. FID+SA Look-Up in the VLAN Mode

Advanced VLAN features are also supported in KSZ8895MLU, such as “VLAN ingress filtering” and “discard non PVID” defined in bits [6:5] of the port Register Control 2. These features can be controlled on a port basis.

Rate Limiting Support

The KSZ8895MLU provides a fine resolution hardware rate limiting. The rate step is 64Kbps when the rate limit is less than 1Mbps rate for 100BT or 10BT. The rate step is 1Mbps when the rate limit is more than 1Mbps rate for 100BT or 10BT (refer to Data Rate Selection Table which follow the end of the Port Register Queue 0 – 3 Ingress/Egress Limit Control section). The rate limit is independently on the “receive side” and on the “transmit side” on a per port basis. For 10BASE-T, a rate setting above 10 Mbps means the rate is not limited. On the receive side, the data receive rate for each priority at each port can be limited by setting up Ingress Rate Control Registers. On the transmit side, the data transmit rate for each priority queue at each port can be limited by setting up Egress Rate Control Registers. The size of each frame has options to include minimum IFG (Inter Frame Gap) or Preamble byte, in addition to the data field (from packet DA to FCS).

Ingress Rate Limit

For ingress rate limiting, KSZ8895MLU provides options to selectively choose frames from all types, multicast, broadcast, and flooded unicast frames by bits [3 – 2] of the port rate limit control register. The KSZ8895MLU counts the data rate from those selected type of frames. Packets are dropped at the ingress port when the data rate exceeds the specified rate limit or the flow control takes effect without packet dropped when the ingress rate limit flow control is enabled by the port rate limit control register bit 4. The ingress rate limiting supports the port-based, 802.1p and DiffServ-based priorities, the port-based priority is fixed priority 0 – 3 selection by bits [4 – 3] of the port register control 0. The 802.1p and DiffServ-based priority can be mapped to priority 0 – 3 by default of the register 128 and 129. In the ingress rate limit, set register 135 global control 19 bit3 for queue-based rate limit to be enabled if use two queues or four queues mode, all related ingress ports and egress port should be spitted to two queues or four queues mode by the port registers control 9 and control 0. The four queues mode will use Q0-Q3 for priority 0-3 by bit [6-0] of the port register ingress limit control 1 – 4. The two queues mode will use Q0-Q1 for priority 0-1by bit [6-0] of the port register ingress limit control 1 – 2. The priority levels in the packets of the 802.1p and DiffServ can be programmed to priority 0-3 by the register 128 and 129 for a re-mapping.

Egress Rate Limit

For egress rate limiting, the Leaky Bucket algorithm is applied to each output priority queue for shaping output traffic. Inter frame gap is stretched on a per frame base to generate smooth, non-burst egress traffic. The throughput of each output priority queue is limited by the egress rate specified by the data rate selection table followed the egress rate limit control registers.

If any egress queue receives more traffic than the specified egress rate throughput, packets may be accumulated in the output queue and packet memory. After the memory of the queue or the port is used up, packet dropping or flow control will be triggered. As a result of congestion, the actual egress rate may be dominated by flow control/dropping at the ingress end, and may be therefore slightly less than the specified egress rate. The egress rate limiting supports the port-based, 802.1p and DiffServ-based priorities, the port-based priority is fixed priority 0 – 3 selection by bits [4 – 3] of the port register control 0. The 802.1p and DiffServ-based priority can be mapped to priority 0 – 3 by default of the register 128 and 129. In the egress rate limit, set register 135 global control 19 bit3 for queue-based rate limit to be enabled if use two queues or four queues mode, all related ingress ports and egress port should be spitted to two queues or four queues mode by the port registers control 9 and control 0. The four queues mode will use Q0-Q3 for priority 0 – 3 by bit [6 – 0] of the port register egress limit control 1 – 4. The two queues mode will use Q0 – Q1 for priority 0 – 1by bit [6 – 0] of the port register egress limit control 1 – 2.

The priority levels in the packets of the 802.1p and DiffServ can be programmed to priority 0 – 3 by the register 128 and 129 for a re-mapping.

When egress rate limit just use one queue per port for the egress port rate limit, the priority packets will be based on the data rate selection table with the rate limit exact number. If egress rate limit use more than one queue per port for the egress port rate limit, the highest priority packets will be based on the data rate selection table for the rate limit exact number, other lower priority packet rate will be limited based on 8:4:2:1 (default) priority ratio based on the highest priority rate. The transmit queue priority ratio is programmable.

To reduce congestion, it is a good practice to make sure the egress bandwidth exceeds the ingress bandwidth.

Transmit Queue Ratio Programming

In transmit queues 0 – 3 of the egress port, the default priority ratio is 8:4:2:1, the priority ratio can be programmed by the port registers control 10, 11, 12 and 13. When the transmit rate exceed the ratio limit in the transmit queue, the transmit rate will be limited by the transmit queue 0 – 3 ratio of the port register control 10, 11, 12 and 13. The highest priority queue will be no limited, other lower priority queues will be limited based on the transmit queue ratio.

Filtering for Self-Address, Unknown Unicast/Multicast Address and Unknown VID Packet/IP Multicast

Enable Self-address filtering, the unknown unicast packet filtering and forwarding by the Register 131 Global Control 15.

Enable Unknown multicast packet filtering and forwarding by the Register 132 Global Control 16.

Enable Unknown VID packet filtering and forwarding by the Register 133 Global Control 17.

Enable Unknown IP multicast packet filtering and forwarding by the Register 134 Global Control 18.

This function is very useful in preventing those kinds of packets that could degrade the quality of the port in applications such as voice over Internet Protocol (VoIP) and the daisy chain connection to prevent packets into endless loop.

Configuration Interface

I²C Master Serial Bus Configuration

If a 2-wire EEPROM exists, the KSZ8895MLU can perform more advanced features like broadcast storm protection and rate control. The EEPROM should have the entire valid configuration data from Register 0 to Register 255 defined in the “Memory Map,” except the status registers. After reset, the KSZ8895MLU will start to read all 255 registers sequentially from the EEPROM. The configuration access time (t_{prgm}) is less than 30ms as shown in Figure 12.

Figure 8. KSZ8895MLU EEPROM Configuration Timing Diagram

To configure the KSZ8895MLU with a pre-configured EEPROM use the following steps:

1. At the board level, connect pin 110 on the KSZ8895MLU to the SCL pin on the EEPROM. Connect pin 111 on the KSZ8895MLU to the SDA pin on the EEPROM.
2. Set the input signals PS[1:0] (pins 113 and 114, respectively) to "00." This puts the KSZ8895MLU serial bus configuration into I2C master mode.
3. Be sure the board-level reset signal is connected to the KSZ8895MLU reset signal on pin 115 (RST_N).
4. Program the contents of the EEPROM before placing it on the board with the desired configuration data. Note that the first byte in the EEPROM must be "95" and second byte of chip ID must be "00" for the loading to occur properly. If this value is not correct, all other data will be ignored.
5. Place EEPROM on the board and power up the board. Assert the active-low board level reset to RST_N on the KSZ8895MLU. After the reset is de-asserted, the KSZ8895MLU will begin reading configuration data from the EEPROM. The configuration access time (tprgm) is less than 30ms.

Note: For proper operation, make sure that pin 47 (PWRDN_N) is not asserted during the reset operation.

SPI Slave Serial Bus Configuration

The KSZ8895MLU can also act as an SPI slave device. Through the SPI, the entire feature set can be enabled, including "VLAN," "IGMP snooping," "MIB counters," etc. The external master device can access any register from Register 0 to Register 127 randomly. The system should configure all the desired settings before enabling the switch in the KSZ8895MLU. To enable the switch, write a "1" to Register 1 bit 0.

Two standard SPI commands are supported (00000011 for "READ DATA," and 00000010 for "WRITE DATA"). To speed configuration time, the KSZ8895MLU also supports multiple reads or writes. After a byte is written to or read from the KSZ8895MLU, the internal address counter automatically increments if the SPI Slave Select Signal (SPIS_N) continues to be driven low. If SPIS_N is kept low after the first byte is read, the next byte at the next address will be shifted out on SPIQ. If SPIS_N is kept low after the first byte is written, bits on the Master Out Slave Input (SPID) line will be written to the next address. Asserting SPIS_N high terminates a read or write operation. This means that the SPIS_N signal must be asserted high and then low again before issuing another command and address. The address counter wraps back to zero once it reaches the highest address. Therefore the entire register set can be written to or read from by issuing a single command and address.

The default SPI clock speed is 12.5MHz. The KSZ8895MLU is able to support a SPI bus up to 25MHz (set register 12 bit [5:4]=0x10). A high performance SPI master is recommended to prevent internal counter overflow.

To use the KSZ8895MLU SPI:

1. At the board level, connect KSZ8895MLU pins as noted in Table 8:

KSZ8895MLU Pin Number	KSZ8895MLU Signal Name	Microprocessor Signal Description
112	SPIS_N	SPI Slave Select
110	SPIC	SPI Clock
111	SPID	Master Out Slave Input
109	SPIQ	Master In Slave Output

Table 8. SPI Connections

2. Set the input signals PS[1:0] (pins 113 and 114, respectively) to “10” to set the serial configuration to SPI slave mode.
3. Power up the board and assert a reset signal. After reset wait 100 μ s, the start switch bit in Register 1 will be set to ‘0’. Configure the desired settings in the KSZ8895MLU before setting the start register to ‘1.’
4. Write configuration to registers using a typical SPI write data cycle as shown in Figure 9 or SPI multiple write as shown in Figure 11. Note that data input on SPID is registered on the rising edge of SPIC.
5. Registers can be read and configuration can be verified with a typical SPI read data cycle as shown in Figure 10 or a multiple read as shown in Figure 12. Note that read data is registered out of SPIQ on the falling edge of SPIC.
6. After configuration is written and verified, write a ‘1’ to Register 1 bit 0 to begin KSZ8895MLU switch operation.

Figure 9. SPI Write Data Cycle

Figure 10. SPI Read Data Cycle

Figure 11. SPI Multiple Write

Figure 12. SPI Multiple Read

MIIM Management Interface (MIIM)

The KSZ8895MLU supports the standard IEEE 802.3 MII Management Interface, also known as the Management Data Input/Output (MDIO) Interface. This interface allows upper-layer devices to monitor and control the states of the KSZ8895MLU. An external device with MDC/MDIO capability is used to read the PHY status or configure the PHY settings. Further detail on the MIIM interface is found in Clause 22.2.4.5 of the IEEE 802.3u Specification.

The MIIM interface consists of the following:

- A physical connection that incorporates the data line (pin 108 MDIO) and the clock line (pin 107 MDC).
- A specific protocol that operates across the aforementioned physical connection that allows an external controller to communicate with the KSZ8895MLU device.
- Access to a set of eight 16-bit registers, consisting of 8 standard MIIM registers [0:5h], 1d and 1f MIIM registers per port.

The MIIM Interface can operate up to a maximum clock speed of 10MHz MDC clock.

Table 9 depicts the MII Management Interface frame format.

	Preamble	Start of Frame	Read/Write OP Code	PHY Address Bits [4:0]	REG Address Bits [4:0]	TA	Data Bits [15:0]	Idle
Read	32 1's	01	10	AAAAA	RRRRR	Z0	DDDDDDDD_DDDDDDDD	Z
Write	32 1's	01	01	AAAAA	RRRRR	10	DDDDDDDD_DDDDDDDD	Z

Table 9. MII Management Interface Frame Format

The MIIM interface does not have access to all the configuration registers in the KSZ8895MLU. It can only access the standard MIIM registers. See “MIIM Registers”. The SPI interface and MDC/MDIO SMI mode, on the other hand, can be used to access the entire KSZ8895MLU feature set.

Serial Management Interface (SMI)

The SMI is the KSZ8895MLU non-standard MIIM interface that provides access to all KSZ8895MLU configuration registers. This interface allows an external device with MDC/MDIO interface to completely monitor and control the states of the KSZ8895MLU.

The SMI interface consists of the following:

A physical connection that incorporates the data line (MDIO) and the clock line (MDC).

A specific protocol that operates across the aforementioned physical connection that allows an external controller to communicate with the KSZ8895MLU device.

Access all KSZ8895MLU configuration registers. Register access includes the Global, Port and Advanced Control Registers 0 – 255 (0x00 – 0xFF), and indirect access to the standard MIIM registers [0:5] and custom MIIM registers [29, 31].

The SMI Interface can operate up to a maximum clock speed of 10MHz MDC clock.

Table 10 depicts the SMI frame format.

	Preamble	Start of Frame	Read/Write OP Code	PHY Address Bits [4:0]	REG Address Bits [4:0]	TA	Data Bits [15:0]	Idle
Read	32 1's	01	10	RR11R	RRRRR	Z0	0000_0000_DDDD_DDDD	Z
Write	32 1's	01	01	RR11R	RRRRR	10	xxxx_xxxx_DDDD_DDDD	Z

Table 10. Serial Management Interface (SMI) Frame Format

SMI register Read access is selected when OP Code is set to “10” and bits [2:1] of the PHY address is set to ‘11’. SMI register Write access is selected when OP Code is set to “01” and bits [2:1] of the PHY address is set to ‘11’. The 8-bit register address is the concatenation of {PHY address bits [4:3], PHY address bits [0], REG address bit[4:0]}. Since the switch configuration registers are 8-bit wide, only the lower 8 bits of Data Bits [15:0] are used.

To access the KSZ8895MLU registers 0-255 (0x00 – 0xFF), the following applies:

- PHYAD [4,3,0] and REGAD [4:0] are concatenated to form the 8-bit address; that is, {PHYAD[4,3,0], REGAD[4:0]} = bits [7:0] of the 8-bit address.
- Registers are 8 data bits wide. For read operation, data bits [15:8] are read back as 0's. For write operation, data bits [15:8] are not defined, and hence can be set to either 0's or 1's.

SMI register access is the same as the MIIM register access, except for the register access requirements presented in this section.

Register Description

Offset		Description
Decimal	Hex	
0 – 1	0x00-0x01	Chip ID Registers
2 – 13	0x02-0x0D	Global Control Registers
14 – 15	0x0E-0x0F	Power Down Management Control Registers
16 – 20	0x10-0x14	Port 1 Control Registers
21 – 23	0x15-0x17	Port 1 Reserved (Factory Test Registers)
24 – 31	0x18-0x1F	Port 1 Control/Status Registers
32 – 36	0x20-0x24	Port 2 Control Registers
37 – 39	0x25-0x27	Port 2 Reserved (Factory Test Registers)
40 – 47	0x28-0x2F	Port 2 Control/Status Registers
48 – 52	0x30-0x34	Port 3 Control Registers
53 – 55	0x35-0x37	Port 3 Reserved (Factory Test Registers)
56 – 63	0x38-0x3F	Port 3 Control/Status Registers
64 – 68	0x40-0x44	Port 4 Control Registers
69 – 71	0x45-0x47	Port 4 Reserved (Factory Test Registers)
72 – 79	0x48-0x4F	Port 4 Control/Status Registers
80 – 84	0x50-0x54	Port 5 Control Registers
85 – 87	0x55-0x57	Port 5 Reserved (Factory Test Registers)
88 – 95	0x58-0x5F	Port 5 Control/Status Registers
96 – 103	0x60-0x67	Reserved (Factory Testing Registers)
104 – 109	0x68-0x6D	MAC Address Registers
110 – 111	0x6E-0x6F	Indirect Access Control Registers
112 – 120	0x70-0x78	Indirect Data Registers
121 – 123	0x79-0x7B	Reserved (Factory Testing Registers)
124 – 125	0x7C-0x7D	Port Interrupt Registers
126 – 127	0x7E-0x7F	Reserved (Factory Testing Registers)
128 – 135	0x80-0x87	Global Control Registers
136	0x88	Switch Self Test Control Register
137 – 143	0x89-0x8F	QM Global Control Registers
144 – 145	0x90-0x91	TOS Priority Control Registers
146 – 159	0x92-0x9F	TOS Priority Control Registers
160 – 175	0xA0-0xAF	Reserved (Factory Testing Registers)
176 – 190	0xB0-0xBE	Port 1 Control Registers

Register Description (Continued)

Offset		Description
Decimal	Hex	
191	0xBF	Reserved (Factory Testing Register): Transmit Queue Remap Base Register
192 – 206	0xC0-0xCE	Port 2 Control Registers
207	0xCF	Reserved (Factory Testing Register)
208 – 222	0xD0-0xDE	Port 3 Control Registers
223	0xDF	Reserved (Factory Testing Register)
224 – 238	0xE0-0xEE	Port 4 Control Registers
239	0xEF	Reserved (Factory Testing Register)
240 – 254	0xF0-0xFE	Port 5 Control Registers
255	0xFF	Reserved (Factory Testing Register)

Global Registers

Register 0 (0x00): Chip ID0

Address	Name	Description	Mode	Default
7 – 0	Family ID	Chip family.	RO	0 × 95

Register 1 (0x01): Chip ID1 / Start Switch

Address	Name	Description	Mode	Default
7 – 4	Chip ID	Based on each part number in KSZ8895 family	RO	0 × 4
3 – 1	Revision ID	Revision ID	RO	0 × 0
0	Start Switch	<p>1, start the chip when external pins (PS1, PS0) = (01) or (1,0)</p> <p>Note: in (PS1, PS0) = (0,0) mode, the chip will start automatically, after trying to read the external EEPROM. If EEPROM does not exist, the chip will use default values for all internal registers. If EEPROM is present, the contents in the EEPROM will be checked.</p> <p>The switch will check:</p> <p>Register 0 = 0 × 95</p> <p>Register 1 [7:4] chip ID = 00</p> <p>If this check is OK, the contents in the EEPROM will override chip register default values.</p> <p>Chip will not start when external pins (PS1, PS0) = (1, 0) or (0, 1).</p> <p>Note: (PS1, PS0) = (1, 1) for Factory test only.</p> <p>0, stop the switch function of the chip.</p>	R/W	0

Register 2 (0x02): Global Control 0

Address	Name	Description	Mode	Default
7	New Back-off Enable	New back-off algorithm designed for UNH 1 = Enable 0 = Disable	R/W	0
6	Reserved	Reserved.	RO	0
5	Flush Dynamic MAC Table	<p>Flush the entire dynamic MAC table for RSTP</p> <p>1 = Trigger the flush dynamic MAC table operation. This bit is self clear.</p> <p>0 = Normal operation</p> <p>Note: All the entries associated with a port that has its learning capability being turned off (Learning Disable) will be flushed. If you want to flush the entire Table, all ports learning capability must be turned off.</p>	R/W (SC)	0

Global Registers (Continued)

Register 2 (0x02): Global Control 0

Address	Name	Description	Mode	Default
4	Flush Static MAC Table	<p>Flush the matched entries in static MAC table for RSTP</p> <p>1 = Trigger the flush static MAC table operation. This bit is self clear</p> <p>0 = Normal operation</p> <p>Note: The matched entry is defined as the entry whose Forwarding Ports field contains a single port and MAC address with unicast. This port, in turn, has its learning capability being turned off (Learning Disable). Per port, multiple entries can be qualified as matched entries.</p>	R/W (SC)	0
3	Reserved	N/A Don't change	RO	1
2	Reserved	N/A Don't change	RO	1
1	UNH Mode	<p>1, the switch will drop packets with 0x8808 in T/L filed, or DA = 01-80-C2-00-00-01.</p> <p>0, the switch will drop packets qualified as "flow control" packets.</p>	R/W	0
0	Link Change Age	<p>1, link change from "link" to "no link" will cause fast aging (<800μs) to age address table faster. After an age cycle is complete, the age logic will return to normal (300 ±75 seconds). Note: If any port is unplugged, all addresses will be automatically aged out.</p>	R/W	0

Register 3 (0x03): Global Control 1

Address	Name	Description	Mode	Default
7	Pass All Frames	1, switch all packets including bad ones. Used solely for debugging purpose. Works in conjunction with sniffer mode.	R/W	0
6	2K Byte Packet Support	<p>1 = Enable support 2K Byte packet</p> <p>0 = Disable support 2K Byte packet</p>	R/W	0
5	IEEE 802.3x Transmit Flow Control Disable	<p>0, will enable transmit flow control based on AN result.</p> <p>1, will not enable transmit flow control regardless of AN result.</p>	R/W	<p>0</p> <p>Pin PMRXD3 strap option.</p> <p>PD(0): Enable Tx flow control (default).</p> <p>PU(1): Disable Tx/Rx flow control.</p> <p>Note: SPFLC has internal pull-down.</p>

Global Registers (Continued)

Register 3 (0x03): Global Control 1

Address	Name	Description	Mode	Default
4	IEEE 802.3x Receive Flow Control Disable	0, will enable receive flow control based on AN result. 1, will not enable receive flow control regardless of AN result. Note: Bit 5 and bit 4 default values are controlled by the same pin, but they can be programmed independently.	R/W	0 Pin PMRXD3 strap option. PD (0): Enable Rx flow control (default). PU(1): Disable Tx/Rx flow control. Note: SPFLC has internal pull-down.
3	Frame Length Field Check	1, will check frame length field in the IEEE packets. If the actual length does not match, the packet will be dropped (for L/T <1500).	R/W	0
2	Aging Enable	1, enable age function in the chip. 0, disable aging function.	R/W	1 Pin LED[5][2] strap option. PD(0): Aging disable. PU(1): Aging enable (default). Note: LED[5][2] has internal pull up.
1	Fast Age Enable	1 = Turn on fast age (800μs).	R/W	0
0	Aggressive Back Off Enable	1 = Enable more aggressive back-off algorithm in half duplex mode to enhance performance. This is not an IEEE standard.	R/W	0 Pin PMRXD0 strap option. PD(0): Disable aggressive back off (default). PU(1): Aggressive back off. Note: SPPE has internal pull down.

Global Registers (Continued)

Register 4 (0x04): Global Control 2

Address	Name	Description	Mode	Default
7	Unicast Port-VLAN Mismatch Discard	This feature is used for port VLAN (described in Register 17, Register 33...). 1, all packets can not cross VLAN boundary. 0, unicast packets (excluding unknown/multicast/broadcast) can cross VLAN boundary.	R/W	1
6	Multicast Storm Protection Disable	1, "Broadcast Storm Protection" does not include multicast packets. Only DA=FFFFFFFFFFFF packets will be regulated. 0, "Broadcast Storm Protection" includes DA = FFFFFFFFFFFFF and DA[40] = 1 packets.	R/W	1
5	Back Pressure Mode	1, carrier sense based backpressure is selected. 0, collision based backpressure is selected.	R/W	1
4	Flow Control and Back Pressure fair Mode	1, fair mode is selected. In this mode, if a flow control port and a non-flow control port talk to the same destination port, packets from the non-flow control port may be dropped. This is to prevent the flow control port from being flow controlled for an extended period of time. 0, in this mode, if a flow control port and a non-flow control port talk to the same destination port, the flow control port will be flow controlled. This may not be "fair" to the flow control port.	R/W	1
3	No Excessive Collision Drop	1, the switch will not drop packets when 16 or more collisions occur. 0, the switch will drop packets when 16 or more collisions occur.	R/W	0 Pin PMRXD1 strap option. PD(0): (default) Drop excessive collision packets. PU(1): Don't drop excessive collision packets. Note: SPDECP has internal pull down.
2	Huge Packet Support	1, will accept packet sizes up to 1916 bytes (inclusive). This bit setting will override setting from bit 1 of the same register. 0, the maximum packet size will be determined by bit 1 of this register.	R/W	0

Global Registers (Continued)

Register 4 (0x04): Global Control 2

Address	Name	Description	Mode	Default
1	Legal Maximum Packet Size Check Disable	1, will accept packet sizes up to 1536 bytes (inclusive). 0, 1522 bytes for tagged packets (not including packets with STPID from CPU to ports 1-4), 1518 bytes for untagged packets. Any packets larger than the specified value will be dropped.	R/W	0 Pin PMRXER strap option. PD(0): (default) 1518/1522 byte packets. PU(1): 1536 byte packets. Note: SPPSZ has internal pull-down.
0	Reserved	N/A	RO	0

Register 5 (0x05): Global Control 3

Address	Name	Description	Mode	Default
7	802.1q VLAN Enable	1, 802.1q VLAN mode is turned on. VLAN table needs to set up before the operation. 0, 802.1q VLAN is disabled.	R/W	0
6	IGMP Snoop Enable on Switch SW5-MII Interface	1, IGMP snoop enabled. All the IGMP packets will be forwarded to Switch MII port. 0, IGMP snoop disabled.	R/W	0
5	Enable Direct Mode on Switch SW5-MII Interface	1, direct mode on port 5. This is a special mode for the Switch MII interface. Using preamble before MRXDV to direct switch to forward packets, bypassing internal look-up. 0, normal operation.	R/W	0
4	Enable Pre-Tag on Switch SW5-MII Interface	1, packets forwarded to Switch MII interface will be pre-tagged with the source port number (preamble before MRXDV). 0, normal operation.	R/W	0
3 – 2	Reserved	N/A	RO	00
1	Enable "Tag" Mask	1, the last 5 digits in the VID field are used as a mask to determine which port(s) the packet should be forwarded to. 0, no tag masks. Note: Turn off the 802.1q VLAN mode (reg0x5, bit 7 = 0) for this bit to work.	R/W	0
0	Sniff Mode Select	1, will do Rx AND Tx sniff (both source port and destination port need to match). 0, will do Rx OR Tx sniff (Either source port or destination port needs to match). This is the mode used to implement Rx only sniff.	R/W	0

Global Registers (Continued)

Register 6 (0x07): Global Control 4

Address	Name	Description	Mode	Default
7	Switch SW5-MII Back Pressure Enable	1, enable half-duplex back pressure on switch MII interface. 0, disable back pressure on switch MII interface.	R/W	0
6	Switch SW5-MII Half-Duplex Mode	1, enable MII interface half-duplex mode. 0, enable MII interface full-duplex mode.	R/W	Pin SMRXD2 strap option. PD(0): (default) Full-duplex mode. PU(1): Half-duplex mode. Note: SMRXD2 has internal pull-down.
5	Switch SW5-MII Flow Control Enable	1, enable full-duplex flow control on switch MII interface. 0, disable full-duplex flow control on switch MII interface.	R/W	Pin SMRXD3 strap option. PD(0): (default) Disable flow control. PU(1): enable flow control. Note: SMRXD3 has internal pull-down.
4	Switch SW5-MII Speed	1, the switch SW5-MII is in 10Mbps mode. 0, the switch SW5-MII is in 100Mbps mode.	R/W	Pin SMRXD1 strap option. PD(0): (default) Enable 100Mbps. PU(1): Enable 10Mbps. Note: SMRXD1 has internal pull-down.
3	Null VID Replacement	1, will replace null VID with port VID (12 bits). 0, no replacement for null VID.	R/W	0
2 – 0	Broadcast Storm Protection Rate Bit [10:8]	This along with the next register determines how many “64 byte blocks” of packet data allowed on an input port in a preset period. The period is 50ms for 100BT or 500ms for 10BT. The default is 1%.	R/W	000

Global Registers (Continued)

Register 7 (0x07): Global Control 5

Address	Name	Description	Mode	Default
7 – 0	Broadcast Storm Protection Rate Bit [7:0]	This along with the previous register determines how many “64 byte blocks” of packet data are allowed on an input port in a preset period. The period is 50ms for 100BT or 500ms for 10BT. The default is 1%.	R/W	0x4A ⁽¹⁾

Note:

1. $148,800 \text{ frames/sec} \times 1\% = 74 \text{ frames/interval (approx.)} = 0 \times 4A$.

Register 8 (0x08): Global Control 6

Address	Name	Description	Mode	Default
7 – 0	Factory Testing	Reserved	R/W	0 × 24

PD(0): Select Energy detection mode PU(1): (default) Normal mode Note: LED[4][0] has internal pull-up.

Register 14 (0x0E): Power-Down Management Control 1

Address	Name	Description	Mode	Default
2 – 1	Reserved	N/A Don't change	R/W	00
0	Reserved	N/A Don't change	RO	0

Register 15 (0x0F): Power-Down Management Control 2

Address	Name	Description	Mode	Default
7 - 0	Go_sleep_time[7:0]	When the Energy Detect mode is on, this value is used to control the minimum period that the no energy event has to be detected consecutively before the device enters the low power state. The unit is 20 ms. The default of go_sleep time is 1.6 seconds (80Dec x 20ms).	R/W	01010000

Port Registers

The following registers are used to enable features that are assigned on a per port basis. The register bit assignments are the same for all ports, but the address for each port is different, as indicated:

Register 16 (0x10): Port 1 Control 0

Register 32 (0x20): Port 2 Control 0

Register 48 (0x30): Port 3 Control 0

Register 64 (0x40): Port 4 Control 0

Register 80 (0x50): Port 5 Control 0

Address	Name	Description	Mode	Default
7	Broadcast Storm Protection Enable	1, enable broadcast storm protection for ingress packets on the port. 0, disable broadcast storm protection.	R/W	0
6	DiffServ Priority Classification Enable	1, enable DiffServ priority classification for ingress packets on port. 0, disable DiffServ function.	R/W	0
5	802.1p Priority Classification Enable	1, enable 802.1p priority classification for ingress packets on port. 0, disable 802.1p.	R/W	0
4 – 3	Port-Based Priority Classification Enable	= 00, ingress packets on port will be classified as priority 0 queue if “Diffserv” or “802.1p” classification is not enabled or fails to classify. = 01, ingress packets on port will be classified as priority 1 queue if “Diffserv” or “802.1p” classification is not enabled or fails to classify. = 10, ingress packets on port will be classified as priority 2 queue if “Diffserv” or “802.1p” classification is not enabled or fails to classify. = 11, ingress packets on port will be classified as priority 3 queue if “Diffserv” or “802.1p” classification is not enabled or fails to classify. Note: “DiffServ”, “802.1p” and port priority can be enabled at the same time. The OR’d result of 802.1p and DSCP overwrites the port priority.	R/W	00
2	Tag Insertion	1, when packets are output on the port, the switch will add 802.1q tags to packets without 802.1q tags when received. The switch will not add tags to packets already tagged. The tag inserted is the ingress port’s “port VID.” 0, disable tag insertion.	R/W	0
1	Tag Removal	1, when packets are output on the port, the switch will remove 802.1q tags from packets with 802.1q tags when received. The switch will not modify packets received without tags. 0, disable tag removal.	R/W	0

3	Force Link	1, force link in the PHY. 0, normal operation	R/W	0
2 – 0	Port Operation Mode Indication	Indicate the current state of port operation mode: [000] = Reserved [001] = Still in auto-negotiation [010] = 10BASE-T half duplex [011] = 100BASE-TX/FX half duplex [100] = Reserved [101] = 10BASE-T full duplex [110] = 100BASE-TX/FX full duplex [111] = Reserved	RO	000

Note:

Port Control 12 and 13, 14 and Port Status 1, 2 contents can be accessed by MIIM (MDC/MDIO) interface via the standard MIIM register definition.

Advanced Control Registers

Registers 104 to 109 define the switching engine's MAC address. This 48-bit address is used as the source address in MAC pause control frames.

Register 104 (0x68): MAC Address Register 0

Address	Name	Description	Mode	Default
7 – 0	MACA[47:40]		R/W	0x00

Register 105 (0x69): MAC Address Register 1

Address	Name	Description	Mode	Default
7 – 0	MACA[39:32]		R/W	0x10

Register 106 (0x6A): MAC Address Register 2

Address	Name	Description	Mode	Default
7 – 0	MACA[31:24]		R/W	0xA1

Register 107 (0x6B): MAC Address Register 3

Address	Name	Description	Mode	Default
7 – 0	MACA[23:16]		R/W	0xff

Register 108 (0x6C): MAC Address Register 4

Address	Name	Description	Mode	Default
7 – 0	MACA[15:8]		R/W	0xff

Register 109 (0x6D): MAC Address Register 5

Address	Name	Description	Mode	Default
7 – 0	MACA[7:0]		R/W	0xff

Advanced Control Registers (Continued)

Use registers 110 and 111 to read or write data to the static MAC address table, VLAN table, dynamic address table, or the MIB counters.

Register 110 (0x6E): Indirect Access Control 0

Address	Name	Description	Mode	Default
7 – 5	Reserved	Reserved.	R/W	000
4	Read High Write Low	1, read cycle. 0, write cycle.	R/W	0
3 – 2	Table Select	00 = Static MAC address table selected. 01 = VLAN table selected. 10 = Dynamic address table selected. 11 = MIB counter selected.	R/W	0
1 – 0	Indirect Address High	Bit 9 – 8 of indirect address.	R/W	00

Register 111 (0x6F): Indirect Access Control 1

Address	Name	Description	Mode	Default
7 – 0	Indirect Address Low	Bit 7 – 0 of indirect address.	R/W	00000000

Note:

Write to Register 111 will actually trigger a command. Read or write access will be decided by bit 4 of Register 110.

Register 112 (0x70): Indirect Data Register 8

Address	Name	Description	Mode	Default
68 – 64	Indirect Data	Bit 68 – 64 of indirect data.	R/W	00000

Register 113 (0x71): Indirect Data Register 7

Address	Name	Description	Mode	Default
63 – 56	Indirect Data	Bit 63 – 56 of indirect data.	R/W	00000000

Register 114 (0x72): Indirect Data Register 6

Address	Name	Description	Mode	Default
55 – 48	Indirect Data	Bit 55 – 48 of indirect data.	R/W	00000000

Register 115 (0x73): Indirect Data Register 5

Address	Name	Description	Mode	Default
47 – 40	Indirect Data	Bit 47 – 40 of indirect data.	R/W	00000000

Register 116 (0x74): Indirect Data Register 4

Address	Name	Description	Mode	Default
39 – 32	Indirect Data	Bit 39 – 32 of indirect data.	R/W	00000000

Advanced Control Registers (Continued)

Use registers 110 and 111 to read or write data to the static MAC address table, VLAN table, dynamic address table, or the MIB counters.

Register 117 (0x75): Indirect Data Register 3

Address	Name	Description	Mode	Default
31 – 24	Indirect Data	Bit of 31 – 24 of indirect data	R/W	00000000

Register 118 (0x76): Indirect Data Register 2

Address	Name	Description	Mode	Default
23 – 16	Indirect Data	Bit 23 – 16 of indirect data.	R/W	00000000

Register 119 (0x77): Indirect Data Register 1

Address	Name	Description	Mode	Default
15 – 8	Indirect Data	Bit 15 – 8 of indirect data.	R/W	00000000

Register 120 (0x78): Indirect Data Register 0

Address	Name	Description	Mode	Default
7 – 0	Indirect Data	Bit 7 – 0 of indirect data.	R/W	00000000

Register 124 (0x7C): Interrupt Status Register

Address	Name	Description	Mode	Default
7 – 5	Reserved	Reserved	RO	000
4	Reserved	Reserved	RO	0
3	Port 4 Interrupt Status	1, Port 4 interrupt request 0, normal Note: This bit is set by port 4 link change. Write a “1” to clear this bit	RO	0
2	Port 3 Interrupt Status	1, Port 3 interrupt request 0, normal Note: This bit is set by port 3 link change. Write a “1” to clear this bit	RO	0
1	Port 2 Interrupt Status	1, Port 2 interrupt request 0, normal Note: This bit is set by port 2 link change. Write a “1” to clear this bit	RO	0
0	Port 1 Interrupt Status	1, Port 1 interrupt request 0, normal Note: This bit is set by port 1 link change. Write a “1” to clear this bit	RO	0

Advanced Control Registers (Continued)

Use registers 110 and 111 to read or write data to the static MAC address table, VLAN table, dynamic address table, or the MIB counters.

Register 125 (0x7D): Interrupt Mask Register

Address	Name	Description	Mode	Default
7 – 5	Reserved	Reserved.	RO	000
4	Reserved	Reserved	RO	0
3	Port 4 Interrupt Mask	1, Port 4 interrupt mask 0, normal	R/W	0
2	Port 3 Interrupt Mask	1, Port 3 interrupt mask 0, normal	R/W	0
1	Port 2 Interrupt Mask	1, Port 2 interrupt mask 0, normal	R/W	0
0	Port 1 Interrupt Mask	1, Port 1 interrupt mask 0, normal	R/W	0

The registers 128, 129 can be used to map from 802.1p priority field 0-7 to switch's four priority queues 0-3, 0x3 is highest priority queues as priority 3, 0x0 is lowest priority queues as priority 0.

Register 128 (0x80): Global Control 12

Address	Name	Description	Mode	Default
7 - 6	Tag_0x3	IEEE 802.1p mapping. The value in this field is used as the frame's priority when its IEEE 802.1p tag has a value of 0x3	R/W	0x1
5 - 4	Tag_0x2	IEEE 802.1p mapping. The value in this field is used as the frame's priority when its IEEE 802.1p tag has a value of 0x2	R/W	0x1
3 - 2	Tag_0x1	IEEE 802.1p mapping. The value in this field is used as the frame's priority when its IEEE 802.1p tag has a value of 0x1	R/W	0x0
1 - 0	Tag_0x0	IEEE 802.1p mapping. The value in this field is used as the frame's priority when its IEEE 802.1p tag has a value of 0x0	R/W	0x0

Register 129 (0x81): Global Control 13

Address	Name	Description	Mode	Default
7 - 6	Tag_0x7	IEEE 802.1p mapping. The value in this field is used as the frame's priority when its IEEE 802.1p tag has a value of 0x7	R/W	0x3
5 - 4	Tag_0x6	IEEE 802.1p mapping. The value in this field is used as the frame's priority when its IEEE 802.1p tag has a value of 0x6	R/W	0x3
3 - 2	Tag_0x5	IEEE 802.1p mapping. The value in this field is used as the frame's priority when its IEEE 802.1p tag has a value of 0x5	R/W	0x2
1 - 0	Tag_0x4	IEEE 802.1p mapping. The value in this field is used as the frame's priority when its IEEE 802.1p tag has a value of 0x4	R/W	0x2

Advanced Control Registers (Continued)

Register 130 (0x82): Global Control 14

Address	Name	Description	Mode	Default
7 – 6	Pri_2Q[1:0] (Note that program Prio_2Q[1:0] = 01 is not supported and should be avoided)	<p>When the 2 Queue configuration is selected, these Pri_2Q[1:0] bits are used to map the 2-bit result of IEEE 802.1p from register 128/129 or TOS/DiffServ from register 144- 159 mapping (for 4 Queues) into two queues low/high priorities.</p> <p>2-bit result of IEEE 802.1p or TOS/DiffServ 00 (0) = map to Low priority queue 01 (1) = Prio_2Q[0] map to Low/High priority queue 10 (2) = Prio_2Q[1] map to Low/High priority queue 11 (3) = map to High priority queue</p> <p>Pri_2Q[1:0] = 00: Result 0, 1, 2 are low priority. 3 is high priority. 10: Result 0, 1 are low priority. 2, 3 are high priority (default). 11: Result 0 is low priority. 1, 2, 3 are high priority.</p>	R/W	10

Advanced Control Registers (Continued)

Register 144 (0x90): TOS Priority Control Register 0

The IPv4/IPv6 TOS priority control registers implement a fully decoded 64 bit differentiated services code point (DSCP) register used to determine priority from the 6 bit TOS field in the IP header. The most significant 6 bits of the TOS field are fully decoded into 64 possibilities, and the singular code that results is mapped to the value in the corresponding bit in the DSCP register.

Address	Name	Description	Mode	Default
7 – 6	DSCP[7:6]	IPv4 and IPv6 mapping The value in this field is used as the frame's priority when bits[7:2] of the frame's IP TOS/DiffServ/Traffic Class value is 0x0C	R/W	00
5 – 4	DSCP[5:4]	IPv4 and IPv6 mapping The value in this field is used as the frame's priority when bits[7:2] of the frame's IP TOS/DiffServ/Traffic Class value is 0x08	R/W	00
3 – 2	DSCP[3:2]	IPv4 and IPv6 mapping The value in this field is used as the frame's priority when bits[7:2] of the frame's IP TOS/DiffServ/Traffic Class value is 0x04	R/W	00
1 – 0	DSCP[1:0]	IPv4 and IPv6 mapping The value in this field is used as the frame's priority when bits[7:2] of the frame's IP TOS/DiffServ/Traffic Class value is 0x00	R/W	00

Static MAC Address Table

KSZ8895MLU has a static and a dynamic address table. When a DA look-up is requested, both tables will be searched to make a packet forwarding decision. When an SA look-up is requested, only the dynamic table is searched for aging, migration, and learning purposes. The static DA look-up result will have precedence over the dynamic DA look-up result. If there are DA matches in both tables, the result from the static table will be used. The static table can only be accessed and controlled by an external SPI master (usually a processor). The entries in the static table will not be aged out by KSZ8895MLU. An external device does all addition, modification and deletion. Register bit assignments are different for static MAC table reads and static MAC table write, as shown in Table 11 and Table 12.

Address	Name	Description	Mode	Default
63 – 57	FID	Filter VLAN ID, representing one of the 128 active VLANs	RO	0000000
56	Use FID	1, use (FID+MAC) to look-up in static table. 0, use MAC only to look-up in static table.	RO	0
55	Reserved	Reserved.	RO	N/A
54	Override	1, override spanning tree “transmit enable = 0” or “receive enable = 0” setting. This bit is used for spanning tree implementation. 0, no override.	RO	0
53	Valid	1, this entry is valid, the look-up result will be used. 0, this entry is not valid.	RO	0
52 – 48	Forwarding Ports	The 5 bits control the forward ports, example: 00001, forward to port 1 00010, forward to port 2 10000, forward to port 5 00110, forward to port 2 and port 3 11111, broadcasting (excluding the ingress port)	RO	00000
47 – 0	MAC Address	48-bit MAC address.	RO	0x0

Table 11. Format of Static MAC Table for Read (32 Entries)

Examples:

(1) Static Address Table Read (read the 2nd entry)

Write to Register 110 with 0x10 (read static table selected)

Write to Register 111 with 0x1 (trigger the read operation)

Then

Read Register 113 (63 – 56)

Read Register 114 (55 – 48)

Read Register 115 (47 – 40)

Read Register 116 (39 – 32)

Read Register 117 (31 – 24)

Read Register 118 (23 – 16)

Read Register 119 (15 – 8)

Read Register 120 (7 – 0)

Address	Name	Description	Mode	Default
62 – 56	FID	Filter VLAN ID, representing one of the 128 active VLANs.	W	0000000
55	Use FID	1, use (FID+MAC) to look-up in static table. 0, use MAC only to look-up in static table.	W	0
54	Override	1, override spanning tree “transmit enable = 0” or “receive enable = 0” setting. This bit is used for spanning tree implementation. 0, no override.	W	0
53	Valid	1, this entry is valid, the look-up result will be used. 0, this entry is not valid.	W	0
52 – 48	Forwarding Ports	The 5 bits control the forward ports, example: 00001, forward to port 1 00010, forward to port 2 10000, forward to port 5 00110, forward to port 2 and port 3 11111, broadcasting (excluding the ingress port)	W	00000
47 – 0	MAC Address	48-bit MAC address.	W	0x0

Table 12. Format of Static MAC Table for Writes (32 Entries)

Examples:**(2) Static Address Table Write (write the 8th entry)**

Write to Register 110 with 0x10 (read static table selected)
 Write Register 113 (62 – 56)
 Write Register 114 (55 – 48)
 Write Register 115 (47 – 40)
 Write Register 116 (39 – 32)
 Write Register 117 (31 – 24)
 Write Register 118 (23 – 16)
 Write Register 119 (15 – 8)
 Write Register 120 (7 – 0)
 Write to Register 110 with 0x00 (write static table selected)
 Write to Register 111 with 0x7 (trigger the write operation)

VLAN Table

The VLAN table is used for VLAN table look-up. If 802.1q VLAN mode is enabled (Register 5 bit 7 = 1), this table is used to retrieve VLAN information that is associated with the ingress packet. The fields includes FID (filter ID), Valid and VLAN membership need initialization, due to provide 4K spacing for the VLAN table, there is no VID field bits, VID is used as address index to input up to 4096 entries with bits [12:0] information.

Address	Name	Description	Mode	Initial Value suggestion
12	Valid	1, the entry is valid. 0, entry is invalid.	R/W	0
11 – 7	Membership	Specify which ports are members of the VLAN. If a DA look-up fails (no match in both static and dynamic tables), the packet associated with this VLAN will be forwarded to ports specified in this field. E.g., 11001 means port 5, port 4 and port 1.	R/W	11111
6 – 0	FID	Filter ID. KSZ8895MLU supports 128 active VLANs represented by these seven bit fields. FID is the mapped ID. If 802.1q VLAN is enabled, the look-up in MAC table will be based on FID+DA and FID+SA.	R/W	0

Table 13. Format of Static VLAN Table (Support Max 4096 VLAN ID Entries and 128 Active VLANs)

If 802.1q VLAN mode is enabled, KSZ8895MLU assigns a VID to every ingress packet when the packet is untagged or tagged with a null VID, the packet is assigned with the default port VID of the ingress port. If the packet is tagged with non-null VID, the VID in the tag is used. The look-up process starts from the VLAN table look-up based on VID number. If the entry is not valid in VLAN table, the packet is dropped and no address learning occurs. If the entry is valid, the FID is retrieved. The FID+DA and FID+SA lookups in MAC tables are performed. The FID+DA look-up determines the forwarding ports. If FID+DA fails for look-up in MAC table, the packet is broadcast to all the members or specified members (excluding the ingress port) based on the VLAN table. If FID+SA fails, the FID+SA is learned. If want to communicate between different active VLANs, set same FID, otherwise set different FID.

The VLAN table configuration is organized as 1024 VLAN sets, each VLAN set consists of 4 VLAN entries, to support up to 4096 VLAN entries. Each VLAN set has 52 bits and should be read or written at the same time specified by the indirect address.

The VLAN entries in the VLAN set is mapped to indirect data registers as follow:

Entry0[12:0] maps to the VLAN set bits[12 – 0] {register119[4:0], register120[7:0]}

Entry1[12:0] maps to the VLAN set bits[25 – 13] {register117[1:0], register118[7:0], register119[7:5]}

Entry2[12:0] maps to the VLAN set bits[38 – 26] {register116[6:0], register117[7:2]}

Entry3[12:0] maps to the VLAN set bits[51 – 39] {register114[3:0], register115[7:0], register116[7]}

In order to read one VLAN entry, the VLAN set is read first and the specific VLAN entry information can be extracted. To update any VLAN entry, the VLAN set is read first then only the desired VLAN entry is updated and the whole VLAN set is written back. Due to FID in VLAN table is 7-bit, so the VLAN table supports unique 128 flow VLAN groups. Each VLAN set address is 10 bits long (Maximum is 1024) in the indirect address register 110 and 111, the bit [9 – 8] of VLAN set address is at bit [1 – 0] of register 110, and the bit [7 – 0] of VLAN set address is at bit [7-0] of register 111. Each Write and Read can access to four consecutive VLAN entries.

Examples:

(1) VLAN Table Read (read the VID=2 entry)

Write the indirect control and address registers first

Write to Register 110 (0x6E) with 0x14 (read VLAN table selected)

Write to Register 111 (0x6F) with 0x0 (trigger the read operation for VID=0, 1, 2, 3 entries)

Then read the indirect data registers bits [38-26] for VID=2 entry

Read Register 116 (0x74), (register116[6:0] are bits 12 – 6 of VLAN VID=2 entry)

Read Register 117 (0x75), (register117[7:2] are bits 5 – 0 of VLAN VID=2 entry)

(2) VLAN Table Write (write the VID=10 entry)

Read the VLAN set that contains VID=8, 9, 10, 11.

Write to Register 110 (0x6E) with 0x14 (read VLAN table selected)

Write to Register 111 (0x6F) with 0x02 (trigger the read operation and VID=8, 9, 10, 11 indirect address)

Read the VLAN set first by the indirect data registers 114, 115, 116, 117, 118, 119, 120.

Modify the indirect data registers bits [38 – 26] by the register 116 bit [6-0] and register 117 bit [7 – 2] as follows:

Write to Register 116 (0x74), (register116[6:0] are bits 12 – 6 of VLAN VID=10 entry)

Write to Register 117 (0x75), (register117[7:2] are bits 5 – 0 of VLAN VID=10 entry)

Then write the indirect control and address registers

Write to Register 110 (0x6E) with 0x04 (write VLAN table selected)

Write to Register 111 (0x6F) with 0x02 (trigger the write operation and VID=8, 9, 10, 11 indirect address)

Table 14 shows the relationship of the indirect address/data registers and VLAN ID.

Indirect Address High/Low Bit[9-0] for VLAN Sets	Indirect Data Registers Bits for Each VLAN Entry	VID Numbers	VID bit[12-2] in VLAN Tag	VID bit[1-0] in VLAN Tag
0	Bits[12 – 0]	0	0	0
0	Bits[25 – 13]	1	0	1
0	Bits[38 – 26]	2	0	2
0	Bits[51 – 39]	3	0	3
1	Bits[12 – 0]	4	1	0
1	Bits[25 – 13]	5	1	1
1	Bits[38 – 26]	6	1	2
1	Bits[51 – 39]	7	1	3
2	Bits[12 – 0]	8	2	0
2	Bits[25 – 13]	9	2	1
2	Bits[38 – 26]	10	2	2
2	Bits[51 – 39]	11	2	3
:	:	:	:	:
:	:	:	:	:
:	:	:	:	:
1023	Bits[12 – 0]	4092	1023	0
1023	Bits[25 – 13]	4093	1023	1
1023	Bits[38 – 26]	4094	1023	2
1023	Bits[51 – 39]	4095	1023	3

Table 14. VLAN ID and Indirect Registers

Dynamic MAC Address Table

Table 15 is read only. The contents are maintained by the KSZ8895MLU only.

Address	Name	Description	Mode	Default
71	MAC Empty	1, there is no valid entry in the table. 0, there are valid entries in the table.	RO	1
70 – 61	No of Valid Entries	Indicates how many valid entries in the table. 0x3ff means 1K entries 0x1 and bit 71 = 0: means 2 entries 0x0 and bit 71 = 0: means 1 entry 0x0 and bit 71 = 1: means 0 entry	RO	0
60 – 59	Time Stamp	2-bit counters for internal aging	RO	
58 – 56	Source Port	The source port where FID+MAC is learned. 000 Port 1 001 Port 2 010 Port 3 011 Port 4 100 Port 5	RO	0x0
55	Data Ready	1, The entry is not ready, retry until this bit is set to 0. 0, The entry is ready.	RO	
54 – 48	FID	Filter ID.	RO	0x0
47 – 0	MAC Address	48-bit MAC address.	RO	0x0

Table 15. Format of Dynamic MAC Address Table (1K Entries)

Dynamic MAC Address Table Read/Write Examples:

(1) Dynamic MAC Address Table Read (read the 1st entry), and retrieve the MAC table size:

Write to Register 110 with 0x18 (read dynamic table selected)

Write to Register 111 with 0x0 (trigger the read operation) and then

Read Register 112 (71 – 64)

Read Register 113 (63 – 56); // the above two registers show # of entries

Read Register 114 (55 – 48) // if bit 55 is 1, restart (reread) from this register

Read Register 115 (47 – 40)

Read Register 116 (39 – 32)

Read Register 117 (31 – 24)

Read Register 118 (23 – 16)

Read Register 119 (15 – 8)

Read Register 120 (7 – 0)

(2) Dynamic MAC Address Table Read (read the 257th entry), without retrieving # of entries information:

Write to Register 110 with 0x19 (read dynamic table selected)

Write to Register 111 with 0x1 (trigger the read operation) and then

Read Register 112 (71 – 64)

Read Register 113 (63 – 56)

Read Register 114 (55 – 48) // if bit 55 is 1, restart (reread) from this register

Read Register 115 (47 – 40)

Read Register 116 (39 – 32)

Read Register 117 (31 – 24)

Read Register 118 (23 – 16)

Read Register 119 (15 – 8)

Read Register 120 (7 – 0)

Management Information Base (MIB) Counters

The Management Information Base (MIB) counters are provided on per port basis. These counters are read using indirect memory access as noted in the following tables:

For Port 1

Offset	Counter Name	Description
0x0	RxLoPriorityByte	Rx lo-priority (default) octet count including bad packets.
0x1	RxHiPriorityByte	Rx hi-priority octet count including bad packets.
0x2	RxUndersizePkt	Rx undersize packets w/good CRC.
0x3	RxFragments	Rx fragment packets w/bad CRC, symbol errors or alignment errors.
0x4	RxOversize	Rx oversize packets w/good CRC (max: 1536 or 1522 bytes).
0x5	RxJabbers	Rx packets longer than 1522B w/either CRC errors, alignment errors, or symbol errors (depends on max packet size setting) or Rx packets longer than 1916B only.
0x6	RxSymbolError	Rx packets w/ invalid data symbol and legal preamble, packet size.
0x7	RxCRCError	Rx packets within (64,1522) bytes w/an integral number of bytes and a bad CRC (upper limit depends on max packet size setting).
0x8	RxAlignmentError	Rx packets within (64,1522) bytes w/a non-integral number of bytes and a bad CRC (upper limit depends on max packet size setting).
0x9	RxControl8808Pkts	The number of MAC control frames received by a port with 88-08h in EtherType field.
0xA	RxPausePkts	The number of PAUSE frames received by a port. PAUSE frame is qualified with EtherType (88-08h), DA, control opcode (00 – 01), data length (64B min), and a valid CRC.
0xB	RxBroadcast	Rx good broadcast packets (not including errored broadcast packets or valid multicast packets).
0xC	RxMulticast	Rx good multicast packets (not including MAC control frames, errored multicast packets or valid broadcast packets).
0xD	RxUnicast	Rx good unicast packets.
0xE	Rx64Octets	Total Rx packets (bad packets included) that were 64 octets in length.
0xF	Rx65to127Octets	Total Rx packets (bad packets included) that are between 65 and 127 octets in length.
0x10	Rx128to255Octets	Total Rx packets (bad packets included) that are between 128 and 255 octets in length.
0x11	Rx256to511Octets	Total Rx packets (bad packets included) that are between 256 and 511 octets in length.
0x12	Rx512to1023Octets	Total Rx packets (bad packets included) that are between 512 and 1023 octets in length.
0x13	Rx1024to1522Octets	Total Rx packets (bad packets included) that are between 1024 and 1522 octets in length (upper limit depends on max packet size setting).
0x14	TxLoPriorityByte	Tx lo-priority good octet count, including PAUSE packets.
0x15	TxHiPriorityByte	Tx hi-priority good octet count, including PAUSE packets.
0x16	TxLateCollision	The number of times a collision is detected later than 512 bit-times into the Tx of a packet.
0x17	TxPausePkts	The number of PAUSE frames transmitted by a port.
0x18	TxBroadcastPkts	Tx good broadcast packets (not including errored broadcast or valid multicast packets).

Table 16. Port 1 MIB Counter Indirect Memory Offsets

For Port 1 (Continued)

Offset	Counter Name	Description
0x19	TxMulticastPkts	Tx good multicast packets (not including errored multicast packets or valid broadcast packets).
0x1A	TxUnicastPkts	Tx good unicast packets.
0x1B	TxDeferred	Tx packets by a port for which the 1st Tx attempt is delayed due to the busy medium.
0x1C	TxTotalCollision	Tx total collision, half-duplex only.
0x1D	TxExcessiveCollision	A count of frames for which Tx fails due to excessive collisions.
0x1E	TxSingleCollision	Successfully Tx frames on a port for which Tx is inhibited by exactly one collision.
0x1F	TxMultipleCollision	Successfully Tx frames on a port for which Tx is inhibited by more than one collision.

Table 16. Port 1 MIB Counter Indirect Memory Offsets (Continued)*For Port 2, the Base is 0x20, Same Offset Definition (0x20-0x3f)**For Port 3, the Base is 0x40, Same Offset Definition (0x40-0x5f)**For Port 4, the Base is 0x60, Same Offset Definition (0x60-0x7f)**For Port 5, the Base is 0x80, Same Offset Definition (0x80-0x9f)*

Address	Name	Description	Mode	Default
Format of Per Port MIB Counters (16 entries)				
31	Overflow	1, Counter overflow. 0, No Counter overflow.	RO	0
30	Count Valid	1, Counter value is valid. 0, Counter value is not valid.	RO	0
29 – 0	Counter Values	Counter value.	RO	0

Table 17. Format of “Per port” MIB Counter

Offset	Counter Name	Description
0x100	Port1 Tx Drop Packets	Tx packets dropped due to lack of resources.
0x101	Port2 Tx Drop Packets	Tx packets dropped due to lack of resources.
0x102	Port3 Tx Drop Packets	Tx packets dropped due to lack of resources.
0x103	Port4 Tx Drop Packets	Tx packets dropped due to lack of resources.
0x104	Port5 Tx Drop Packets	Tx packets dropped due to lack of resources.
0x105	Port1 Rx Drop Packets	Rx packets dropped due to lack of resources.
0x106	Port2 Rx Drop Packets	Rx packets dropped due to lack of resources.
0x107	Port3 Rx Drop Packets	Rx packets dropped due to lack of resources.
0x108	Port4 Rx Drop Packets	Rx packets dropped due to lack of resources.
0x109	Port5 Rx Drop Packets	Rx packets dropped due to lack of resources.

Table 18. All Port Dropped Packet MIB Counters

Address	Name	Description	Mode	Default
30 – 16	Reserved	Reserved.	N/A	N/A
15 – 0	Counter Values	Counter value.	RO	0

Table 19. Format of All Dropped Packet MIB Counters

Note that all port dropped packet MIB counters do not indicate overflow or validity; therefore the application must keep track of overflow and valid conditions.

The KSZ8895MLU provides total 34 MIB counter per port. These counter are used to monitor the port detail activity for network management and maintenance. These MIB counters are read using indirect memory access as as noted in the following examples:

Programming Examples:

(1) MIB counter read (read port 1 Rx64Octets counter)

Write to Register 110 with 0x1c (read MIB counters selected)

Write to Register 111 with 0xe (trigger the read operation)

Then

Read Register 117 (counter value 31 – 24)

// If bit 31 = 1, there was a counter overflow

// If bit 30 = 0, restart (reread) from this register

Read Register 118 (counter value 23 – 16)

Read Register 119 (counter value 15 – 8)

Read Register 120 (counter value 7 – 0)

(2) MIB counter read (read port 2 Rx64Octets counter)

Write to Register 110 with 0x1c (read MIB counter selected)

Write to Register 111 with 0x2e (trigger the read operation)

Then

Read Register 117 (counter value 31 – 24)

//If bit 31 = 1, there was a counter overflow

//If bit 30 = 0, restart (reread) from this register

Read Register 118 (counter value 23 – 16)

Read Register 119 (counter value 15 – 8)

Read Register 120 (counter value 7 – 0)

Programming Examples (Continued):

(3) MIB counter read (read port 1 tx drop packets)

Write to Register 110 with 0x1d

Write to Register 111 with 0x00

Then

Read Register 119 (counter value 15 – 8)

Read Register 120 (counter value 7 – 0)

Note that to read out all the counters, the best performance over the SPI bus is $(160+3) \times 8 \times 80 = 104\mu\text{s}$, where there are 160 registers, 3 overhead, 8 clocks per access, at 12.5MHz. In the heaviest condition, the byte counter will overflow in 2 minutes. It is recommended that the software read all the counters at least every 30 seconds. The per port MIB counters are designed as “read clear.” A per port MIB counter will be cleared after it is accessed. All port dropped packet MIB counters are not cleared after they are accessed. The application needs to keep track of overflow and valid conditions on these counters.

MIIM Registers

All the registers defined in this section can be also accessed via the SPI interface. Note that different mapping mechanisms are used for MIIM and SPI. The “PHYAD” defined in IEEE is assigned as “0x1” for port 1, “0x2” for port 2, “0x3” for port 3 and “0x4” for port 4.. The “REGAD” supported are 0x0-0x5 (0h-5h), 0x1D (1dh) and 0x1F (1fh).

Register 0h: MII Control

Address	Name	Description	Mode	Default
15	Soft Reset	1, PHY soft reset. 0, Normal operation.	R/W (SC)	0
14	Loop Back	1 = Perform MAC loopback, loop back path as follows: Assume the loop-back is at port 1 MAC, port 2 is the monitor port. Port 1 MAC Loopback (port 1 reg. 0, bit 14 = '1') Start: RXP2/RXM2 (port 2). Can also start from port 3, 4, 5 Loopback: MAC/PHY interface of port 1's MAC End: TXP2/TXM2 (port 2). Can also end at port 3, 4, 5 respectively Setting address ox3,4,5 reg. 0, bit 14 = '1' will perform MAC loopback on port 3, 4, 5 respectively. 0 = Normal Operation.	R/W	0
13	Force 100	1, 100Mbps. 0, 10Mbps.	R/W	1
12	AN Enable	1, Auto-negotiation enabled. 0, Auto-negotiation disabled.	R/W	1
11	Power Down	1, Power down. 0, Normal operation.	R/W	0
10	PHY Isolate	1, Electrical PHY isolation of PHY from Tx+/Tx-. 0, Normal operation.	R/W	0
9	Restart AN	1, Restart Auto-negotiation. 0, Normal operation.	R/W	0
8	Force Full Duplex	1, Full duplex. 0, Half duplex.	R/W	0
7	Collision Test	Not supported.	RO	0
6	Reserved		RO	0
5	Hp_mdix	1 = HP Auto MDI/MDI-X mode 0 = Micrel Auto MDI/MDI-X mode	R/W	1
4	Force MDI	1, Force MDI. 0, Normal operation.	R/W	0
3	Disable Auto MDI/MDI-X	1, Disable auto MDI/MDI-X. 0, Normal operation.	R/W	0
2	Disable far End fault	1, Disable far end fault detection. 0, Normal operation.	R/W	0
1	Disable Transmit	1, Disable transmit. 0, Normal operation.	R/W	0
0	Disable LED	1, Disable LED. 0, Normal operation.	R/W	0

MIIM Registers (Continued)

Register 1h: MII Status

Address	Name	Description	Mode	Default
15	T4 Capable	0, Not 100 BASET4 capable.	RO	0
14	100 Full Capable	1, 100BASE-TX full-duplex capable. 0, Not capable of 100BASE-TX full-duplex.	RO	1
13	100 Half Capable	1, 100BASE-TX half-duplex capable. 0, Not 100BASE-TX half-duplex capable.	RO	1
12	10 Full Capable	1, 10BASE-T full-duplex capable. 0, Not 10BASE-T full-duplex capable.	RO	1
11	10 Half Capable	1, 10BASE-T half-duplex capable. 0, 10BASE-T half-duplex capable.	RO	1
10 – 7	Reserved		RO	0
6	Preamble Suppressed	Not supported.	RO	0
5	AN Complete	1, Auto-negotiation complete. 0, Auto-negotiation not completed.	RO	0
4	far End fault	1, far end fault detected. 0, No far end fault detected.	RO	0
3	AN Capable	1, Auto-negotiation capable. 0, Not auto-negotiation capable.	RO	1
2	Link Status	1, Link is up. 0, Link is down.	RO	0
1	Jabber Test	Not supported.	RO	0
0	Extended Capable	0, Not extended register capable.	RO	0

Register 2h: PHYID HIGH

Address	Name	Description	Mode	Default
15 – 0	Phyid High	High order PHYID bits.	RO	0x0022

Register 3h: PHYID LOW

Address	Name	Description	Mode	Default
15 – 0	Phyid Low	Low order PHYID bits.	RO	0x1450

MIIM Registers (Continued)

Register 4h: Advertisement Ability

Address	Name	Description	Mode	Default

I _{EDM1}	Energy Detect Mode 3.3V	V _{DDAT} + V _{DDIO}		7.5		mA
I _{EDM2}	Energy Detect Mode 1.2V	V _{DDAR} + V _{DDC}		46		mA

Notes:

- Exceeding the absolute maximum rating may damage the device.
- The device is not guaranteed to function outside its operating rating. Unused inputs must always be tied to an appropriate logic voltage level (ground or VDD).
- No heat spreader in package. The thermal junction to ambient (θ_{JA}) and the thermal junction to case (θ_{JC}) are under air velocity 0m/s.
- Specification for packaged product only. There is no an additional transformer consumption due to use on chip termination technology with internal biasing for 10Base-T and 100Base-TX.
- Measurements were taken with operating ratings.

Electrical Characteristics^(4, 5) (Continued)

$V_{IN} = 1.2V/3.3V$ (typ.); $T_A = 25^\circ C$.

Symbol	Parameter	Condition	Min.	Typ.	Max.	Units

t _{RC}	Reset to Strap-In Pin Output	50			ns
t _{vr}	3.3V rise time	100			μs

Table 25. Reset Timing Parameters

Reset Circuit Diagram

Micrel recommends the following discrete reset circuit as shown in Figure 25 when powering up the KS8895MQ device. For the application where the reset circuit signal comes from another device (e.g., CPU, FPGA, etc), we recommend the reset circuit as shown in Figure 26.

Figure 25. Recommended Reset Circuit

Figure 26. Recommended Circuit for Interfacing with CPU/FPGA Reset

At power-on-reset, R, C, and D1 provide the necessary ramp rise time to reset the Micrel device. The reset out RST_OUT_n from CPU/FPGA provides the warm reset after power up.

Isolation Transformer Selection

One simple 1:1 isolation transformer is needed at the line interface. An isolation transformer with integrated common-mode choke is recommended for exceeding FCC requirements at line side. Request to separate the center taps of RX/TX at chip side. Table 26 gives recommended transformer characteristics.

Characteristics Name	Value	Test Condition
Turns Ratio	1 CT : 1 CT	
Open-Circuit Inductance (min.)	350 μ H	100mV, 100kHz, 8mA
Leakage Inductance (max.)	0.4 μ H	1MHz (min.)
Inter-Winding Capacitance (max.)	12pF	
D.C. Resistance (max.)	0.9 Ω	
Insertion Loss (max.)	1.0dB	0MHz to 65MHz
HIPOT (min.)	1500Vrms	

Note:

1. The IEEE 802.3u standard for 100BASE-TX assumes a transformer loss of 0.5dB. For the transmit line transformer, insertion loss of up to 1.3dB can be compensated by increasing the line drive current by means of reducing the ISET resistor value.
2. The center taps of RX and TX should be isolated for the low power consumption.

Table 26. Qualified Magnetic Vendors

Table 27 provide transformer vendors provide compatible magnetic parts for Micrel's device.

Vendors and Parts		Auto MDIX	# of Ports	Vendors and Parts		Auto MDIX	# of Ports
Pulse	H1664NL	Yes	4	Pulse	H1102	Yes	1
YCL	PH406082	Yes	4	Bel Fuse	S558-5999-U7	Yes	1
TDK	TLA-6T718A	Yes	1	YCL	PT163020	Yes	1
