# **Current Transducer LA 55-P**

For the electronic measurement of currents : DC, AC, pulsed..., with a galvanic isolation between the primary circuit (high power) and the secondary circuit (electronic circuit).

## **Electrical data**

CE

Primary nominal r.m.s. current			50

Notes : <sup>1)</sup> Measuring range limited to ± 60 A <sub>max</sub>

<sup>2)</sup> Measuring range limited to ± 55 A<sub>max</sub>
 <sup>3)</sup> Result of the coercive field of the magnetic circuit
 <sup>4)</sup> A list of corresponding tests is available

- Closed loop (compensated) current transducer using the Hall effect
- Printed circuit board mounting
- Insulated plastic case recognized according to UL 94-V0.

#### **Advantages**

I<sub>PN</sub>

- Excellent accuracy
- Very good linearity
- Low temperature drift
- Optimized response time
- Wide frequency bandwidth
- No insertion losses
- High immunity to external interference
- Current overload capability.

#### Applications

- AC variable speed drives and servo motor drives
- Static converters for DC motor drives
- Battery supplied applications
- Uninterruptible Power Supplies (UPS)
- Switched Mode Power Supplies (SMPS)
- Power supplies for welding applications.

980706/8

50 A

### Dimensions LA 55-P (in mm. 1 mm = 0.0394 inch)

#### **Mechanical characteristics**

#### • General tolerance

- Primary through-hole
- Fastening & connection of secondary

Recommended PCB hole

± 0.2 mm
12.7 x 7 mm
12.7 × 7 11111

3 pins 0.63 x 0.56mm 0.9 mm

#### Remarks

- $I_s$  is positive when  $I_p$  flows in the direction of the arrow.
- Temperature of the primary conductor should not exceed 90°C.
- Dynamic performances (di/dt and response time) are best with a single bar completely filling the primary hole.
- In order to achieve the best magnetic coupling, the primary windings have to be wound over the top edge of the device.
- This is a standard model. For different versions (supply voltages, turns ratios, unidirectional measurements...), please contact us.
