

6-axis inertial measurement unit (IMU) and AI sensor with embedded sensor fusion, Qvar for high-end applications

Features

LGA-14L
(2.5 x 3.0 x 0.83 mm) typ.

- Triple-channel architecture for UI, EIS, and OIS data processing
- "Always-on" experience with low power consumption for both accelerometer and gyroscope
- Smart FIFO up to 4.5 KB
- Android compliant
- $\pm 2/\pm 4/\pm 8/\pm 16\text{ g}$ full scale
- $\pm 125/\pm 250/\pm 500/\pm 1000/\pm 2000/\pm 4000\text{ dps}$ full scale
- SPI / I²C & MIPI I3C® v1.1 serial interface with main processor data synchronization
- Auxiliary SPI for OIS data output for gyroscope and accelerometer
- OIS configurable from aux. SPI, primary interface (SPI / I²C & MIPI I3C® v1.1)
- EIS dedicated channel on primary interface with dedicated filtering
- Advanced pedometer, step detector, and step counter
- Significant motion detection, tilt detection
- Standard interrupts: free-fall, wake-up, 6D/4D orientation, click and double click
- Programmable finite state machine for accelerometer, gyroscope, and external sensor data processing with high rate @ 960 Hz
- Machine learning core with exportable features and filters for AI applications
- Embedded adaptive self-configuration (ASC)
- Embedded Qvar (electrostatic sensor) for user interface functions (tap, double tap, triple tap, long press, L/R – R/L swipe)
- Embedded analog hub for ADC and processing analog input data
- Embedded sensor fusion low-power algorithm
- Embedded temperature sensor
- Analog supply voltage: 1.71 V to 3.6 V
- Independent IO supply (extended range: 1.08 V to 3.6 V)
- Power consumption: 0.65 mA in combo high-performance mode
- Compact footprint: 2.5 mm x 3 mm x 0.83 mm
- ECOPACK and RoHS compliant

Description

The [LSM6DSV16X](#) is a high-performance, low-power 6-axis small IMU, featuring a 3-axis digital accelerometer and a 3-axis digital gyroscope, that offers the best IMU sensor with a triple-channel architecture for processing acceleration and angular rate data on three separate channels (user interface, OIS, and EIS) with dedicated configuration, processing, and filtering.

The LSM6DSV16X enables processes in edge computing, leveraging embedded advanced dedicated features such as a finite state machine (FSM) for configurable motion tracking and a machine learning core (MLC) for context awareness with exportable AI features for IoT applications.

The LSM6DSV16X supports the adaptive self-configuration (ASC) feature, which allows the FSM to automatically reconfigure the device in real time based on the detection of a specific motion pattern or based on the output of a specific decision tree configured in the MLC, without any intervention from the host processor.

The LSM6DSV16X embeds Qvar (electric charge variation detection) for user interface functions like tap, double tap, triple tap, long press, or L/R – R/L swipe.

The LSM6DSV16X embeds an analog hub able to connect an external analog input and convert it to a digital signal for processing.

1 Overview

The LSM6DSV16X is a system-in-package featuring a high-performance 3-axis digital accelerometer and 3-axis digital gyroscope.

The LSM6DSV16X delivers best-in-class motion sensing that can detect orientation and gestures in order to empower application developers and consumers with features and capabilities that are more sophisticated than simply orienting their devices to portrait and landscape mode.

The event-detection interrupts enable efficient and reliable motion tracking and context awareness, implementing hardware recognition of free-fall events, 6D orientation, click and double-click sensing, activity or inactivity, stationary/motion detection and wake-up events. Machine learning and finite state machine processing allow moving some algorithms from the application processor to the LSM6DSV16X sensor, enabling consistent reduction of power consumption.

The LSM6DSV16X supports the main OS requirements, offering real, virtual, and batch mode sensors. In addition, the LSM6DSV16X can efficiently run the sensor-related features specified in Android, saving power and enabling faster reaction time. In particular, the LSM6DSV16X has been designed to implement hardware features such as significant motion detection, stationary/motion detection, tilt, pedometer functions, timestamping and to support the data acquisition of external sensors.

The LSM6DSV16X offers hardware flexibility to connect the pins with different mode connections to external sensors to expand functionalities such as adding a sensor hub, auxiliary SPI, and so forth.

The LSM6DSV16X offers advanced design flexibility for OIS and EIS applications. Both channels have a dedicated processing path with independent filtering and enhanced EIS channel gyroscope data are read over the primary interfaces I²C/ MIPI I3C® v1.1 / SPI.

Channel 1 has been designed for user interface data processing for motion tracking. Data are available on the primary output of I²C / SPI / I3C® for the accelerometer and gyroscope with independent ODR and FS.

Channel 2 has been designed for OIS applications. Data are available on the aux SPI at 7.68 kHz with accelerometer/gyroscope processing with independent FS at ±2 g - ±16 g (accelerometer) / ±125 dps - ±2000 dps (gyroscope). The accelerometer is also available as standalone with dedicated filtering.

Channel 3 has been design for enhanced EIS. Data are available in freerun mode in the output registers or in FIFO with dedicated tag and timestamp.

Up to 4.5 KB of FIFO with compression and dynamic allocation of significant data (that is, external sensors, timestamp, and so forth) allows overall power saving of the system.

The LSM6DSV16X embeds a sensor fusion low-power (SFLP) algorithm able to provide a 6-axis (accelerometer + gyroscope) game rotation vector represented as a quaternion. The X, Y, Z quaternion components are stored in FIFO.

Like the entire portfolio of MEMS sensor modules, the LSM6DSV16X leverages the robust and mature in-house manufacturing processes already used for the production of micromachined accelerometers and gyroscopes. The various sensing elements are manufactured using specialized micromachining processes, while the IC interfaces are developed using CMOS technology that allows the design of a dedicated circuit, which is trimmed to better match the characteristics of the sensing element.

The LSM6DSV16X embeds an analog hub, which is able to connect an external analog input and convert it to a digital signal for processing as well as advanced dedicated features like a finite state machine and data filtering for OIS, EIS, and motion processing.

The LSM6DSV16X embeds Qvar functionality, which is an electrostatic sensor able to measure the variation of the quasi-electrostatic potential. The Qvar sensing channel can be used for user interface applications like tap, double tap, triple tap, long press, and L/R – R/L swipe.

The LSM6DSV16X is available in a small plastic land grid array (LGA) package of 2.5 x 3.0 x 0.83 mm to address ultracompact solutions.

2 Embedded low-power features

The LSM6DSV16X has been designed to be fully compliant with Android, featuring the following on-chip functions:

- 4.5 KB FIFO data buffering, data can be compressed two or three times
 - 100% efficiency with flexible configurations and partitioning
 - Possibility to store timestamp
- Event-detection interrupts (fully configurable)
 - Free-fall
 - Wake-up
 - 6D orientation
 - Click and double-click sensing
 - Activity/inactivity recognition
 - Stationary/motion detection
- Specific IP blocks (called "embedded functions") with negligible power consumption and high performance
 - Pedometer functions: step detector and step counters
 - Tilt
 - Significant motion detection
 - Finite state machine (FSM)
 - Machine learning core (MLC) with exportable features and filters for AI applications
 - Adaptive self-configuration (ASC)
 - Embedded sensor fusion low-power (SFLP) algorithm
- Sensor hub
 - Up to six total sensors: two internal (accelerometer and gyroscope) and four external sensors
- Analog hub for processing external analog input data
- Qvar: electric charge variation detection

2.1

Pedometer functions: step detector and step counters

The LSM6DSV16X embeds an advanced pedometer with an algorithm running in an ultralow-power domain in order to ensure extensive battery life in battery-constrained applications.

Leveraging enhanced configurability, the advanced embedded pedometer is suitable for a large range of applications from mobile to wearable devices.

The algorithm processes and analyzes the accelerometer waveform in order to count the user's steps during walking and running activities.

The pedometer works at 30 Hz and it is not affected by the selected device power mode (ultralow-power, low-power, high-performance), thus guaranteeing an ultralow-power experience and extreme flexibility in conjunction with other device functionalities.

The pedometer output can be batched in the device's FIFO buffer, in order to decrease overall system current consumption.

ST freely provides the support and the tools for easily configuring the device and tuning the algorithm configuration for a best-in-class user experience.

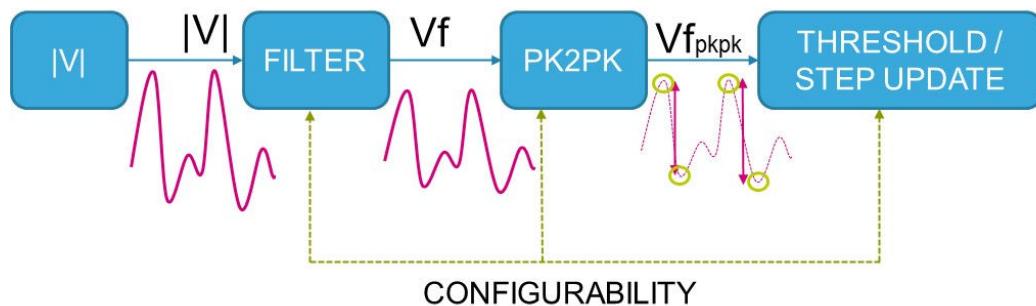

2.2

Pedometer algorithm

The pedometer algorithm is composed of a cascade of four stages:

1. Computation of the acceleration magnitude signal in order to detect the signal independently from device orientation;
2. FIR filter to extract relevant frequency components and to smooth the signal by cutting off high frequencies;
3. Peak detector to find the maximum and minimum of the waveform and compute the peak-to-peak value;
4. Step count: if the peak-to-peak value is greater than the settled threshold, a step is counted.

Figure 1. Four-stage pedometer algorithm

The LSM6DSV16X embeds a dynamic internal threshold for step detection that is updated after each peak-to-peak evaluation: the internal threshold is increased with a configurable speed if a step is detected or decreased with a configurable speed if a step is not detected.

This approach ensures high accuracy when the user starts to walk and a false peak rejection when the user is walking or running.

An internal configurable debounce algorithm can be also set to filter false walks: indeed, an accelerometer pattern is recognized as a walk or run only if a minimum number of steps are counted.

The LSM6DSV16X has been designed to reject a false-positive signal inside the algorithm core.

On top of the mechanisms detailed above, the LSM6DSV16X allows enabling and configuring a dedicated false-positive rejection block to further boost pedometer accuracy.

2.3

Tilt detection

The tilt function helps to detect activity change and has been implemented in hardware using only the accelerometer to achieve targets of both ultralow power consumption and robustness during the short duration of dynamic accelerations.

The tilt function is based on a trigger of an event each time the device's tilt changes and can be used with different scenarios, for example:

- Triggers when a phone is in a front pants pocket and the user goes from sitting to standing or standing to sitting;
- Does not trigger when a phone is in a front pants pocket and the user is walking, running, or going upstairs.

2.4

Significant motion detection

The significant motion detection (SMD) function generates an interrupt when a 'significant motion', that could be due to a change in user location, is detected. In the LSM6DSV16X device this function has been implemented in hardware using only the accelerometer.

SMD functionality can be used in location-based applications in order to receive a notification indicating when the user is changing location.

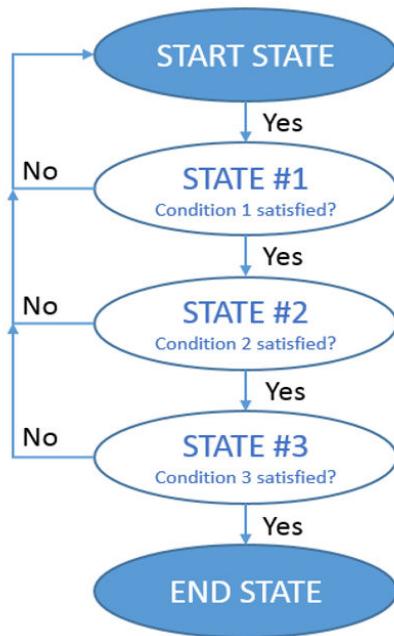

2.5 Finite state machine

The LSM6DSV16X can be configured to generate interrupt signals activated by user-defined motion patterns. To do this, up to 8 embedded finite state machines can be programmed independently for motion detection such as glance gestures, absolute wrist tilt, shake and double-shake detection.

Definition of finite state machine

A state machine is a mathematical abstraction used to design logic connections. It is a behavioral model composed of a finite number of states and transitions between states, similar to a flow chart in which one can inspect the way logic runs when certain conditions are met. The state machine begins with a start state, goes to different states through transitions dependent on the inputs, and can finally end in a specific state (called stop state). The current state is determined by the past states of the system. The following figure shows a generic state machine.

Figure 2. Generic state machine

Finite state machine in the LSM6DSV16X

The LSM6DSV16X works as a combo accelerometer-gyroscope sensor, generating acceleration and angular rate output data. It is also possible to connect an external sensor like a magnetometer or pressure sensor by using the sensor hub feature (mode 2). These data can be used as input of up to 8 programs in the embedded finite state machine (Figure 3. State machine in the LSM6DSV16X).

All 8 finite state machines are independent: each one has its dedicated memory area and it is independently executed. An interrupt is generated when the end state is reached or when some specific command is performed.

Figure 3. State machine in the LSM6DSV16X

2.6

Machine learning core

The LSM6DSV16X embeds a dedicated core for machine learning processing that provides system flexibility, allowing some algorithms run in the application processor to be moved to the MEMS sensor with the advantage of consistent reduction in power consumption.

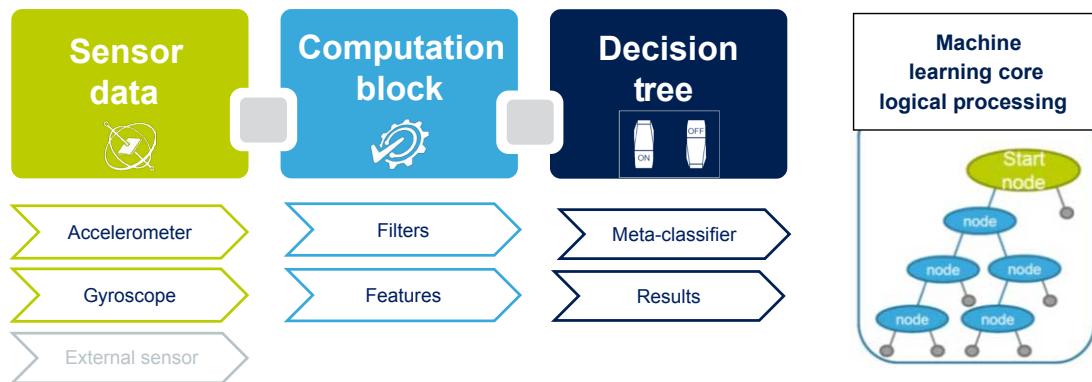

Machine learning core logic allows identifying if a data pattern (for example motion, pressure, temperature, magnetic data, and so forth) matches a user-defined set of classes. Typical examples of applications could be activity detection like running, walking, driving, and so forth.

The LSM6DSV16X machine learning core works on data patterns coming from the accelerometer and gyro sensors, but it is also possible to connect and process external sensor data (like magnetometer or pressure sensor) by using the sensor hub feature (mode 2).

The input data can be filtered using a dedicated configurable computation block containing filters and features computed in a fixed time window defined by the user. Computed feature values and filtered data values can also be read through the FIFO buffer.

Machine learning processing is based on logical processing composed of a series of configurable nodes characterized by "if-then-else" conditions where the "feature" values are evaluated against defined thresholds.

Figure 4. Machine learning core in the LSM6DSV16X

The LSM6DSV16X can be configured to run up to 4 decision trees simultaneously and independently and every decision tree can generate up to 16 results. The total number of nodes can be up to 128.

The results of the machine learning processing are available in dedicated output registers readable from the application processor at any time.

The LSM6DSV16X machine learning core can be configured to generate an interrupt when a change in the result occurs.

2.7

Adaptive self-configuration (ASC)

The LSM6DSV16X supports the adaptive self-configuration (ASC) feature, which allows the FSM to automatically reconfigure the device in real time based on the detection of a specific motion pattern or based on the output of a specific decision tree configured in the MLC, without any intervention from the host processor. The FSM can write a subset of the device registers using the SETR command, which allows indicating the register address and the new value to be written in such a register. The access to these device registers is mutually exclusive to the host.

2.8

Sensor fusion low power

A sensor fusion low-power (SFLP) block is available in the LSM6DSV16X for generating the following data based on the accelerometer and gyroscope data processing:

- Game rotation vector, which provides a quaternion representing the attitude of the device
- Gravity vector, which provides a three-dimensional vector representing the direction of gravity
- Gyroscope bias, which provides a three-dimensional vector representing the gyroscope bias

The SFLP block is enabled by setting the SFLP_GAME_EN bit to 1 of the [EMB_FUNC_EN_A \(04h\)](#) embedded functions register.

The SFLP block can be reinitialized by setting the SFLP_GAME_INIT bit to 1 of the [EMB_FUNC_INIT_A \(66h\)](#) embedded functions register.

3.1 Pin connections

The LSM6DSV16X offers flexibility to connect the pins in order to have three different mode connections and functionalities. In detail:

- **Mode 1:** I²C / MIPI I3C® slave interface or SPI (3- and 4-wire) serial interface is available. The analog hub and Qvar functionalities are available in mode 1 with I²C interface only.
- **Mode 2:** I²C / MIPI I3C® slave interface or SPI (3- and 4-wire) serial interface and I²C interface master for external sensor connections are available.
- **Mode 3:** I²C / MIPI I3C® slave interface or SPI (3- and 4-wire) serial interface is available for the application processor interface while an auxiliary SPI (3- and 4-wire) serial interface for external sensor connections is available for the accelerometer and gyroscope.

Note: Refer to the product application note for the details regarding operating/power mode configurations, settings, turn-on/off time and on-the-fly changes.

4.5

Absolute maximum ratings

Stresses above those listed as “absolute maximum ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device under these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

Table 9. Absolute maximum ratings

| Symbol | Ratings | Maximum value | Unit |
|------------------|---|---------------------|------|
| Vdd | Supply voltage | -0.3 to 4.8 | V |
| T _{STG} | Storage temperature range | -40 to +125 | °C |
| Sg | Acceleration g for 0.2 ms | 20,000 | g |
| ESD | Electrostatic discharge protection (HBM) | 2 | kV |
| Vin | Input voltage on any control pin (including CS, SCL/SPC, SDA/SDI/SDO, SDO/SA0) | -0.3 to Vdd_IO +0.3 | V |

Note: Supply voltage on any pin should never exceed 4.8 V.

This device is sensitive to mechanical shock, improper handling can cause permanent damage to the part.

This device is sensitive to electrostatic discharge (ESD), improper handling can cause permanent damage to the part.

4.6 Terminology

4.6.1 Sensitivity

Linear acceleration sensitivity can be determined, for example, by applying 1 g acceleration to the device. Because the sensor can measure DC accelerations, this can be done easily by pointing the selected axis towards the ground, noting the output value, rotating the sensor 180 degrees (pointing towards the sky) and noting the output value again. By doing so, $\pm 1 \text{ g}$ acceleration is applied to the sensor. Subtracting the larger output value from the smaller one, and dividing the result by 2, leads to the actual sensitivity of the sensor. This value changes very little over temperature and over time. The sensitivity tolerance describes the range of sensitivities of a large number of sensors (see [Table 3](#)).

An angular rate gyroscope is a device that produces a positive-going digital output for counterclockwise rotation around the axis considered. Sensitivity describes the gain of the sensor and can be determined by applying a defined angular velocity to it. This value changes very little over temperature and time (see [Table 3](#)).

4.6.2 Zero-g and zero-rate level

Linear acceleration zero-g level offset (TyOff) describes the deviation of an actual output signal from the ideal output signal if no acceleration is present. A sensor in a steady state on a horizontal surface measures 0 g on both the X-axis and Y-axis, whereas the Z-axis measures 1 g. Ideally, the output is in the middle of the dynamic range of the sensor (content of OUT registers 00h, data expressed as two's complement number). A deviation from the ideal value in this case is called zero-g offset.

Offset is to some extent a result of stress to the MEMS sensor and therefore the offset can slightly change after mounting the sensor onto a printed circuit board or exposing it to extensive mechanical stress. Offset changes little over temperature, see "Linear acceleration zero-g level change vs. temperature" in [Table 3](#). The zero-g level tolerance (TyOff) describes the standard deviation of the range of zero-g levels of a group of sensors.

Zero-rate level describes the actual output signal if there is no angular rate present. The zero-rate level of precise MEMS sensors is, to some extent, a result of stress to the sensor and therefore the zero-rate level can slightly change after mounting the sensor onto a printed circuit board or after exposing it to extensive mechanical stress. This value changes very little over temperature and time (see [Table 3](#)).

5 Digital interfaces

5.1 I²C/SPI interface

The registers embedded inside the LSM6DSV16X may be accessed through both the I²C and SPI serial interfaces. The latter may be software configured to operate either in 3-wire or 4-wire interface mode. The device is compatible with SPI modes 0 and 3.

The serial interfaces are mapped to the same pins. To select/exploit the I²C interface, the CS line must be tied high (that is, connected to Vdd_IO).

Table 10. Serial interface pin description

| Pin name | Pin description |
|-------------|---|
| CS | Enables SPI I ² C/SPI mode selection (1: SPI idle mode / I ² C communication enabled; 0: SPI communication mode / I ² C disabled) |
| SCL/SPC | I ² C serial clock (SCL) SPI serial port clock (SPC) |
| SDA/SDI/SDO | I ² C serial data (SDA) SPI serial data input (SDI) 3-wire interface serial data output (SDO) |
| SDO/SA0 | SPI serial data output (SDO) I ² C less significant bit of the device address |

5.1.1 I²C serial interface

The LSM6DSV16X I²C is a bus slave. The I²C is employed to write the data to the registers, whose content can also be read back.

The relevant I²C terminology is provided in the table below.

Table 11. I²C terminology

| Term | Description |
|-------------|--|
| Transmitter | The device that sends data to the bus |
| Receiver | The device that receives data from the bus |
| Master | The device that initiates a transfer, generates clock signals, and terminates a transfer |
| Slave | The device addressed by the master |

There are two signals associated with the I²C bus: the serial clock line (SCL) and the serial data line (SDA). The latter is a bidirectional line used for sending and receiving the data to/from the interface. Both the lines must be connected to Vdd_IO through external pull-up resistors. When the bus is free, both the lines are high.

The I²C interface is implemented with fast mode (400 kHz) I²C standards as well as with fast mode plus (1000 kHz).

In order to disable the I²C block, I²C_I3C_disable = 1 must be written in [IF_CFG \(03h\)](#).

5.1.2 I²C operation

The transaction on the bus is started through a start (ST) signal. A start condition is defined as a high to low transition on the data line while the SCL line is held high. After this has been transmitted by the master, the bus is considered busy. The next byte of data transmitted after the start condition contains the address of the slave in the first 7 bits and the eighth bit tells whether the master is receiving data from the slave or transmitting data to the slave. When an address is sent, each device in the system compares the first seven bits after a start condition with its address. If they match, the device considers itself addressed by the master.

The slave address (SAD) associated to the LSM6DSV16X is 110101xb. The SDO/SA0 pin can be used to modify the less significant bit of the device address. If the SDO/SA0 pin is connected to the supply voltage, LSb is 1 (address 1101011b); else if the SDO/SA0 pin is connected to ground, the LSb value is 0 (address 1101010b). This solution permits to connect and address two different inertial modules to the same I²C bus.

Data transfer with acknowledge is mandatory. The transmitter must release the SDA line during the acknowledge pulse. The receiver must then pull the data line low so that it remains stable low during the high period of the acknowledge clock pulse. A receiver that has been addressed is obliged to generate an acknowledge after each byte of data received.

The I²C embedded inside the LSM6DSV16X behaves like a slave device and the following protocol must be adhered to. After the start condition (ST) a slave address is sent, once a slave acknowledge (SAK) has been returned, an 8-bit subaddress (SUB) is transmitted. The increment of the address is configured by the **CTRL3 (12h)** (IF_INC).

The slave address is completed with a read/write bit. If the bit is 1 (read), a repeated start (SR) condition must be issued after the two subaddress bytes; if the bit is 0 (write) the master transmits to the slave with direction unchanged. **Table 12** explains how the SAD+read/write bit pattern is composed, listing all the possible configurations.

Table 12. SAD+read/write patterns

| Command | SAD[6:1] | SAD[0] = SA0 | R/W | SAD+R/W |
|---------|----------|--------------|-----|----------------|
| Read | 110101 | 0 | 1 | 11010101 (D5h) |
| Write | 110101 | 0 | 0 | 11010100 (D4h) |
| Read | 110101 | 1 | 1 | 11010111 (D7h) |

| Master | ST | SAD+ W | | SUB | | SR | SAD+ R | | MAK | | MAK | | NMAK | SP |
| Slave | | | SAK | | SAK | | | SAK | DATA | | DATA | | DATA | |

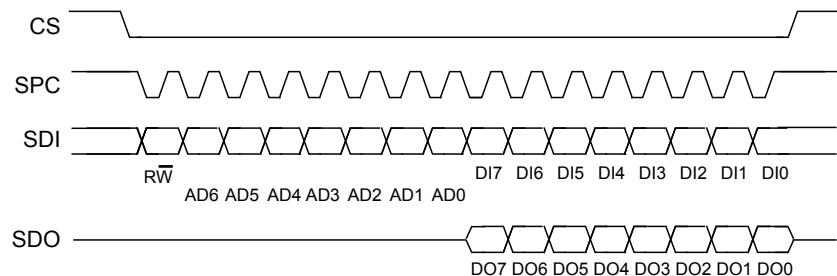

Data are transmitted in byte format (DATA). Each data transfer contains 8 bits. The number of bytes transferred per transfer is unlimited. Data is transferred with the most significant bit (MSb) first. If a slave receiver does not acknowledge the slave address (that is, it is not able to receive because it is performing some real-time function) the data line must be left high by the slave. The master can then abort the transfer. A low to high transition on the SDA line while the SCL line is high is defined as a stop condition. Each data transfer must be terminated by the generation of a stop (SP) condition.

In the presented communication format, MAK is master acknowledge and NMAK is no master acknowledge.

5.1.3 SPI bus interface

The SPI on the LSM6DSV16X is a bus slave which allows writing and reading the registers of the device.

Figure 10. Read and write protocol (in mode 3)

CS enables the serial port and it is controlled by the SPI master. It goes low at the start of the transmission and goes back high at the end. **SPC** is the serial port clock and it is controlled by the SPI master. It is stopped high when **CS** is high (no transmission). **SDI** and **SDO** are, respectively, the serial port data input and output. Those lines are driven at the falling edge of **SPC** and should be captured at the rising edge of **SPC**.

Both the read register and write register commands are completed in 16 clock pulses or in multiples of 8 in case of multiple read/write bytes. Bit duration is the time between two falling edges of **SPC**. The first bit (bit 0) starts at the first falling edge of **SPC** after the falling edge of **CS** while the last bit (bit 15, bit 23, ...) starts at the last falling edge of **SPC** just before the rising edge of **CS**.

bit 0: **RW** bit. When 0, the data DI(7:0) is written into the device. When 1, the data DO(7:0) from the device is read. In latter case, the chip drives **SDO** at the start of bit 8.

bit 1-7: address AD(6:0). This is the address field of the indexed register.

bit 8-15: data DI(7:0) (write mode). This is the data that is written into the device (MSb first).

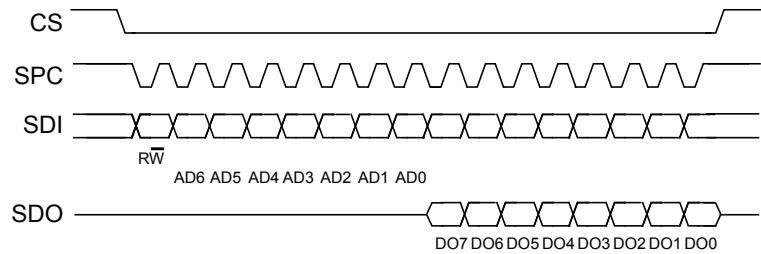

bit 8-15: data DO(7:0) (read mode). This is the data that is read from the device (MSb first).

In multiple read/write commands further blocks of 8 clock periods are added. When the **CTRL3 (12h) (IF_INC)** bit is 0, the address used to read/write data remains the same for every block. When the **CTRL3 (12h) (IF_INC)** bit is 1, the address used to read/write data is increased at every block.

The function and the behavior of **SDI** and **SDO** remain unchanged.

5.1.3.1 SPI read

The SPI read command is performed with 16 clock pulses. A multiple byte read command is performed by adding blocks of 8 clock pulses to the previous one.

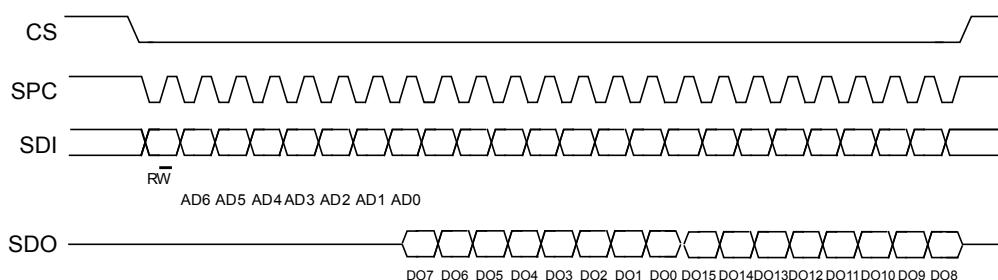

bit 0: READ bit. The value is 1.

bit 1-7: address AD(6:0). This is the address field of the indexed register.

bit 8-15: data DO(7:0) (read mode). This is the data that is read from the device (MSb first).

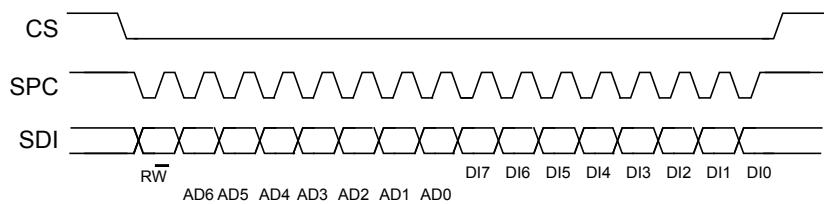

bit 16-...: data DO(...-8). Further data in multiple byte reads.

bit 0: WRITE bit. The value is 0.

bit 1 -7: address AD(6:0). This is the address field of the indexed register.

bit 8-15: data DI(7:0) (write mode). This is the data that is written inside the device (MSb first).

bit 16-... : data DI(...-8). Further data in multiple byte writes.

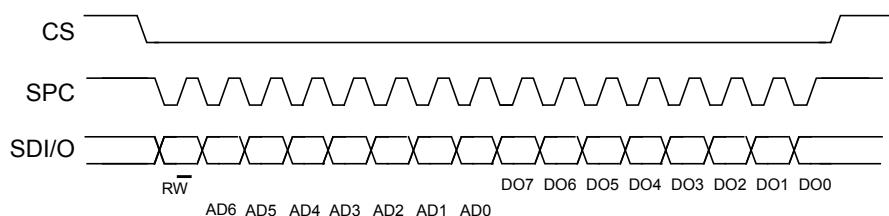

Figure 14. Multiple byte SPI write protocol (2-byte example) (in mode 3)

5.1.3.3 SPI read in 3-wire mode

3-wire mode is entered by setting the IF_CFG (03h) (SIM) bit equal to 1 (SPI serial interface mode selection).

Figure 15. SPI read protocol in 3-wire mode (in mode 3)

The SPI read command is performed with 16 clock pulses:

bit 0: READ bit. The value is 1.

bit 1-7: address AD(6:0). This is the address field of the indexed register.

bit 8-15: data DO(7:0) (read mode). This is the data that is read from the device (MSb first).

A multiple read command is also available in 3-wire mode.

5.2 MIPI I3C® interface

5.2.1 MIPI I3C® slave interface

The LSM6DSV16X interface includes an MIPI I3C® SDR only slave interface (compliant with release 1.1 of the specification) with MIPI I3C® SDR embedded features:

- CCC command
- Direct CCC communication (SET and GET)
- Broadcast CCC communication
- Private communications
- Private read and write for single byte
- Multiple read and write
- In-band interrupt request
- Slave reset pattern
- Group address
- Full range Vdd_IO support
- Asynchronous modes 0 and 1
- Synchronous mode
- Error detection and recovery methods (S0-S6)

In order to disable the MIPI I3C® block, I2C_I3C_disable = 1 must be written in [IF_CFG \(03h\)](#).

5.2.2 MIPI I3C® CCC supported commands

The list of MIPI I3C® CCC commands supported by the device is detailed in the following table.

Table 17. MIPI I3C® CCC commands

| Command | Command code | Default | Description |
|-----------|--------------|--|--|
| ENTDAA | 0x07 | | DAA procedure |
| SETDASA | 0x87 | | Assign dynamic address using static address 0x6B/0x6A depending on SDO pin |

| RSTGRPA | 0x2C / 0x9C | | Reset the group address |
| RSTACT | 0x9A / 0x2A | | Configure slave reset action |

5.2.3 Overview of anti-spike filter management

The device acts as a standard I²C target as long as it has an I²C static address. The device is capable of detecting and disabling the I²C anti-spike filter after detecting the broadcast address (7'h7E/W). In order to guarantee proper behavior of the device, the I3C master must emit the first START, 7'h7E/W at open-drain speed using I²C fast mode plus reference timing.

After detecting the broadcast address, the device can receive the I3C dynamic address following the I3C push-pull timing. If the device is not assigned a dynamic address, then the device continues to operate as an I²C device with no anti-spike filter. For the case in which the host decides to keep the device as I²C with anti-spike filter, there is a configuration required to keep the anti-spike filter active. This configuration is done by writing the ASF_CTRL bit to 1 in the [IF_CFG \(03h\)](#) register. This configuration forces the anti-spike filter to always be turned on instead of being managed by the communication on the bus.

5.3 Master I²C interface

If the LSM6DSV16X is configured in mode 2, a master I²C line is available. The master serial interface is mapped to the following dedicated pins.

Table 18. Master I²C pin details

| Pin name | Pin description |
|----------|---|
| MSCL | I ² C serial clock master |
| MSDA | I ² C serial data master |
| MDRDY | I ² C master external synchronization signal |

5.4 Auxiliary SPI interface

If the LSM6DSV16X is configured in mode 3, the auxiliary SPI is available. The auxiliary SPI interface is mapped to the following dedicated pins.

Table 19. Auxiliary SPI pin details

| Pin name | Pin description |
|---------------|--|
| OCS_Aux | Enables auxiliary SPI 3/4-wire |
| SDx/AH1/Qvar1 | Auxiliary SPI 3/4-wire data input (SDI_Aux) and SPI 3-wire data output (SDO_Aux) |
| SCx/AH2/Qvar2 | Auxiliary SPI 3/4-wire interface serial port clock |
| SDO_Aux | Auxiliary SPI 4-wire data output (SDO_Aux) |

When the LSM6DSV16X is configured in mode 3, the auxiliary SPI can be connected to a camera module for OIS support.

6 Functionality

This section describes all the operating modes and power modes of the LSM6DSV16X.

Note: Refer to the product application note for the details regarding operating/power mode configurations, settings, turn-on/off time and on-the-fly changes.

6.1 Operating modes

In the LSM6DSV16X, the accelerometer and the gyroscope can be turned on/off independently of each other and are allowed to have different ODRs and power modes.

The LSM6DSV16X has three operating modes available:

- Only accelerometer active and gyroscope in power-down
- Only gyroscope active and accelerometer in power-down
- Both accelerometer and gyroscope sensors active with independent ODR and power mode

The accelerometer is activated from power-down by writing ODR_XL_[3:0] in [CTRL1 \(10h\)](#) while the gyroscope is activated from power-down by writing ODR_G_[3:0] in [CTRL2 \(11h\)](#). For combo mode, the ODRs are totally independent.

6.2 Accelerometer power modes

In the LSM6DSV16X, the accelerometer can be configured in five different operating modes: power-down mode, low-power mode (1, 2, 3), normal mode, high-performance mode and high-accuracy ODR mode.

The operating mode selected depends on the value of the OP_MODE_XL_[2:0] bits in [CTRL1 \(10h\)](#).

If the value of the OP_MODE_XL_[2:0] bits is 000 (default), high-performance mode is valid for all ODRs (from 7.5 Hz up to 7.68 kHz).

Normal mode is available for ODR values from 7.5 Hz to 1.92 kHz and it is enabled by setting the OP_MODE_XL_[2:0] bits to 111. Normal mode cannot be used in mode 3 connection mode.

In high-performance mode and in normal mode the analog anti-aliasing filter is active.

Low-power mode is available for lower ODRs (1.875 Hz, 15 Hz, 30 Hz, 60 Hz, 120 Hz, 240 Hz). The three low-power modes are enabled by setting OP_MODE_XL_[2:0] to 100 (LPM1), 101 (LPM2), 110 (LPM3).

High-accuracy ODR mode is available for ODR values from 15 Hz up to 7.68 kHz and it is enabled by setting the OP_MODE_XL_[2:0] bits to 001. Refer to [Section 6.5 High-accuracy ODR mode](#) for more details.

The embedded functions based on accelerometer data (free-fall, 6D/4D, tap/double-tap, wake-up, activity/inactivity, stationary/motion, step counter, step detection, significant motion, tilt) and the FIFO batching functionality are supported in all modes.

6.3

Accelerometer dual-channel mode

The LSM6DSV16X accelerometer block has a dual-channel architecture able to work with two different full scales simultaneously. By default, the device operates in single-channel mode supporting FS scale values from $\pm 2\text{ g}$ through $\pm 16\text{ g}$ and different power modes, as described in [Section 6.2 Accelerometer power modes](#). The block diagrams in the following figures show the configuration of acceleration data processing in the two different modes.

Figure 16. Single-channel mode (XL_DualC_EN = 0)

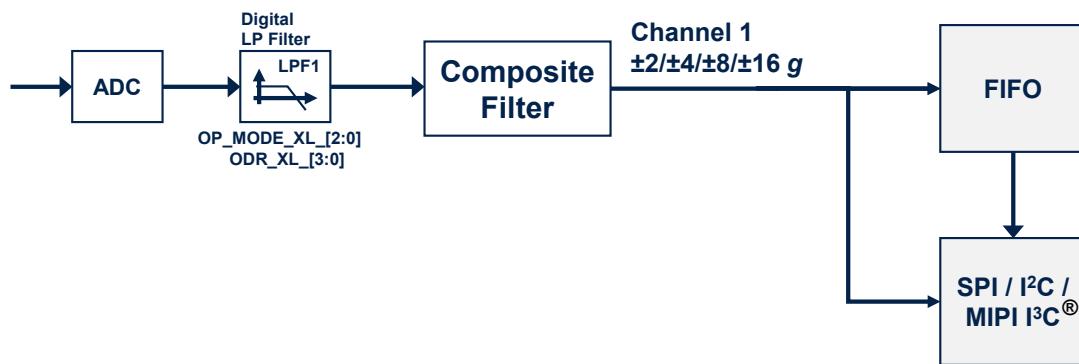

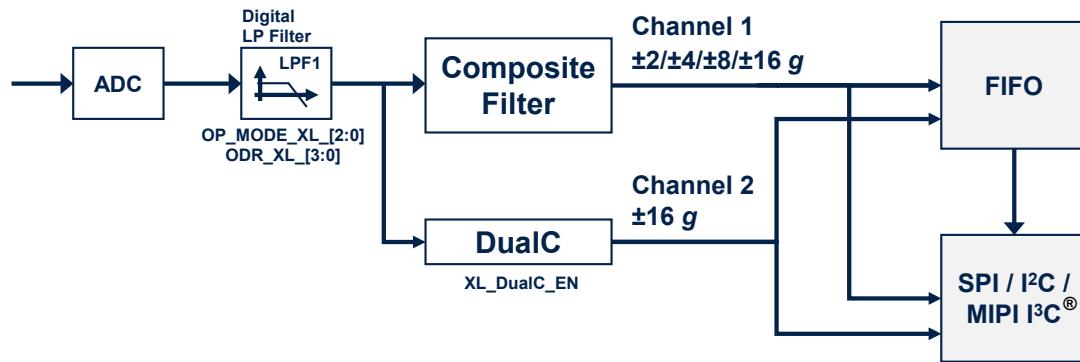

Figure 17. Dual-channel mode (XL_DualC_EN = 1)

The dual-channel functionality can be enabled/disabled by configuring the bit XL_DualC_EN to 1 (enable) or to 0 (disable) in [CTRL8 \(17h\)](#).

Referring to [Figure 17. Dual-channel mode \(XL_DualC_EN = 1\)](#), when the dual-channel mode has been activated:

1. Channel 1 supports user-selectable full-scale acceleration range of $\pm 2/\pm 4/\pm 8/\pm 16\text{ g}$ based on the value of the FS_XL_[1:0] bits in the [CTRL8 \(17h\)](#) register.
2. Channel 2 full scale is set to $\pm 16\text{ g}$. Acceleration data are available in the output registers from [UI_OUTX_L_A_OIS_DualC \(34h\)](#) and [UI_OUTX_H_A_OIS_DualC \(35h\)](#) through [UI_OUTZ_L_A_OIS_DualC \(38h\)](#) and [UI_OUTZ_H_A_OIS_DualC \(39h\)](#).

6.4

Gyroscope power modes

In the LSM6DSV16X, the gyroscope can be configured in five different operating modes: power-down mode, sleep mode, low-power mode, high-performance mode and high-accuracy ODR mode.

The operating mode selected depends on the value of the OP_MODE_G_[2:0] bits in [CTRL2 \(11h\)](#).

If the value of the OP_MODE_G_[2:0] bits is 000 (default), high-performance mode is valid for all ODRs (from 7.5 Hz up to 7.68 kHz).

Low-power mode is available for lower ODRs (7.5 Hz, 15 Hz, 30 Hz, 60 Hz, 120 Hz, 240 Hz) and it is enabled by setting the the OP_MODE_G_[2:0] bits to 101.

High-accuracy ODR mode is available for ODR values from 15 Hz up to 7.68 kHz and it is enabled by setting the OP_MODE_G_[2:0] bits to 001. Refer to [Section 6.5 High-accuracy ODR mode](#) for more details.

6.5

High-accuracy ODR mode

High-accuracy ODR (HAODR) mode can be enabled to reduce the part-to-part output data rate variation. It supports accelerometer only, gyroscope only, and combo (accelerometer and gyroscope) modes. When this mode is used for one sensor (accelerometer or gyroscope), the other sensor also has to be configured in high-accuracy ODR (HAODR) mode.

The main high-accuracy ODR features are:

- Noise level is aligned with high-performance mode
- Power consumption increase of 20 μ A (typical) vs. the corresponding high-performance mode configuration selected
- The UI channel bandwidth can be selected through the gyroscope LPF1 and accelerometer HPF/LPF2 filters.
- When HAODR mode is enabled, it is applied to the UI accelerometer, UI gyroscope, EIS gyroscope, and temperature. It is not applied to OIS accelerometer/gyroscope channels.

Note:

HAODR mode has to be enabled / disabled when the device is in power-down mode.

When HAODR mode is enabled, two different sets of ODRs are supported based on the configuration of the HAODR_SEL_[1:0] bitfield in the [HAODR_CFG \(62h\)](#) register, as shown in the table below.

Note:

High-accuracy ODR mode is not compatible with the analog hub / Qvar functionality and the activity/inactivity functionality (motion/stationary can be used).

Table 20. Accelerometer and gyroscope ODR selection in high-accuracy ODR mode

6.6

ODR-triggered mode

When ODR-triggered mode is enabled, a reference signal must be provided to the INT2 pin, and the device then automatically aligns (in frequency and phase) the data generation to the edges of the reference signal.

It supports accelerometer only, gyroscope only, and combo (accelerometer and gyroscope) modes. When both the accelerometer and gyroscope are enabled, the user must configure the same ODR on both the accelerometer and gyroscope. It is not possible to select different ODRs for the accelerometer and gyroscope; if different output data rate values are set, the ODR configured for the gyroscope data is also applied to the accelerometer data.

The full-scale configurations are totally independent between the accelerometer and gyroscope and they can be set in any combination.

Note:

ODR-triggered mode has to be enabled / disabled when the device is in power-down mode.

Note:

When ODR-triggered mode is enabled, the 1100 configuration of the ODR_XL_[3:0] bits in register CTRL1 (10h) and the 1100 configuration of the ODR_G_[3:0] bits in register CTRL2 (11h) cannot be used.

Note:

ODR-triggered mode is not compatible with the analog hub / Qvar functionality nor the EIS functionality.

6.7

Analog hub functionality

The LSM6DSV16X embeds an analog hub sensing functionality which is able to connect an analog input and convert it to a digital signal for embedded processing.

In the LSM6DSV16X, the analog hub has a dedicated channel that can be activated by setting the AH_QVAR_EN bit to 1 in the [CTRL7 \(16h\)](#) register.

The accelerometer sensor must be set in high-performance mode or in normal mode when the analog hub channel is enabled.

The analog hub data-ready signal is represented by the AH_QVARDA bit of the [STATUS_REG \(1Eh\)](#) register. This signal can be driven to the INT2 pin by setting the INT2_DRDY_AH_QVAR bit to 1 in the [CTRL7 \(16h\)](#) register.

Analog hub data are available as a 16-bit word in two's complement in the [AH_QVAR_OUT_L \(3Ah\)](#) and [AH_QVAR_OUT_H \(3Bh\)](#) registers at a fixed rate of 240 Hz (typical).

Analog signal data can be also processed by MLC/FSM logic.

The analog hub functionality is available in mode 1 connection mode for the I²C interface only. The external analog lines have to be connected to pin 2 (SDx/AH1/Qvar1) and/or pin 3 (SCx/AH2/Qvar2), so the I²C-master interface (mode 2) and the auxiliary SPI (mode 3) are not available when the analog hub is used.

The equivalent input impedance of the analog hub buffers can be selected by properly setting the AH_QVAR_C_ZIN_[1:0] bits in the [CTRL7 \(16h\)](#) register.

6.8

Qvar functionality

The LSM6DSV16X embeds a Qvar sensor which is able to detect electric charge variations in the proximity of the external electrodes connected to the device.

In the LSM6DSV16X, Qvar has a dedicated channel that can be activated by setting the AH_QVAR_EN bit to 1 in the [CTRL7 \(16h\)](#) register.

The accelerometer sensor must be set in high-performance mode or in normal mode when the Qvar channel is enabled.

The Qvar data-ready signal is represented by the AH_QVARDA bit of the [STATUS_REG \(1Eh\)](#) register. This signal can be driven to the INT2 pin by setting the INT2_DRDY_AH_QVAR bit to 1 in the [CTRL7 \(16h\)](#) register.

Qvar data are available as a 16-bit word in two's complement in the [AH_QVAR_OUT_L \(3Ah\)](#) and [AH_QVAR_OUT_H \(3Bh\)](#) registers at a fixed rate of 240 Hz (typical).

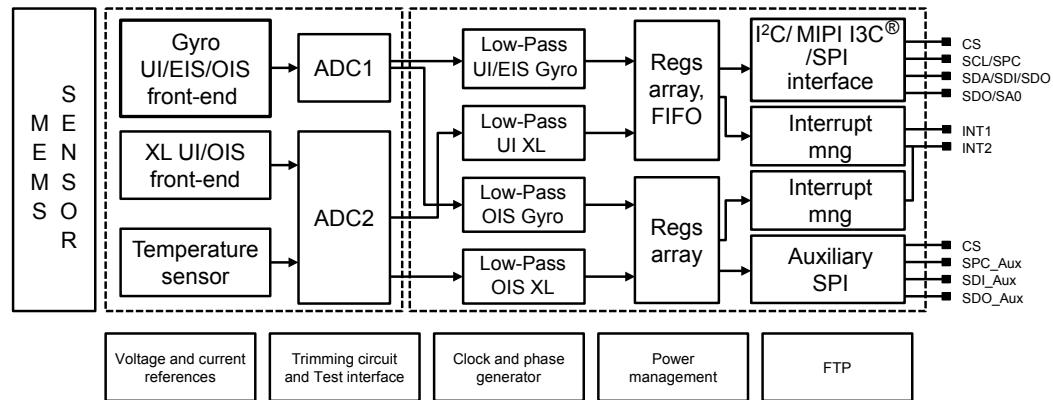

Qvar data can also be processed by MLC/FSM logic.

The Qvar functionality is available in mode 1 connection mode for the I²C interface only. The external electrodes have to be connected to pin 2 (SDx/AH1/Qvar1) and/or pin 3 (SCx/AH2/Qvar2), so the I²C-master interface (mode 2) and the auxiliary SPI (mode 3) are not available when Qvar is used.

The equivalent input impedance of the Qvar buffers can be selected by properly setting the AH_QVAR_C_ZIN_[1:0] bits in the [CTRL7 \(16h\)](#) register.

6.9 Block diagram of filters

Figure 18. Block diagram of filters

6.9.1 Block diagrams of the accelerometer filters

In the LSM6DSV16X, the filtering chain for the accelerometer part is composed of the following:

- Digital filter (LPF1)
- Composite filter

Details of the block diagram appear in the following figure.

Figure 19. Accelerometer UI chain

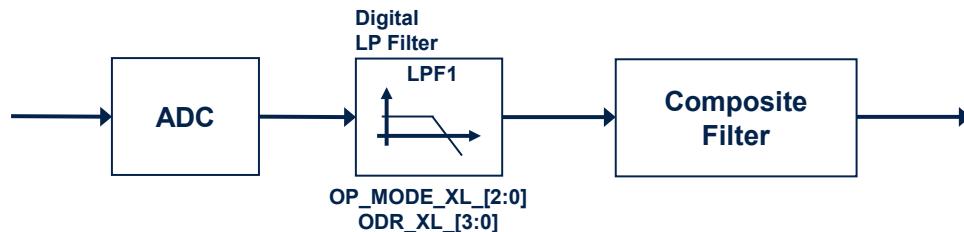

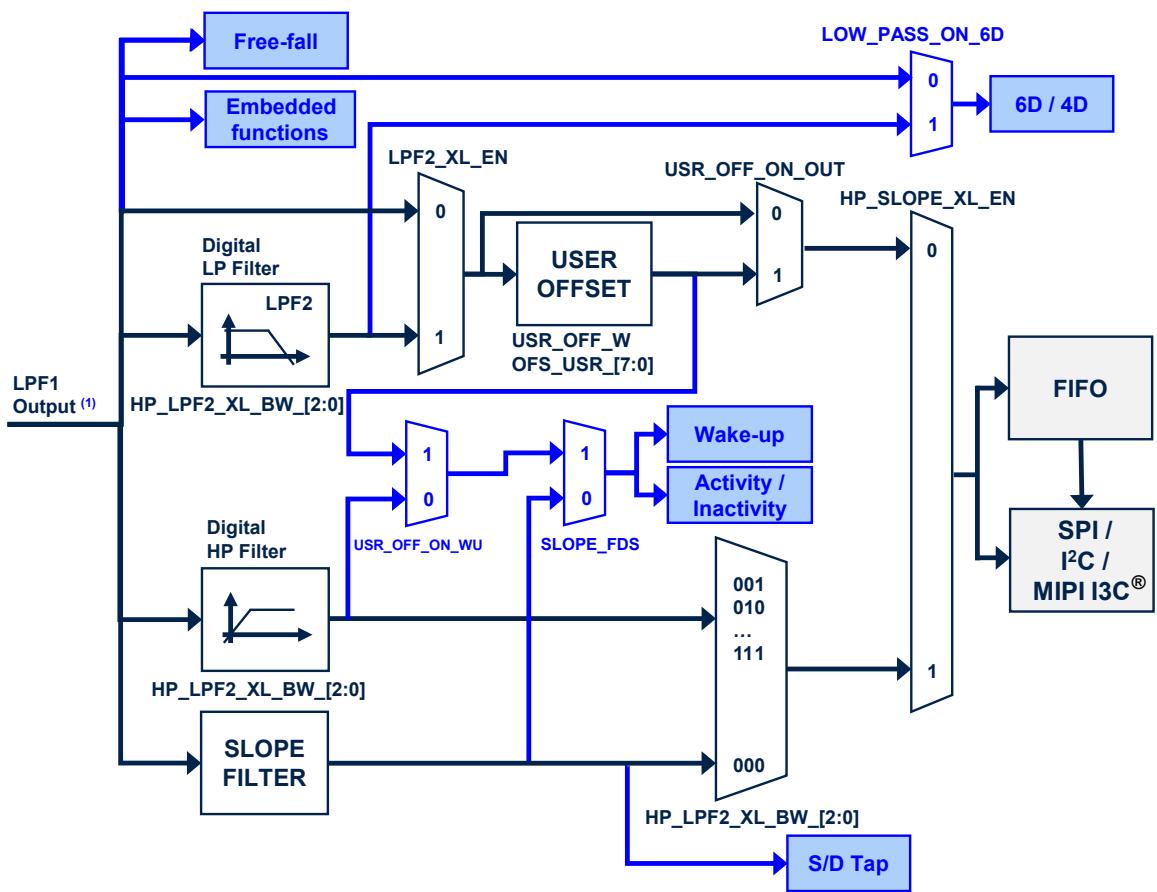

Figure 20. Accelerometer composite filter

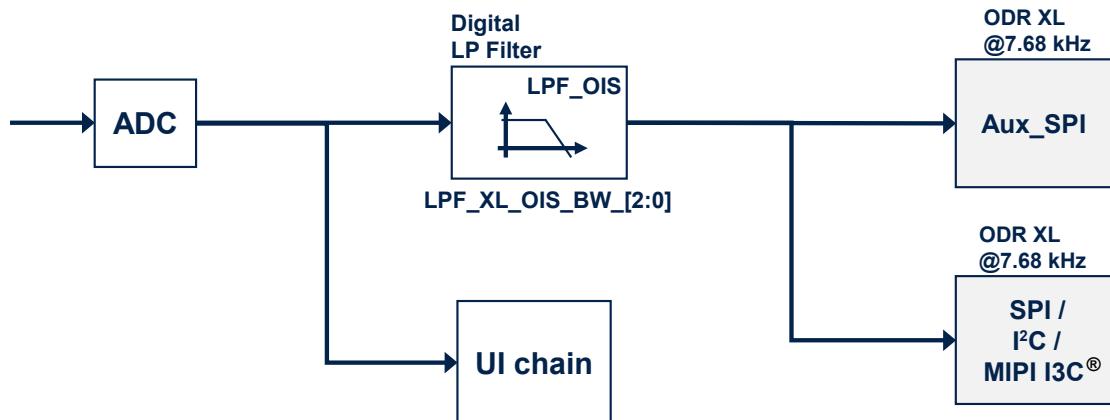

1. The cutoff value of the LPF1 output is ODR/2 when the accelerometer is in high-performance mode, high-accuracy ODR mode, or normal mode. This value is equal to 2300 Hz when the accelerometer is in low-power mode 1 (2 mean), 912 Hz in low-power mode 2 (4 mean) or 431 Hz in low-power mode 3 (8 mean).

Note:

Embedded functions include finite state machine, machine learning core, pedometer, step detector and step counter, significant motion detection, and tilt functions.

The accelerometer filtering chain when mode 3 is enabled is illustrated in the following figure.

Figure 21. Accelerometer chain with mode 3 enabled

Note: The accelerometer OIS chain is enabled by setting the OIS_XL_EN bit to 1 in the [UI_CTRL1_OIS \(70h\)](#) / [SPI2_CTRL1_OIS \(70h\)](#) register.

The configuration of the accelerometer UI chain is not affected by enabling/disabling the accelerometer OIS chain, with one exception: accelerometer normal operating mode ($OP_MODE_XL_{[2:0]} = 111$ in the [CTRL1 \(10h\)](#) register) cannot be used when the accelerometer OIS chain is enabled.

Accelerometer output values are available in the following registers with ODR at 7.68 kHz:

- [UI_OUTX_L_A_OIS_DualC \(34h\)](#) and [UI_OUTX_H_A_OIS_DualC \(35h\)](#) through [UI_OUTZ_L_A_OIS_DualC \(38h\)](#) and [UI_OUTZ_H_A_OIS_DualC \(39h\)](#)
- [SPI2_OUTX_L_A_OIS \(28h\)](#) and [SPI2_OUTX_H_A_OIS \(29h\)](#) through [SPI2_OUTZ_L_A_OIS \(2Ch\)](#) and [SPI2_OUTZ_H_A_OIS \(2Dh\)](#)

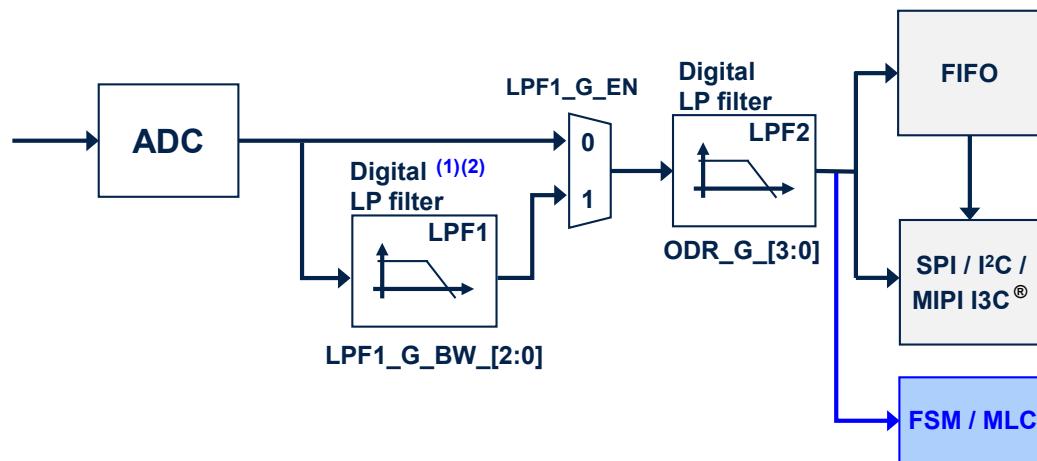

Note: When the accelerometer OIS is used, refer to the product application note for the power mode configuration and settings.

6.9.2 Block diagrams of the gyroscope filters

In the LSM6DSV16X, the gyroscope filtering chain depends on the mode configuration:

- Mode 1 (for user interface (UI) and electronic image stabilization (EIS) functionality through the primary interface) and mode 2

Figure 22. Gyroscope digital chain - mode 1 (UI/EIS) and mode 2

1. When the gyroscope OIS or EIS chain is enabled, the LPF1 filter is not available in the gyroscope UI chain. It is recommended to avoid using the LPF1 filter in the gyroscope UI chain when the gyroscope OIS or EIS is used.
2. The LPF1 filter is available in high-performance mode only. If the gyroscope is configured in low-power mode, the LPF1 filter is bypassed.

In this configuration, the gyroscope ODR is selectable from 7.5 Hz up to 7.68 kHz. A low-pass filter (LPF1) is available, for more details about the filter characteristics see [Table 64. Gyroscope LPF1 + LPF2 bandwidth selection](#).

The digital LPF2 filter's cutoff frequency depends on the selected gyroscope ODR, as indicated in the following table.

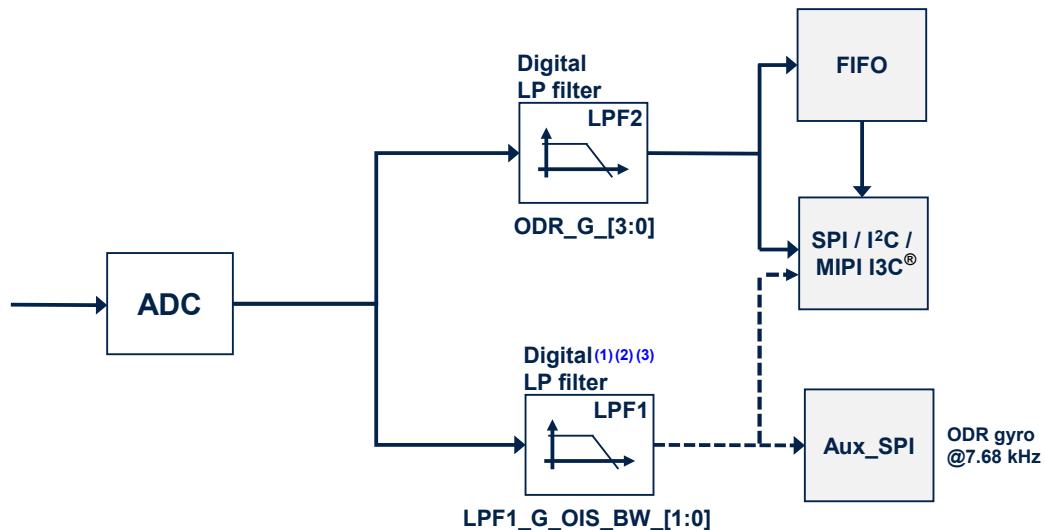

Table 21. Gyroscope LPF2 bandwidth selection

| Gyroscope ODR [Hz] | LPF2 cutoff [Hz] |
|--------------------|------------------|
| 7.5 | 3.4 |
| 15 | 6.6 |
| 30 | 13.0 |
| 60 | 24.6 |
| 120 | 49.4 |
| 240 | 96 |
| 480 | 187 |
| 960 | 342 |
| 1.92 kHz | 491 |
| 3.84 kHz | 528 |
| 7.68 kHz | 537 |

Note: Data can be acquired from the output registers and FIFO over the primary I²C/MIPI I3C®/SPI interface.

- Mode 3 (for OIS functionality)

Figure 23. Gyroscope digital chain - mode 3 (OIS)

1. When the gyroscope OIS or EIS chain is enabled, the LPF1 filter is not available in the gyroscope UI chain.
2. It is recommended to avoid using the LPF1 filter in mode 1/2 when the gyroscope OIS or EIS chain is used.
3. When the gyroscope OIS is used, refer to the product application note for the power mode configuration and settings.

The auxiliary interface needs to be enabled in [UI_CTRL1_OIS \(70h\) / SPI2_CTRL1_OIS \(70h\)](#).

In mode 3 configuration, there are two paths:

- The chain for user interface (UI) where the ODR is selectable from 7.5 Hz up to 7.68 kHz
- The chain for OIS where the ODR is at 7.68 kHz and the LPF1 is available. The LPF1 configuration depends on the setting of the LPF1_G_OIS_BW_[1:0] bits in register [UI_CTRL2_OIS \(71h\) / SPI2_CTRL2_OIS \(71h\)](#); for more details about the filter characteristics see [UI_CTRL2_OIS \(71h\)](#). Gyroscope output values are in registers 22h to 27h if read from the Auxi_SPI or in registers 2Eh to 33h if read from the primary interface with the selected full scale FS_G_OIS_[1:0] bits in [UI_CTRL2_OIS \(71h\) / SPI2_CTRL2_OIS \(71h\)](#).

6.10 Enhanced EIS

The LSM6DSV16X offers advanced design flexibility for EIS applications: enhanced EIS functionality has a dedicated channel and processing with independent filtering.

Enhanced EIS main features:

- Enhanced EIS channel gyroscope data can be read over the primary interfaces through I²C / MIPI I3C® / SPI.
 - EIS data are available in free-run mode in the output registers (`UI_OUTX_L_G_OIS_EIS` (2Eh) and `UI_OUTX_H_G_OIS_EIS` (2Fh) through `UI_OUTZ_L_G_OIS_EIS` (32h) and `UI_OUTZ_H_G_OIS_EIS` (33h)) by setting the G_EIS_ON_G_OIS_OUT_REG bit to 1 in the `CTRL_EIS` (6Bh) register or in FIFO (by setting the G_EIS_FIFO_EN bit to 1 in the `FIFO_CTRL4` (0Ah) register) with dedicated TAG and timestamp configurable using `FIFO_CTRL4` (0Ah).
 - Enhanced EIS option is compatible with mode 3 selection. When EIS data-out are read from the output registers (setting G_EIS_ON_G_OIS_OUT_REG bit), data from the gyroscope OIS chain can be only read from the auxiliary SPI interface.

Figure 24. LSM6DSV16X supports UI, enhanced EIS, and OIS processing simultaneously

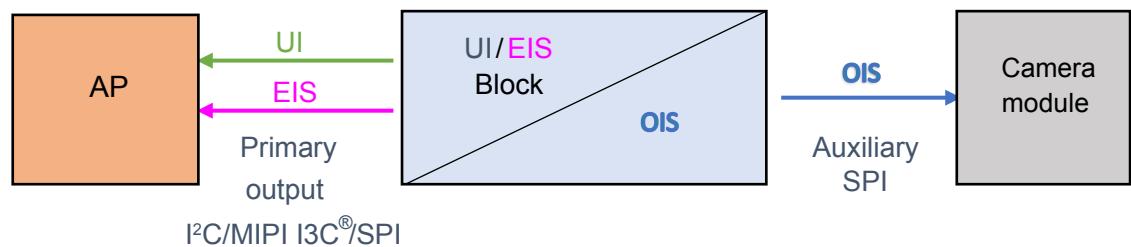

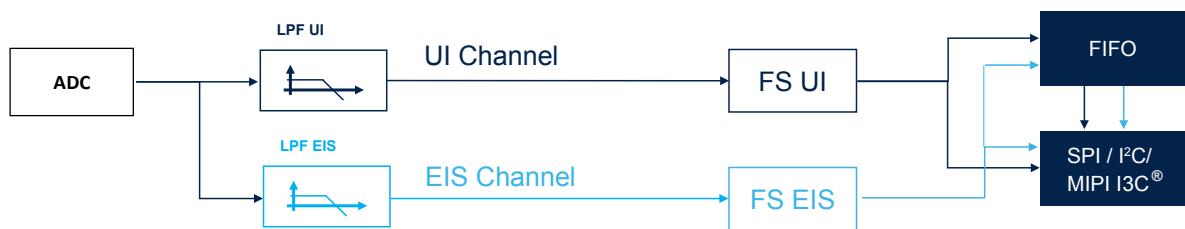

Figure 25. Gyroscope enhanced EIS and UI block diagram

When enhanced EIS mode is activated through the ODR_EIS[1:0] bits in the CTRL_EIS (6Bh) register:

- Gyroscope UI can be configured only in power-down mode, high-performance mode, or high-accuracy ODR mode.
 - Gyroscope EIS full scale can be selected by using the FS_G_EIS_[2:0] bits in the [CTRL_EIS \(6Bh\)](#) register.
 - Gyroscope EIS data rate selectable at 1.92 kHz or 960 Hz configurable through the ODR_G_EIS_[1:0] bits in the [CTRL_EIS \(6Bh\)](#) register.
 - LPF_EIS low-pass filter (refer to [Figure 25](#)) bandwidth selection can be configured through the LPF_G_EIS_BW bit in the [CTRL_EIS \(6Bh\)](#) register.

6.11 OIS

This section describes OIS functionality. There is a dedicated gyroscope and accelerometer DSP for OIS. The device also supports self-test functionality on the OIS side.

6.11.1 Enabling OIS functionality and connection schemes

There are two different ways in order to enable and configure OIS functionality:

- **Auxiliary SPI full control:** Enabling and configuration done from the auxiliary SPI
- **Primary interface full control:** Enabling and configuration done from the primary interface

The configurations that allow selecting these two different options are done using the OIS_CTRL_FROM_UI bit in the [FUNC_CFG_ACCESS \(01h\)](#) register as described in the following table.

Table 22. OIS configurations

| OIS_CTRL_FROM_UI | OIS configuration option |
|------------------|--------------------------------|
| 0 | Auxiliary SPI full control |
| 1 | Primary interface full control |

6.11.1.1 Auxiliary SPI full control

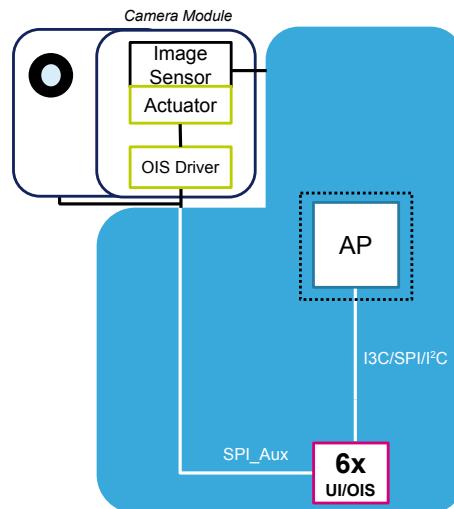

This is the default condition of the device. The camera module is completely independent from the application processor as shown in Figure 26.

The auxiliary SPI can configure OIS functionality through SPI2_INT_OIS (6Fh), SPI2_CTRL1_OIS (70h), SPI2_CTRL2_OIS (71h), SPI2_CTRL3_OIS (72h).

Reading from the auxiliary SPI is enabled only when the SPI2_READ_EN bit in the SPI2_CTRL1_OIS (70h) register is set to 1.

The primary interface can access the OIS control registers (UI_INT_OIS (6Fh), UI_CTRL1_OIS (70h), UI_CTRL2_OIS (71h), UI_CTRL3_OIS (72h)) in read mode.

Figure 26. Auxiliary SPI full control

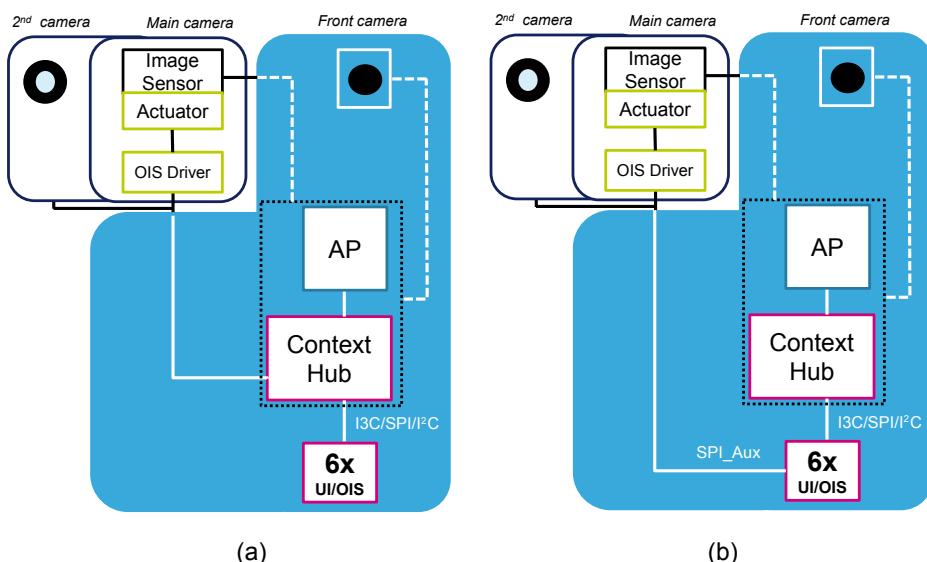

6.11.1.2 Primary interface full control

This option allows the application processor to configure all OIS functionalities from the primary interface. This option allows using embedded OIS data for both the main and front camera, connecting them to the application processor (eventually adding a context hub) as shown in Figure 27: the AP can also do some processing on the data before sending them to the cameras.

In order to place the device in this mode, the OIS_CTRL_FROM_UI bit in the FUNC_CFG_ACCESS (01h) register must be set to 1 from the primary interface.

Figure 27. OIS Primary interface full control

Then, the AP can configure OIS functionalities through [UI_INT_OIS](#) (6Fh), [UI_CTRL1_OIS](#) (70h), [UI_CTRL2_OIS](#) (71h), [UI_CTRL3_OIS](#) (72h).

Reading from the auxiliary SPI can be enabled by setting the SPI2_READ_EN bit in the [UI_CTRL1_OIS](#) (70h) register to 1 in order to directly read OIS data (as shown in Figure 27 (b)). The auxiliary SPI can access the [SPI2_INT_OIS](#) (6Fh), [SPI2_CTRL1_OIS](#) (70h), [SPI2_CTRL2_OIS](#) (71h), and [SPI2_CTRL3_OIS](#) (72h) registers in read-only mode.

Note: The OIS_CTRL_FROM_UI bit is reset by the software reset procedure.

6.12

FIFO

The presence of a FIFO allows consistent power saving for the system since the host processor does not need continuously poll data from the sensor, but it can wake up only when needed and burst the significant data out from the FIFO.

The LSM6DSV16X embeds 1.5 KB of data in FIFO (up to 4.5 KB with the compression feature enabled) to store the following data:

- Gyroscope
- Accelerometer
- External sensors (up to 4)
- Step counter
- Timestamp
- Temperature
- MLC features and filters
- SFLP output data (quaternion, gyroscope bias, gravity vector)

Writing data in the FIFO can be configured to be triggered by the:

- Accelerometer / gyroscope data-ready signal
- Sensor hub data-ready signal
- Step detection signal

The applications have maximum flexibility in choosing the rate of batching for physical sensors with FIFO-dedicated configurations: accelerometer, gyroscope and temperature sensor batch rates can be selected by the user. External sensor writing in FIFO can be triggered by the accelerometer data-ready signal or by an external sensor interrupt. The step counter can be stored in FIFO with associated timestamp each time a step is detected. It is possible to select decimation for timestamp batching in FIFO with a factor of 1, 8, or 32.

The reconstruction of a FIFO stream is a simple task thanks to the FIFO_DATA_OUT_TAG byte that allows recognizing the meaning of a word in FIFO.

FIFO allows correct reconstruction of the timestamp information for each sensor stored in FIFO. If a change in the ODR or BDR (batch data rate) configuration is performed, the application can correctly reconstruct the timestamp and know exactly when the change was applied without disabling FIFO batching. FIFO stores information of the new configuration and timestamp in which the change was applied in the device.

Finally, FIFO embeds a compression algorithm that the user can enable in order to have up to 4.5 KB data stored in FIFO and take advantage of interface communication length for FIFO flushing and communication power consumption.

The programmable FIFO watermark threshold can be set using the WTM[7:0] bits in the [FIFO_CTRL1 \(07h\)](#) register. To monitor the FIFO status, dedicated registers ([FIFO_STATUS1 \(1Bh\)](#), [FIFO_STATUS2 \(1Ch\)](#)) can be read to detect FIFO overrun events, FIFO full status, FIFO empty status, FIFO watermark status and the number of unread samples stored in the FIFO. To generate dedicated interrupts on the INT1 and INT2 pins of these status events, the configuration can be set in [INT1_CTRL \(0Dh\)](#) and [INT2_CTRL \(0Eh\)](#).

The FIFO buffer can be configured according to seven different modes:

- Bypass mode
- FIFO mode
- Continuous mode
- Continuous-to-FIFO mode
- ContinuousWTM-to-full mode
- Bypass-to-continuous mode
- Bypass-to-FIFO mode

Each mode is selected by the FIFO_MODE_[2:0] bits in the [FIFO_CTRL4 \(0Ah\)](#) register.

6.12.1

Bypass mode

In bypass mode ([FIFO_CTRL4 \(0Ah\)](#)([FIFO_MODE_\[2:0\]](#) = 000), the FIFO is not operational and it remains empty. Bypass mode is also used to reset the FIFO when in FIFO mode.

6.12.2 FIFO mode

In FIFO mode ([FIFO_CTRL4 \(0Ah\)](#)([FIFO_MODE_\[2:0\]](#) = 001) data from the output channels are stored in the FIFO until it is full.

To reset FIFO content, bypass mode should be selected by writing [FIFO_CTRL4 \(0Ah\)](#)([FIFO_MODE_\[2:0\]](#)) to 000. After this reset command, it is possible to restart FIFO mode by writing [FIFO_CTRL4 \(0Ah\)](#)([FIFO_MODE_\[2:0\]](#)) to 001.

The FIFO buffer memorizes up to 4.5 KB of data (with compression enabled) but the depth of the FIFO can be resized by setting the WTM[7:0] bits in [FIFO_CTRL1 \(07h\)](#). If the STOP_ON_WTM bit in [FIFO_CTRL2 \(08h\)](#) is set to 1, FIFO depth is limited up to the WTM[7:0] bits in the [FIFO_CTRL1 \(07h\)](#) register.

6.12.3 Continuous mode

Continuous mode ([FIFO_CTRL4 \(0Ah\)](#)([FIFO_MODE_\[2:0\]](#) = 110) provides a continuous FIFO update: as new data arrives, the older data is discarded.

A FIFO threshold flag [FIFO_STATUS2 \(1Ch\)](#)([FIFO_WTM_IA](#)) is asserted when the number of unread samples in FIFO is greater than or equal to [FIFO_CTRL1 \(07h\)](#) (WTM[7:0]).

It is possible to route the [FIFO_WTM_IA](#) flag to the INT1 pin by writing in register [INT1_CTRL \(0Dh\)](#) ([INT1_FIFO_TH](#)) = 1 or to the INT2 pin by writing in register [INT2_CTRL \(0Eh\)](#)([INT2_FIFO_TH](#)) = 1.

A full-flag interrupt can be enabled, [INT1_CTRL \(0Dh\)](#)([INT1_FIFO_FULL](#)) = 1 or [INT2_CTRL \(0Eh\)](#) ([INT2_FIFO_FULL](#)) = 1, in order to indicate FIFO saturation and eventually read its content all at once.

If an overrun occurs, at least one of the oldest samples in FIFO has been overwritten and the [FIFO_OVR_IA](#) flag in [FIFO_STATUS2 \(1Ch\)](#) is asserted.

In order to empty the FIFO before it is full, it is also possible to pull from FIFO the number of unread samples available in [FIFO_STATUS1 \(1Bh\)](#) and [FIFO_STATUS2 \(1Ch\)](#)([DIFF_FIFO_\[8:0\]](#)).

6.12.4 Continuous-to-FIFO mode

In continuous-to-FIFO mode ([FIFO_CTRL4 \(0Ah\)](#)([FIFO_MODE_\[2:0\]](#) = 011), FIFO behavior changes according to the trigger event detected in one of the following interrupt events:

- Single tap
- Double tap
- Wake-up
- Free-fall
- D6D

When the selected trigger bit is equal to 1, FIFO operates in FIFO mode.

When the selected trigger bit is equal to 0, FIFO operates in continuous mode.

6.12.5 ContinuousWTM-to-full mode

In continuousWTM-to-full mode ([FIFO_CTRL4 \(0Ah\)](#)([FIFO_MODE_\[2:0\]](#) = 010), FIFO behavior changes according to the trigger event detected in one of the following interrupt events:

- Single tap
- Double tap
- Wake-up
- Free-fall
- D6D

When the selected trigger bit is equal to 0, FIFO operates in continuous mode with the FIFO size limited to the FIFO watermark level (defined by the WTM[7:0] bits in the [FIFO_CTRL1 \(07h\)](#) register).

When the selected trigger bit is equal to 1, FIFO continues to store data until it is full.

6.12.6 Bypass-to-continuous mode

In bypass-to-continuous mode ([FIFO_CTRL4 \(0Ah\)](#)([FIFO_MODE_\[2:0\]](#) = 100), data measurement storage inside FIFO operates in Continuous mode when selected triggers are equal to 1, otherwise FIFO content is reset (bypass mode).

FIFO behavior changes according to the trigger event detected in one of the following interrupt events:

- Single tap
- Double tap
- Wake-up
- Free-fall
- D6D

6.12.7 Bypass-to-FIFO mode

In bypass-to-FIFO mode ([FIFO_CTRL4 \(0Ah\)](#)([FIFO_MODE_\[2:0\]](#) = 111), data measurement storage inside FIFO operates in FIFO mode when selected triggers are equal to 1, otherwise FIFO content is reset (bypass mode).

FIFO behavior changes according to the trigger event detected in one of the following interrupt events:

- Single tap
- Double tap
- Wake-up
- Free-fall
- D6D

6.12.8 FIFO reading procedure

The data stored in FIFO are accessible from dedicated registers and each FIFO word is composed of 7 bytes: one tag byte ([FIFO_DATA_OUT_TAG \(78h\)](#), in order to identify the sensor, and 6 bytes of fixed data ([FIFO_DATA_OUT](#) registers from (79h) to (7Eh)).

The DIFF_FIFO_[8:0] field in the [FIFO_STATUS1 \(1Bh\)](#) and [FIFO_STATUS2 \(1Ch\)](#) registers contains the number of words (1 byte TAG + 6 bytes DATA) collected in FIFO.

In addition, it is possible to configure a counter of the batch events of accelerometer or gyroscope sensors. The flag COUNTER_BDR_IA in [FIFO_STATUS2 \(1Ch\)](#) alerts that the counter reaches a selectable threshold ([CNT_BDR_TH_\[9:0\]](#) field in [COUNTER_BDR_REG1 \(0Bh\)](#) and [COUNTER_BDR_REG2 \(0Ch\)](#)). This allows triggering the reading of FIFO with the desired latency of one single sensor. The sensor is selectable using the TRIG_COUNTER_BDR_[1:0] bits in [COUNTER_BDR_REG1 \(0Bh\)](#). As for the other FIFO status events, the flag COUNTER_BDR_IA can be routed on the INT1 or INT2 pins by asserting the corresponding bits (INT1_CNT_BDR of [INT1_CTRL \(0Dh\)](#) and INT2_CNT_BDR of [INT2_CTRL \(0Eh\)](#)).

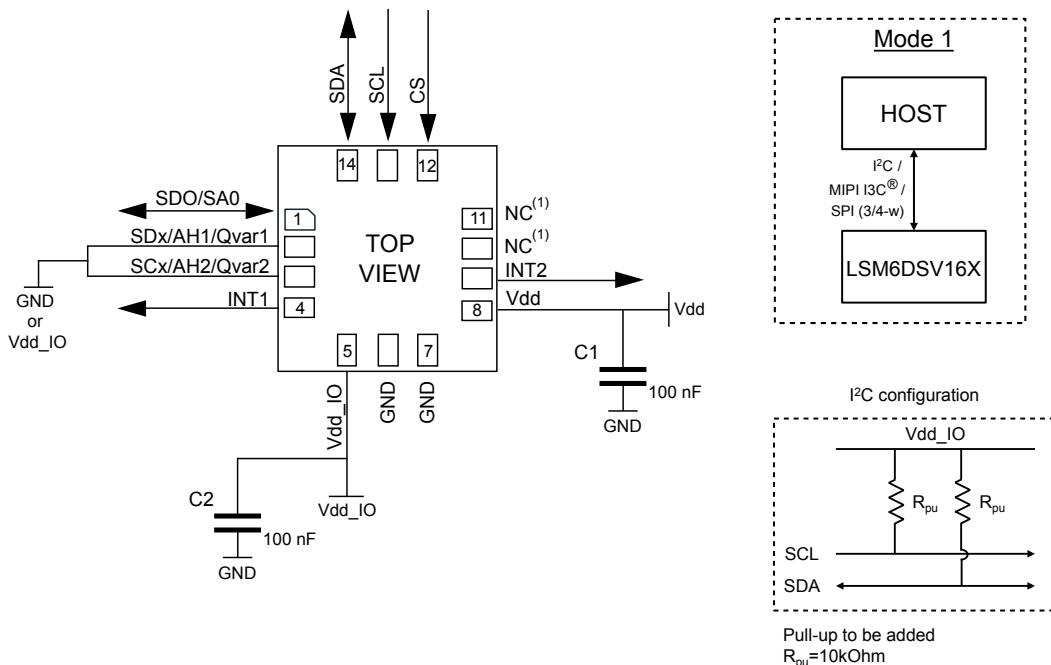

In order to maximize the amount of accelerometer and gyroscope data in FIFO, the user can enable the compression algorithm by setting to 1 both the [FIFO_COMPR_EN](#) bit in [EMB_FUNC_EN_B \(05h\)](#) (embedded functions registers bank) and the [FIFO_COMPR_RT_EN](#) bit in [FIFO_CTRL2 \(08h\)](#). When compression is enabled, it is also possible to force writing noncompressed data at a selectable rate using the UNCOMPR_RATE_[1:0] field in [FIFO_CTRL2 \(08h\)](#).

Meta information about accelerometer and gyroscope sensor configuration changes can be managed by enabling the ODR_CHG_EN bit in [FIFO_CTRL2 \(08h\)](#).

7 Application hints

7.1 LSM6DSV16X electrical connections in mode 1

Figure 28. LSM6DSV16X electrical connections in mode 1

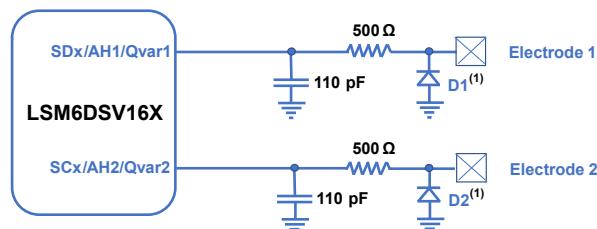

1. Leave pin electrically unconnected and soldered to PCB.

The device core is supplied through the Vdd line. Power supply decoupling capacitors ($C_1, C_2 = 100 \text{ nF}$ ceramic) should be placed as near as possible to the supply pin of the device (common design practice).

The functionality of the device and the measured acceleration/angular rate data is selectable and accessible through the SPI/I²C/MIPI I3C[®] interface.

The functions, the threshold, and the timing of the two interrupt pins for each sensor can be completely programmed by the user through the SPI/I²C/MIPI I3C[®] interface.

(1) ST ESDALCL5-1BM2 is referenced as an ST catalog product but similar features of other ESD diodes also can be used.

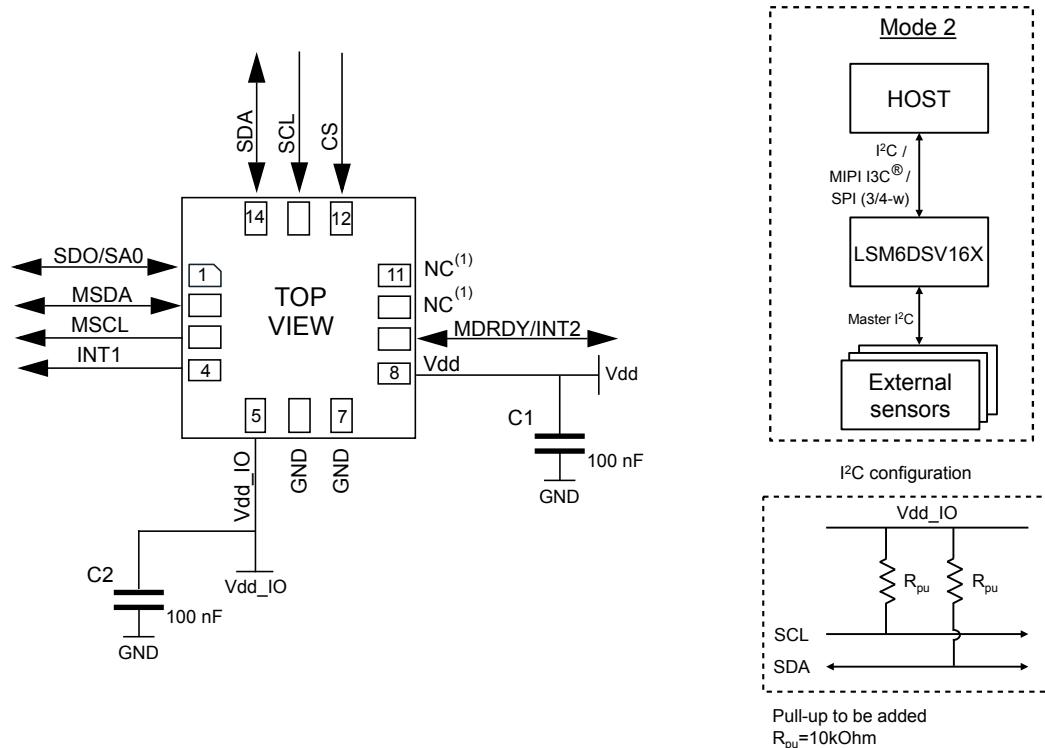

Note:

Figure 29 provides an example of a test circuit. For a specific application, refer to the related application note.

1. *Leave pin electrically unconnected and soldered to PCB.*

The device core is supplied through the Vdd line. Power supply decoupling capacitors ($C_1, C_2 = 100 \text{ nF}$ ceramic) should be placed as near as possible to the supply pin of the device (common design practice).

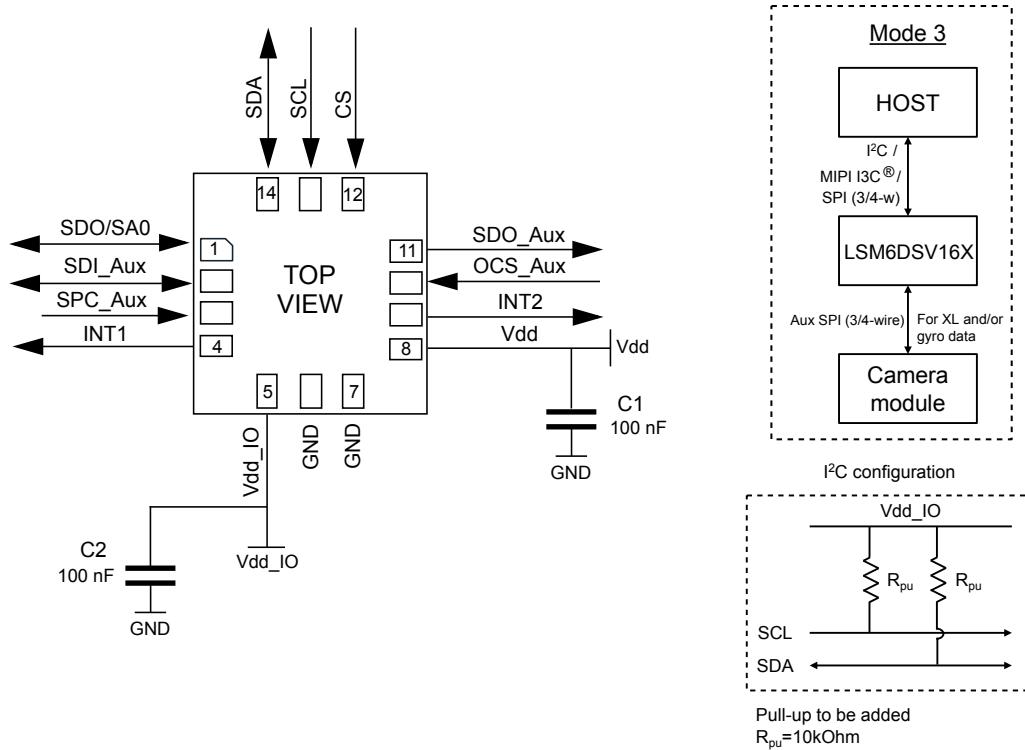

The functionality of the device and the measured acceleration/angular rate data is selectable and accessible through the SPI/I²C/MIPI I3C[®] primary interface.

The functions, the threshold, and the timing of the two interrupt pins for each sensor can be completely programmed by the user through the SPI/I²C/MIPI I3C[®] primary interface.

LSM6DSV16X electrical connections in mode 3

Figure 31. LSM6DSV16X electrical connections in mode 3 (auxiliary 3/4-wire SPI)

Note: When mode 3 is used, the pull-up on pins 10 and 11 can be enabled or disabled (refer to Table 23. Internal pin status). To avoid leakage current, it is not recommended to leave the SPI lines floating (or when the OIS system is off).

The device core is supplied through the Vdd line. Power supply decoupling capacitors ($C_1, C_2 = 100 \text{ nF}$ ceramic) should be placed as near as possible to the supply pin of the device (common design practice).

The functionality of the device is selectable and accessible through the SPI/I²C/MIPI I3C® primary interface.

Measured acceleration/angular rate data is selectable and accessible through the SPI/I²C/MIPI I3C® primary interface and auxiliary SPI.

The functions, the threshold, and the timing of the two interrupt pins for each sensor can be completely programmed by the user through the SPI/I²C/MIPI I3C® interface.

Note: When mode 3 is used, refer to the product application note for the power mode configuration and settings.

Reserved registers must not be changed. Writing to those registers may cause permanent damage to the device.
The content of the registers that are loaded at boot should not be changed. They contain the factory calibration values. Their content is automatically restored when the device is powered up.

9 Register description

The device contains a set of registers which are used to control its behavior and to retrieve linear acceleration, angular rate, temperature, analog hub and Qvar data. The register addresses, made up of 7 bits, are used to identify them and to write the data through the serial interface.

9.1 FUNC_CFG_ACCESS (01h)

Enable embedded functions (R/W)

| EMB_FUNC_REG_ACCESS | Enables access to the embedded functions configuration registers. ⁽¹⁾ Default value: 0 |
| SHUB_REG_ACCESS | Enables access to the sensor hub (I ² C master) configuration registers. ⁽²⁾ Default value: 0 |
| FSM_WR_CTRL_EN | Enables the control of the CTRL registers to FSM (FSM can change some configurations of the device autonomously). Default value: 0 (0: disabled; 1: enabled) |
| SW_POR | Global reset of the device. Default value: 0 |
| SPI2_RESET | Resets the control registers of SPI2 from the primary interface. This bit must be set to 1 and then back to 0 (this bit is not automatically cleared). Default value: 0 |
| OIS_CTRL_FROM_UI | Enables the full control of OIS configurations from the primary interface. Default value: 0 (0: OIS chain full control from primary interface disabled; 1: OIS chain full control from primary interface enabled) |

1. Details concerning the embedded functions configuration registers are available in [Section 12 Embedded functions register mapping](#) and [Section 13 Embedded functions register description](#).
2. Details concerning the sensor hub registers are available in [Section 16 Sensor hub register mapping](#) and [Section 17 Sensor hub register description](#).

9.2 PIN_CTRL (02h)

SDO, OCS_Aux, SDO_Aux pins pull-up register (R/W). This register is not reset during the software reset procedure (see bit 0 of the [CTRL3 \(12h\)](#) register).

| OIS_PU_DIS | Disables pull-up on both OCS_Aux and SDO_Aux pins (for mode 1 and mode 2). For further details about the configuration of the pull-up resistors in mode 3, refer to Table 23 . Default value: 0 (0: OCS_Aux and SDO_Aux pins with pull-up; 1: OCS_Aux and SDO_Aux pins pull-up disconnected) |
| SDO_PU_EN | Enables pull-up on SDO pin. For details, refer to Table 23 . Default value: 0 (0: SDO pin pull-up disconnected; 1: SDO pin with pull-up) |
| IBHR_POR_EN | Selects the action the device performs after "reset whole chip" I3C pattern. Default value: 1 (0: configuration reset (SW reset + dynamic address reset); 1: global reset (POR reset)) |

9.3 IF_CFG (03h)

Interface configuration register (R/W). This register is not reset during the software reset procedure (see bit 0 of the CTRL3 (12h) register).

9.11 INT1_CTRL (0Dh)

INT1 pin control register (R/W)

Each bit in this register enables a signal to be carried over INT1 when the MIPI I3C® dynamic address is not assigned (I²C or SPI is used). Some bits can be also used to trigger an IBI (in-band interrupt) when the MIPI I3C® interface is used. The output of the pin is the OR combination of the signals selected here and in [MD1_CFG \(5Eh\)](#).

Table 66. CTRL7 register description

| | |
|---------------------|---|
| AH_QVAR_EN | Enables the analog hub and Qvar chain. When this bit is set to 1, the analog hub and Qvar buffers are connected to the SDx/AH1/Qvar1 and SCx/AH2/Qvar2 pins. Before setting this bit to 1, the accelerometer and gyroscope sensors have to be configured in power-down mode. Default value: 0 (0: disabled; 1: enabled) |
| INT2_DRDY_AH_QVAR | Analog hub and Qvar data-ready interrupt on the INT2 pin. Default value: 0 (0: disabled; 1: enabled) |
| AH_QVAR_C_ZIN_[1:0] | Configures the equivalent input impedance of the analog hub and Qvar buffers. (00: 2.4 GΩ (default); 01: 730 MΩ; 10: 300 MΩ; 11: 235 MΩ) |
| LPF1_G_EN | Enables the gyroscope digital LPF1 filter. If the OIS chain is disabled, the bandwidth can be selected through LPF1_G_BW_[2:0] in CTRL6 (15h) |

Table 167. TAP_DUR register description

| | |
|-------------|---|
| DUR_[3:0] | Duration of maximum time gap for double-tap recognition. Default: 0000 When double-tap recognition is enabled, this register expresses the maximum time between two consecutive detected taps to determine a double-tap event. The default value of these bits is 0000b which corresponds to 16/ODR_XL time. If the DUR_[3:0] bits are set to a different value, 1LSB corresponds to 32/ODR_XL time. |
| QUIET_[1:0] | Expected quiet time after a tap detection. Default value: 00 Quiet time is the time after the first detected tap in which there must not be any overthreshold event. The default value of these bits is 00b which corresponds to 2/ODR_XL time. If the QUIET_[1:0] bits are set to a different value, 1LSB corresponds to 4/ODR_XL time. |
| SHOCK_[1:0] | Maximum duration of overthreshold event. Default value: 00 Maximum duration is the maximum time of an overthreshold signal detection to be recognized as a tap event. The default value of these bits is 00b which corresponds to 4/ODR_XL time. If the SHOCK_[1:0] bits are set to a different value, 1LSB corresponds to 8/ODR_XL time. |

9.80 UI_CTRL3_OIS (72h)

OIS configuration register

The primary interface can write this register when the OIS_CTRL_FROM_UI bit in the FUNC_CFG_ACCESS (01h) register is equal to 1 (primary IF full-control mode); this register is read-only when the OIS_CTRL_FROM_UI bit is equal to 0 (SPI2 full-control mode) and shows the content of the SPI2_CTRL3_OIS (72h) register.

Reserved registers must not be changed. Writing to those registers may cause permanent damage to the device.

The content of the registers that are loaded at boot should not be changed. They contain the factory calibration values. Their content is automatically restored when the device is powered up.

| SPI2_SHARED_ACK | Auxiliary SPI (SPI2) interface side. This bit acknowledges the handshake. If the primary interface is not accessing the shared registers, this bit is set to 1 by the device and the R/W operation on the UI_SPI2_SHARED_0 (65h) through UI_SPI2_SHARED_5 (6Ah) registers is allowed on the auxiliary SPI interface. |

11.11 SPI2_INT_OIS (6Fh)

OIS interrupt configuration register and self-test setting

The auxiliary SPI interface can write this register when the OIS_CTRL_FROM_UI bit in the [FUNC_CFG_ACCESS \(01h\)](#) register is equal to 0 (SPI2 full-control mode); this register is read-only when the OIS_CTRL_FROM_UI bit is equal to 1 (primary IF full-control mode) and shows the content of the [UI_INT_OIS \(6Fh\)](#) register.

11.12 SPI2_CTRL1_OIS (70h)

OIS configuration register

The auxiliary SPI interface can write this register when the OIS_CTRL_FROM_UI bit in the [FUNC_CFG_ACCESS \(01h\)](#) register is equal to 0 (SPI2 full-control mode); this register is read-only when the OIS_CTRL_FROM_UI bit is equal to 1 (primary IF full-control mode) and shows the content of the [UI_CTRL1_OIS \(70h\)](#) register.

Reserved registers must not be changed. Writing to those registers may cause permanent damage to the device. The content of the registers that are loaded at boot should not be changed. They contain the factory calibration values. Their content is automatically restored when the device is powered up.

Reserved registers must not be changed. Writing to those registers may cause permanent damage to the device. The content of the registers that are loaded at boot should not be changed. They contain the factory calibration values. Their content is automatically restored when the device is powered up.

Write procedure example: write value 06h in register at address 84h (PEDO_DEB_STEPS_CONF) in Page 1

1. Write bit EMB_FUNC_REG_ACCESS = 1 in FUNC_CFG_ACCESS (01h) // Enable access to embedded functions registers
2. Write bit PAGE_WRITE = 1 in PAGE_RW (17h) register // Select write operation mode
3. Write 0001 in PAGE_SEL[3:0] field of register PAGE_SEL (02h) // Select page 1
4. Write 84h in PAGE_ADDR register (08h) // Set address
5. Write 06h in PAGE_DATA register (09h) // Set value to be written
6. Write bit PAGE_WRITE = 0 in PAGE_RW (17h) register // Write operation disabled
7. Write bit EMB_FUNC_REG_ACCESS = 0 in FUNC_CFG_ACCESS (01h) // Disable access to embedded functions registers

Read procedure example: read value of register at address 84h (PEDO_DEB_STEPS_CONF) in Page 1

1. Write bit EMB_FUNC_REG_ACCESS = 1 in FUNC_CFG_ACCESS (01h) // Enable access to embedded functions registers
2. Write bit PAGE_READ = 1 in PAGE_RW (17h) register // Select read operation mode
3. Write 0001 in PAGE_SEL[3:0] field of register PAGE_SEL (02h) // Select page 1
4. Write 84h in PAGE_ADDR register (08h) // Set address
5. Read value of PAGE_DATA register (09h) // Get register value
6. Write bit PAGE_READ = 0 in PAGE_RW (17h) register // Read operation disabled
7. Write bit EMB_FUNC_REG_ACCESS = 0 in FUNC_CFG_ACCESS (01h) // Disable access to embedded functions registers

Note:

Steps 1 and 2 of both procedures are intended to be performed at the beginning of the procedure. Steps 6 and 7 of both procedures are intended to be performed at the end of the procedure. If the procedure involves multiple operations, only steps 3, 4 and 5 must be repeated for each operation. If, in particular, the multiple operations involve consecutive registers, only step 5 can be performed.

15.1.4

FSM_EXT_SENSITIVITY_L (BAh) and FSM_EXT_SENSITIVITY_H (BBh)

External sensor sensitivity value register for the finite state machine (R/W)

This register corresponds to the conversion value of the external sensor. The register value is expressed as half-precision floating-point format: SEEEEEFFFFFFFFF (S: 1 sign bit; E: 5 exponent bits; F: 10 fraction bits).

Default value of FSM_EXT_S_[15:0] bits is 0x1624 (when using an external magnetometer this value corresponds to 0.0015 gauss/LSB).

MLC_EXT_SENSITIVITY_L (E8h) and MLC_EXT_SENSITIVITY_H (E9h)

External sensor sensitivity value register for the machine learning core (R/W)

This register corresponds to the conversion value of the external sensor. The register value is expressed as half-precision floating-point format: SEEEEFFFFFFFFF (S: 1 sign bit; E: 5 exponent bits; F: 10 fraction bits).

Default value of MLC_EXT_S_[15:0] is 0x3C00 (when using an external magnetometer this value corresponds to 1 gauss/LSB).

External sensor (3-byte output data) sensitivity value register for the finite state machine and machine learning core (R/W)

This register corresponds to the conversion value of the external sensor having 3-byte output data. The register value is expressed as half-precision floating-point format: SEEEEFFFFFFFFF (S: 1 sign bit; E: 5 exponent bits; F: 10 fraction bits).

The default value of EXT_3BYTE_S_[15:0] is 0x0C00 (when using an external pressure sensor this value corresponds to 2.441e-04 hPa/LSB).

15.3.3 EXT_3BYTE_OFFSET_XL (06h), EXT_3BYTE_OFFSET_L (07h) and EXT_3BYTE_OFFSET_H (08h)

External sensor (3-byte output data) offset value register for the finite state machine and machine learning core (R/W)

This register corresponds to the offset value applied to external sensor output data (3-byte) before being processed in FSM and MLC. The value is expressed as a 24-bit word in two's complement.

The default value of EXT_3BYTE_OFFSET_[23:0] is 0x3F5400, which corresponds to 4150272 LSB. This offset is subtracted from the external output data (in LSB) before the sensitivity (configured in the EXT_3BYTE_SENSITIVITY_L (02h) and EXT_3BYTE_SENSITIVITY_H (03h) registers) is internally applied.

Reserved registers must not be changed. Writing to those registers may cause permanent damage to the device. The content of the registers that are loaded at boot should not be changed. They contain the factory calibration values. Their content is automatically restored when the device is powered up.

17 Sensor hub register description

17.1 SENSOR_HUB_1 (02h)

Sensor hub output register (R)

First byte associated to external sensors. The content of the register is consistent with the SLVx_CONFIG number of read operation configurations (for external sensors from x = 0 to x = 3).

18 Soldering information

The LGA package is compliant with the [ECOPACK](#) and RoHS standard.

It is qualified for soldering heat resistance according to JEDEC J-STD-020.

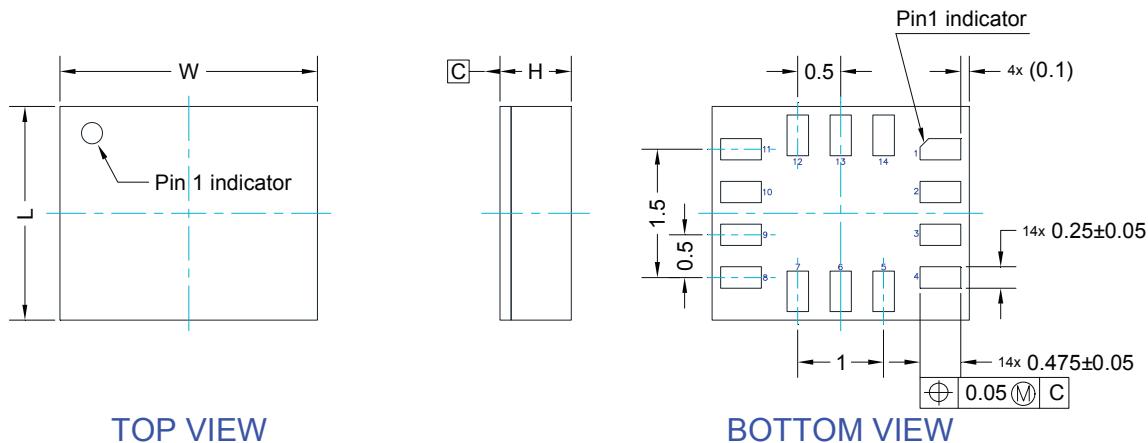

For land pattern and soldering recommendations, consult technical note [TN0018](#) available on [www.st.com](#).

19 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK packages, depending on their level of environmental compliance. ECOPACK specifications, grade definitions and product status are available at: www.st.com. ECOPACK is an ST trademark.
