## Single and Dual Low Voltage, Rail-to-Rail Input and Output, Operational Amplifiers with Shutdown

The LMV981 Single and LMV982 Dual are low-voltage operational amplifiers which can operate on single-sided power supplies (1.8 V to 5.0 V) with rail-to-rail input and output swing. Both devices come in small state-of-the-art packages and require very low quiescent current making them ideal for battery-operated, portable applications such as notebook computers and hand-held instruments. Rail-to-Rail operation allows for optimal signal-to-noise applications plus the small packages allow for closer placement to signal sources further enhancing overall signal chain performance.

The LMV981 Single and LMV982 Dual both have a shutdown pin that can be used to disable the device and further reduce power consumption. Shutdown is implemented by driving the  $\overline{\text{SHDN}}$  Pin LOW.

	Maximum Input Current	10	mA
$t_{SO}$	Output Short Circuit (Note 1)	Continuous	
$T_J$	Maximum Junction Temperature (Operating Range $-40^\circ\text{C to }85^\circ\text{C}$ )	150	$^\circ\text{C}$
$\theta_{JA}$	Thermal Resistance	SC-70 ULLGA8 Micro10 UQFN10	$^\circ\text{C/W}$
$T_{stg}$	Storage Temperature (SOT23-6)	$-65\text{ to }150$	$^\circ\text{C}$
	Mounting Temperature (Infrared or Convection –30 sec)	260	$^\circ\text{C}$

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

ESD data available upon request.

1. Continuous short-circuit operation to ground at elevated ambient temperature can result in exceeding the maximum allowed junction temperature of  $150^\circ\text{C}$ . Output currents in excess of 45 mA over long term may adversely affect reliability. Shorting output to either  $V_+$  or  $V_-$  will adversely affect reliability.

## APPLICATION INFORMATION

Figure 27. Voltage Reference

Figure 28. Wien Bridge Oscillator

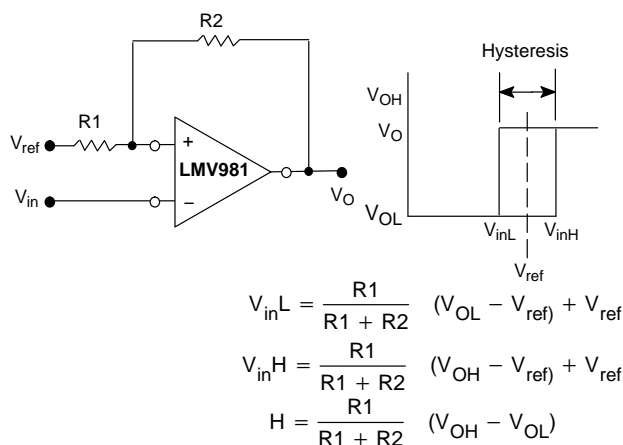

Figure 29. Comparator with Hysteresis

Given:  $f_o$  = center frequency  
 $A(f_o)$  = gain at center frequency

Choose value  $f_o$ ,  $C_Q$   
 Then:  $R3 = \frac{C_Q}{\pi f_o C}$   
 $R1 = \frac{R3}{2 A(f_o)}$   
 $R2 = \frac{R1 R3}{4Q^2 R1 - R3}$

For less than 10% error from operational amplifier,  
 $((Q f_o)/BW) < 0.1$  where  $f_o$  and BW are expressed in Hz.  
 If source impedance varies, filter may be preceded with  
 voltage follower buffer to stabilize filter parameters.
